He adds, that for the conservation of the water, and moisture of the planets, *comets* seem absolutely requisite; from whose condensed vapours and exhalations, all that moisture which is spent in vegetations and putrefactions, and turned into dry earth, &c. may be resupplied and recruited. For all vegetables grow, and increase wholly from fluids; and, again, as to their greatest part, turn, by putrefaction, into earth again; an earthy slime being perpetually precipitated to the bottom of putrefying liquors. Hence, the quantity of dry earth must continually increase, and the moisture of the globe decrease, and at last be quite evaporated; if it have not a continual supply from some part or other of the universe. And I suspect, adds our great author, that the spirit, which makes the finest, subtlest, and best part of our air, and which is absolutely requisite for the life and being of all things, comes principally from the *comets*.

On this principle, there seems to be some foundation for the popular opinion of presages from *comets*: since the tail of a *comet* thus intermingled with our atmosphere, may produce changes very sensible in animal and vegetable bodies. See SPIRIT and MEDIUM.

M. Facio has suggested, that some of the *comets* having their nodes so very near the annual orbit of the earth; should the earth happen to be found in that part next the node, at the time of a *comet's* passing by; as the apparent motion of the *comet* will be incredibly swift, so its parallax will become very sensible; and the proportion thereof to that of the sun will be given: whence, such transits of *comets* will afford the best means of determining the distance of the earth and sun.

The *comet* of 1472, *v. gr.* had a parallax above twenty times greater than the sun's: and if that of 1618 had come down in the beginning of March to its descending node, it would have been much nearer the earth, and its parallax much more notable. But, hitherto, none has threatened the earth with a nearer approach than that of 1680: for, by calculation, Dr. Halley finds, that November 11, 11 H. 6 Min. P. M. that *comet* was not above one semidiameter of the earth, to the northwards of the way of the earth; at which time, had the earth been in that part of its orbit, the *comet* could have had a parallax equal to that of the moon: what might have been the consequence of so near an approach, a contact, or lastly, a shock of the celestial bodies?—A deluge Mr. Whiston says! See DELUGE.

Motion of COMETS.—If the paths of *comets* be supposed directly parabolical, as some have imagined, it would follow, that being impelled towards the sun by a centripetal force, they descend as from spaces infinitely distant; and by their falls acquire such a velocity, as that they may again run off into the remotest regions; still moving upwards, with such a perpetual tendency as never to return.—But the frequency of their appearance, and their degree of velocity, which does not exceed what they might acquire by their gravity towards the sun, seem to put it past doubt that they move, planet-like, in elliptic orbits, though those exceedingly excentric; and so return again, though after very long periods. See ELLIPTIC.

Apollonius Myndius declar'd that he took *comets* for regular stars; and ventured to foretell, that one day the periods and laws of their motion would be discovered.

Astronomers, however, are still divided on that head: Newton, Flamsteed, Halley, and the English astronomers, &c. seem satisfied of the return of *comets*: Cassini, and others of the French, think it highly probable; but de la Hire, and others, oppose it.

Those on the affirmative side, suppose the *comets* to describe circles prodigiously excentric, inasmuch as we can only see them in a very small part of their revolution: out of this, they are lost in the immense spaces; hid not only from our eyes, but our telescopes. That little part of their circle next us, M. Cassini, &c. have found to pass between the orbits of Venus and Mars.

For the reasons of the return of COMETS, M. Cassini gives these that follow.—1. In considering the course of the *comets*, with regard

to the fixed stars, they are found to keep a considerable time in the arch of a great circle, *i. e.* a circle whose plane passes thro' the center of the earth: indeed, they deviate a little from it, chiefly towards the end of their appearance; but this deviation is common to them with the planets.

2°. *Comets*, as well as planets, appear to move so much the faster as they are nearer the earth; and when they are at equal distances from their perigee, their velocities are nearly the same.

By subtracting from their motion the apparent inequality of velocity occasioned by their different distance from the earth, their equal motion might be found; but we should not be certain this motion were their true one: in regard they might have considerable inequalities, not distinguishable in that small part of their orbit visible to us. It is, indeed, probable, their real motion, as well as that of the planets, is unequal in itself; and hence we have a reason why the observations made during the appearance of a *comet* cannot give the just period of their revolution. See PERIOD.

3°. There are no two different planets whose orbits cut the ecliptic in the same angle, whose nodes are in the same points of the ecliptic, and whose apparent velocity in their perigee is the same: of consequence, two *comets* seen at different times, yet agreeing in all those three circumstances, can only be one and the same *comet*.

And this were the *comets* of 1577 and 1680 observed to do; and those of 1652, and 1698: not that this exact agreement in these circumstances is absolutely necessary to determine them the same *comet*. M. Cassini finds the moon herself irregular in them all: accordingly, he is of opinion, there are several which disagree herein, and yet may be accounted the same.

The great objections against the return of COMETS, are, the rarity of their appearance, with regard to the number of revolutions assigned to them.

In 1702 there was a *comet* or rather the tail of one, seen at Rome, which M. Cassini takes to be the same with that observed by Aristotle, and that since seen in 1668; which would imply its period to be 34 years. Now, it may seem strange, that a star which has so short a revolution, and of consequence such frequent returns, should be so seldom seen.—Again, in April of the same year, 1702, a *comet* was observed by Mess. Bianchini and Maraldi, supposed by the latter to be the same with that of 1664, both by reason of its motion, velocity, and direction. M. de la Hire took it to have some relation to another he had observed in 1698; which M. Cassini refers to that of 1652: on this supposition its period appears to be 43 months, and the number of revolutions between 1652, and 1698, fourteen: but it is hard to suppose, that in this age, wherein the heavens are so narrowly watched, a star should make 14 appearances unperceived: especially such a star as this, which might appear above a month together; and of consequence be frequently disengaged from the crepusculæ.

For this reason M. Cassini is very reserved in maintaining the hypothesis of the return of *comets*, and only proposes those for planets, where the motions are easy and simple, and are solved without straining, or allowing many irregularities.

M. de la Hire proposes one general difficulty against the whole system of the return of *comets*, which would seem to hinder any *comet* from being a planet: and it is this: that, by the disposition necessarily given to their courses, they ought to appear as small at first as at last; and always increase, till they arrive at their greatest proximity to the earth: or, if they should chance not to be observed as soon as they become visible, for want of attention thereto; at least, it is impossible but they must frequently shew themselves ere they have arrived at their full magnitude and brightness: but he adds, that none were ever yet observed till they had arrived at it.

But the appearance of a *comet* in the month of October, 1723, while at a great distance, so as to be too small and dim to be viewed without a telescope, may serve to remove this obstacle, and let the *comets*, still, on the same footing with the planets.

Sir Isaac Newton supposes, that as those planets which are nearest the sun, and revolve in the least orbits, are the smallest; so among the *comets*, such as in their perihelion come nearest the sun, are the smallest, and revolve in lesser orbits.

Dr. Halley has given us a table of the astronomical elements of all the *comets* that have been yet observed with due care; whereby, whenever a new *comet* shall appear, it may be determined, by comparing it therewith, whether it be any of those which have yet appeared; and consequently its period, and the axis of its orbit be determined, and its return foretold.

There are many things in the *comet* of 1532, observed by Peter Apian, which intimate its being the same with that of 1607, observed by Kepler and Longomontanus; and which Dr. Halley himself again observed in 1682. All the elements agree, and there is nothing contradicts the opinion, but that inequality in the periodic revolution; which, however, he thinks, is no more than may be accounted for from physical causes: no more, in effect, than is observed in Saturn; the motion of which planet is so disturbed by the rest, especially Jupiter, that its period is uncertain for several days together; to what errors then may not

not a comet be liable, which rises to almost four times the height of Saturn; and whose velocity, if but a little increased, would change its elliptic orb into a parabolic one?

What further confirms the identity, is the appearance of another comet in the summer of 1456; which, though observed by none with accuracy, yet by its period, and the manner of its transit, he concludes to be the same: and thence ventures to foretell its return in the year 1758. See Whiston's *Solar System*, where the orbits of the several Comets are delineated, and their periods, so many of them as are known, express'd.

To determine the Place and Course of a COMET.—Observe the distance of the comet from two fixed stars, whose longitudes and latitudes are known: from the distances thus found, calculate the place of the comet by trigonometry, after the manner delivered under PLANET.—By repeating the observations and operations for several days successively, the course of the comet will be had.

To determine the Course of a COMET mechanically, and without any apparatus of instruments.—The following ingenious method, by a thread, we owe to Longomontanus: observe four stars round the comet, such, as that the comet may be in the intersection of the right lines that join the two opposite stars; which is easily found by means of a thread placed before the eye, and extended over-against the stars and comet.

Suppose, *v. gr.* the comet's place in the heavens A, (Tab. *Astronomy*, fig. 23.) between the four stars, B, C, D, E; where the line joining the stars B and D, passes through the body of the comet; and the like does the line passing through C and E. On a globe, whereon these four stars are found, extend a thread through B and D, and another through C and E; the point of intersection will give the place of the comet. This practice being repeated for several days, the comet's course will be had on the globe; which course will be found to be a great circle: from any two points whereof, it will be easy to find its inclination to the ecliptic, and the place of the nodes; only by observing where a thread stretched through the two points cuts the ecliptic.

To determine the Parallax of a COMET. See PARALLAX.

Trajectory of a COMET. See TRAJECTORY.

COMITATUS *Poss.* See the article POSSESSOR.

COMITIA *, an assembly of the Roman people, either in the *comitium*, or *campus martius*; meeting for the election of magistrates, or for consulting on the important affairs of the republic. See FIELD of Mars, &c.

* The word comes from the verb *comis*, or *comes*, to go together.

There were certain days fixed for these assemblies, called *comitiales*; marked with a c in the calendar of Julius Cæsar. Comitial assemblies held for the election of consuls, were called *comitia consularia*: in like manner, the other *comitia* took names from the officer to be created; whether a tribune, a pontiff, ædile, or the like.

There were three kinds of these *comitia*, *viz.* *curiata*, *centuriata*, and *tributa*; so distinguished, from the manner wherein the people voted, and gave their suffrages, *viz.* by *curiæ* or *parishes*, *tribes*, or *centuries*.

Authors make the difference between *comitia*, and *concilia*, to consist in this; that in the former the whole people were called together, in the latter only a part.

The *comitium*, or the place where the *comitia* were ordinarily held, was a large hall in the Roman Forum: it was a long time open at top; on which account, the assemblies were often interrupted by the ill weather: it was first covered over in the time of the second Punic war. See FORUM.

Rofinus observes, that the consuls and tribunes were not created in the *comitium*, but in the *campus martius*.

COMITIALIS *Morbis*, an ancient term for the epilepsy, or falling-sickness; so called, because if any person was seized with it in the Roman *comitia*, the assembly was immediately dissolved; this being esteem'd an unlucky omen: or rather because those liable to it were chiefly seized in the *comitia*, or great assemblies. See EPILEPSY.

COMMA *, *Κομμα*, in grammar, a point, or character formed thus [,]; serving to mark a short stop, or pause; and to divide the members of a period.

* The word is Greek, formed of *κομω*, *sew*, I cut.

It is very difficult to fix the precise use of the comma; different authors define, and use it differently: the ordinary doctrine is, that the comma serves to distinguish nouns, verbs, adverbs, and the several parts of a period that are not necessarily joined together. But this conveys no clear, precise idea; for what is it to distinguish the parts of a period not necessarily joined together? F. Butler has carried the doctrine of the comma further: according to him, the comma serves to distinguish those members of a period, in each whereof is a verb, and the nominative case of the verb. Thus, *That so many people are pleased with trifles, is owing to a weakness of mind, which makes them love things easy to be comprehended.*

Besides this, the comma is used to distinguish, in the same member of a period, several nouns substantives, or nouns adjectives, or verbs not united by a conjunction. Thus, *Virtue, wit, knowledge, are the chief advantages of a man: or, a man never becomes learned without studying constantly, methodically, with a gust, application, &c.*

If those words be united in the same phrase by a conjunction, the comma is omitted: thus, *The imagination and the judgment do not always agree.* The comma may also be omitted between two phrases that are very short, especially if they depend on the same regimen, and are united by a conjunction: thus, *Alexander conquered Asia and established the monarchy of the Greeks.*

The ingenious author of the *tracté de raison interposée*, printed with Voltaire's *Element. Rhetor.* Lond. 1724. lays down the use of a comma to be, to distinguish the simple members of a period, or sentence; *i. e.* such as only consist of one subject, and one definite verb.—Thus Cicero, *Venia munc ad voluptates agricolarum, quibus ego incredibiliter delector, quæ nec ulla impediuntur somnitate, & mihi ad sapientis vitam proxime accedere videntur.* See SENTENCE.

But this rule does not go throughout; the same author instantiating many particular cases, not included herein, where yet the comma is advisable.

Sometimes, *v. gr.* a proposition includes another, which may be called *partitive*, as being only a part of the entire phrase; in which case, the two are to be divided from each other by commas. Thus, *He always says, as he tells us, the finest things in the world.* The points, or pauses in discourse, it is observed, are in a kind of musical proportion: the comma stops the reader's voice while he may privately tell one; the semicolon, two; the colon, three; and the period or full-stop, four.

The ancients only made use of two kinds of points, or pauses in a period; the larger they called *members*, the Greeks *cola*, marked thus [:]; the smaller *enclise*, the Greeks *commata*, thus [,].

The moderns, refining on their predecessors, have subdivided the first into a colon and semicolon; some say, without any good foundation in nature; though others stand up for the usefulness of the division.

As the member, or colon, divides the period into two parts, each containing a sense, though that imperfect; thus, *Antequam de republica, patres conscripti, dicam ea quæ dicenda hoc tempore arbitror*; where the sense does not rest, nor is the period or sentence perfect, without the addition of, *exponam vobis breviter & profectissimè & reverentissimè meæ*: the comma subdivides each member into intermediate divisions, which, of themselves, have no precise meaning at all; *v. gr.* *Nihil est, mihi crede, virtute firmius, nihil pulchrius, nihil amabilius.*

Frequent commas, as on other occasions they promote perspicuity and distinctness, and ease the reader, both in the rehearsal and comprehension of his author; so, in oratory, are they of especial use and effect; particularly where an adversary is to be closely and pointedly attacked, upbraided, reprehended, wounded, &c. witness that of Cicero against Verres; *Non enim eos color iste servilis, non pilosæ genæ, non dentes putridi deceperunt: oculi, supercilia, frons, vultus denique totus, qui sermo quidam tacitus mentis est, hic in fraudem, homines impulit: hic, eos, quibus erat ignotus, decepit, fessit, in fraudem induxit: pauci sua ipsa ludentia vitia novimus; pauci tarditatem ingenii, stuporem, debilitatemque lingue, &c.*

COMMA, in musick, is the smallest of all the sensible intervals of tune.

The comma is about the tenth part of a tone: or it is the interval whereby a perfect semitone surpasses an imperfect one; or a perfect tone, an imperfect one. See TONE.

Mr. Sauveur says, a comma is the difference between a tone major and minor. It is seldom in use, except in the theory of musick, to shew the justness of the concords; for in the practice, the division is drowned and lost. Each lesser tone ordinarily contains ten commas.

Lancelot only divides his tone into nine parts, or commas; so that according to him, a comma is the ninth part of a tone.

The proportion of the greater comma in number, is as 80 to 81; that of the smaller, as 2025 to 2048.

COMMANDING Ground, in fortification, an eminence or rising ground which overlooks any post, or strong place.

Of this they reckon three sorts: 1°. *A front commanding ground*; which is an height opposite to the face of the post, which plays upon its front.

2°. *A reverse commanding ground*, which is an eminence that can play upon the back of any place or post.

3°. *An enfilade commanding ground*, or *curtain commanding ground*; which is an high place, that can with its shot scour all the length of a strait line.

COMMANDMENT, in a legal sense, has various uses; as, *Commandment of the king*; when, on his own mere motion, and from his own mouth, he casts a man into prison.

Commandment of the justices, is either *absolute*, or *ordinary*; *absolute*, as when on their own authority, and their own discretion, they commit a man to prison for punishment.

Ordinary, as when they commit him rather for safe custody than punishment.—A man committed to an ordinary *Commandment* is releasable.

COMMANDMENT is also used for the offence of him who directs or wills another to transgress the law; as by murder, theft, and the like.

COMMANDRY, a kind of benefice, or fixed revenue belonging to a military order, and conferred on ancient knights who had done considerable services to the order.

There

There are *strict*, or regular *Commandries*, obtained in order, and by merit: there are others of *grace* or *favour*, conferred at the pleasure of the grand master.

There are also *Commandries* for the religious in the orders of S. Bernard and S. Anthony.—The kings of France have converted several of the hospitals for lepers into *Commandries* of the order of S. Lazarus.

Commandries may be compared to conventual priories; which, at first, were no more than administrations of the revenue of certain places at a distance from the principal monastery: as there was a necessity for having monks disposed in these houses to take care of the effects; so there was the like necessity for sending knights into those places where the order had lands.

The *Commandries* of Malta are of different kinds; for as the order consists of knights, chaplains, and brothers servants, there are peculiar *Commandries* or revenues attached to each.

The knight to whom one of these benefices or *Commandries* is given, is called *Commander*: which agrees pretty nearly with the *propositus* set over the monks in places at a distance from the monastery, whose administration was called *obediencia*; because depending entirely on the abbot who gave him his commission. Thus it is with the simple *Commanders* of Malta, who are rather farmers of the order, than beneficiaries; paying a certain tribute or rent, called *responsio*, to the common treasure of the order.

COMMEMORATION, the remembrance of any one; or something done in honour of a person's memory.

Among the Romanists, it is a practice for dying persons to leave a legacy to the church, for the rehearsing so many masses in Commemoration of them.

The eucharist is a Commemoration of the sufferings of Jesus Christ; and is not, therefore, Jesus Christ himself.

COMMEMORATION is also the name of a religious feast, otherwise called *All-saints*, held on the first of November, in memory of all the faithful deceased; instituted in the XIIIth century, by Odilo abbot of Cluny. See *FEAST*.

The occasion of its institution is variously related; the most plausible account is this: a religious knight returning from a pilgrimage to the holy land, and losing his road, met a hermit; who hearing that he was a Franc, asked him if he knew the monastery of Cluny, and the abbot Odilo; the pilgrim professing his knowledge of both, the hermit told him, that God had discovered to him, that he was to have the credit of delivering souls from the pains they suffer in the other life; charging him, at his return, to exhort Odilo, and those of his community, to continue their prayers and alms for the dead. See *CLUNY*.

COMMENDAM, in the canon law, expresses the charge, trust, and administration of the revenues of a benefice, given to a layman to enjoy, by way of depositum, for the space of six months; in order to its being repaired, &c. or to another bishop, or ecclesiastic, to perform the pastoral offices thereof, till such time as the benefice is provided of a regular incumbent. See *BENEFICE*.

Antiently, the administration of vacant bishopricks belonged to the nearest neighbouring bishop; which is still practised between the archbishoprick of Lyons, and the bishoprick of Autun: on this account they were called *commendatory bishopricks*.

This custom appears to be very antient: S. Athanasius says of himself, according to Nicephorus, that there had been given him in *commendam*, i. e. in administration, another church besides that of Alexandria whereof he was stated bishop.

The care of churches, it seems, which had no pastor, was committed to a bishop, till they were provided of an ordinary: the register of pope Gregory I. is full of these commissions, or *Commendams*, granted during the absence or sickness of a bishop, or the vacancy of the see.

Some say, that pope Leo IV. first set the modern *Commendams* on foot, in favour of ecclesiastics who had been expelled their benefices by the Saracens; to whom the administration of the vacant churches was committed for a time, in expectation of their being restored; though S. Gregory is said also to have used the same, while the Lombards desolated Italy.

In a little time, the practice of *Commendams* became exceedingly abused; and the revenues of monasteries were given to laymen for their subsistence. The bishops also procured several benefices, or even bishopricks in *commendam*, which served as a pretext for holding them all without directly violating the canons. Part of the abuse has been retrenched; but the use of *Commendams* is still retained; as an expedient to take off the incompatibility of the person, by the nature of the benefice. When a parson is made bishop, his parsonage becomes vacant; but if the king give him power, he may still hold it in *commendam*.

COMMENDAM; in Romish countries, is a real title of a regular benefice; as an abby, or priory given by the pope to a secular clerk, or even to a layman, with power to dispose of the fruits thereof during his life.

No benefice that has a cure of souls, i. e. no parsonage, or bishopric can be given in *commendam*. This practice being entirely contrary to the canons, none but the pope, who has a power of dispensing with the canons, can confer it.

When the *Commendam* becomes vacant by the death of the *commendatory*, it is not esteemed vacant by his death, but as it

was before the *Commendam* was granted; that making no alteration in the thing: yet the pope gives the same benefice in *commendam* again, by a privilege which he still continues.

By the pope's bulls, a *commendatory* abbot has the full authority of the regular abbot to whom he is substituted: this is expressed in plain terms, *curam monasterii ac regimen & administrationem tibi in spiritualibus & temporalibus plene committendo*. For this reason, the bulls expressly require, that he be a priest; or, that if he have not yet attained the age of a priesthood, he shall take orders as soon as he has. But this is a mere formality, or matter of style; the thing is never executed.

Indeed, the spiritual direction of the abby, while it is in *Commendam*, is lodged wholly in the claustral prior. The *commendatory* abbots have not any authority over the religious in *spiritualibus*: they even cannot either appoint or set aside the claustral priors, who are nominated in the bulls the administrators of the spiritualities; in which, however, this restriction is added, *viz.* till the abbot arrive at the age of 25 years, to assume the priesthood. The bull given the prince of Neubourg for the abby of Fefcamp, runs thus: *Et ne ob defectum ætatis primo-dictum monasterium aliquod in spiritualibus patiat detrimentum; priorem-claustralem pro tempore existentem, primo-dicti monasterii in spiritualibus, donec tu 25 tue ætatis annum pervereris, duntaxat constitutimus ac deputamus*. The words *administration in spiritualibus*, are understood principally of the monastic rule, or discipline; from which the *commendatory* abbots are excluded, when they are promoted to the priesthood, unless they become regulars.

The pope grants benefices in *commendam*, not only to clerks, by dispensing with their age, and other qualifications required; but they also dispense with the clericate even in children yet in the cradle, till they become of age to take the tonsure: it being sufficient to obtain a bull, that it be represented at Rome, that the child is destined for the ecclesiastical state.

In this case there is an economist, or steward, appointed to take care of the temporal concerns. See *OECONOMUS*.

COMMENDATI. See *AFFIDATUS*.

COMMENSURABLE quantities, in geometry, are such as have some common aliquot part, or which may be measured by some common measure, so as to leave no remainder in either.

Thus, a foot and a yard are *commensurable*; there being a third quantity which will measure each, *viz.* an inch; which taken 12 times makes a foot, and 36 times a yard.

Commensurables are to each other, either as unites to a rational whole number; or as one rational whole number to another. In *incommensurables* it is otherwise. The ratio of *Commensurables* therefore is rational; that of *incommensurables* irrational: hence, also, the exponent of the ratio of *Commensurables* is a rational number.

COMMENSURABLE numbers, whether integers or fractions, are such as have some other number which will measure or divide them without any remainder.

Thus, 6 and 8, $\frac{4}{3}$, and $\frac{5}{2}$, are respectively *commensurable* numbers.

COMMENSURABLE in power. Right lines are said to be *commensurable in power*, when their squares are measured by one and the same space, or superficies.

COMMENSURABLE furds, are such furds as being reduced to their least terms, become true figurative quantities of their kind; and are therefore as a rational quantity to a rational.

COMMENTARY, or COMMENT, a gloss, or interpretation, affixed to some antient, obscure, or difficult author, to render him more intelligible, or to supply what he has left undone.

Sir Henry Savil has wrote a *Commentary* of 300 pages in quarto, to explain the first eight propositions in Euclid.—S. Ewemond observes, that commentators commonly spend a great part of their time in finding out beauties the author never dreamt of, and in enriching him with their own thoughts.

COMMENTARY is also used for a sort of history, written by a person who had a chief hand in the transactions related.

Such are the *Commentaries* of Cæsar, of Sleidan, of Montluc, &c. The word is also used for certain books written on some particular subject: Kepler has an excellent book of *Commentaries* on *Mars*, containing observations on the motion of that planet.

COMMERCE, the exchange of commodities; or, the buying, selling, or trafficking of merchandise, money, or even paper; in order to profit by the same.

There is no doubt but *Commerce* is nearly as antient as the world itself: necessity set it on foot, the desire of convenience improved it, and vanity, luxury, and avarice, have brought it to its present pitch. At first it only consisted in the exchange of things necessary for life: the plowman gave his corn and his pulse to the shepherd, and received milk and wool in exchange; which method of *Commerce* by exchange subsists still in many places; as about the coasts of Siberia, and the Danish, and Muscovite Lapland; among several nations on the coasts of Africa; among most of those of America, and many of Asia. See *EXCHANGE*.

It is not precisely known when the *Commerce* by buying and selling first began; nor when coins, and the several species of gold, silver, and copper, had their rise. The first monies were wood, leather, and iron; and even at this day, it is the custom in some places

places of both Indies, to give a certain value in sea-shells and coco-nuts, for merchandises, drugs, &c. See MONEY, and COIN. The first instance of this kind of *Commerce* in the sacred writings, is in the time of the patriarch Abraham. For prophane authors, they usually fix its epocha to the reign of Saturn and Janus in Italy; and the antient authors, according to Cæsar, attribute its invention to the god Mercury.

The Egyptians, Phenicians, and Carthaginians, who were a Tyrian colony, were the first, the most daring and expert traders of all antiquity: at least, it is evident they were the first who run the hazard of long voyages; and who set on foot a traffick by sea between coasts very remote.

Among the antients, *Commerce* did not appear unworthy the application of persons of the first rank: Solomon, we are told, frequently joined his merchant-fleets with those of the king of Tyre, for their Voyage to Ophir; and by this means rendered himself, though in a little kingdom, the richest king of his time in the universe. Under the Asiatic and Græcian empires, antient history gives us from time to time the traces of a *Commerce* cultivated by several nations: but it flourished more considerably under the dominion of the Romans; as appears from that vast number of colleges and companies of merchants in the several cities mentioned in historians and antient inscriptions.

The destruction of the Roman empire by the irruptions of the Barbarians, brought that of *Commerce* along with it; or at least suspended its ordinary operation for some time: by degrees it began to recover itself, and made a new progress; especially in Italy. Hence, the Pisans, Florentines, Genoese, and Venetians, who abounding in shipping, took occasion to spread themselves through all the ports of the Levant and Egypt; bringing thence silk, spices, and other merchandises; and furnishing the greatest part of Europe therewith. And thus was the modern *Commerce* founded on the ruins of that of the antient Greeks and Romans to the same places: and thus did those famous republics acquire their lustre and power.

The Germans, however, had a long time carried on a separate *Commerce*; which was not borrowed from the Romans, nor did it fall with theirs. Towards the end of the twelfth century, the German cities situate on the coast of the Baltic, and the rivers that run into it, got into a considerable traffick with the neighbouring states.

As their *Commerce* was much interrupted by pyrates, 72 of them united together for their mutual defence; and were thence called *hanseatic*, or *hans towns*. See HANS TOWN.

Thus they flourished till the beginning of the sixteenth or the end of the fifteenth century; when a division arising among them, and about the same time a new passage to the Indies, by the Cape of Good Hope, being discovered by the Portuguese; and settlements made on the coast of Africa, Arabia, and the Indies: the antient Italian and Hanseatic *Commerce* sunk; and the chief trade came into the hands of the Portuguese.

The Portuguese had not possessed those different trades above 100 years, when, about the beginning of the seventeenth century, the Dutch began to share it with them; and in a little time dispossessed them of almost the whole. The English, French, Danes, and Hamburgers, excited by their success, have likewise made settlements in the Indies, and on the coasts of Africa; though much less considerable ones, excepting those of the English.

Lastly, America, discovered by the Spaniards soon after the Portuguese had discovered the new way to the Indies, likewise became the object of a new, vast, and most important *Commerce*, for all the nations of Europe; whereof Cadiz and Sevil were made the center.

It is true, the first conquerors of this new world still possess the greatest and richest part of it; and preserve the *Commerce* thereof to themselves with a world of jealousy: yet, besides that the English, French, Portuguese, and Dutch, have several rich and flourishing colonies, both in the islands and the continent; it is certain, that it is as much for other nations as themselves that the Spaniards every year send their fleets for the treasures of Peru and Mexico.

The trade of Europe was no sufferer by this new one of America; the north and south have still the same mutual occasion for each other as before.

The navigation from the Baltick to the Mediterranean was tedious and difficult: the situation of Flanders, and the manufactures which there flourished from the tenth century, together with the free fairs of that country, engaged the merchants, both of the north and south, to establish their magazines first in Bruges, and then in Antwerp.

The establishment of the republic of Holland, the favourable reception it gave to strangers, and the refuge it afforded to religionaries, drew store of manufacturers to it, as well as manufactures; and soon sunk the *Commerce* of Antwerp.

And the same reasons, the convenience and multitude of the ports of England, the good of the wools, and the industry of the workmen, have brought thither a considerable part of the *Commerce* of Europe.

In France, the nobles are allowed to exercise *Commerce* with-

out derogating from their nobility: by an ordonnance of Louis XIII. merchants are allowed to take on them the quality of nobles; and by another of Louis XIV. they are declared capable of being secretaries of state, without laying aside their *Commerce*. It may be added, for the honour of trade, that some of the Italian princes, looking on themselves as the chief merchants of their states, do not disdain to make their own palaces serve as magazines: and there are several kings in Asia, as well as most of those on the coasts of Africa and Guinea, who negotiate with the Europeans by their factors, and frequently in person.

Commerce, on the foot it now stands, is divided into *Commerce* by land, and by sea; that by long voyages, and by short; inland or domestic, and foreign; and by wholesale and retail.

A great part of the foreign *Commerce* of England is now carried on by collective companies: some incorporated by the king's charters, with an exclusive privilege, as the East-India and South-Sea companies; others only private associations, as the Turkey and Hamburg companies. See COMPANY.

Chambers of COMMERCE. See the article CHAMBER.

Characters in COMMERCE. See the article CHARACTER.

COMMINATORY, a clause inserted in a law, edict, patent, &c. importing a punishment wherewith delinquents are menaced; which, however, is not to be executed in its rigor.

Thus, in France, when an exile is enjoined not to return on pain of death, it is deemed a *Comminatory* penalty; since, if he do return, it is not strictly executed; but a second injunction is then laid on him, which is more than *Comminatory*, and from the day of the date thereof, imports death without remedy.

COMMUNITION, the act of grinding, or breaking any matter into smaller particles.—The effect of chewing, or masticating our food, is the *Comminution* thereof.

COMMISSARY, an officer of the bishop, who exercises ecclesiastical jurisdiction in those parts of the diocese which are so far remote from the see, that the chancellor cannot call the subjects thereof to the bishop's principal consistory, without their too great molestation.

This officer, called by the canonists *Commissarius*, or *officialis foraneus*, is appointed to supply the bishop's office in the out-parts of the diocese, and in such parishes as are peculiar to the bishop, and exempted from the jurisdiction of the archdeacon: for where the archdeacons have jurisdiction, as in most places they have, either by prescription or composition, the *Commissary* is superfluous, and frequently vexatious.

COMMISSARY, in an army.—There are two sorts of *Commissaries*:

COMMISSARY-GENERAL of the *musters*, or muster-master general, takes an account of the strength of every regiment, reviews them, sees that the horse be well mounted, and all the men well armed and accoutred.

COMMISSARY-GENERAL of *provisions*, has the charge of furnishing the army with all things of that kind.

COMMISSION, in common law, is the same with *delegation* among the civilians; and is taken for the warrant, or patent which any man exercising jurisdiction, either ordinary or extraordinary, hath to authorize him to hear, or determine any cause or action.

The term, however, is sometimes extended further than to matters of judgment; as in the *Commission* of purveyors, which seems to be null by the statute for taking away purveyance, 12 Car. II. and the high *Commission-court*, which was founded on the statute 1 Eliz. and is also abolished by act of parliament 17 Car. I. The persons charged with a *Commission* are hence called *Commissioners*; sometimes *Committees*.

COMMISSION of *anticipation*, was antiently a *Commission* given under the great seal, to collect a subsidy before the day. See ANTICIPATION.

COMMISSION of *association*, is a *Commission* under the great seal, to associate two, or more learned persons, with the several justices in the several circuits and counties in Wales.

COMMISSION of *bankruptcy*, a *Commission* under the great seal, directed to five or more commissioners, to inquire into the particulars of a man's circumstances, who hath failed, or broke; and to act according to certain statutes made in that behalf.

COMMISSION of *peace*. See JUSTICE of *peace*.

COMMISSION of *rebellion*, or *writ of rebellion*, is issued out when a man, after proclamation issued out of the chancery, or the exchequer, and made by the sheriff, to present himself, under pain of his allegiance, to the court by a certain day; does not appear. See REBELLION.

This *Commission* is directed, by way of command, to certain persons; three, two, or one of them, to apprehend, or cause to be apprehended, the party as a rebel; and to bring him to the court on a day assigned.

COMMISSION-OFFICERS. See the article OFFICER.

Book of COMMISSIONS. See the article BOOK.

COMMISSION, in commerce. See FACTORAGE.

COMMISSIONER, he who has a *commission*, e. gr. a patent, or other legal warrant, to execute any publick office. See COMMISSION, WARRANT, &c.

Such are, *Commissioners of hawkers and pedlars, Commissioners of alienation, Commissioners of the stamps, &c.*

COMMISSIONERS of the Customs. } See CUSTOMS.

COMMISSIONERS of Excise. } See EXCISE.

COMMISSIONERS of the Navy. See the article NAVY.

Lords COMMISSIONERS of the Treasury. See TREASURY, and EX-CHEQUER.

COMMISSUM Fidei. See the article FIDEI.

COMMISSURE*, COMMISSURA, a term used by some authors, for the junctures, or for the small meatus's, or interstices of bodies; or the little clefts between the particles; especially when those particles are broadish and flat, and lie contiguous to one another, like thin plates, or lamellæ. See PORE.

* The word literally signifies a joining, or connecting of one thing to another.

COMMISSURE, in architecture, &c. denotes the joint of two stones; or, the application of the surface of the one to that of the other.

Among anatomists, *Commissure* is sometimes also used for a suture of the cranium, or skull.

COMMITTEE, in law, one or more persons, to whom the consideration of any matter is referred, either by a court, or by consent of the parties concerned.

COMMITTEE of Parliament, is a board consisting of a certain number of members, appointed by the whole house, for the examining of a bill, or making report of an inquiry, or process of the house, &c.

Sometimes, the whole house is resolved into a committee; on which occasion each person has a right to speak, and reply as much, and as often as he pleases: an expedient they usually have recourse to in extraordinary cases, and where any thing is to be thoroughly canvassed.—When the house is not in a Committee, each gives his opinion regularly, and is only allowed to speak once.

COMMITTEE of the King, is used for a widow of one of the king's tenants; it is thus called, as being by the antient law of the realm committed to the king's care and protection. See WIDOW.

COMMEDIATE, COMMODATUM, in the civil jurisprudence, the loan, or free concession of any thing moveable or immoveable, for a certain time, on condition of restoring again the same individual after a certain term.

The *Commodate* is a kind of loan: there is this difference, however, between a loan and a *Commodate*, that the latter is gratis, and does not transfer the property: the thing must be returned in essence, and without impairment: so that things which consume by use, or time, cannot be objects of a *Commodate*, but of a loan; in regard they may be returned in kind, though not in identity.

COMMODITIES Staple. See the article STAPLE.

COMMODORE, in the navy, an under-admiral, or person commissioned by an admiral to command a squadron of ships in chief. See ADMIRAL, and SQUADRON.

COMMON, COMMUNIS, something that belongs to all alike; is owned, or allowed by all; and is not confined to this more than that. See COMMUNIS.

In which sense, *Common* stands opposed to *proper, peculiar, &c.* Thus, the earth is said to be our *Common* mother; in the first, or golden age, all things were in *Common*, as well as the sun and elements: the name animal is *Common* to man and beast; that of substance to body and spirit.

Philosophers dispute whether there be any such thing as *common* notions, innate, or impressed on the mind by nature herself; or whether our ideas are all adventitious.

COMMON Bench. See the article COMMON PLEAS.

COMMON Council. See the article COMMON COUNCIL.

COMMON Duct, in anatomy. See DUCTUS COMMUNIS.

COMMON Fine, in law, a certain sum of money which the tenants within the liberty of some leets pay to the lord thereof; called, in some places, *head-fine*; in others *cert-money*, or *certum letæ*, and *head-pence*.

It was first granted to the lord towards the charge of his purchase of the court-leet; whereby the tenants have now the convenience of doing their suit-royal near home, without being compelled to go to the sheriff's turn.

COMMON Hunt, the chief huntsman belonging to the lord-mayor and aldermen of London.

COMMON Intendment, in law, the common understanding, meaning, or construction of any thing; without tracing it to any foreign, remote, or particular sense.

Bar to COMMON Intendment, is an ordinary or general bar, which commonly disables the declaration of the plaintiff. See BAR, and INTENDMENT.

COMMON Law, that body of rules generally received, and held as law in this nation, before any statute, or written law, was made to alter the same.

After the decay of the Roman empire, Britain became invaded by three kinds of German people, viz. the Saxons, Angles, and Jutes. From the Jutes descended the men of Kent, and those of the life of Wight; from the Saxons came the people called the East, South, and West-Saxons; and from the Angles came

the East-Angles, Mercians, and Northumbrians.

Now, as each people had its peculiar customs, so each inclined to different laws; whereof, those of the West-Saxons, and Mercians, who inhabited the midland countries, were upon the dissolution of the heptarchy, and establishment of a monarchy, preferred to the rest, and acquired the common appellation of *Jus Anglorum*. Their particular names were *Wigt-Saxonlage*, and *Merchenlage*.

By these laws the nation was governed for several ages, till being at length subdued by the Danes, the customs of those people were introduced, and incorporated with the rest; and thus a new form of *Common law* arose, called *Danelage*.

The Danes being afterwards, in their turn, overcome by the Normans; the conqueror, on a review of the several laws and customs that then obtained, abrogated some, and abolished others; adding some of his own country laws: and the system, or assemblage of these, is what we call the *Common law*.

The *Common law* of England, is properly, the common customs of this kingdom; which, by length of time, have obtained the force of laws.

It is called *lex non scripta*, the *unwritten law*: not but that we have most of it written in the old Norman dialect, but because it cannot be made by charter, or parliament: for those are always matters of record; whereas customs are only matter of fact, and subsist no where but in the memory of the people.

From the common reason of things, therefore, *Common law* should appear the best, most beneficial, and easy to the people; in regard it consists of such rules and practices as they themselves spontaneously, and as it were by the impulse and direction of their own interests, were led to: whereas, the written laws, made in England by the king and parliament, are imposed on the subject at once, and without any trial, or foreknowledge how they shall answer; and whether or no they are like to prove beneficial to the nation, and agreeable to the nature of the people: excepting such as are first made temporary; and for their approved utility, afterwards perpetuated.

The first Saxon laws published in England, were those of king Ethelbert in the VIth century. 300 years after, king Alfred, whom our historians call *magnus juris anglicani conditor*, having united the heptarchy, and rendered himself master of the whole nation, made a collection from among the several laws of the several provinces of his domains; and commanded them to be observed throughout his kingdom. This collection was denominated *folk-right*, and soon after, the *Common law*; as being *common* to the whole nation.

Beside the *Common law* of England in general; there are in divers parts of the nation particular customs, and common usages, which have the force of *Common law* among those people who have retained them: such as the Borough-English, Gavelkind, &c.—Where the *Common law* is silent, there the statute law speaks. See STATUTE.

All trials at *Common law* are by a jury of twelve men. See JURY, TRIAL, &c.

COMMON Month. } See the article { MONTH.
COMMON Motion. } MOTION.
COMMON Object. } OBJECT.

COMMON-PLACE Book, *Adversaria*, among the learned, denotes a register, or orderly collection of what things occur worthy to be noted, and retained in the course of a man's reading, or study; so disposed, as that among a multiplicity of heads, and things of all kinds, any one may be easily found, and turned to at pleasure.

Common-place-books are things of great service: they are a kind of promiscuaries or storehouses, wherein to deposit the choicest and most valuable parts of authors, to be ready at hand when wanted. Several persons have their several methods of ordering them: but that which comes best recommended, and which many learned men have now given into, is the method of that great master of order Mr. Locke. He has thought fit to publish it in a letter to M. Toynard; determined thereto, by the great convenience and advantage he had found from it in 20 years experience; as well as by the recommendations and intreaties of many of his friends, who had likewise proved it.

The substance of this method we shall here give the reader; whereby he will be easily enabled to execute it himself.

The first page of the book you intend to take down their *Common-places* in, is to serve as a kind of index to the whole; and to contain references to every place or matter therein: in the commodious contrivance of which index, so as it may admit of a sufficient copia, or variety of materials, without any confusion; all the secret of the method consists.

In order to this, the first page, as already mentioned, or, for more room, the two first pages that front each other, are to be divided, by parallel lines, into 25 equal parts; whereof, every fifth line is to be distinguished, by its colour or some other circumstance. These lines are to be cut perpendicularly by others, drawn from top to bottom; and in the several spaces thereof, the several letters of the alphabet, both capital and minuscule, are to be duly wrote.

The form of the lines and divisions, both horizontal and perpendicular

dicular, with the manner of writing the letters therein, will be conceived from the following specimen; wherein what is to

be done in the book for all the letters of the alphabet, is here shewn in the first four, *A, B, C, and D.*

The index of the *common place* book thus formed, matters are ready for the taking down any thing therein.

In order to this, consider to what head, the thing you would enter is most naturally referred; and under which, one would be led to look for such a thing: in this head, or word, regard is had to the initial letter; and the first vowel that follows it; which are the characteristic letters whereon all the use of the index depends.

Suppose, *e. gr.* I would enter down a passage that refers to the head *beauty*; *B*, I consider, is the initial letter, and *e* the first vowel: then, looking upon the index for the partition *B*, and therein the line *e* (which is the place for all words whose first letter is *B*, and first vowel *e*; as *Beauty, Beneficence, Bread, Bleeding, Blemishes, &c.*) and finding no numbers already down to direct me to any page of the book where words of this characteristic have been enter'd, I turn forward to the first blank page I find, which in a fresh book as this is supposed to be, will be page 2, and here I now write what I have occasion for on the head *beauty*; beginning the head in the margin, and indenting all the other subservient lines that the head may stand out and shew itself: this done, I enter the page where it is wrote, *viz.* 2, in the index, in the space *Be*; from which time, the class *Be* becomes wholly in possession of the 2d and 3d pages, which are assigned to letters of this characteristic.

Had I found any page or number already entered in the space *Be*, I must have turned to the page, and have wrote my matter in what room was left therein: so, if after entering the passage on *beauty*, I should have occasion for *benevolence*, or the like, finding the number 2 already possessed of the space of this characteristic, I begin the passage on *benevolence* in the remainder of the page, which not containing the whole, I carry it on to page 3, which is also for *Be*; and add the number 3 in the index.

An example will make the method of writing down the heads obvious.

BEAUTY. 'The power of perceiving the ideas of *beauty* is justly called a *sense*, because of its affinity to the other senses in this, that the pleasure does not arise from any knowledge of principles, proportions, causes, or of the usefulness of the object; but strikes us at first with the idea of *beauty*: nor does the most accurate knowledge increase this pleasure of *beauty*; however, it may super-add a distinct rational pleasure from prospects of advantage, or from the increase of knowledge. And further, the ideas of *beauty*, like other sensible ideas, are necessarily pleasant to us, as well as immediately so; neither can any resolution of our own, nor any prospect of advantage or disadvantage, vary the *beauty* or deformity of an object: for as in the external sensations, no view of interest will make an object grateful; nor detriment, distinct from immediate pain in the perception, make it disagreeable to the sense; so, propose the world as a reward, or threaten the greatest evil, to make us approve a deformed object, or disapprove a beautiful one; dissimulation may be procured by rewards, or threatenings; or we may in external conduct abstain from any pursuit of the beautiful, and pursue the deformed; but our sentiments of the forms, and our perceptions would continue invariably the same. Hence, it plainly appears, that some objects are immediately the occasions of this pleasure of *beauty*; and that we have senses fitted for perceiving it; and that it is distinct from that joy which arises from self-love, upon prospect of advantage. Nay, do not we often see convenience and use neglected to obtain *beauty*, without any other prospect of advantage in the beautiful form, than suggesting the pleasant ideas of *beauty*? Now this shews us, that however we may pursue beautiful objects from self-love, with a view to obtain the pleasures of *beauty*; as in architecture, gardening, &c. yet there must be a sense of *beauty* antecedent to prospects of even

'this advantage: without which sense, these objects would not be thus advantageous; nor excite in us this pleasure which constitutes them advantageous. Our sense of *beauty*, from objects by which they are constituted good to us, is very distinct from our desire of them, when they are thus constituted: our desire of *beauty* may be counterbalanced by rewards and punishments, but never our sense of it. Had we no such sense of *beauty*, houses, gardens, dresses, equipage, might be recommended to us as convenient, fruitful, warm, easy; but never as beautiful: and in faces, I see nothing that could please us, but liveliness of colour, and smoothness of surface.—*Inquiry into the Original of our Ideas of Beauty, &c.* 8vo. Lond. 1725. p. 10, 11, 12.

BENEVOLENCE. 'The true spring of all actions called *virtuous*, is some determination of our nature to study the good of others; or some instinct, antecedent to all reason from interest, which influences us to the love of others:—The same cause which determines us to pursue happiness for ourselves, determines us to esteem and *benevolence* for others: even the very frame of our nature, or a generous instinct.—This universal *benevolence* towards all men, we may compare to that principle of gravitation, which extends to all bodies in the universe, but like the love of *benevolence*, increases as the distance is diminished; and is strongest when bodies come to touch each other, *Id. ib.* p. 131, 143. 199.—As all men have self-love, as well as *benevolence*; those two principles may jointly excite a man to the same action: and then they are to be considered as two forces impelling the same body to motion: sometimes they conspire; sometimes are indifferent to each other; and sometimes are opposite. Thus, if a man has such strong *benevolence* as would have produced an action without any views to self interest; that such a man has also in view private advantage, does no way diminish the *benevolence* of the action. When he would not have produced so much public good, had it not been for prospect of self-interest; then the effect of self-love is to be deducted; and his *benevolence* is proportioned to the remainder of good, which pure *benevolence* would have produced. When a man's *benevolence* is hurtful to himself, then self-love is opposite to *benevolence*; and the *benevolence* is proportioned to the sum of the good produced, and the resistance of the self-love surmounted thereby.—The morality of any person, or the quantity of public good produced by him, is in a compound ratio of his *benevolence* and abilities: or, (by substituting the initial letters for the words, as *M* = moment of good, and *μ* = moment of evil) *M* = *B* + *A*. *Idem. ib.* p. 130, 131, 143, 199.'

When the two pages destined for one class are full, look forwards for the next backside that is blank; if it be that which immediately follows, write at the bottom of the margin of the page filled, the letter *v.* for *verte*, turn over; and the same at the top of the next page; and continue from this new page as before. If the pages immediately following be already filled with other classes; then write at the bottom of the page last filled the letter *v.* with the number of the next blank page; and at the top of that page, the number of the page last filled: then entering that head in this new page, proceed as before. By these two numbers of reference, the one at the top, and the other at the bottom of the page, the discontinued matters are again connected. It may not be amiss, too, every time you put a number at the bottom of a page, to put it likewise in the index. Note, if the head be a monosyllable beginning with a vowel, the vowel is at the same time both the initial letter and the characteristic vowel: thus, the word *art* is to be wrote in *Aa*. Mr. Locke omits three letters of the alphabet in his index, *viz.* *K, Y, and W*; which are supplied by *C, ɣ, U*, equivalent to them: and as for *Q*, since it is always followed by an *u*, he puts it in the fifth place of *Z*; and so has no *Zu*, which is a characteristic

characteristic very rarely occurs. By thus making *Q* the last in the index, its regularity is preserved, without diminishing its extent. Others chuse to retain the class *Z u*, and assign a place for *Q* below the index.

If any imagine that those hundred classes are not sufficient to comprehend all kinds of subjects without confusion, he may follow the same method, and yet augment the number to 500, by taking in one more characteristic to them.

But the inventor assures us, that in all his collections, for a long series of years, he never found any deficiency in the index, as above laid down.

COMMON PLEAS, *Communia placita*, or *Bancus communis*, one of the king's courts, now constantly held in Westminster-hall; but antiently moveable.

Gwyn observes, that till the granting of *magna charta* there were but two courts called the king's courts, *viz.* the exchequer, and the king's-bench; and that upon the grant of that charter the court of common-pleas was erected, and fixed to a place certain, *viz.* Westminster-hall: whence the writs which before ran *coram me vel iudicariis meis*, simply; were now changed, and run *coram iudicariis meis apud Westmon.*

All civil causes, both real, personal, and mixed, are tried in this court, according to the strict law of the realm: Fortescue represents it as the only court for real causes. The chief-justice hereof is called the *lord chief-justice of the common pleas*; who is accompanied with three or four his associates, created by letters patent, and as it were judges installed or placed on the *common bench* by the lord chancellor, and the lord chief-justice of the court.

The rest of the officers belonging to this court, are the *custos brevium*; three *prothonotaries*, or *protonotaries*: See **PROTHONOTARY**. A *chirographer*; fourteen *clerks*; four *exigents*; clerk of the warrants; clerk of the juries, or *jurata writs*; clerk of the treasury; clerk of the king's silver; clerk of the effigies; clerk of the outlaws; clerk of the errors; whose several functions see in their places, **CUSTOS BREVIVM**, **CHIROGRAPHER**, **EXIGENTER**, **CLERK**, &c.

COMMON RAY. See the article **RAY**.

COMMON, in grammar, denotes the gender of nouns which is equally applicable to both sexes, male and female.

Such is that of *parens* parent; which is either masculine, or feminine, as it is used to signify either father, or mother.

The Latin grammarians, besides this, which they call the *common of two*, do also make a *common of three*; which extends to masculine, feminine, and neuter.

COMMON, in geometry, is applied to an angle, line or the like, which belongs equally to two figures, or makes a necessary part of both.

COMMON CENTER of Gravity. See **CENTER of Gravity**.

COMMON DIVISOR, is a quantity, or number, which exactly divides two, or more other quantities, or numbers, without leaving any remainder.

COMMON, in law, that soil, the use whereof lies open or common to the several inhabitants, or holders of a particular town, or lordship.

In which sense, we say, *common of pasture*, *common of fishing*, *common of turbary*, *common of estovers*, &c.

Common of pasture, is divided into *common in gross*, *common appendant*, *common appurtenant*, and *common by way of neighbourhood*.

COMMON in gross, is a liberty to have common alone, that is, without any land or tenement in another man's land, granted either to a person for life, or to him and his heirs. This is commonly passed by deed, or specialty.

COMMON appendant, and **COMMON appurtenant**, are usually confounded; both being defined to be a liberty of *common* appertaining to, or depending on such, or such a freehold; which *common* must be taken with beasts *commonable*; as horses, oxen, &c. being accounted fittest for the plowman; and not with goats, geese, and hogs.

Others distinguish between the two, thus; *common appurtenant* may be severed from the land whereto it appertains; but not *common appendant*, which, according to my lord Coke, had its original in the following manner:

- 1. When a lord enfeoffed another in arable lands to hold of him
- 2. in socage; the feeoffee, to maintain the service of his plow,
- 3. had at first, by courtesy of his landlord, *common* in his wastes,
- 4. for necessary beasts, to ear and compost his lands: and that
- 5. for two causes; 1^o. because it was tacitly implied in the feoffment; by reason the feeoffee could not till, or compost his
- 6. pasture; by consequence, therefore, the feeoffee had, as a thing necessary, or incident, *common* in the wastes, or lands
- 7. of the lord. 2^o. For the maintenance and advancement
- 8. of tillage.

COMMON per Cause de Vicinage, i. e. by reason of neighbourhood; is a liberty that the tenants of one lord in one town, have to *common* with the tenants of another lord in another town.

But it is to be observed, that those who claim this kind of *common* (which is usually called *intercommoning*) may not put their cattle into the *common* of the other two, for then they are distrainable; but, turning them into their own fields, if they

flay into their neighbours *common*, they must be suffered. See **INTERCOMMONING**.

Tenants in COMMON. See the article **TENANT**.

COMMON receptacle. See { **RECEPTACLE**.

COMMON sensory. See { **SENSORY**.

COMMON time. See the article **TIME**.

COMMON year. See the article **YEAR**.

COMMONER, is used for a student in some universities, entered in a particular rank.

The word is also applied to a member of the house of *commons*; in contradistinction to a *peer*.

COMMONS, in parliament, are the lower house, consisting of knights elected by the counties, and of citizens and burgesies by the cities and borough-towns.

In these elections, antiently, all the people had votes; but king Henry VI. to avoid tumults, first appointed, that none should vote for knights but such as were freeholders, did reside in the county, and had 40 s. yearly revenue: the persons elected for counties to be *militis notabiles*, at least esquires, or gentlemen fit for knighthood; native Englishmen, at least naturalized; and 21 years of age: no judge, sheriff, or ecclesiastical person, to sit in the house for county, city, or borough.

All members of either house, with their menial servants, and necessary goods brought with them, are privileged from all attachments and imprisonments; except for treason, felony, or breach of peace, all the time of the session, and till they arrive at home, *eundo, morando, ad propria redeundo*.

The *commons* sit in their house promiscuously; only the *speaker* has a chair, or feat, fixed towards the upper end; and the clerk, with his assistant, sits near him.

The members have no robes, as the lords ever had; excepting the speaker and clerks; and sometimes the professors of law in term-time, and the members of the city of London.

On the first day of the new parliament, before any affair is meddled with, all the members take the oaths; usually, before the lord steward, and in the court of wards. They then proceed to the choice of a *speaker*. And after the election of a *speaker*, they take the oaths a second time. See **SPEAKER**.

Privileges of the COMMONS. All bills for levying money on the subject, begin in the house of *commons*; in regard, it is from them the greatest part of the monies arise: nor will they allow the lords to make any alteration in a money-bill.

They have the privilege to propose laws, and are, in effect, the grand inquest of the realm; present public grievances; impeach public delinquents, even the highest officers of the kingdom; and prosecute them before the house of lords, who are a court of judicature, though the *commons* are not.

The *commons* are allowed their expences during parliament-time, *rationabiles expensas*, as the words of the writ are; i. e. such allowance as the king, considering the prices of things, shall think proper to impose on the people they represent. In 17 Edward II. the allowance was ten groats for knights, and five for burgesies, per day; afterwards it was raised to four shillings a day for dubbed knights, and two shillings for all the rest: but all allowance is now grown into disuse; and the course of the money turned the other way.

COMMONS is also used in opposition to *nobles*, or *peers*, *viz.* for all sorts of persons under the degree of a baron; including the orders of knights, esquires, gentlemen, the sons of the nobility, and yeomen. See each under its proper article **ESQUIRE**, **GENTLEMAN**, **YEOMAN**, &c.

Doctors COMMONS. See **COLLEGE of Civilians**.

Proctor of the COMMONS. See **PROCTOR**.

COMMONS is also used for the stated and ordinary diet, or eating, of a college, inns of court, or other society. See **INN**, &c.

COMMONWEALTH. See **REPUBLIC**, and **ROMAN**.

COMMOTE, an antient term in Wales, denoting half a cantred, or hundred; containing 50 villages. See **HUNDRED**. Wales was antiently divided into three provinces; each of these subdivided into cantreds; and every cantred into two *commotes* or half hundreds.

Silvester Girald, however, tells us in his *itinerary*, that a *commote* is but a quarter of a hundred.

COMMOTION, an intestine motion, or luctation in the parts of any thing.

In medicine, the term is chiefly used for a blow, or shake of the brain. A convulsion is a *commotion* of the fine medullary fibres of the brain. A fall occasions a *commotion*, whence frequently arises a counterstroke on the opposite part; which occasions sometimes a contrainflure, and at other times a rupture of the vessels, and an apothume, by shaking the whole mass of the brain.

COMMUNAM appropriare. See the article **APPROPRIARE**.

COMMUNE rectum. See the article **RECTUM**.

COMMUNIBUS locis, a Latin term, in frequent use among philosophical, &c. writers; implying some medium, or mean relation between several places.

Dr. Keil supposes the ocean to be one quarter of a mile deep, *communibus locis*, q. d. at a medium, or taking one place with another.

COMMUNIBUS annis, has the same import with regard to years, that *communibus locis* has with regard to places.

Mr. Derham observes, that the depth of rain, *communibus annis*, i. e. one year with another, were it to stagnate on the earth, would amount to, at Townly in Lancashire, $42\frac{1}{2}$ inches; at Uppminster in Essex $19\frac{1}{2}$; at Zurich $32\frac{1}{2}$; at Pisa $43\frac{1}{2}$; and at Paris to 19 inches.

COMMUNICATING, in theology, the act of receiving the sacrament of the eucharist. See **EUCARIST**.

Those of the reformed, and of the Greek churches, *communicate* under both kinds; those of the Romish only under one.

From the second book of Tertullian to his wife, it appears, that antiently they *communicated* fasting. S. Augustin says expressly, that in some churches, in his time, they *communicated* every day. Among the Greeks, M. Fleury observes, the laity still *communicate* every Sunday; and that those who omit it three Sundays together are excommunicated.

The oriental communicants receive the species of wine by a spoon; and antiently they sucked it through a pipe, as has been observed by Beat. Rhenanus on Tertullian.

COMMUNICATION, the act of imparting a thing to another, or making him a sharer with us therein.

Thus, God is said to *communicate* his grace to us, by means of his sacraments. The use of speech is for the *communicating* of our ideas and sentiments to each other.

Philosophers are at a loss as to the manner of the *Communication*, or intercourse between soul and body. See **SOUL**, **CAUSE**, &c.

COMMUNICATION is also used for the connection of one thing with another; or the passage from one place to another.

Antiently, it was frequent to have *subterraneous Communications* between one quarter and another. Such a gallery makes a *Communication* between such two apartments.

Bridge of COMMUNICATION. See the article **BRIDGE**.

Lines of COMMUNICATION, in war, called also simply *lines*; are trenches six or seven foot deep, and twelve broad, made between one fort, or work, and another; in order for a safe passage between one quarter and another; especially in sieges.—See **Tab. Fortification**, fig. 21, 22, &c.

COMMUNICATION of idioms, in theology, the act of imparting the attributes of one of the natures in Jesus Christ, to the other.

The *Communication of idioms*, is founded on the union of two natures in the person of Christ: by this *Communications of idioms* it is, that we say, God suffered, died, &c. which is strictly understood of the human nature; and signifies, that God suffered in his humanity, that he died as to his human nature, &c.

For the denominations which signify natures, or properties of nature, the schoolmen tell us, are denominations of *suppositum*, or persons, and are to be attributed to them: thus, the two natures only subsisting in Jesus Christ by the sole person of the Word, to this person must be attributed the denominations of both natures, and of their properties. But we may not by *Communication of idioms* attribute to Jesus Christ what would suppose him not to be God; since that would destroy the hypostatical union, which is the foundation of the *Communication of idioms*. Thus, we may not say that Jesus Christ is mere man; that he is fallible; &c.

The Lutherans carry the *Communication of idioms* so far, as to say, that Jesus Christ is not only in his divine nature, and by reason of his divine person, but also really and properly in his humanity, immortal, immoveable, &c.

COMMUNICATION of motion, that act of a moving body, whereby another body at rest is put by it in motion, or a body already in motion is accelerated.

F. Malebranch looks on the *Communication of motion* as something metaphysical; i. e. as not necessarily arising from any physical principles, or any properties of bodies, but flowing from the immediate agency of God: there being, according to him, no more connection, or dependance between the motion or rest of one body, and that of another, than between the form, colour, magnitude, &c. of one body and those of another. The motion of one body, therefore, on his principle, is not any physical cause of that of another. See **CAUSE**.

Laws of the COMMUNICATION of motion.—Action, and reaction, Sir Isaac Newton demonstrates, are equal and opposite: so that one body striking against another, and thereby occasioning a change in its motion, does itself undergo the very same change in its own motion, the contrary way. See **MOTION**.

Hence, a moving body striking directly against another at rest, the one loses just as much of its motion as it *communicates* to the other; and they will proceed with the same velocity as if united into one mass.

If, therefore, the body in motion be triple that at rest against which it strikes, it will lose a fourth part of its motion; and whereas, before, it would have run over (*v. gr.*) a line of 20 foot, in a given time, it will now only run over 15; i. e. it will lose a fourth part of its velocity.

If the moving body strike on another already in motion, the first will augment the velocity of the latter; but will lose less of its own motion, than had the latter been absolutely at rest. Thus, *v. gr.* if a body in motion be triple of another at rest, and strike against it with 32 degrees of motion; it will *communicate* eight degrees of its motion to the other, and retain 24 to itself. If the other body had already four degrees of

motion, the first would only *communicate* five, and retain 27; since those five were sufficient, in regard of the inequality of the bodies, to make them proceed with equal velocity.

After the same manner may the other laws of *Communication* of motion in bodies perfectly hard, and void of all elasticity, be determined. But all hard bodies that we know of have an elastick power; and in elastick bodies, the laws are different, and much more intricate. See **ELASTICITY**; and the laws of *percussion* in elastick bodies, see under **PERCUSSION**.

If a body, when moved by another, happen to decline out of the way, so as to leave a free passage to the body whereby it was moved; yet, that will only proceed with the velocity which it had after its *Communication* to the other, not with that it had before: it being a rule, that every thing endeavours to persevere, not in the state wherein it was formerly, but ... that wherein it is at that juncture: therefore, a body which has already lost part of its motion, by its meeting with another; may lose still more by a second and a third, so as at length to become perfectly quiescent.

Hence, 1st, if two unequal homogeneous bodies move in a right line with the same velocity, the greater must persevere in motion longer than the smaller: for the motions of both bodies are as their masses; but each *communicates* of its motion to the circumjacent bodies which touch its surface, in proportion to the magnitude of its surface; the larger body, therefore, though it has more surface than the smaller, yet having less, in proportion to its mass or quantity of matter than the smaller, will lose a less portion of its motion every moment than the smaller.

Suppose, *e. gr.* a cube, A, to be two foot every way, and another B, one foot: the surfaces here will be as four to one, but their masses as eight to one. If therefore those bodies move with the same velocity, the cube A will have eight times as much motion as the cube B (the quantity of motion being ever as the quantity of matter.) That each of them, therefore, may become quiescent at the same time, the cube A must lose eight times as much motion every moment as the cube B: but that is impossible, because as their surfaces are to each other as four to one; the bodies against which they strike, will only be as four to one: therefore, when the cube B is become perfectly quiescent, A will have half its motion.

Hence, 2dly, we see the reason why any long body, as a dart, thrown lengthwise, continues its motion longer than when thrown transversely: it meeting fewer bodies in the way to *communicate* its motion to in the one case than in the other.

Hence also, 3dly, if a body be moved almost wholly within itself, so as to *communicate* little of its motion to the ambient bodies, it must continue its motion a long time. Thus, a smooth brass ball of half a foot diameter, supported on a slender smooth axis, with a very weak impulse, is found to revolve, for the space of three or four hours.

COMMUNION, in theology, an uniform belief in several persons; whereby they are united under one head, in one church. See **UNITY**, **UNIFORMITY**, **CHURCH**, &c.

In this sense, the Lutherans, Calvinists, &c. are said to have been cut off from the Romish *Communion*.

This is the primitive use of the word *Communion*, as appears from the canons of the council of Elvira.

COMMUNION is also used for the act of *communicating* in, or participating of, the sacrament of the eucharist.

The fourth council of Lateran, decrees, that every believer shall receive the *Communion*, at least, at Easter; which seem to import a tacit desire that they should do it often; as, in effect, they did do it much often in the primitive days. Gratian, and the master of the sentences, prescribe it as a rule for the laity, to *communicate* three times a year, at Easter, Whitson-tide, and Christmas. But in the thirteenth century, the practice was got on foot, never to approach the eucharist except at Easter; and the council thought fit to enjoin it then by a law, lest their coldness and remissness should go farther still.

COMMUNION under both kinds.—In the eleventh century, the *Communion* was still received by the laity in both kinds; or, rather, the species of bread was dipped in the wine, as is owned by the Romanists themselves. *Acta SS. Benedicti. Sac. III.*

M. de Marca observes, that they received it at first in their hands, *Hist. de Bearn*. and believes the *Communion* under one kind alone, to have had its rise in the West under pope Urban II. in 1096, at the time of the conquest of the holy land. The twenty-eighth canon of the council of Clermont, enjoins the *Communion* to be received under both kinds, distinctly: adding, however, two exceptions; the one of necessity, the other of caution, *nisi per necessitatem, & cautelam*; the first in favour of the sick, the second of the abstemious, or those who had an aversion for wine.

It was formerly a kind of canonical punishment, for clerks guilty of any crime, to be reduced to lay *Communion*, i. e. only to receive it as the laity did, *viz.* under one kind.

They had another punishment of the same nature, tho' under a different name, called *foreign Communion*; to which the canons frequently condemned their bishops and other clerks. This punishment was not any excommunication, or deposition; but a kind of suspension from the function of the order, and a degradation from the rank they held in the church.

It had its name, because the *Communion* was only granted to the criminal on the foot of a foreign clerk, i. e. being reduced to the lowest of his order, he took place after all those of his rank, as all clerks, &c. did in the churches to which they did not belong. The second council of Agda, orders every clerk that absents himself from the church, to be reduced to foreign *Communion*.

COMMUNIS capsula.

 MISERICORDIA.

COMMUNITY, a society or body of men united together under certain common laws, agreed on among themselves, or imposed by a superior.

The Romans, who seem to have given the first hint of *Communities* to the several nations into which their empire was divided, doubtless borrowed it from some rules of their neighbours: they called them *colleges*; which term, among them, had nearly the same signification with *Community* among us. *Communities* are of two kinds, *ecclesiastical* and *laick*: the first are either *secular*, as chapters of cathedral and collegiate churches; or *regular*, as convents, monasteries, &c.

Lay Communities are of various kinds; some contracted by a fixed abode of a year and a day in the same place; others formed by the discharge of the same office, the profession of the same art, or attending the same place of worship; as those of parishes, fraternities, &c.

Accordingly, the word is commonly understood of pious foundations for the support of several persons, either in a secular or regular life; as *colleges*, *abbies*, *convents*, *priories*, *feminaries*, *hospitals*, *inns*, &c.

COMMUNITY is more particularly used in the French law, for the joint property in goods between the husband and the wife: the result of which is, that during marriage they are equally intitled to all effects, and liable to all debts, contracted either before or under marriage.

Community, is a species of succession, and the acceptance of *Community* resembles an *aditio hereditatis*.

Community was set on foot in favour of the wives, to enter them as sharers in their husband's effects.

In countries where the civil law obtains, this *Community* has no place; nor even in several customary countries; as being reputed a burden on the man.

Antiently, the woman's share in the *Community* was only one third: and this appears still the sense of the law among us; the widow, at the decease of her husband, being only intitled to one third part of the moveables.

COMMUNITY continued, in the French law, is that which subsists between the survivor of two persons joined in marriage, and the minor children of that marriage; when the survivor has not made an inventory of the effects in possession during marriage. The widow may either renounce *Community* with her children, or continue it.

COMMUNITY tacit, is a *Community* contracted between a man and woman, by the mere mingling of their effects; provided they have lived together the space of a year and a day: this *Community* being odious, is now abolished.

COMMUTATION, in law, a change of a penalty, or punishment, viz. of a greater for a less, &c. as when death is commuted for, by banishment or perpetual imprisonment, &c. Some doubt whether the word be properly applied to any change but that of punishment: others will have it indifferently serve for the exchanging, or trucking of any thing.

COMMUTATION, in astronomy. *Angle of COMMUTATION*, is the distance between the sun's true place seen from the earth, and the place of a planet reduced to the ecliptic. See *PLACE*. Thus the angle *ESR*, (Tab. *Astronomy*, fig. 25.) subtended between the sun's true place *E*, viewed from the earth at *S*; and that of a planet reduced to the ecliptic, *R*, is the *angle of Commutation*.

The *angle of Commutation*, therefore, is found by subtracting the sun's true place *E*, from the heliocentric place of the planet *R*; or contrarily.

COMPACT, in physics, denotes a body to be close, dense, and heavy; having few pores, and those small ones.

The heaviest metals, as gold and silver, are the most *compact*. See *GRAVITY*.

COMPACT, in a legal sense, signifies an agreement, or a contract stipulated between several parties. See *CONTRACT*.

COMPACT is also the name of a celebrated bull, confirmed by pope Paul IV. relating to the cardinals.

In virtue of the bull of *Compacts*, cardinals can only confer benefices in their natural state; i. e. regular benefices on regulars.

COMPANY*, a collective term, understood of several persons assembled together in the same place, or with the same design. See *SOCIETY*.

* The word is formed of the French *compagnie*, and that of *companto*, or *compantes*, which, Chifflet observes, are found in the Salic law, Tit. 66. and are properly military words, understood

of soldiers, who, according to the modern phrase, are comrades, or mess mates, i. e. lodge together, eat together, &c. of the Latin *cum*, with, and *panis*, bread. It may be added, that in some Greek authors under the Western empire, the word *κωμωγία* occurs in the sense of *society*: but it is more probable, that the Greeks borrowed it from the French or Italians.

COMPANY, in commerce, is an association of several merchants, or others, who unite in one common interest, and contribute by their stock, their counsel, and study, to the setting on foot, or supporting of some lucrative establishment.

Though *Company*, and society, or fellowship, be in effect, the same thing, yet custom has made a difference between them: society, or partnership, being understood of two, or three dealers, or not many more; and *Company* usually of a greater number. See *SOCIETY*.

A second difference between *Companies* and societies, is, that the first, especially when they have exclusive privileges, cannot be established without the concession of the prince; and need letters patent, charters, &c.

Whereas, for the latter, it is sufficient to have the consent of the members, fixed, and certified by acts and contracts, and authorized by by-laws.

Lastly, the word *Company* seems more peculiarly appropriated to those grand associations, set on foot for the commerce of the remote parts of the world; as the English and Dutch East-India *Company*, South-sea *Company*, Mississippi *Company*, &c. The rise and establishment whereof, we shall here set before the reader.

English COMPANIES.—*East-India COMPANY*, was formed towards the latter end of the reign of queen Elizabeth; their charter being dated in 1599.

Their first fleet, sent out in 1600, brought back so rich a cargo, that in a few years they numbered 20 ships. King James I. to shew how much he had its interest at heart, sent several embassies to the great Mogul, the kings of Persia, Japan, and other princes, to make treaties of commerce in his name, and that of the *Company*; some of which subsist still: the king of Persia, in particular, granted the *Company* several extraordinary favours, in recompence for the service the English had done him, in assisting him to expel the Portuguese from Ormus; who, by means of their lodgment there, usurped the whole commerce of the Persian gulf.

But its chief favours the *Company* received at the hands of king Charles II. who, by a charter in 1669, granted them the port and island of Bombay, with all the rights thereof, as surrendered to him by the Portuguese: only reserving to himself the sovereignty and homage thereof, with a yearly acknowledgment of 10 l. per ann. in gold.—By another charter in 1674, he also granted them, in like manner, the island of St. Helena, belonging to him by right of conquest, from the Dutch, who had before taken it from the English.—By a third charter, he granted them a power to erect a court of judicature, composed of a lawyer, and two merchants, in all their places, settlements, factories, &c. to judge of seizures, and all marine disputes; as also about bargains, exchange, &c. and even of all crimes committed on the high seas, or in the countries and territories of the *Company*, in Asia, Africa, and America; the whole, however, agreeable to the usages and customs of merchants, and the laws of England.

In 1662, the same prince granted the *Company* a charter, which contained a confirmation of the antient ones of king James I. and queen Elizabeth; or rather, a new charter, granting them abundance of privileges which they had not before enjoyed: this charter is properly the basis of the *Company*, and that whereon are founded all the rights, and the policy of the *new Company*, afterwards established in 1698. It consists of twenty-eight articles: In the first, the king erects the *Company* into a corporation, or body politic, under the name of the *governor and Company of merchants trading to the East-Indies*. The third grants them a common seal: the fourth a governor, and twenty-four directors, or assistants, chose out of the proprietors, or stockholders; the sixth, seventh, eighth, and ninth, regulate the order and policy of the *Company*, settle the officers, manner of election, authority, general meetings, &c. The tenth fixes the extent the grant; permits all those of the *Company*, their children of 21 years of age, and their apprentices, factors, and domesticks, to trade to the Indies, and any part of Asia, Africa, and America, beyond the Cape of Good Hope, and the Straits of Magellan. The eleventh grants them power to make by-laws to be observed by the officers, factors, &c. and to enjoin penalties; provided those laws be not contrary to the standing laws of England. By the twelfth, the payment of the duties, customs, &c. of goods imported or exported is delayed; one half of it for half a year, the other half a whole one: providing, withal, that if the goods thus imported, be exported again in the space of thirteen months, no duties shall be paid for such export, provided it be done aboard English vessels. The thirteenth article grants them a power of exporting foreign gold for their service abroad, and even English gold coined in the Tower; provided the sum do not exceed 50,000 pounds sterling at a voyage. By the fourteenth and fifteenth, they are allowed six large ships, and six pinks, to pass freely through all the limits of their grant, without the king's being able to lay any imbraga

imbarco on them on any occasion. The sixteenth grants them an exclusive privilege; to have the sole right of dealing to the Indies: ordering the seizure and confiscation of all vessels, &c. which shall interfere. The nineteenth obliges them to bring, at least, as much gold and silver into the kingdom, as they carry out each voyage. The twenty-first fixes the sum in the capital stock necessary to have a vote in the meetings, at 500 l. sterling: allowing, however, several of those who have less, to join several together to form a voice. Lastly, the twenty-sixth allows them to send vessels of war, and even to make peace and war with all the nations not christian, in the extent of their grant.

All these four charters of king Charles II. were confirmed by king James II. especially the last, which was enforced with new sanctions; particularly the article of exclusion; which, in the time of king Charles, had been but little regarded, but was now enforced with such rigorous prohibitions, that all interlopers seemed for ever excluded.

The shares, or subscriptions of the *Company*, were originally only of fifty pounds sterling: but the directors having a considerable dividend to make in 1676, it was agreed to join the profit to the original, instead of withdrawing it; and thus the shares were doubled, and became of 100 l. sterling.

The first capital was only 368891 l. sterling, and 5 s. which being thus doubled, amounted to 739782 l. sterling, and 10 s. to which, if the profits of the *Company* to the year 1685, viz. 963639 l. sterling be added, the whole stock will be 1703422 l. sterling.

The *Company* had from time to time undergone great losses; first, in 1680, by the loss of Bantam, out of which they were driven, and had their magazines plundered by the Dutch; under pretence of assisting sultan Agui against sultan Agom, his father. Secondly, in 1682, when the great numbers of interlopers, to whom king Charles II. too easily granted permissions, lowered their shares *cent. per cent.* Thirdly, By the war which the *Company* maintained in the Indies against the great Mogul; wherein it was obliged to abandon the factory of Surat, and to retire to Bombay. But still she repaired her stock, and supported the reputation of her commerce, till the revolution which happened soon after: when the war, and the incredible losses the *Company* sustained by the French privateers, &c. put it into so desperate a condition, that appearing scarce possible to be supported, a new one was erected.

The charter of the new East-India *Company* was of the year 1688, its stock was so considerable, and the subscriptions so very ready, that in two years time, the *Company* had 40 vessels equipped in its service; which was double of what the old one ever had: and sent to the Indies (*communibus annis*) at least a million sterling in silver: whereas the former had never sent above 500000 l. After the two *Companies* had subsisted a few years in a separate state, means were contrived to unite them, which was effected in 1702, when a new charter of union was granted them, under the name of the united *Company of merchants of England trading to the East-Indies*: which being since expired, another charter with new powers was granted them in 1730.

The cargo which the *Company* sends to the East-Indies, is chiefly silver, bullion, and pieces of eight; with cloth, either scarlet or blue: they also send some iron, and lead.

The returns from the Indies are chiefly silks, both raw and manufactured, cottons, calicoes, muslins, drugs, tea, coffee, china-ware, rice, fago, red wood, salt-petre, pepper, Carmania wool, indigo, &c.

For the economy and policy of the united *Company*; all persons, without exception, are admitted members of it, natives and foreigners, men and women; with this circumstance, that 500 l. in the stock of the *Company* gives the owner a vote in the general courts, and 2000 l. qualifies him to be chosen a director. The directors are twenty-four in number, including the chairman and deputy-chairman, but may be re-elected for four years successively. They have a salary of 150 l. *per ann.* and the chairman of 200 l.—The meetings, or courts of directors, are to be held at least once a week, but are commonly oftner, and they are summoned as occasions require.

Out of the body of directors are chosen divers committees, who have the peculiar inspection of certain particular branches of the *Company's* business: as, the committee of correspondence, committee of buying, committee of treasury, committee of warehouses, committee of shipping, committee of accounts, committee of private trade, committee of house, and committee to prevent the growth of private trade.

Other officers of the *Company* are—a secretary, and assistant with six clerks: two cashiers, with five clerks: a chief accountant, with three assistants, and twenty-two clerks: a head accountant of the freight-accounts, with three clerks: a pay-master, with two assistants, and one clerk: to which may be added a surveyor of ships, and two assistants; a ships husband for receiving the *Company's* goods at the water-side, with an assistant, and three elders; a solicitor for law affairs; besides warehouse-keepers, elders, and labourers employed in the several warehouses.

The warehouses, or magazines of the *Company*, are—that for Bengal goods, which is managed by a warehouse-keeper, and his assistant, with three elders; under whom are a number of porters, employed at daily wages.—St. Helens warehouse for coast

and Surat goods, in which are two warehouse-keepers, and four elders, besides labourers.—The drug warehouse, for drugs and china-ware.—Pepper-warehouse.—Lastly, the private trade warehouse, all officer'd much like the first.—The *Company* has no ships of its own, except a few small craft used in the Indies. The rest, whereby their commerce is carried on, belong to other persons, who build and let them out on freight to the *Company* for each voyage, according to the terms of a charter-party agreed on.—By the by-laws of the *Company*, no vessel is to be hired, wherein any director is concerned directly or indirectly, either as owner, or part-owner: a regulation which it is said, is not over-strictly observed.

No persons are allowed to have any private trade, except the *Company's* officers, and seamen sent to India on board their ships; who are regularly licensed to carry out and bring back commodities to a certain value, greater or less, according to their rank. But at their return, their cargoes are to be confiscated to the *Company*, and sold by them at their next sale. The Jews also and others dealing in diamonds, are allowed to trade for themselves by the *Company's* ships, on allowing so much *per cent.* to the *Company* for freight.

The *Company* has three principal settlements, viz. Fort-William in Bengal; Fort St. George on the coast of Coromandel; and the island of Bombay: each of which has several subordinate factories.

The factories dependent on Fort-William, are Cassimbuzar, Patna, Dacca, Ballasore, and Juedga.—Those on Fort St. George, are Fort-Marborough, Fort St. David, Vizagapatnam, Ingeram, and Madipollam.—Those on the island of Bombay are Gombroon, Surat, Anjingo, and Tellicherry.

Royal African Company, established for the commerce of the coasts of Guinea, is governed much like that of the East-Indies. Its privilege is exclusive: it sends out yearly, ten or a dozen ships, of about 150 ton, laden with old and new draperies, and with iron-works, scissars, knives, muskets, cottons, and other less considerable merchandises.

The returns are in gold-dust, elephants teeth, wax, and leathers: but the best article of its commerce is the negroes, which it sends to Jamaica, Barbadoes, and other English isles in America; frequently, even to the ports of New Spain. See NEGRO, ASSIENTO, &c.

The first establishment of this *Company*, was by a charter granted 1661, in favour of the duke of York; securing to him the commerce of all the country, coasts, islands, &c. belonging to the crown of England, or not possessed by any other christian prince; from Cape Blanc in 20° nor. lat. to the Cape of Good Hope in 34° 30' sou. lat. The charter was soon after returned into the king's hands by the duke, and revoked, by consent of the parties associated with him in the enterprise; and a new charter was granted in 1663, with ampler privileges than the former. The principal adventurers here, were queen Katherine of Portugal, queen Mary of France, the duke of York, Henrietta Maria duchess of Orleans, prince Rupert; in brief, the whole court came into it. The other adventurers, i. e. those who were to be charged with the management of affairs, were chosen from among the wealthiest and ablest merchants; especially those who had already dealt to those countries. By this charter the grant was enlarged, and the *Company* put in possession of all the countries, &c. between the port of Sally in S. Barbary to the Cape of Good Hope, for a thousand years; only reserving to the crown the homage thereof, with the acknowledgment of two elephants to be presented the king, or his successors, every time any of them should set foot within the countries and colonies within their grant.

The privileges granted by the charter, are, first, that the *Company* shall be a corporation, or body politic; shall have a common seal, bearing on one side an elephant, supported by two negroes; on the other, the king's portrait. That the governor, with his deputy, and seven of the twenty-four assistants, be authorized to take on them the direction of affairs: that they may hold courts, make laws, inflict punishments, &c. provided, still, they be equitable, and consistent with the laws of England. That the adventurers may transfer their stock at pleasure; provided the transfer be made in open court, and be registered. That they may equip and send out what vessels they please, for commerce or war; but that they pay the duties and customs. That no vessels but those of the *Company*, and those authorized by it, shall traffick within the limits of its grant, on pain of confiscation. That the *Company* may make war, in defence of its colonies, against invaders, &c. That it have the benefit of all the mines in its territory; the king only reserving to himself two thirds of the gold mines, upon bearing two thirds of the expence. Lastly, that the king reserves for himself and his successors, the right of intervening, and being admitted at any time a sharer in the stock, upon contributing a proportionable sum to the rest.

This charter was confirmed by new letters patent in 1673; followed by a proclamation, enforcing the observance of the article of exclusion: but neither charter nor proclamation being able to secure them from interlopers, they had recourse to the protection of king James II. who had been twice among the number of merchant adventurers; of whom they obtained a most severe declaration on their behalf, in the year 1685.

On this foot the *Company* has stood ever since, till the year 1720;

1720; when a new African Company being formed by the duke of Chandos, and others; and a charter purchased at the expence of 250000 l. sterling; the two companies soon became united.

Hamburgh COMPANY, is the oldest trading establishment in the kingdom; though not always known by that name, nor restrained to those narrow bounds under which it is now confined. It was first called, the *Company of merchants trading to Calais, Holland, Zealand, Brabant, and Flanders*: then it acquired the general title of *merchant-adventurers of England*; as being composed of all the English merchants who traded to the Low-Countries, the Baltic, and the German ocean. Lastly, it was called the *Company of merchant-adventurers of England trading to Hamburgh*.

This *Company*, as well as some others in England built on its model, is very different from those abovementioned; and differs widely from the ordinary plan and system of such societies. In effect, this is not a society of dealers, each furnishing a part of the sum to constitute the capital stock of the *company*; but a mere association, or body of merchants, who have nothing in common but the grant and privilege of trading to Hamburgh, and some other cities of Germany; each managing his own commerce, and trading on his own bottom: only observing a certain discipline, and some regulations, which none but the *Company* can establish or change.

The first charter whereby the *Hamburgh Company* was established, was in 1406, under the reign of king Henry IV. It was afterwards confirmed, and augmented with divers privileges by many of his successors; among the rest, by Henry V. in 1413, Henry VI. in 1422, Henry VII. in 1493, 1505, and 1506; Henry VIII. in 1509, 1517, and 1536; Edward VI. in 1547; queen Mary in 1553, Elizabeth in 1564, and 1586; James I. in 1605, and Charles II. in 1661.

But of all these charters, there are, properly, none but those of Henry IV. Henry VII. Elizabeth, James, and Charles, that are of any importance, or that give the *Company* any thing new; the rest being only simple confirmations.

Before the charter of Henry IV. all the English merchants who trafficked out of the realm, were left to their own discretion; and managed their affairs with foreigners, as might be most for their respective interests; without any regard to the general commerce of the nation.

Henry, observing this disorder, endeavoured to remedy it, by uniting all the merchants in his dominions into one body; wherein, without losing the liberty of trading each for himself, they might be governed by a *Company* still subsisting; and be subject to regulations, which should secure the general interest of the national commerce, without prejudice to the interest of particulars.

With this view, he granted all the merchants of his states, particularly those of Calais, then in his hands, a power of associating themselves into a body politic, with directors and governors, both in England and abroad; to hold assemblies, both for the direction of business, and the deciding of controversies among merchants; make laws; punish delinquents; and impose moderate duties and taxes on merchandizes, and merchants, to be employed in the service of the corporation.

These few articles of the charter of Henry IV. were afterwards much augmented by Henry VII. who first gave them the title of *merchant-adventurers to Calais, Holland, &c.* gave them a power of proclaiming and continuing free fairs at Calais; and ordered, that to be reputed a member of the society, each person pay twenty marks sterling; and that the several members should attend the general meetings or courts appointed by the directors, whether at London, Calais, or elsewhere.

The inexecution of this last article, and contempt of some of the rest, occasioning great inconveniences to the *company's* affairs, another charter was procured; whereby, the pain of imprisonment was menaced, for those who should absent themselves from the meetings without lawful cause, or should disobey the laws.

A petition being made to queen Elizabeth, in 1564, for an explanation of certain articles in the charter of Henry VII. and a confirmation of the rest granted by other kings; that princess, by a charter of the same year, declares, that to end all disputes, they shall be incorporated anew, under the title of the *Company of merchant-adventurers of England*; that all who were members of the former *Company*, should, if they desired it, be admitted members of this; that they should have a common seal; that they should admit into their society what other persons, and on what terms they pleased; and expel them again on misbehaviour: that the city of Hamburgh, and neighbouring cities, should be reputed within their grant, together with those of the Low-Countries, &c. in that of the former *company*. That no member should marry out of the kingdom; nor purchase lands, &c. in any city beyond sea: and that those who do, shall be, *ipso facto*, excluded for ever.

Twenty-two years after this first charter, queen Elizabeth granted them a second; confirming the former, and further, granting them a privilege of exclusion; with a power of erecting in each city within their grant a standing council.

The woollen manufacture being the principal object of their application; they met with great opposition therein first from the Hanse, who forced them frequently to change their mart or staple; and afterwards under king James I. who having erected a corporation in 1616, in favour of some private persons, who offered

to set up a manufacture for dying and pressing cloths, &c. under pretence whereof, the *Company* of merchant-adventurers were prohibited dealing therein. But that project not succeeding, and the charter being revoked two years afterwards, the merchant-adventurers, whose *Company* had been dissolved two years before, were restored in 1617 to their antient privileges, and a new charter was given them, confirming their exclusive right; and allowing them to have officers in the several custom-houses, to have an eye that they were not prejudiced in their woollens, under pretence of the like merchandizes, which others were allowed to send to other parts. This charter of king James, is the last of those confirmed by Charles II. in the grand charter of 1661. The revolutions which had happened in the Low-Countries towards the end of the sixteenth century, and which laid the foundation of the republic of Holland, having hindered the *Company* from continuing their commerce with their antient freedom; it was obliged to turn it almost wholly to the side of Hamburgh, and the cities on the German ocean: from which change, some people took occasion to change its name to that of the *Hamburgh Company*; though the antient title of *merchant-adventurers* is still retained in all their writings.

Russia COMPANY, this was first projected towards the end of the reign of king Edward VI. executed in the first and second years of Philip and Mary; but had not its perfection, till its charter was confirmed by act of parliament under queen Elizabeth, in 1566. It had its rise from certain adventurers, who were sent in three vessels on the discovery of new countries; and to find out a north-east passage to China: these falling into the white sea, and making up to the port of archangel, were exceedingly well received by the Muscovites, and at their return, solicited letters patent to secure to themselves the commerce of Russia, for which they had formed an association.

The charter was promised them by Edward VI. but he dying, was first dispatched by queen Mary, in 1555. By this charter, the association was declared a body politic, under the name of the *Company of merchant-adventurers of England, for the discovery of lands, territories, islands, &c. unknown, or unfrequented*. Their privileges were, to have a governor, four consuls, and twenty-four assistants, for their commerce; for their policy, to make laws, inflict penalties, send out ships to make discoveries, take possession of them in the king's name, set up the banner royal of England, plant them; and, lastly, the exclusive privilege of trading to Archangel, and other ports of Muscovy, not yet frequented by the English.

This charter, not being sufficiently guarded, was confirmed by parliament in the eighth year of queen Elizabeth; wherein it was enacted, that in regard the former name was too long, they should now be called the *Company of English merchants for discovering new trades*; under which name, they should be capable of acquiring and holding all kinds of lands, manors, rents, &c. not exceeding 100 marks per ann. and not held of her majesty. That no part of the continent, island, harbour, &c. not known or frequented before the first enterprise of the merchants of their *company*, situate to the north, or north-west, or north-east of London; nor any part of the continent, islands, &c. under the obedience of the emperor of Russia, or in the countries of Armenia, Media, Hircania, Persia, or the Caspian sea; should be visited by any subjects of England, to exercise any commerce, without the consent of the said *Company*, on pain of confiscation.

The said *Company* shall use no ships in her new commerce, but those of the nation; nor transport any cloths, ferges, or other woollen stuffs, till they have been dyed and pressed. That in case the *Company* discontinue of itself to unload commodities in the road of the abbey of S. Nicholas in Russia, or some other port on the north coasts of Russia, for the space of three years; the other subjects of England shall be allowed to traffick to Narva, while the said *Company* discontinues its commerce into Russia; only using English vessels.

This *Company* subsisted with reputation almost a whole century; till the time of the civil wars. It is said, the Czar then reigning, hearing of the murder of king Charles I. ordered all the English in his states to be expelled; which the Dutch taking the advantage of, settled in their room. After the restoration, the remains of the *Company* re-established part of their commerce at Archangel, but never with the same success as before; the Russians being now well accustomed to the Dutch merchants, and merchandize. This *Company* subsists still, nearly on the foot of that of Hamburgh, and the northern, and Turkey Companies, i. e. each member thereof trafficks for himself, and on his own bottom; only paying an acknowledgment of 12 or 13 l. sterling, besides some other dues imposed from time to time for the occasions of the *Company* and the commerce in general.

North Sea COMPANY, or, as some more agreeably to its charter, call it, *eastland company*, is established on the foot of that of Hamburgh; from whence it appears to have been dismembered.

Its charter is dated in the year 1579. By the first article the *Company* is erected into a body politic, under the title of the *Company of merchants of the east*; to consist of Englishmen, all real merchants, who have exercised the business thereof, and trafficked through the Sound, before the year 1568, into Norway, Sweden, Poland, Livonia, Prussia, Pomerania, &c. as also Revel, Copenhagen, Dantzick, Copenhagen, &c. excepting Narva, Muscovy, and its dependencies. Most of the following articles grant them

them the usual prerogatives of such *Companies*; as a seal, governor, courts, laws, &c.

The privileges peculiar to this *Company*, are, that none shall be admitted a member, who is already a member of any other *Company*; nor any retail-dealer at all. That no merchant qualified, be admitted without paying six pounds, thirteen shillings, and six-pence. That a member of another *Company*, desiring to renounce the privileges thereof, and to be received into that of the East, shall be admitted *gratis*; provided he procures the same favour for a merchant of the East, willing to fill his place. That the merchant-adventurers who never dealt in the East, in the places expressed in the charter, may be received as members of the *Company* on paying forty marks: that notwithstanding this union of the *adventurers* of England, with the *company of the East*, each shall retain its rights and privileges. That they shall export no cloths but what are dyed and pressed; except 100 pieces *per ann.* which are allowed them *gratis*.

This charter was confirmed by Charles II. in 1661, with this addition; that no person of what quality soever, living in London, should be admitted a member, unless he were free of the city.

TURKY COMPANY, or Levant COMPANY. This *Company* is established on foot of the *Hamburgh Company*, i. e. there is no common fund, wherein the *adventurers* deposit their stock, to make one single commerce; but the commerce thither is free, each member trafficking for himself; but observing, withal, the rules and orders of the *Company*; and all contributing, occasionally, towards the common expences.

This flourishing body had its rise under queen Elizabeth: James I. confirmed its charter in 1606; adding new privileges. During the civil wars, there happened some innovations in the government of the *Company*; many persons having been admitted members, not qualified by the charters of queen Elizabeth and king James, or that did not conform to the regulations prescribed: Charles II. upon his restoration, endeavoured to set it upon its ancient basis; to which end, he gave them a charter, containing not only a confirmation of their old one, but also several new articles of reformation.

By this, the *Company* is erected into a body politic, capable of making laws, &c. under the title of the *company of merchants of England trading to the seas of the Levant*. The number of members is not limited, but is ordinarily about three hundred. The principal qualification required, is, that the candidate be a free-man of London, and a wholesale merchant, either by family, or by serving an apprenticeship of seven years. Those under 25 years of age, pay 25 l. sterl. at their admission; those above, twice as much. Each makes oath, at his entrance, not to send any merchandises to the Levant, but on his own account; and not to consign them to any but the *Companies* agents, or factors.

The *Company* has a court, or board at London, which is composed of a governor, deputy-governor, and twelve directors, or assistants; who are all actually to live in London, or the suburbs. They have also a deputy-governor in every city, and port, where there are any members of the *Company*. The assembly at London sends out the vessels, regulates the tariff for the price at which the European merchandises sent to the Levant are to be sold; and for the quality of those returned. It raises taxes on merchandises, to defray impositions, and the common expences of the *Company*; presents the ambassador which the king is to keep at the port, elects two consuls for Smyrna and Constantinople, &c.

One of the best regulations of the *Company*, is, not to leave the consuls, or even ambassador, to fix the imposition on vessels for defraying the common expences; (a thing fatal to the *Companies* of most other nations) but to allow a pension to the ambassador, and consuls, and even to the chief officers; as secretary, chaplain, interpreters, and janizaries; that there may not be any pretence for their raising any sum at all on the merchants or merchandises.

In extraordinary cases, the consuls, and even ambassador himself, have recourse to two deputies of the *Company*, residing in the Levant: or, if the affair be very important, they assemble the whole body. Here are regulated the presents to be given, the voyages to be made, and every thing to be deliberated: and on the resolutions here taken, the deputies appoint the treasurer to furnish the monies, &c. required.

It is true, the ambassador and consul may act alone on these occasions; but the pension being allowed them on condition of declining them, they chuse rather to sit still.

The ordinary commerce of this *Company*, employs from 20 to 25 vessels, from 25 to 30 pieces of cannon.

The merchandises exported thither are cloths of all kinds and colours, pewter, lead, pepper, cochineal, and a great deal of silver, which they take up at Cadiz: the returns are in raw silk, galls, camlets, wools, cottons, Morocco leather, affes for making glass and soap, and several gums and medicinal drugs.

The commerce of this *Company* to Smyrna, Constantinople, and Scanderoon, is not esteemed much less considerable than that of the East-India *Company*; but is, doubtless, more advantageous to England; in regard, it takes off much more of the English manufactures than the other, which is chiefly carried on in money.

The places reserved for the commerce of this *Company*, are all the states of Venice, in the gulph of Venice; the state of Ragusa; all the states of the grand seignior, and the ports of the Levant and Mediterranean; excepting Carthage, Alicante, Barcelona, Valencia, Marseilles, Toulon, Genoa, Leghorn, Civita Vecchia, Palermo, Messina, Malta, Majorca, Minorca, and Corfica; and other places on the coasts of France, Spain, and Italy.

South-Sea COMPANY. Many take this *Company*, established towards the close of the XVIIth century, to have been originally intended, rather as a political contrivance for raising a fund of money, to serve in the pressing occasions of the state, than as a real establishment for the sake of commerce. For the nation being exhausted of money by the long wars with France, it is no wonder the phantom of a new *Company* should be raised, to bring in the subscriptions of the monied men; as the only expedient to be supplied with money, without dissatisfying the people, already worn out with subsidies, &c.

Be this as it will, it is certain the ministry never thought seriously, during the whole course of the war, about making any settlement on the coasts of South America; which was the thing wherewith the people were first flattered: besides, that the fund having been apparently perverted to defray the expences of the war, its value was so lowered, that it must in all probability have sunk outright, but for the unexpected help it met with in 1713.

By the treaty of Utrecht, the business of the French *Asiatica Company*, which was to furnish the Spanish West-Indies with negroes, was resigned to the English, in favour of the *South-Sea Company*; which by this turn relieved itself from its languishing condition, and became in a condition to vie with the most flourishing *Companies* of commerce in England.

The treaty of this *Company* with the Spaniards, commences from May 1713; and was to hold 30 years; during which time, the *Company* was to furnish the Spanish America with 144,000 negroes, of both sexes, between fifteen and twenty-five years of age, found, &c. at the rate of 4800 *per annum*; and for all that they furnish besides, only to pay half the dues to the king of Spain, for the first 25 years of the term, or assiento. It may be added, that in consideration of 200,000 piasters, paid in advance to the king of Spain, to be reimbursed as the dues rise during the first ten years, the *Company* is only to pay dues for 4000: the king's due is 33 piasters $\frac{1}{2}$ *per head*. See *ASIENTO*.

The chief establishment of the French *Asiatica Company* was at Buenos Ayres, a town of considerable trade on the coast of South America. The *South-Sea Company*, who without changing their name, took on them the *Asiatica*, or farm of negroes, preserves the same establishment; and it is here their vessels disembark their negroes, which they had purchased through all the coasts of Africa within their grant.

The *Company*, it is certain, set out with good success; and there was room to hope still better; since, besides that the value of their stock the first five years, rose faster, in proportion, than that of any other *Company*; his majesty, after purchasing 10000 l. sterling therein, was pleased to condescend to be their governor, or first director. For what remains of the history of this *Company*, with that fatal train of romantic *Companies* it drew after it, we chuse to refer to the article *BUBBLE*.

Harborough COMPANY. This *Company*, anno 1722, was in embryo: its design was to set on foot an immediate commerce between the subjects of England, and those of his majesty's German territories. The first scheme was laid in 1717; a charter was obtained some time after.

West-India COMPANIES, or those of the English colonies in North America, are of a lower class than those abovementioned; and too numerous to be here described.

Their names are, the *Hudson's Bay Company*, *Virginia Company*, *New England*, *New York*, *Pennsylvania*, *New Scotland*, *Massachusetts*, *Connecticut*, *Bermudas*, *Tobago*, and *Carolina Companies*.

Scotch Darien COMPANY. This was established with good prospect at Edinburgh in 1699, for the commerce of S. America. They sent an armament and a colony, which they endeavoured to establish in the isthmus of Darien, which parts N. and S. America: but the English ministry not thinking proper to avow and support the first successes of the *Company*, which had alarmed Spain, ever jealous of this part of her territories, the Scotch colony was dispersed by the Spaniards in 1700: and thus vanished the best project that ever was formed, for disputing with that nation the possession of those countries, from which the pretends to exclude all other nations.

Dutch East-India COMPANY, had its rise in the midst of the struggle which that people had for their liberty: for the Spaniards having forbid all commerce with them, and shut up all their ports; necessity inspired some Zealanders to seek a new north-east passage to China.

This enterprize proving unsuccessful to three several armaments in 1594, 1595 and 1596; a second *Company* was formed, under the name of the *Company of remote ports*; which, in 1595, took the ordinary rout of the Portuguese to the Indies, and returned in two year and a half's time, with little gain, but good hopes.

This *Company*, and a new one just established at Amsterdam, being united, equipped other fleets; and these occasioned other *Companies* at Amsterdam, Rotterdam, in Zealand, &c. inasmuch that the states soon began to apprehend they might be prejudicial to each other: under this concern, they called all the directors of the several *Companies* together, who all consented to an union, the treaty whereof was confirmed by the states in 1602: a very remarkable epocha, as being that of the most solid and celebrated establishment of commerce that ever was in the world.

Its first capital was six millions six hundred thousand florins. It has 60 directors divided into several chambers; 20 in that of Amsterdam, 12 in that of Zealand, 14 in that of Delph and Rotterdam, and a like number in those at Sluys and Horn. As each grant expires, the *Company* is obliged to procure a new one, which it has already done four times since the first; viz. one in 1622, for 21 years, like the first; another for 21 years, commencing in 1647; and a third in 1665, for 25 years; a fourth in advance, commencing in 1698, to end in 1740. Each grant costs the *Company* a considerable sum; that of 1647 cost 1600000 livres, and the two following ones more. The last of 1698 was confirmed by a placard of the states general, granting them an exclusive privilege.

Their factories, residences, &c. in the East-Indies, are almost infinite; reaching from the Persian gulph to the coast of China: the principal is that of Batavia, the center of their commerce: here resides their general, with the state and splendor of a sovereign prince; making war and peace with the eastern kings and emperors at pleasure.

The other more considerable factories, are Taiouan on the coast of China, Nangfac in Japan, Malacca, Surat, Amboyna, Banda, Siam, Moluccos, &c. Several on the coast of Coromandel, and at Ipahan, Cape of good Hope, &c. In all, they number 40 factories and 25 fortresses. They have the whole trade of the spicery in their own hands.

Dutch West-India COMPANY, established in 1621, with an exclusive privilege to trade 24 years along the coasts of Africa, between the tropic of Cancer, and the Cape of Good Hope; and in America, from the fourth point of Newfoundland, thro' the freights of Magellan, that of le Maire, or others, to the freights of Anian, both in the north and south sea.

The directors are divided into five chambers, (as in the East-India *Company*) out of which, 19 are chosen for the general direction of affairs. In 1647 the *Company* renewed its grant for 25 years, but it was scarce able to hold out the term; by reason of its great losses, and expences in taking the bay of Todos los Santos, Fernambuc, and the greatest part of Brasil from the Portuguese. The weakness of this *Company*, which had several times in vain attempted to be joined to that of the East-Indies, occasioned its dissolution at the expiration of its grant.

In 1674, a new *Company*, composed of the ancient proprietors and their creditors, was settled in the same rights and establishment with the former; and still subsists with honour: their first capital was about six millions of florins. Its principal establishments, are, one at Cape Verd, another on the gold coast of Africa, at Tabago, Curassao, &c. in America.

Dutch North Company has no exclusive privilege; the advantages of its patent being of another kind, and very inconsiderable.

There are also in Holland, *Companies* for the Baltic sea, the fishery of Nova Zembla, Davis's Streights, and Greenland; yet, none of their fisheries are interdicted to private traders; all the difference between these and the *Companies* consisting in this; that the former may not go ashore to cut their fish in pieces, and melt their lard; but must bring their luggage to Holland.

Dutch Levant COMPANY. In strictness, there is no Levant *Company* in Holland: but the commerce of the private traders is so considerable, that the state has taken the regulation thereof on itself.

To this end, they have established a chamber of direction at Amsterdam, composed of six deputies and a register; who, under the burgomasters, take care of every thing relating to the commerce of the Mediterranean: especially that of Smyrna and Constantinople.

This *Company* names the consuls, appoints the number and strength of convoys, terminates differences among the traders; and has also a right, on occasion, to add new regulations to the old ones; though those be of no force, till confirmed by the states-general.

French East-India COMPANY, was established in 1664, with an exclusive privilege, to trade for 30 years in all the seas of the East-Indies and South-Sea: no adventurer to be admitted without 1000 livres in stock; and foreigners who have 20000 livres in stock, to be reputed Regnicoles.

The patent grants them the island of Madagascar; and the king to be at one fifth of the expence of the three first armaments, without interest; the principal to be refunded in ten years; or, if the *Company* find it loses on the whole, the loss to fall on the king's side.

The capital fund of the *Company*, which was mostly furnished by the king, was seven or eight millions of livres, but was to have been 15 millions.

In effect, though no means were wanting to support the *Company*, yet it still drooped, and still struggled; till having subsisted ten years without any change in its form, and being no longer able to discharge its engagements, there were new regulations concerted; but to little purpose. At length, things not being disposed for a new East-India *Company*, not much good to be expected from the old one; in 1708, the ministry allowed the directors to treat with the rich traders of S. Malo, and resign to them their privilege under certain conditions. In the hands of these last, the *Company* began to flourish.

Its chief factory is at Ponichery, or Pondichery, on the coast of Coromandel: this is the residence of the director-general; the other factories are inconsiderable. The merchandises which the *Company* brings into France, are silks, cottons, spices, coffee, rice, salt-petre; several kinds of gums and drugs, woods, wax, printed calicoes, mullins, &c.

French West-India COMPANY, was established in 1664: their charter gave them the property and seignior of Canada, Acadia, the Antilles Islands, Isle of Cayenne, and the Terra-firma of America, from the river of the Amazons to that of Oronoko; with an exclusive privilege for the commerce of those places, as also of Senegal and the coasts of Guinea, for forty years, only paying half the duties.

The stock of the *Company* was so considerable, that in less than six months, 45 vessels were equipped; wherewith they took possession of all the places in their grant, and settled a commerce: yet this only subsisted nine years. In 1674 the grant was revoked, and the countries above reunited to the king's dominions, as before; the king reimbursing the actions of the adventurers. This revocation was owing partly to the poverty of the *Company*, occasioned by its losses in the wars with England, which had necessitated it to borrow above a million; and even to alienate its exclusive privilege for the coasts of Guinea: but also to its having in good measure answered its end; which was to recover the commerce of the West-Indies from the Dutch, who had tore it from them: for the French merchants being now accustomed to traffic to the Antilles, by permission of the *Company*, were so attached to it, that it was not doubted they would support the commerce after the dissolution of the *Company*.

French Mississippi COMPANY, was first established in 1684, in favour of the chevalier de la Salle; who having projected it in 1660, and being appointed governor of the fort of Espagnac, at the mouth of that river, travelled over the country in the year 1683, and returned to France to solicit the establishment. This obtained, he set sail for his new colony, with four vessels laden with inhabitants, &c. but entering the gulph of Mexico, he did not, it seems, know the river that had cost him so much fatigue; but settled on another river, unknown; where his colony perished by degrees: so that in 1685, there were not 100 persons remaining. Making several expeditions to find the Mississippi, he was killed in one of them by a party who mutinied against him: whereupon the colony was dispersed and lost. M. Hiberville afterwards succeeded better; he found the Mississippi, built a fort, and settled a French colony there: but he being poisoned, it is said, by the intrigues of the Spaniards, who feared such a neighbourhood; in 1712, M. Crozat had the whole property of trading to the French territories, called Louisiane, granted him for 15 years.

COMPANY of the West. In 1717, the sieur Crozat surrendered his grant; and in the same year a new *Company* was erected, under the title of *Company of the west*: to which, besides every thing granted to the former *Company*, was added the commerce of calico, enjoyed by the Canada *Company* from the year 1706, but expiring in 1717. In this establishment, an equal view was had to the finances, and the commerce of the nation: and accordingly, part of the conditions of its establishment regarded the settling a colony, a trade, &c. the other the venting part of the bills, called bills of state; which could no longer subsist on their present footing. The former are no more than are usual in such establishments: for the latter, the actions are fixed at five hundred livres; each payable in bills of state: the actions to be esteemed as merchandise; and in that quality to be bought, sold, and trafficked. The bills of state, which make the fund of the actions, to be converted into yearly revenue. To put the finishing hand to the *Company*, in 1717 its fund was fixed at an hundred millions of livres: which being filled, the cash was shut up.

India COMPANY. The junction of the former *Company* with that of Canada, was immediately followed by its union with that of Senegal; both in the year 1718, by an arret of council, which at the same time granted the new *Company* the commerce of calico, and made it mistress of the negro, or Guinea trade, to the French colonies in America.

Nothing was now wanting to its perfection, but an union with the East-India *Company*, and with those of China and S. Domingo, which was effected; with the two first in 1719, and with the third in 1720. This union of the East-India and China *Company* with the *Company* of the west, occasioned an alteration of the name, and it was henceforth called the *India Company*.

The reasons of the union, were the inability of the two former

to carry on their commerce, the immense debts they had contracted in the Indies, especially the *East Company*; complaints whereof had been sent to court by the Indians, which discredited the *Company* so, that they durst not appear any longer at Surat: lastly, the little care they took to discharge their engagements; and their having transferred their privilege to the private traders of S. Malo, in consideration of a tenth in the profits of the returns of their ships.

The ancient actions of the *Company* of the west, which were not at par when this engrainment was projected, ere it was completed, were risen to 300 per cent. which unexpected success gave occasion to conclude the new actions of the united *Companies* would not bear less credit. The concourse of subscribers was so great, that in a month's time there were above fifty millions subscribed for: the first twenty-five million actions which were granted to the *India Company*, beyond the 100 millions of stock allowed the *Company* of the west, being filled as soon as the books were opened; to satisfy the earnestness of the subscribers, the stock was increased by several arrears to three hundred millions. Credit still increasing, the new actions rose to 1200 per cent. and those of the ancient *Company* of the west to 1900 per cent. an exorbitant price, to which no other *Company* ever rose.

Its condition was now so flourishing, that in 1719 it offered the king to take a lease of all his farms for nine years, at the rate of three millions five hundred thousand livres *per annum* more than had been given before; and also to lend his majesty twelve hundred millions to pay the debts of the state: these offers were accepted: and the king, in consideration hereof, granted them all the privileges of the several grants of the *Companies* united to that *Company*, to the year 1770: on condition, however, of discharging all the debts of the old *East-India Company*, without any deduction at all. The loan of twelve hundred millions not being sufficient for the occasions of the state, was augmented, three months afterwards, with three hundred millions more; which, with the former loan, and another of one hundred millions before, made sixteen hundred millions: for which the king was to pay interest at the rate of three per cent.

The duke of Orleans, in February 1720, did the *Company* the honour to preside in their assembly, where he made several proposals to them on the part of the king: the principal of these was, that they should take on them the charge and administration of the royal bank. This was accepted of, and Mr. Law, comptroller-general of the finances, was named by the king, *Inspector-General of the India Company and Bank united*.

This union, which, it was proposed, should have been a mutual help to both those famous establishments, proved the fatal point from whence the fall of both commenced: from this time, both the bank-bills and the actions of the *Company* began to fall: in effect, the first perished absolutely, and the other had been drawn along with it, but for the prudent precautions taken for its support.

The first precaution was the revoking the office of inspector-general, and the obliging Mr. Law to quit the kingdom: the ancient directors were discarded, and new ones substituted; and, to find the bottom of the *Company's* affairs, it was ordered, they should give an account of what they had received, and disbursed, both on the account of the *Company*, and of the bank, which they had had the management of near a year. Another precaution to come at the state of the *Company*, was by endeavouring to distinguish the lawful actionaries from the Mississippi extortioners; whose immense riches, as well as their criminal address in realising their actions, either into species or merchandise, were become so fatal to the state; in order, if possible, to secure the honest adventurers their stock. To this end, an inquiry was made into their books, &c. by persons appointed by the king: and the new directors, or, as they were called *Regisseurs*, began seriously to look about for their commerce abroad.

The French have had several other *Companies*; some whereof have fallen of themselves, the rest upon the expiration of their grants: as, the

Bastion Company of France, which was, at first, only a simple association of two merchants at Marfeilles, in the XVth century, for fishing of coral in the gulph of Stora-Courcoury on the coast of Barbary, on the frontiers of Algiers and Tunis. Having obtained leave of the sultan Solyman II. to make an establishment, and having likewise treated with the moorish princes of the country; in 1561 they built a little fort, called the *Bastion of France*, whence the *Company* took its name.

The first undertakers not being successful, a new grant was obtained of Mahomet III. in 1604, to new undertakers: in 1628 it began to flourish, and the colony consisted of 800 people: but the death of their governor in 1633, gave them a blow they never recovered.

Several of the *Companies* have since endeavoured to set the fishing of coral on its ancient foot, but hitherto in vain.

Guinea Company, was established in 1685: its grant expired in 1705, but it continued its trade of negroes, by the king's permission, under the name of *Affiento Company*, to the year 1713; when, by the treaty of Utrecht, that trade was surrendered to the English *South-Sea Company*, which see.

Affiento Company. See *Guinea Company*, and *ASSIENTO*.

Cape Verd Company, the same with that of *Senegal*, under another name: it was established in 1664, before the *Company* of the west; but the coasts of Africa being included in the grant of this last, we hear no more of the *Cape Verd Company* till the year 1673, when it rose afresh under the title of *Company of Senegal*.

French South-Sea Company, is the same with the *Affiento Company*, See *ASSIENTO*.

Canada Company, established in 1628, for the commerce of castor-skins, &c. Its grant expiring in 1717, it was united to the *Company* of the west; which see.

Acadie Company, established in 1683. Its grant expiring in 1703, and the war, &c. preventing a new one, the colony was neglected; and was taken by the English 1710, and confirmed to them by the treaty of Utrecht.

French Levant Company, established in 1670; but its privilege revoked in 1684.

French North Company, established in 1669, and expiring with its grant in 1690.

S. Domingo Company, established in 1698, for fifty years; carried on with honour to the year 1720, and then united to the *India Company*.

Danish North Company, was established at Copenhagen, in 1647: its establishments are very considerable in Norway; besides which, it sends vessels to Waranger, whence they convey their merchandises by land into the Danish Lapland; and by sledges drawn by rein-deer, into the Muscovite Lapland. It also sends others for Borandat and Siberia; where its agents take them up, and convey them, in like manner, on sledges to Panigoro, the capital of this part of the Muscovite empire.

The commodities it sends thither are rixdollars, tobacco, and linnens; it returns nothing but furs and skins.

Danish Iceland Company, established in the same year with the north *Company*: its chief factory is Kirkebar, a large town in that island.

Danish East-India Company, established in the middle of the XVIIth century; their chief factory is at Tranquebar, whither they send two or three vessels every year.

Levant Company of the Genoese, established in 1664, and confirmed by the Porte; notwithstanding the opposition of the French.

Its chief commerce was to be in pieces of 5 sols, which the Genoese had before furnished the Turks withal, though in the French name, and under their banner; they were now to do it under their own banner; and accordingly, while the humour of these pieces lasted, as they served not only for money, but were likewise used by the Greek and Turkish women of the islands, as ornaments in their head-dress, at the bottom of their vests, or petticoats, which were covered with them; the *Company* succeeded well enough: but that money being afterwards decried in 1670, the *Company* has languished ever since; and can now scarce support a miserable commerce.

Company of Ships, is used for a fleet of merchant-vessels, who make a kind of charter-party among themselves; whereby, under several clauses and conditions tending to their common safety, they engage not to quit one another, but to defend each other reciprocally, during their voyage.

These associates, in the mediterranean, are called *conserves*. The chief conditions of the charter-party, are, that such and such shall be owned admiral, vice-admiral, and rear-admiral. That those which bear no guns, shall pay so much per cent. of their cargo, for the expences of the admiral, &c. that such and such signals shall be observed; that if they be attacked, the damages shall be reimbursed by the *Company* in general, &c.

Rule of Company, or *Fellowship*, in arithmetic, is a rule whereby we discover, or ascertain the share of the profits, or losses, belonging to the several partners, or associates in any enterprize, in proportion to the stock each contributed thereto, and the time that stock was in bank.

Company, in war, denotes a little body of infantry, commanded by a captain.

The French use the word indifferently for the horse, or foot; but the English appropriate the term troop to a *Company* of horse. See *TROOP*.

The number of men in a *Company* is uncertain; in the ordinary regiments it is 50 centinels, besides 3 sergeants, 3 corporals and 2 drums, &c.—A *Company* in the guards is 80 private men. See *REGIMENT*, and *GUARDS*.—In the French guards the *Company* is 120, in the Swiss guards 200.

Companies not imbedded into regiments, are called *independent Companies*.—The French also have their *free Companies*, who never enter the body of any regiment; and *Companies of ordonnance*, who in like manner never enter the body of a regiment; but consist of the gendarmes and light-horse. They were instituted by Charles VII. who chose out fifteen captains, under each of whom was to be 100 lances, or men at arms, each man at arms to receive pay for six persons, himself among the number; the rest to be three archers on horseback, a cutler, and a servant.

Artillery Company. See the article *ARTILLERY*.

COMPARATES, *COMPARATA*, in logic, the terms or subjects of a comparison; or the two things compared to each other. See *COMPARISON*.

COMPARATIONE—*Punctum ex* COMPARATIONE. See PUNCTUM.

COMPARATIONIS *Homogeneous*. See the article HOMOGENEUM.

COMPARATIVE *Anatomy*, is that branch of anatomy which considers the same parts of different animals, with relation to the particular structure, and formation which is best suited to their several manners of living, and the necessities of every creature.

Thus, in the *Comparative anatomy* of stomachs, for instance, it is remarkable, that those creatures which have the opportunities of frequent feeding, have their stomachs very small, in comparison to some creatures of prey, which, probably, may be under a necessity of fasting a long time; and therefore have stomachs large enough to hold food sufficient for such a time.

However, in the common use of the term, *Comparative anatomy* is understood of any anatomy of brutes; whether with an immediate reference of their structure to that of other animals, or not.

COMPARATIVE *Degree*, in grammar, is an inflexion between the positive and superlative degrees; whose effect is, to set a thing above or beneath the level of another.

The Latins expressed their *Comparative degree* by a particular termination of their adjectives, and participles; wherein they are followed by the English, though by few other of the modern languages.

The French form most of their *Comparatives*, by adding the participles *plus*, *moins*, and *aussi*; the Italians by *piu*, *meno*, &c. as the thing is to be raised, lowered, or equalled to another.

COMPARISON, the relation of two persons or things, considered as opposed, or set against each other, in order to find wherein they agree or differ; or wherein one has the advantage of the other.

COMPARISON of *Ideas*, an act of the mind, whereby it compares its ideas one with another, in respect of extent, degree, time, place, or any other circumstances. See IDEA.

This operation of the mind is the ground of relations. See RELATION.

Brutes seem not to have this faculty in any great degree: they have, probably, several ideas distinct enough; but cannot compare them farther than as to some sensible circumstances annexed to the objects themselves: the power of comparing general ideas, which we observe in men, we may probably conjecture they have not at all.

COMPARISON, in rhetoric, is a figure, or rather place, in speech, whereby two things are considered with regard to some third, which is common to them both. See FIGURE, and PLACE.

Thus, Cicero. *Catonem licuit sequi bellum civile, igitur & Ciceroni licuit. It was allowed Cato to engage in the civil wars, therefore it may be allowed Cicero: where, to engage in the civil wars is common to both.*

There are three kinds of *Comparison*; the first à *majori*, i.e. from the major to the minor, as that of Cicero against Anthony, *Quid feceris domi tuæ, cum alienæ tam sis inflexus?* Or that of Terence; *Quem feret, si parentem non ferit suum?* From the same place, Ovid endeavours to appease Cæsar.

*Cui ego posse regem leniri Cæsaris iram,
Cum videam miles hostibus esse Deos?*

The second à *minoris*, i.e. from the minor to the major: thus Cicero, *maiores nostri sæpe mercatoribus, ac naviculariis injurijs tractatis, bella gesserunt; vos tot civium Romanorum milibus una mortis atque uno tempore necatis, quo tandem animo esse debetis?*

The third à *pari*; as when we contend that what obtains in one thing, ought to obtain in another of the same kind: thus, *It was a law, that he who killed his father should be sewed up in a sack and thrown into a river; therefore, he who killed his mother deserves the same punishment.*

*Capto tuam, pudet bene, sed capto, Maxime, cenam
Tu capis alterius; jam sumus ergo pares.
Manc salutatam venio, tu diceris iste,
Ante salutatam: jam sumus ergo pares, &c.*

Mart. Lib. II.

COMPARTIMENT, or COMPARTMENT, a design composed of several different figures, disposed with symmetry; to adorn a partition, a ceiling, panel of joinery, or the like.

A COMPARTIMENT of *Tiles*, is an arrangement of white and red tiles varnished, for the decoration of the covering of a roof.

The term *Compartment* is also used in painting. The Turkish and Moorish paintings are only *Compartments*: the fine bindings of books are in *Compartments*, &c.

ALLEY of COMPARTIMENT. See the article ALLEY.

COMPARTIMENT, in heraldry. See the article PARTITION.

COMPARTITION, in architecture, the useful and graceful distribution of the whole ground-plot of an edifice, into rooms of office, and of reception, or entertainment.

Compartment makes one of the great divisions of the art of building. See BUILDING.

COMPASS. The mariner's, or nautical *Compass*, is an instru-

ment used by pilots, to direct the course of their ships.

It consists of a box, which includes a magnetical needle, that always turns to the north; excepting for a little declination, which is various in various places, and even at various times, in the same place.

In the middle of the box is fixed a perpendicular pivot, which bears a card, or pastboard, on whose upper surface are described several concentric circles; the outmost of which is divided into 360 degrees; the other into 32 points, answering to the 32 winds.

In the center of this card is fitted a brass cone, or cap, a little concave, which plays at liberty on the pivot; and along, in the thickness of the card, is fitted the needle, which is covered over with a glass, that its motions may be observed: the whole is inclosed in another box; where it is sustained by brass hoops, to keep the needle horizontal. See it represented, *Tab. Navigation*, fig. 1. The needle, which is, as it were, the soul of the *Compass*, is made of a thin plate of steel in form of a lozenge: the middle being cut out, so as to leave nothing but the extremities and an axis in the middle, to which the cap is fitted. To animate, or touch it, it must be rubbed on a good loadstone: that end intended for the north point on the north pole of the stone, and that for the south point on the south pole. In rubbing it, care must be taken to begin first in the middle of the lozenge, drawing it gently to the acute angle of the lozenge intended for the north; never suffering it to stay at the end when arrived there, nor drawing it back again from the end to the middle, but rubbing it a second, and even a third time, in the same manner as the first, only beginning a little further and further from the north point: some say, the stone and needle should be so disposed as that the line of the rub be in the direction of the meridian.

The invention of the COMPASS is usually ascribed to Flavio de Meli, or Flavio Gioia a Neapolitan, about the year 1302: and hence it is, that the territory of Principato, which makes a part of the kingdom of Naples, where he was born, bears a *Compass* for its arms.

Others say, that Marcus Paulus a Venetian, making a journey to China, brought back the invention with him in 1260: what confirms this conjecture, is, that at first they used the *Compass* in the same manner as the Chinese still do; i.e. they let it float on a little piece of cork, instead of suspending it on a pivot. It is added, that their emperor Chiningus, a celebrated astrologer, had the knowledge of it 1120 years before Christ. The Chinese only divide their *Compass* into twenty-four points.

Faucher relates some verses of Guyot de Provence, who lived in France about the year 1200, which seem to make mention of the *Compass* under the name of *marinette*, or *mariner's stone*; which shews it to have been used in France near 100 years before either the Melphite or Venetian. The French even lay claim to the invention, from the flower de lis, wherewith all nations still distinguish the north point of the card.

With as much reason Dr. Wallis ascribes it to the English, from its name *Compass*, whereby most nations call it; and which he observes, is used in many parts of England to signify a circle.

The use of the Sea-Compass is obvious. For, the course a ship is to sail in, being known by the chart; and the *Compass* so placed, as that the two parallel sides of the square box be disposed according to the length of the ship, i.e. parallel to a line drawn from the head to the stern; the rudder is to be directed accordingly; v.g. if the course be found on the chart between the south-west and south-south-west, i.e. south-west $\frac{1}{2}$ to the south: turn the stern so as that a line from the south-west, $\frac{1}{2}$ south, exactly answer the mark on the middle of the side of the box. This is all that is required.

COMPASS is also an instrument of considerable use in surveying land, dialing, &c. See SURVEYING.

Its structure, in the main, is the same with that of the *mariner's Compass*; consisting, like that, of a box and needle: the principal difference consists in this, that instead of the needle's being fitted into the card, and playing with it on a pivot, it here plays alone; the card being drawn on the bottom of the box, and a circle divided in 360 degrees on the limb. See *Tab. Surveying*, fig. 15. This instrument is of obvious use to travellers, to direct them in their road; and to miners, to shew them what way to dig, &c. but it has other uses, though less easy, yet more considerable.

1. To take the declination of a wall by the COMPASS. Apply that side of the *Compass* whereon the north is marked along the side of the wall; the number of degrees over which the north end of the needle fixes, will be the declination of the wall, and on that side: v.g. if the north point of the needle tends towards the north; that wall may be shone on by the sun at noon; if it fix over fifty degrees, counting from the north towards the east, the declination is so many degrees from north towards east. But since the needle itself declines from the north towards the west, with us, 13°; it must be noted, that to retrieve the irregularity, 13° are always to be added to the degrees shewn by the needle, when the declination of the wall is towards the east: on the contrary, when the declination is towards the west, the declination of the needle to be subtracted.

2. *To take an angle with the COMPASS.* Suppose the angle required be DAE, (Tab. *Surveying*, fig. 11.) apply that side of the compass whereon the north is marked to one of the lines, AD; when the needle rests, observe the degrees at which its north point stands, which suppose 80: so many degrees does the line decline from the meridian.

In the same manner take the declination of the line AE, which suppose 215°; subtract 80° from 215, the remainder is 135; which subtracted from 180, there will remain 45°; the quantity of the angle required.

But if the difference between the declination of the two lines exceed 180°; in that case, 180° must be subtracted from that difference: the remainder then is the angle required.

For the method of laying this down on paper; see PLOTTING.

Note, In measuring angles by the compass, there needs not any regard be had to the variation; that being supposed the same in all the lines of the angles.

3. *To take the plot of a field by the COMPASS.* Suppose the field A, B, C, D, E, (fig. 12.) for the greater accuracy let there be two sights fitted to the meridian line of the compass, place it horizontal, and through the sights look along the side AB, or a line parallel to it; applying the eye to the sight at the south point of the compass. Draw a rough sketch of the field by the eye, and on the corresponding line enter down the degree to which the needle points, which suppose 90; measure the length of the side, and enter that too, which suppose 10 chains.

In this manner proceed with all the rest of the sides and angles of the field; the sides which suppose 70, 65, 70, 50, 94 chains; and the angles which suppose 30, 100, 130, 240, 300 degrees. To protract the field, let down the several angles observed, one after another, and subtract the lesser from the next greater: thus will you have the quantity of the several angles, and the length of the lines that include them. For the rest, see PLOTTING, and PROTRACTING.

Note, All the angles of the figure taken together, must make twice as many right angles, abating two; if no mistake have been committed.

The *Azimuth COMPASS*, differs from the common sea compass, in this; that there is fastened, on the round box wherein the card is, a broad circle A B, (Tab. *Navigation*, fig. 2.) one half whereof is divided into 90 degrees, and those subdivided diagonally into minutes: *b c* is an index moveable on *b*, having a sight, *b a*, erected thereon, and moving on a hinge. From the upper part of the sight, to the middle of the index, is fastened a fine hypotenusal lutestring *a e*, to give a shadow on a line in the middle of the index. The circle A B is crossed at right angles with two threads, from the extremities whereof are drawn four lines on the inside of the round box: there are also four lines drawn at right angles to each other on the card. The round box fitted with its card, graduated circle, and index, is hung in the brass hoops BB, and those hoops fastened to the square box CC.

The use of the *azimuth COMPASS*, is for finding the sun's magnetical azimuth, or amplitude; and thence the variation of the compass. If the observation be for an amplitude at sun-rising, or for an azimuth before noon; apply the center of the index *b c* on the west point of the card, within the box; so that the four lines on the edge of the card, and those on the inside of the box may meet. If the observation be for the sun's amplitude setting, or an azimuth in the afternoon, turn the centre of the index right against the east point of the card, and make the lines within the box concur with those on the card: the instrument thus fitted for observation, turn the index *b c* towards the sun, till the shadow of the thread *a e* fall directly on the slit of the sight, and on the line that is along the middle of the index; then will the inner edge of the index cut the degree and minute of the sun's magnetical azimuth from the north or south. But note, that if, when the compass is thus placed, the azimuth is less than 45° from the south, and the index *b c* turned towards the sun, it will pass off the divisions of the limb: the instrument, therefore, in this case, must be turned just a quarter of the compass, i. e. the centre of the index must be placed on the north or south point of the card, according as the sun is from you; and then the edge will cut the degree of the magnetic azimuth, or the sun's azimuth from the north, as before. See AMPLITUDE.

The sun's magnetical amplitude thus found, the variation of the needle is thus determined.

Being out at sea the 15th of May, 1715, in 45° nor. lat. the tables give me the sun's latitude 19° north, and his east amplitude 27° 25' north: by the *azimuth compass*, I find the sun's magnetical amplitude at his rising and setting; and find he rises, *v. gr.* between the 62d and 63d degree, reckoning from the north towards the east point of the compass, i. e. between the 27th and 28th degree, reckoning from the east.

The magnetical amplitude, therefore, being here equal to the true one, the needle has no variation: but if the sun at his rising should have appeared between the 52d and 53d degree, from the north towards the east; his magnetical amplitude would then have been between 37 and 38 degrees, i. e. about 10 degrees greater than the true amplitude: therefore, the needle would vary about 10 degrees north-easterly.

V O L. I.

If the magnetical east amplitude found by the instrument, should be less than the true amplitude, their difference would shew the variation of the needle easterly.

If the true east-amplitude be southward, as also the magnetical amplitude, and this last be the greater; the variation of the needle will be north-west: and *vice versa*.

What has been said of north-east amplitudes, holds also of south-west amplitudes. And what of south-east amplitudes, holds of north-west amplitudes.

Lastly, If amplitudes be found of different denominations, *v. gr.* if the true amplitude be six degrees north, and the magnetical amplitude five degrees south; the variation, which in this case is north-west, will be equal to the sum of the magnetical and true amplitudes: understand the same for west amplitudes.

The variation may likewise be found from the azimuth; but in that case, the sun's declination, latitude of the place, and his altitude must be given, that his true azimuth may be found.

COMPASS of proportion. See the articles SECTOR, and PROPORTION.

COMPASS dial, are small dials, fitted in boxes, for the pocket; to shew the hour of the day by direction of the needle; which indicates how to place them right by turning the dial about, till the cock or style stand directly over the needle, and point to the northward; but these can never be very exact, because of the variation of the needle itself. See DIAL.

COMPASS saw. See the article SAW.

COMPASSES, or pair of COMPASSES, a mathematical instrument, used for the describing of circles, measuring lines, &c. The common compasses consist of two branches, or legs, of iron, brass, or other metal, pointed at bottom; and a-top joined by a rivet, whereon they move, as on a centre.

The invention of compasses is ascribed to Talaus, nephew of Dædalus by his sister, whom the poets say, Dædalus killed out of envy. We have compasses now of various kinds and contrivances, accommodated to the various uses they are intended for: as,

COMPASSES of three legs. Their structure is like that of the common compasses, setting aside the excess of a leg: their use is to take three points at once; and so to form triangles; to lay down three positions of a map to be copied at once, &c.

Beam COMPASSES, consist of a long branch, or beam, carrying two brass cursors; the one fixed at one end, the other sliding along the beam, with a screw to fasten it, on occasion. To the cursors may be screwed points of any kind; whether steel, for pencils, or the like. It is used to draw large circles, to take great extents, &c.

Caliber COMPASSES. See the article CALIBER.

Clock-makers COMPASSES are very substantial, serving to cut past-board, brass, &c. jointed like the common compasses with a quadrant, or bow, as the spring compasses, only its use different; as serving here, to keep the instrument firm at any opening.

Cylindrical and spherical COMPASSES, used in taking the diameter, thickness, or caliber of round, or cylindrical bodies; such as, cannons, pipes, &c. They consist of four branches joined in a center; two of them circular, and two flat, a little bent at the ends.

To use them, one of the flat points is put within the cannon, the other without: the two opposite points shew the thickness. See CALIBER-compasses.

There are also spherical compasses, differing in nothing from the common ones, but that their legs are arched; serving to take the diameters of round bodies, &c.

Elliptick COMPASSES. Their use is to draw ellipses, or ovals of any kind: they consist of a beam A B, (Tab. *Geometry*, fig. 2.) about a foot long, bearing three cursors; to one of which may be screwed points of any kind: to the bottom of the other two are riveted two sliding dove-tails, adjusted in grooves made in the cross branches of the beam. The dove-tails having a motion every way, by turning about the long branch, go backwards and forwards along the cross; so that when the beam has gone half way about, one of these will have moved the whole length of one of the branches; and when the beam has got quite round, the same dove-tail has got back the whole length of the branch. Understand the same of the other dove-tail.

Note, the distance between the two sliding dove-tails, is the distance between the two foci of the ellipsis; so that by changing that distance, the ellipsis will be rounder or slenderer. Under the ends of the branches of the cross, are placed four steel points to keep it fast.

The use of this compass is easy; by turning round the long branch, the ink, pencil, or other point, will draw the ellipsis required. Its figure shews both its use and construction.

German COMPASSES, whose legs are a little bent outwards towards the top; so that when shut, only the points meet.

Hair-COMPASSES, so contrived within-side, as to take an extent to a hair's-breadth.

Lapidary's COMPASSES, a piece of wood in form of the shaft of a plane, cleft a-top, as far as half its length; wherewith they measure the angles, &c. of the precious stones, as they cut them. In the cleft is a little brass rule, fastened there, at one end, by a pin; but so that it may be moved in manner of a bevel: with this kind of square they take the angles

of the stones, laying them on the shaft as they cut them.

Proportional COMPASSES, consist of two branches, (Tab. *Geometry*, fig. 3,) each pointed at either end with steel: the length of the branches is cut through, for a cursor to slide up and down; in the middle of which cursor is a screw, serving to join the branches, and to fix them at any point required.

On the one leg are divisions, serving to divide lines into any number of equal parts, for reducing of figures, &c. On the other are numbers, for the inscribing any regular polygon in a circle proposed.

The use of the first is easy: Suppose, *v. gr.* a right line required to be divided into three equal parts; push the cursor till the screw be just on the figure 3; where fixing it, take the length of the given line between the longest parts of the legs: the distance between the two shortest, will be one third of the given line. In the same manner may the line be divided into any other number of parts.

For the use of the line of polygons: Suppose, *v. gr.* a pentagon required to be inscribed in a circle; push the cursor till the middle of the screw be against 5, the number of sides in a pentagon; between the shortest parts of the legs take the semidiameter of the circle: the legs thus opened, the distance between the points of the longest parts, will be the side of the pentagon to be inscribed in the circle. And thus for a figure of any other number of sides.

Proportional COMPASSES with the sector lines. The structure of these is so like that of the common *proportional compasses*, only a little nicer, that it needs no particular description. See Tab. *Geometry*, fig. 4.

The lines on the first face, are the line of lines, marked *lines*: it is divided into 100 unequal parts, every tenth numbered; and the line of chord, which goes to 60°, and is marked *chords*.

On the other face are a line of sines to 90°, and a line of tangents to 45°. On the first side are the tangents from 45° to 71° 34'; on the other secants from 0° to 70° 30'.

For the use of these compasses. 1. To divide a line into any number of equal parts, less than 100: divide 100 by the number of parts required; slip the cursor till the line on the sliding dove-tail be against the quotient on the line of lines: then, the whole line being taken between the points of the *compasses* most remote from the centre; the aperture of the other will shew the division required. 2. A right line given, supposed to be divided into 100 parts, to take any number of those parts: slip the line on the sliding dove-tail to the number of parts required: the whole line being taken between the points furthest from the centre, the aperture of the other two will include the number of divisions required. 3. The radius being given, to find the chord of any arch under 60°: slip the line on the sliding dove-tail to the degrees required on the line of chords: the radius being taken between the points furthest from the centre of the cursor; the aperture of the other line will be the chord required, provided the number of degrees be greater than 29: if it be less, the aperture taken from the radius will leave the chord required. 4. If the chord of an arch under 60° be given, and the radius required; slip the line on the dove-tail to the degrees given on the line of chords: the given chord being taken between the two points next the cursor, the aperture of the other will be the radius required. 5. The radius being given, to find the sine of any number of degrees. Slip the line on the dove-tail to the degree on the line of sines whose sine is required: the radius taken between the points furthest from the cursor; the aperture of the other will give the sine of the angle required. But if the sine sought be less than 30°, the difference of the apertures of the opposite points, will be the sine required. 6. The radius being given, to find the tangent of any number of degrees under 71: if the tangent required be under 26°. 30', then slip the line on the dove-tail to the degree proposed on the tangent-line: the radius taken between the points furthest from the cursor; the aperture of the others, will be the tangent of the degrees required: if the tangent required be above 26°. 30', but under 45°; the line on the cursor must be slipped to the degrees given on the tangent-line: then the radius being taken between the points furthest from the cursor; the aperture of the others will be the tangent. If the tangent required be greater than 45°, but less than 56°. 20'; slip the notch on the tangent-side of the turned cheek to the degree 0 in the tangent-line on the side of the *compasses*: the radius taken between the points furthest from the cursor; the difference between the aperture of the other, and these, added together, will be the tangent required. Thus, for the tangents of other degrees under 71.—After the like manner may the secant of any number of degrees under 71 be found. See **PROPORTIONAL**.

Spring COMPASSES, or *dividers*, made of hardened steel, the head arched; which, by its spring, opens the *compasses*; the opening being directed by a circular screw, fastened to one leg, and let through the other, worked with a nut.

Triangular COMPASSES. See the article **TRIANGULAR**.

Trifideting COMPASSES, the invention of M. Tarragon, for the trisection of angles, geometrically.

The instrument consists of two central rules, and an arch of a circle of 120 degrees, immovable, with its radius: the radius is fastened with one of the central rules, like the two legs of a sector, that the central rule may be carried through all the points of the circumference of the arch. The radius and rule to be as

thin as possible, and the rule fastened to the radius hammered cold, to acquire an elasticity: the breadth of the other central rule, to be triple the breadth of the radius. In this rule to be a groove, with a dove-tail, to be fastened on it, for its motion: In the center of each rule must likewise be a hole. See the *Journ. des Savans*, Sept. 1688.

Turn-up COMPASSES, a late contrivance to save the trouble of changing the points: the body is like the common *compasses*; towards the bottom of the legs, without-side, are added two other points, besides the usual ones; the one carrying a drawing pen-point, the other a port craion; both adjusted so as to turn round, and so be in the way of use, or out of it, as occasion requires.

The points of small *compasses* are tempered by a lamp and blow-pipe, heating them red hot; when cold they are hard: the larger are tempered by a charcoal-fire and a blow-pipe, heating them to a cherry-colour, then plunging them in water.

COMPATIBLE, something that may suit, or consist with another. See **INCOMPATIBLE**.

COMPENDIUM, an abstract, epitome, or reduction of a large matter into a little compass. See **EPITOME**.

COMPENSATION, an action whereby any thing is admitted as an equivalent to another.

COMPENSATION, in the civil law, is a kind of right, whereby a debtor pursued by his creditor, for the payment of a debt, demands that the debt may be *compensated* with what is owing him by the creditor.—*Compensation* is equivalent to payment.

COMPETENCE, or **COMPETENCY**, in law, the authority, or right, of a judge for taking cognizance of any matter. See **JURISDICTION**.

COMPITALIA*, or **COMPITALITIA**, feasts held among the antients in honour of the *lares*.

* The word comes from the Latin *compitum*, a cross-way; by reason the feast was held in the meeting of several roads.

The *compitalia* are more antient than the building of Rome. Dionysius Halicarnassicus, and Pliny, indeed, say, that they were instituted by Servius Tullius; but this only signifies that they were then introduced into Rome.

Notwithstanding what Dion relates, that the *compitalia* were celebrated a little after the Saturnalia; and that the Roman calendar fixes them on the 12th of January; it appears that they had not any fixed day: at least, not in the time of Varro, as is observed by Casaubon.

The feast being thus moveable, the day whereon it was to be observed, was proclaimed every year. It was ordinarily held on the 4th of the nones of February, *i. e.* on the second of that month. Macrobius observes, that they were held not only in honour of the *lares*, but also of *mania*, madness. The priests who officiated at them were slaves and liberti; and the sacrifice was a fow. They were re-established, after a long neglect, by Tarquin the proud, on occasion of an answer of the oracle, that they should sacrifice heads for heads, *i. e.* that for the health and prosperity of each family, children were to be sacrificed: but Brutus, after expelling the kings, in lieu of those barbarous victims, substituted the heads of garlic and poppy; thus satisfying the oracle which had enjoined *capita*, heads, at an easier rate.

During the celebration of this feast, each family placed at the door of their house, the statue of the goddess *mania*: they also hung up at their doors figures of wool, representing men and women; accompanying them with supplications that the *lares* and *mania* would be contented with those figures, and spare the people of the house.

As for slaves, in lieu of the figures of men, they offered balls, or fleeces of wool. Servius Tullius ordered, that the slaves who assisted at the *compitalia*, should be free during the whole time of the feast. Augustus ordered the statues of the *lares*, placed in the cross-ways, to be adorned with flowers twice a-year.

COMPLAINANT, in law, a plaintiff, or one who prefers a complaint against another, to be relieved by justice, or equity. See **PLAINTIFF**.

COMPLEMENT, in geometry, is what remains of a quadrant of a circle, or of ninety degrees, after any certain arch has been retrenched from it.

Thus, if an arch or an angle be 30 degrees, we say its complement is 60 degrees, since $60 + 30 = 90$.

The arch and its complement are relatives; and are only used with regard to each other.

The sine of the complement of an arch, is called the *co-sine*; of a tangent, the *co-tangent*, &c.

We sometimes also say, the complement of an angle; meaning so much as it wants of a right angle, or of 90 degrees.

COMPLEMENT of the course, in navigation, is the number of points the course wants of 90 degrees, or eight points, *viz.* of a quarter of the compass.

COMPLEMENT, in astronomy, is used for the distance of a star from the zenith; or the arch comprehended between the place of the star above the horizon, and the zenith.

COMPLEMENT of the curtain, in fortification, that part of the interior side thereof which makes the demigorge. See **CURTAIN**, and **DEMIGORGE**.

COMPLEMENT of the line of defence, is the remainder of the line of defence, after you have taken away the angle of the flank. See **DEFENCE**, and **ANGLE**.

COMPLEMENTS of a *Parallelogram*, are the two lesser parallelograms, made by drawing two right lines parallel to each side of a parallelogram, through a given point in the diagonal.

Such are the parallelograms C and M, (Tab. *Geometry*, fig. 5. n^o. 2.)—It is demonstrated, that in every parallelogram, the complements C and M are equal: for $Z + C + O = R + M + x$; as making up on each side the great triangles, made = by the diagonal; of which, $Z = R$, and $O = x$, (because the diagonal makes them so;) wherefore, the remaining parallelogram $C = M$. See *PARALLELOGRAM*.

Arithmetical COMPLEMENT. See *ARITHMETICAL*.

COMPLEX, a term ordinarily used as synonymous with *compound*; though, strictly speaking, there is some difference between them.

Complex is properly applied where a thing contains divers others: or consists of divers parts, not really distinct from one another; but only imaginarily, or in our conception.

In which sense, the soul may be said to be *complex*, in respect of the understanding and will, which are two things our reason alone distinguishes in it.

Complex Object. See the article *OBJECT*.

Complex Opposition. See the article *OPPOSITION*.

COMPLEX Term, or *Idea*, is a term or idea compounded of several simple, or incomplex ones. See *TERM*, and *IDEA*.
Thus, in the proposition, *A just God cannot leave crimes unpunished*; the subject of this proposition, *viz.* a just God, is a *complex term*, or stands for a *complex idea*, composed of two simple, or incomplex ones, *viz.* God and just.

COMPLEX Proposition, is either that which has at least one of its terms *complex*, as that just mentioned; or such a one as contains several members, as causal propositions. *E. gr.* *If God be almighty, the wicked can never escape him*.

Mr. Locke observes, that though the mind be perfectly passive in the formation of simple ideas; yet it exerts several actions of its own about them, when once formed: and that by this means it is, that they become the materials and foundation out of which all our knowledge is framed.

These acts are chiefly three, *viz.* 1^o. The combining of several simple ideas into one compound one: and thus it is that all *complex* ideas are made.

2^o. The bringing two ideas, whether simple or *complex*, together; setting them by each other, and so viewing them, without uniting them into one: by which it gets its ideas of relation. See *RELATION*.

3^o. The separating several ideas from all other ideas that accompany them in their real existence: and thus all its general ideas are formed.

As simple ideas are observed to exist in several combinations united together; so the mind may consider them as united, not only as they are really united in external objects, but as itself has joined them: ideas thus made up of several simple ones put together, we call *complex*; as man, beauty, army, gratitude, &c.

Complex ideas, however compounded and decompounded, tho' their number be infinite, and their variety endless, may be all reduced under these three heads, *viz.* *modes*, *substances*, and *relations*; which see under their proper heads, *MODE*, *SUBSTANCE*, and *RELATION*.

COMPLEXIO, **COMPLEXION**, in metaphysics, the union, or coalition of several things different from each other; either really, or only in our conception. See *COMPLEX*.

COMPLEXIO, in logics, is sometimes applied to the second operation of the mind, *viz.* the judgment; considered as it affirms or denies any thing: such affirmation, &c. necessarily importing a combination of several things.

Complexio, is sometimes also used by logicians in the sense of dilemma.

COMPLEXIO, in rhetoric, &c. is a figure including a repetition, and a conversion at the same time; the sentence both beginning, and ending with the same word.

Thus Tully: *Quis legem tulit? Rullus. Quis majorem partem populi suffragiis privavit? Rullus. Quis civitatis praefuit? Rullus.*

COMPLEXION, in physics, is used for the temperature, habitude, or natural disposition of the body.

Some philosophers distinguish four general and principal *complexions* in man, *viz.* the *jaundine complexion*, which, according to them, answers to the air; having the qualities thereof, as being hot, and moist. It takes its name from *jaundis*; because the blood is there supposed to be predominant.

The *plegmatic complexion* takes its name from the puita, or phlegm, in which it abounds; and corresponds to water; being cold, and moist.

The *bilious*, or *choleric complexion*, takes its name from the bile, or choler: it is supposed of the nature of fire, hot and dry.

Lastly, the *melancholic complexion* partakes of the nature of earth, being cold and dry. But this sort of reasoning is now out of doors.

COMPLEXUS, or *Par COMPLEXUS*, in anatomy, is a pair of muscles, arising with six thin small tendons from the transverse processes of the vertebrae of the neck and thorax; growing fleshy in its ascent; again becoming tendinous about the

middle; and again fleshy, where it is inserted laterally into the upper part of os occipitis, and the hind part of the processus mastoideus.—See Tab. *Anatomy*, (Myol.) fig. 7. n. 5.

When they act together, they pull the head directly backwards, but either of them acting alone, it draws it obliquely back.

COMPLICATION of *diseases*, a mixture, or combination of several diseases; especially where they have any affinity to one another; as the dropsy, asthma and jaundice happening together.

What much perplexes the physicians is, when with a fever there is a *complication* of some other disorder.

COMPONE, or **COMPONED**, or *Gebony*, in heraldry.—A *borderure compone*, is that formed or composed of a row of angular parts, or chequers of two colours.—See Tab. *Heraldry*, fig. 19.

COMPONED, or **COMPOSED**, is also used in the general for a *borderure*, a *pale*, or a *fess*, composed of two different colours, or metals, disposed alternately, separated and divided by fillets, excepting at the corners; where the junctures are made in the form of a goats-foot.

COMPOS Mentis.

COMPOSED Bastion. } See the articles { **NON-COMPOS.**

COMPOSITE Order, in architecture, the last of the five orders

of columns; so called, because its capital is *composed* out of those of the other orders.—See Tab. *Architecture*, fig. 30.

It borrows a quarter-round from the Tuscan, and Doric; a double row of leaves, from the Corinthian; and volutes from the Ionic: Its cornice has single modillions, or dentils.

The *composite* is also called the *Roman* and the *Italic* order; as having been invented by the Romans; conformably to the rest, which are denominated from the people among whom they had their rise.

Most authors rank this after the Corinthian; either as being the richest, or as the last that was invented: Scamozzi alone places it between the Ionic and Corinthian; out of a view to its delicacy and richness, which he esteems inferior to that of the Corinthian; and therefore makes no scruple to use it under the Corinthian: wherein he is followed by M. le Clerc. See *CORINTHIAN*.

The proportions of this order are not fixed by Vitruvius; he only marks its general character, by observing that its capital is composed of several parts taken from the Doric, Ionic, and Corinthian: he does not seem to regard it as a particular order; nor does he vary it at all from the Corinthian, except in its capital. In effect, it was Serlio who first added the *composite* order to the four of Vitruvius, forming it from the remains of the temple of Bacchus, the arches of Titus, Septimius, and the goldsmiths: till then, this order was esteemed a species of the Corinthian, only differing in its capital.

The order being thus left undetermined by the ancients, the moderns have a kind of right to differ about its proportions, &c. accordingly Scamozzi, and after him M. le Clerc, make its column 19 modules and an half; which is less by half a module than that of the Corinthian: as, in effect, the order is less delicate than the Corinthian. Vignola makes it 20; which is the same with that of his Corinthian: but Serlio, who first formed it into an order, by giving it a proper entablature and base, and after him M. Perrault, raise it still higher than the Corinthian.

This last does not think different ornaments and characters sufficient to constitute a different order, unless it have a different height too: agreeably, therefore, to his rule of augmenting the heights of the several columns by a series of two modules in each; he makes the *composite* 20 modules, and the Corinthian 18; which, it seems, is a medium between the arches of Titus and the temple of Bacchus.

For the parts of the Order, see *COLUMN*, *ENTABLATURE*, *CAPITAL*, *BASE*, *FREEZE*, *PEDESTAL*, &c.

M. Perrault, in his Vitruvius, distinguishes between *composite* and *composed* order.—The latter, he says, denotes any composition whole parts and ornaments are extraordinary, and unusual; but have, withal, somewhat of beauty; both on account of their novelty, and in respect of the manner, or genius of the architect: so that a *composed* order is an arbitrary, humorous composition, whether regular or irregular.

The same author adds, that the Corinthian order is the first *composite* order, as being composed of the Doric and Ionic; which is the observation of Vitruvius himself, Lib. 4. cap. 1.

COMPOSITION, in a physical sense, is the uniting or joining of several different things, so as to form one whole, called a *compound*.

The schoolmen distinguish two kinds of *composition*; the one *entitative*, which is between things of the same nature, *e. gr.* two or more drops of water: the other *essential*, when things of different kinds are joined, and thus constitute new things, or essences, different from any of the parts; and thus, say they, from the matter and the form of wood, arises wood; whose essence is very different from either of those ingredients taken separately.

COMPOSITION of *Ideas*, is an operation of the mind; whereby it combines several of its simple ideas into complex ones. See *COMPLEX Idea*.

Under the same operation may likewise be reckoned that of enlarging; whereby we put several ideas together of the same kind, as several unites to makes a dozen.

In this, as in others, brutes come far short of men; for though they take in and retain several combinations of simple ideas; as possibly, a dog does the shape, smell, and voice of his master: yet these are rather for many distinct marks whereby he knows him, than one complex idea, made out of those simple ones.

COMPOSITION, in grammar, denotes the joining of two words together; or prefixing a particle to another word, to augment, diminish, or change its signification. See **WORD**, &c.

COMPOSITION, in oratory, the order and coherence of the parts of a discourse.

To *composition* belong, both the artful joining of the words, whereof the style is formed, and whereby it is rendered soft and smooth, gentle and flowing, full and sonorous; or the contrary: and the order, which requires things first in nature and dignity, to be put before those of inferior consideration.

COMPOSITION, in painting, includes the invention as well as disposition of the figures, the choice of attitudes, &c.

Composition, therefore, consists of two parts; one of which finds out, by means of history, proper objects for a picture; and the other disposes them to advantage.

COMPOSITION, in music, is the art of disposing musical sounds into airs, songs, &c. either in one, or more parts; to be sung with the voice, or played on instruments.

Zarlino defines *composition* to be the art of joining and combining concords together, which are the matter of music: but this definition is too scanty; in regard, discords are always used with concords in the *composition* of parts. See **CONCORD**, and **DISCORD**.

Under *composition* are comprehended the rules, 1^o. of *melody*, or the art of making a single part; i. e. of contriving and disposing the simple sounds, so as that their succession and progress may be agreeable. 2^o. Of *harmony*, or the art of disposing and concerting several single parts so together, that they may make one agreeable whole.

It may be here observed, that melody being chiefly the business of the imagination, the rules of *composition* serve only to prescribe certain limits to it; beyond which, the imagination, in searching out the variety and beauty of airs, ought not to go: but harmony, being the work of judgment, its rules are more certain, extensive, and more difficult in practice.

In the variety and elegance of the melody, the invention labours a great deal more than the judgment; so that method has but little place: but in harmony it is otherwise; the invention, here, has nothing to do; and the *composition* is conducted from a nice observation of the rules of harmony, without any assistance from the imagination at all.

COMPOSITION, in logic, is a method of reasoning, wherein we proceed from some general self-evident truth, to other particular and singular ones.

The method of *composition*, called also *synthesis*, is just the reverse of that of *resolution*, or *analysis*.

Resolution is the method whereby we ordinarily search after truth; *composition*, that whereby a truth found, is discovered and demonstrated to others: *resolution* is the method of investigation, *composition* of demonstration.

The method of *composition* is that used by Euclid, and other geometers; *resolution* that used by algebraists and philosophers.

The two methods differ, just as the methods of searching a genealogy; which are either by descending from the ancestors to the posterity, or by ascending from the posterity to their ancestors: each have this in common, that their progression is from a thing known, to another unknown.

The method of *composition* is best observed by the mathematicians: the rules hereof are, 1^o. To offer nothing but what is couched in clear express terms; and to that end, to begin with definition. 2^o. To build only on evident and clear principles; and to that end, to proceed from axioms or maxims. 3^o. To prove demonstratively all the conclusions that are drawn hence; and to this purpose, to make use of no arguments or proofs, but definitions already laid down, axioms already granted, and propositions already proved; which serve as principles to things that follow.

COMPOSITION of motion, is an assemblage of several directions of motion, resulting from powers acting in different, though not opposite lines.

If a point move or flow according to one and the same direction; whether that motion be equable or not, yet it will still keep the same right line; the celerity alone being changed, i. e. increased, or diminished according to the forces with which it is impelled. If the directions be opposite, as one, e. gr. directly downward, the other upward, &c. yet still the line of motion will be the same.

But if the compounding motions be not according to the same line of direction, the compound motion will not be according to the line of direction of any of them, but in a different one from them all; and this either straight or crooked, according as the direction or celerities shall require.

If two compounding motions be each of them equable, the line of the compound motion will still be a straight line; and this,

though the motions be neither at right angles one to another, nor equally swift, nor (each to itself) equable; provided that they be but similar; that is, both accelerated and retarded alike.

Thus, if the point *a*, (Tab. *Mechanicks*, fig. 4.) be impelled equally with two forces; viz. upwards, towards *b*, and forwards, towards *d*; it is plain, that when it is gone forwards as far as *a c*, it must of necessity be gone upwards as far as *c e*; so that were the motions both equable, it would always go on in the diagonal *a e c*.

Nay, suppose the motions unequal as to celerity, so *v. gr.* as that the body move twice as fast upwards as forwards, &c. yet still it must go on in the diagonal *a c*; because the triangles *a c e*, *a e c*, &c. and *a c d* will still be similar, being as the motions are.

But, if the motions be dissimilar, then the compound motion must be a curve.

Thus, if a body, as *b*, (fig. 5.) be impelled or drawn by three different forces, in the three different directions *b a*, *b c*, and *b d*, so that it yields to none of them, but continues in *equilibrium*: then will those three powers or forces be to one another, as three right lines drawn parallel to those lines, expressing the three different directions, and terminated by their mutual concourses.

Let *b e* represent the force by which the body *b* is impelled from *b* to *a*, then will the same right line *b e*, represent also the contrary equal force, by which it is impelled from *b* to *e*; but by what hath been said before, the force *b e* is resolvable into the two forces acting according to the two directions *b d* and *b c*, to which the other impelling from *b* to *e*, is as *b e* to *b d*, and *b e* to *b c*, respectively.

So likewise two forces, acting without the directions *b d*, *b c*, and being equipollent to the force acting without the direction *b e*, from *b* to *e*; will be to the force acting according to the direction *b e*, from *b* to *e*, as *b d*, *b c*, to *b e*: and therefore, the forces acting in the directions *b d*, *b c*, and equipollent to the force acting in the directions *b c*, are to the force acting in the direction, as *b d*, *b c*, or *d c* to *b e*: that is, if a body be urged by three different equipollent powers in the directions *b a*, *b d*, and *b c*; these three forces shall be to one another as *b e*, *b d*, and *b c*, respectively. *Q. E. D.*

This theorem, with its corollaries, Dr. Keill observes, is the foundation of all the new mechanics of M. Varignon: by help hereof, may the force of the muscles be computed, and most of the mechanic theorems in Borelli, *de motu animalium*, be immediately deduced.

COMPOSITION of Proportion.—If there be two ratios, wherein the antecedent of the first is to its consequent, as the antecedent of the other is to its consequent: then, by *composition* of proportion; as the sum of the antecedent and consequent of the first ratio, are to the antecedent, or the consequent of the first; so is the sum of the antecedent and consequent of the second ratio, to the antecedent or the consequent of the second.

E. gr. If *A : B :: C : D*, then by *composition*, *A + B : A (B) :: C + D : C (D)*.

COMPOSITION, in pharmacy, the art, or act of mixing divers ingredients together into a medicine; so as they may assist each other's virtues, supply each other's defects, or correct any ill qualities thereof. See **PHARMACY**.

COMPOSITION, in printing, ordinarily called *composing*, is the arranging of several types, or letters in the composing-stick, in order to form a line; and of several lines ranged in order in the galley, to make a page; and of several of those to make a form. See **PRINTING**, &c.

The *composing-stick* is made of iron generally, sometimes brass, or wood; of more or less length or depth, according to the page to be composed, or the compositor's fancy: it hath two sliding pieces, to be fastened by means of a nut and screw, which are slipped forwards or backwards, at the pleasure of the compositor; and according to the space which the lines, notes, &c. are to take up. See Tab. *Miscellany*, fig. 9.

The *composing-stick* ordinarily contains seven or eight lines of a middle-sized letter; these, when set, are taken out, by help of a thin slip of brass, termed a rule, and disposed in the galley; and others composed, till a page be formed. The page being composed, is tied up, and set by; and the rest of the pages of the sheet prepared in the same manner: when done, they are carried to the imposing or correcting-stone; there ranged in order, and disposed in a chase, or iron frame, fitted with wooden furniture; then, the quins being struck in, it is carried to the press to be printed.

COMPOSITION, in commerce, a contract between an insolvent debtor and his creditors; whereby the latter agree to accept of a part of the debt, in compensation for the whole, and give a general acquittance accordingly.

COMPOSSIBLES, **COMPOSSIBLIA**, in logic, such things as are compatible, or capable of subsisting together. See **COMPATIBLE**.

COMPOST, in agriculture and gardening, a compound, or mixture, of earths, dungs, &c. applied, by way of manure, for the meliorating and improving of soils, and assisting the natural earth in the work of vegetation. See **MANURING**.

The gardeners have magazines, or layfalls of *composts*, adapted to

to the different sorts of soil. Light loose land requires a *compost* of a heavy nature; such as the scouring of ditches, ponds, &c. mixed with earth, dung, &c. A heavy, clayey, or cloddy land requires a *compost* of a more sprightly and active kind, to infuse into the heavy, lumpy clods; as dungs, sand, ashes, and natural mould.

Mr. Bradley prescribes seven different sorts of *composts*, to forward the growth of trees; *viz.* a quantity of stiff soil, broke, and mixed with sharp sand, and ashes of burnt furzes, weeds, &c. or stiff soil with sand and burnt grass-turf, and rotten-wood; or stiff soil with sand and rape-feed, after the oil is pressed out, with burnt turf; or stiff soil with sand and malt grains; or sheeps dung, with wood ashes and loam, or mother earth. See SOIL.

The same author recommends a mixture or preparation of soils answering to loam, or mother earth, as greatly preferable for planting or sowing forest-trees in, to any of these richer *composts*; which, though they hasten the growth of the tree, will not make the timber near so firm and durable.

COMPOUND, the result or effect of a composition of different things; or that which arises therefrom.

Strictly speaking, every new *composition* does not produce a new *compound*; but only that from which a new essence arises. Thus, when one drop of water is added to another, there does not arise a new physical *compound*; the essence being the same now, as before the union.

COMPOUND differs from *complex*, and stands opposed to *simple*. See COMPLEX and SIMPLE.

We say, the ingredients of a *compound*; apothecaries are great dealers in *compounds*; they prepare a *compound* diacodium, *compound* diamargariton, *compound* diamorum, *compound* diaprunum, *compound* oxytel, *compound* fomentations, *compound* waters, &c.

COMPOUND Flowers, called also *composite*, and aggregate flowers; are such as consist of many little flowers, concurring to make up one whole one; each of which has its style, stamina, and adhering feed, but all are contained within one and the same calyx, or perianthium.

This *compound* flower distinguishes a large genus of plants, which Mr. Ray divides thus.—Herbs having *compounded* or *aggregated* flowers, are,

1^o. Such as have a *plain-leaved* flower naturally, and for the most part full; and having their whole body milky, (yielding a milky juice on cutting them;) and these have their seeds, firstly, Pappous, or winged; that is, having a little lanugo adhering to each seed, by which the wind can easily carry it from place to place: such are the *Lactuca*, *Tragopogon*, *Scorzonera*, *Dens Leonis*, *Hieracium*, and the *Pilosella*.

Secondly, Such as have a solid seed, without any Pappus or down upon them; as the *Eryngium* *Luteum*, *Cichorium*, *Lampfana*.

2^o. Such as have a *discous* flower; i. e. one composed of many short, thick, compassed, small, tubuli (which some, by mistake, call *lamina*) fit together, so as to make one flat, or hollow superficies: and these are also either such as have their seeds.

Firstly, Pappous, as the *Tussilago*, *Petasites*, *Carlina*, *Helonium*, *Doronicum*, *Conyza*, *Aster*, *Virga Aurea*, *Jacobaea*, *Stechas* *Citrina*, *Jacea*, *Senecio*, *Eupatorium*, *Avicennae*, *Cacalia* *Vulgaris*, *Gnaphalium* *Maritimum*, and *Monspeliense*.

Secondly, Such whose seeds are solid, and not pappous; as the corymbiferous herbs.

COMPOUND force.	} See the articles {	FORCE.
COMPOUND forms.		FORMS.
COMPOUND fossils.		FOSSILS.
COMPOUND fractions.		FRACTIONS.
COMPOUND gland.		GLAND.
COMPOUND harmony.		HARMONY.

COMPOUND interest, called also *interest upon interest*, is that which is reckoned not only upon the principal, but upon the interest itself forborn; which hereby becomes a sort of secondary principal. See INTEREST.

COMPOUND machine. See the article MACHINE.

COMPOUND masonry. See the article MASONRY.

COMPOUND motion, that motion which is effected by several conspiring powers.

Powers are said to conspire, if the direction of the one be not directly opposite to that of the other; as when the radius of a circle is conceived to revolve about a centre; and at the same time a point to move straight along it.

All curvilinear motion is *compound*.

It is a popular theorem, in mechanics, that in an uniform *compound* motion, the velocity produced by the conspiring powers, is to that of either of the powers separately, as the diagonal of a parallelogram according to the direction of whose sides they act separately, to either of the sides.

COMPOUND Numbers, are those which may be measured, or exactly divided, by some other number beside unity.

Such is 15; which is measured by 3, and also by 5.

COMPOUND Pendulum, in mechanics, that which consists of several weights constantly keeping the same distance, both from

VOL. I.

each other, and from the centre about which they oscillate. See PENDULUM.

COMPOUND Proposition. See the article PROPOSITION.

COMPOUND Quantities, in algebra, are such as are connected together by the signs + and —: thus, $a + b - c$, and $bb - b$ are *compound* quantities.

COMPOUND Ratio, is that which the product of the antecedents of two or more ratios has to the product of their consequents.

Thus, 6 to 72 is in a ratio *compounded* of 2 to 6, and 3 to 12.

See PROPORTION.

COMPOUND Rule of Three. See the article RULE of Three.

COMPOUND Sounds.

COMPOUND Sord.

COMPOUND Taste.

COMPOUND Ulcer.

COMPOUND Words.

COMPREHENSION, in metaphysics, is that act of the mind whereby it apprehends, or knows any object presented to it, on all the sides whereon it is capable of being apprehended, or known.

To *comprehend* a thing, is defined by the schoolmen, *rem aliquam totam & totaliter cognoscere*: and, in this sense, it is a popular point of controversy among school-divines, whether the blessed in Heaven comprehend God? The more orthodox maintain the negative, by reason such knowledge must be infinite.

COMPREHENSION, in rhetorick, a trope, or figure whereby the name of a whole is put for a part; or that of a part for a whole: or a definite number of any thing for an indefinite.

COMPRESS *, in chirurgery, a bolster of linnen cloth, folded in several doubles, and laid under the bandage, to prevent a wound from bleeding or swelling; or to retain the medicines applied thereto.

* The word comes from *comprimere*, to press hard.

Scultetus, in his *Arsenal of Chirurgery*, observes, that the antients composed their *compresses* of carded flax, or of feathers, fewed between two linnens; and called them *pulvius*, or *plumages*, *pulvini*, or *pulvilli*, &c.

COMPRESSION, the act of pressing, or squeezing something, so as to set its parts nearer each other, and make it possess less space.

Compression properly differs from *condensation*, in that the latter is performed by the action of cold, the former by some external violence.

Pumps, which the antients imagined to act by suction, do, in reality, act by *compression*; the embolus, or sucker, in going and returning in the narrow pipe, *compresses* the air inclosed therein, so as to enable it by the force of its elasticity to raise the valve, and make its escape: upon which, the balance being destroyed, the pressure of the atmosphere on the stagnant surface, drives up the water in the pipe thus evacuated of its air. See PUMP.

Water is incapable of *compression*: after the air has been purged out of it, no art or violence is able to bring its parts closer, or make it take up less compass. In an experiment made by the academy de'l Cimento, water, when violently squeezed, made its way through the infinitely fine pores of a ball of gold, rather than it would undergo *compression*.

The *compression* of the air, by its own weight, is surprizingly great: it appears, by calculation, that the common air we breathe, near the surface of the earth, is *compressed* by the weight of the super-incumbent atmosphere, into $\frac{1}{13.75}$ part of the space it would take up were it at liberty.

But the air may be still further *compressed* by art; and it appears from Mr. Boyle's experiments, that the space which the air takes up, when at its utmost dilatation, is to that it takes up when most *compressed*, as five hundred and fifty thousand to one.

This immense *compression* and dilatation, Sir Isaac Newton observes, cannot be accounted for from supposing the particles of the air elastick and branched, or in form of slender twigs interwoven into circles; nor any other way, but by a repelling force, wherewith they are endued; by virtue whereof when at liberty, they mutually fly each other. See ATTRACTION. This repelling power, he adds, is stronger and more sensible in air, than in other bodies; in regard air is generated out of very fixed bodies, but not without great difficulty, and the help of fermentation: Now those particles always recede from each other with the greatest violence, and are *compressed* with the greatest difficulty, which, when contiguous, cohere the most strongly.

That there is such a repelling power, appears from this; that flies walk on the water without wetting their feet; that the object-glasses of telescopes laid on each other do not touch; that dry dust is not brought to touch or cohere without difficulty, *v. gr.* unless either liquified by fire, or wet with water; and that two polished pieces of marble, which as often as they touch cohere, are yet very hardly pressed to closely, and joined so aptly as to cohere. See REPELLING Force; see also COHESION, DILATATION, &c.

COMPRISE Nient. See the article **NIENT**.

COMPROMISE, a treaty, or contract, whereby two contending parties establish one; or more arbitrators, to judge of and terminate their differences in an amicable way.

The regular way of appointing a *compromise*, is by a writing, expressing the names of the arbitrators, the power of choosing an umpire, or super-arbitrator in case of need, a time limited for the arbitrage, and a penalty on the party who does not abide by the decision.

By the civil law, a slave cannot make a *compromise* without the leave of his master, nor can a pupil without the authority of his guardian, or a wife without that of her husband. So a slave, a deaf or dumb man, a minor, and the person who is a party in the cause, are incapable of being chosen arbitrators in a *compromise*.

The occasions on which a *compromise* is not allowed of, are restitutions, marriage causes, criminal affairs, questions of state; and, generally, any thing wherein the publick interest is more concerned than that of private persons.

In our law, *compromise* is not of so much extent: West defines it the faculty, or power of pronouncing sentence between persons at controversy, given to arbitrators by the parties mutual private consent, without publick authority.

COMPROMISE is also used in beneficiary matters; where it signifies an act, whereby those who have the right of election, transfer it to one or more persons, to elect a person capable of the office or dignity.

We have seen members of parliament elected by *compromise*; when the electors, not being able to agree among themselves, give the power of electing, at least of nominating, to two persons; obliging them by oath, or otherwise, to choose such as they think the most capable, and best disposed.

COMPTING, or **COUNTING-HOUSE**, an office in the king's household, under the direction of the lord steward; so called, because the accounts for all expences of the king's household are there taken daily by the lord steward, comptroller, cofferer, master of the household, the two clerks of the green-cloth, and the two clerks comptrollers. They also there make provision for the household, and make payments, and orders for the good government thereof.

In the *compting-house* is the board of *green-cloth*. See **GREEN-CLOTH**.

COMPTROL. See **CONTROL**.

COMPTROLLER. See **CONTROLLER**.

COMPULSOR *, an officer under the Roman emperors, dispatched from court into the provinces, to compel the payment of taxes, &c. not paid within the time prescribed.

* The word is Latin, formed of the verb *compellere*, to oblige, constrain.

These were charged with so many exactions, under colour of their office, that Honorius cashiered them by a law in 412. The laws of the Visigoths mention military *compulsors*; which were officers among the Goths, whose business was to oblige the tardy soldiers to go into the fight, or to run to an attack, &c.

Cassian mentions a kind of monastick *compulsors*, whose business was to declare the hours of canonical office, and to take care the monks went to church at those hours.

COMPUNCTION *, in theology, an inward grief in the mind, for having offended God.

* The word comes from *compungere*, of *pungere*, to prick.

The Romanists own their confession insignificant, unless attended with *compunction*, or pricking of heart. See **CONFESSION**.

Among spiritualists, *compunction* carries a more extensive signification; and implies not only a grief for having offended God, but also a pious sensation of grief, sorrow, and displeasure on other motives.—Thus, the miseries of life, the danger of being lost in the world, the blindness of the wicked, &c. are to pious people motives of *compunction*.

COMPURGATOR, in law, one that by oath justifies, or clears another's innocence.

COMPUTATION, the manner of accounting and estimating time, weights, measures, and monies.

The word is sometimes also used among mathematicians in the like sense as calculation. See **CALCULATION**.

COMPUTATION of a planet's motion. See **PLANET**.

COMPUTATION is particularly used in law, in respect of the true account, or construction of time, so understood, as that neither party do wrong to the other, nor the determination of time be left at large, or be taken otherwise than according to the judgment and intention of law.

If indentures of demise be ingrossed, bearing date May 11, 1679. to have and to hold the land in S. for three years from henceforth; and the indentures be delivered the 4th of June following: in this case, *from henceforth* shall be computed from the day of the delivery, and not from the date. And if the indentures be delivered at four of the clock in the afternoon, the said 4th of June, the lease shall end the third day of June in the third year: the law, in such *computation*, rejecting all fractions or divisions of the day, on account of that uncertainty which is the mother of contention.—In writings, or-

dered by the stat. 27 Hen. VIII. to be inrolled within fix months; if such writings have date, the fix months shall be accounted from the date, and not from the delivery: if they want date, it shall be accounted from the delivery: Coke, lib. 5.

If a deed be shewed to a court at Westminster, it shall remain in court (by judgment of law) all the term in which it is shewed: for all the term is but as one day in law. Coke. *ibid*.

—If a church be void, and the patron does not present within six months, the bishop of the diocese may collate his chaplain: but these six months shall be computed according to twenty-eight days of the month; and not according to the calendar. See **CALENDAR**.

COMPUTO, a writ, thus called from its effect, which is to compel a bailiff, chamberlain, or receiver to yield his accounts. See **ACCOUNT**.

The same lies for executors of executors; and against the guardian in focage, for waste made in the minority of the heir.

COMPUTO vicecomitis habendo respectu. See **RESPECTU**.

CONARION, or **CONOIDES**, a name for the pineal gland; a small gland, about the bigness of a pea, placed in the upper part of that hole in the third ventricle of the brain called the *anus*; and tied by some fibres to the nates.

It is composed of the same substance as the rest of the brain; and has this peculiar, that it is single; whereas all the other parts are double: Hence, Des Cartes takes occasion to suppose it the immediate place, or seat of the soul.

CONATUS *endeavour*, a term frequently used in philosophical and mathematical writers; nearly equivalent to *visus*.

Conatus seems to be the same, with respect to motion, that a point is with respect to a line; at least, the two have this in common, that as the point is inceptive of the line, or the term from which it commences; so is the beginning of all motion called the *conatus*. Add, that as in mathematical demonstrations, the extension of the point is conceived as if it were nothing at all; so, in the *conatus* of motion, there is no regard to the time wherein, or the length which it advances. See **LAWS** of **NATURE**.

Hence, some define *conatus* to be a quantity of motion not capable of being expressed by any time or length.—Accordingly, all motion tends precisely the same way wherein the moveable is acted on, or determined by the moving power. See **MOTION**.

CONCATENATION, in philosophy, a connection of things, in manner of a chain.

The concatenation of second causes, is an effect of providence. See **CAUSE**, **PROVIDENCE**, &c.

CONCAVE, is applied to the inner surface of a hollow body; especially if it be circular.

CONCAVE is particularly understood of mirrors and lenses: *concave lenses*, are either concave on both sides, called *concavo-concave*; or concave on one side, and plane on the other, called *plano-concave*; or concave on one side, and convex on the other, called *concavo-convex*, or *convexo-concave*, as the one or the other surface is a portion of a less sphere.

The property of all *concave* lenses is, that the rays of light, in passing through them, are deflected, or made to recede from one another; as in convex lenses they are inflected towards each other; and that the more, as the concavity and convexity are portions of less circles.

Hence, parallel rays, as those of the sun, by passing through a *concave* lens, become diverging; diverging rays are made to diverge the more, and converging rays either made to converge less, or become parallel, or go out diverging.

Hence, objects viewed through *concave* lenses, appear diminished; and the more so, as they are portions of less spheres; and this in oblique, as well as in direct rays.

Concave mirrors have the contrary effect to lenses: they reflect the rays which fall on them, so as to make them approach more to, or recede less from each other than before; and that the more as the concavity is greater, or the spheres whereof they are segments, less.

Hence, *concave* mirrors magnify objects presented to them; and that in a greater proportion, as they are portions of greater spheres.

Hence also, *concave* mirrors have the effect of burning objects, when placed in their focus. See **BURNING-GLASS**.

CONCEALERS *, in law, such as find out concealed lands, i. e. lands kept privily from the king, by common persons, having nothing to shew for their title, or estate therein.

* They are thus called per *antiphrasin*, à *concelando*; as *mons* is à *moendo*, &c. My lord Coke calls them *turbidum hominum genus*.

CONCENTRATION, the retiring, or withdrawing of a thing inwards, towards the centre, or middle.

External cold is said to *concentrate* the heat within bodies: after meals, the natural warmth retires, and as it were *concentrates*, to promote the digestion.

CONCENTRATION is also used by Dr. Grew for the highest degree of mixture, *viz.* that wherein two or more atoms or particles touch, by a reception, and intrusion of the one within the other. See **MIXTION**.

This he takes to be the case of all fixed bodies without taste or smell; their constitution being so firm, that till the particles be detached

detached from each other by some extraordinary means, they cannot afford those senses.

CONCENTRIC, in geometry and astronomy, something that has the same common centre with another. The word is principally used in speaking of round bodies, and figures, viz. circular, elliptical ones, &c. but may be likewise used for polygons, drawn parallel to each other, upon the same centre.

Concentric stands opposite to *excentric*. See **EXCENTRIC**, and **EXCENTRICITY**.

Nonius's method of graduating instruments consists in describing with the same quadrant 45 *concentric arches*, dividing the outermost into 90 equal parts, the next into 89, &c.

CONCEPTION, in logicks, the simple apprehension, or perception, which we have of any thing, without proceeding to affirm, or deny any thing about it.

The schoolmen usually make two kinds of *conception*; the one *formal*, the other *objective*.

The *first* is defined to be the immediate and actual representation of any thing proposed to the mind: on which footing, it should be the same thing to the understanding, that a word or voice is to the ear; whence some also call it, *verbum mentis*.

The *second* is the thing itself represented by a formal *conception*. But others explode the notion of an *objective conception*, as being, in reality, no conception at all; excepting where the mind contemplates its own acts, &c.

Formal, or *proper conceptions*, are subdivided into *univocal*, where several things are distinctly represented as under some common ratio, or in the same degree of perfection; *analogous*, where several things are represented as under some proportional likeness; and *equivocal*, where they are represented immediately as such, without regard to any common ratio or likeness.

CONCEPTION, in medicine, denotes the first formation of the embryo, or foetus, in the womb.

Conception is no other than such a concurrence and commixture of the prolific seed of the male, with that of the female, in the cavity of the uterus, as immediately produces an embryo. See **EMBRYO**.

The symptoms of *conception*, or pregnancy, are, when in a few days after the conjugal act, a small pain is perceived about the navel, and is attended with some gentle commotions in the bottom of the abdomen; and within one, two, three, or even four months, the menses cease to flow, or prove in less quantity than usual. Upon the first failure of this kind, the woman begins to count the series of her weeks, without taking any notice of the time before elapsed: after this, or between the second and third months, but generally about the third, the motions of the embryo become perceivable to the mother; who hereupon becomes troubled with a nausea, vomiting, loathing, longing, &c. About this time, the breasts begin to swell, grow hard and painful, and contain a little milk; the nipples also become larger, firmer, and darker coloured, a livid circle appearing around them: the eyes seem sunk and hollow. During the two first months pregnancy, the woman grows thinner, and slenderer; the abdomen being also depressed; though it afterwards distends, and grows gradually larger.

The manner wherein *conception* is effected, is thus laid down by the modern writers: in the superficies of the ovaries of women, there are found little pellucid spherules, consisting of two concentric membranes, filled with a lymphatic humour, and connected to the surface of the ovaria, underneath the tegument, by a thick calix, contiguous to the extremities of the minute ramifications of the fallopian tubes.

These spherules, by the use of venery, grow, swell, raise, and dilate the membrane of the ovary into the form of papillae; till, the head propending from the stalk, it is at length separated from it; leaving behind it a hollow cicatrix, in the broken membrane of the ovary; which, however, soon grows up again.

Now, in these spherules, while still adhering to the ovary, foetus's have been frequently found: whence it appears, that these are a kind of ova, or eggs, deriving their structure from the vessels of the ovary, and their liquor from the humours prepared therein.

Hence, also, it appears, that the fallopian tubes being swelled, and stiffened by the act of venery, with their muscular firmness, like fingers, may embrace the ovaries, compress them, and by that compression, expand their own mouths: and thus the eggs now mature, and detached as before, may be forced into their cavities; and thence conveyed into the cavity of the uterus; where they may either be cherished and retained, as when they meet with the male seed; or, if they want that, again expelled.

Hence the phenomena of false *conceptions*, abortion, foetus's found in the cavity of the abdomen, the fallopian tubes, &c.

For, in coition, the male feed, abounding with living animalcules, agitated with a great force, a brisk heat, and, probably, with a great quantity of animal spirits, is violently impelled through the mouth of the uterus, which on this occasion is opener; and through the valves of the neck of the uterus,

which on this occasion are laxer than ordinary, into the uterus itself; which now, in like manner, becomes more active, turbulent, hot, inflamed, and moistened with the flux of its lymph and spirits, by means of the titillation excited in the nervous papillae by the attrition against the rugae of the vagina.

The semen thus disposed in the uterus, is retained, heated, and agitated by the convulsive constriction of the uterus itself; till meeting with the ova, the finest and most animated part enters thro' the dilated pores of the membrana of the ovum, now become glandulous, is there retained, nourished, dilated, grows to its umbilicus, or navel; stifles the other less lively animalcules: and thus is *conception* effected.

Hence, it appears, that *conception* may happen in any part where the semen meets with an ovum: thus, whether it be carried thro' the fallopian tube to the ovary, and there cast upon the ovum; or whether it meet with it in some recess of the tube itself; or, lastly, whether it join it in the cavity of the uterus, it may still have the same effect; as it appears from observation it actually has. But it is probable that *conception* is then most perfect, when the two, viz. the semen and ovum, are carried at the same time into the uterus, and there mixed, &c.

Other anatomists chuse to suppose the male seed taken up, ere it arrive in the uterus, by the veins which open into the vagina, &c. and thus mixed with the blood; by which, in the course of circulation, it is carried, duly prepared, into the ovary, to impregnate the eggs. See **GENERATION**.

CONCEPTION *immaculate* of the holy virgin, is a feast established in honour of the holy virgin; particularly with regard to her having been conceived and born *immaculate*, i. e. without original sin; held in the Romish church on the 8th of December.

Allatius, in his *prolegomena* on Damascenus, endeavours to prove this feast to have been celebrated by several churches in the east, as early as the eighth century.

The *immaculate conception* is the great head of controversy between the Scots and Thomists; the former maintaining, and the latter impugning it.

The Dominicans espoused the party of S. Thomas, and held out a long time in defence of the virgin's being conceived in original sin: they were condemned by pope Clement VII. in 1308. at the prosecution of the university of Paris, and were obliged to retract. The council of Trent, *sess. v.* in the decree of *original sin*, declares it not to be the intention of the council to include the virgin under it; her *conception* it calls *immaculate*; and appoints the constitutions of Sixtus IV. to be observed with regard thereto.

Some authors have observed several passages dispersed in the old editions of S. Thomas's works, which assert the *immaculate conception* in express terms; but many of them are corrupted in the later editions, say some: though others will have the corruption lie on the side of the old ones.

In the three Spanish military orders of S. James of the sword, calatrava, and alcantara; the knights take a vow, at their admission, to defend the *immaculate conception*. This resolution was first taken in 1652.

Peter d'Alva and Astorga, has published forty-eight huge volumes in folio, on the mysteries of the *conception*.

Religious of the order of CONCEPTION, see **THEATINS**.

CONCERT, or **CONCERTO**, a number, or company of musicians playing, or singing the same song, or piece of music together.

The word *concert* may be applied where the music is only melody, i. e. where the performers are all either in unison, or only at the interval of an octave; but it is more properly, as well as more usually understood of harmony, or where the music consists of divers parts; as bass, tenor, &c.

CONCESSI, a term much used in conveyances, &c. its effect is to create a covenant, as *dedi* does a warranty. See **COVENANT**.

CONCESSION, in rhetoric, a figure whereby something is granted, or allowed to the adversary, either to prevent being detained by unnecessary incidents, or to make some advantage of. *I will not contest with you the reality of the contract; what I plead for is relief against the injustice of it.—True, she is fair, but ought she not to show her acknowledgments to heaven for the favour, by making a virtuous use of her beauty?*

CONCHA, in anatomy, a name given the second, or inward cavity of the auricle, or external ear; reaching to the entrance of the auditory duct. See **EAR**.

• The name has its origin from a resemblance this cavity bears to a sea shell, call'd in Latin *concha*.

Some also give the same name to the first cavity of the inward ear, which others call the *drum*; and others to the vestibulum of the labyrinth, which is the second cavity of the internal ear.

CONCHOID, or **CONCHILIS**, in geometry, a curve line which always approaches nearer a straight line to which it is inclined, but never meets it.

It is described thus: draw a right line BD, (Tab. *Analytickæ*, fig. 1.) and another AC, perpendicular to it in E; draw any number of right lines, as CM, CM, cutting BD in Q; make QM = QN = AE = EF, is the curve wherein the points MM are found, is the *conchilis*, or *conchois prima*; so called by its inventor Nicomedes.

medes. The others, wherein the points NN are found, is the *conchoid secundæ*; the right line BD the *rule*, the point C the *pole*. The inventor also contrived an instrument, whereby the first *conchoid* may be described mechanically: thus, in the rule AD, (Tab. *Analytick*, fig. 2.) is a channel or groove cut, so as a smooth nail, firmly fixed in the moveable rule CB, in the point F, may slide freely within it: into the rule EG is fixed another nail in K, for the moveable rule CB to slide upon. If then the rule BC be so moved, as that the nail F passes along the canal AD; the style, or point in C, will describe the first *conchoid*.

Now let AP=x, (fig. 1.) AE=a; PE=MR=a-x; wherefore, as x increases, a-x or MR will decrease; and therefore the curve continually approaches nearer to the rule BD.

In the same manner it appears, that the right line NO must continually decrease; and therefore that the second *conchoid*, also, must continually approach nearer the rule.

But inasmuch as between each *conchoid* and the right line BD, there will still be the right line QM or QN, equal to AE; neither of the *conchoids* can concur with the right line BD: consequently, B is an asymptote of each *conchoid*. See *ASYMPTOTE*. There will be other kinds of *conchoids* produced, if CE: CQ:: QM: AE, or indefinitely, if CE^m: CQⁿ:: QM^m: AEⁿ; wherefore, if CE=b, EA=a, CQ=x, QM=y; then, $a^m = xy$; and for infinite *conchoids*, $a^m = x^m y^m$.

CONCILIO—*Querclam coram rege* & CONCILIO. See *QUERELA*.

CONCINNOUS intervals, in musick.—Discords are distinguished into *concinuous* and *inconcinuous* intervals: the *concinuous* are such as are fit for musick, next to, and in combination with concords; being neither very agreeable nor disagreeable in themselves; but having a good effect, as by their opposition they heighten the more essential principles of pleasure; or as by their mixture and combination with them, they produce a variety necessary to our being better pleased.

The other discords, that are never used in musick, are called *inconcinuous*.

Systems are also divided into *concinuous* and *inconcinuous*. A system is said to be *concinuous*, or concinuously divided, when the parts thereof, considered as simple intervals, are *concinuous*; and are, besides, placed in such an order, between the extremes, as that the succession of sounds from one extreme to the other, may have an agreeable effect.

Where the simple intervals are *inconcinuous*, or ill-disposed between the extremes, the system is said to be *inconcinuous*.

CONCLAVE, an assembly, or meeting of all the cardinals that are at Rome, shut up for the election of a pope. See *POPE*, and *ELECTION*.

The *conclave* had its rise in the year 1270, and on this occasion: Clement IV. being dead at Viterbo, in 1268; the cardinals were two years without being able to agree on the election of a successor: in effect, things were carried to such pass, that they were upon the point of breaking up, without coming to any conclusion at all.

The inhabitants of Viterbo, then, being apprized of their design, by the advice of S. Bonaventure, then at Viterbo, shut the gates of their city, and locked up the cardinals in the pontifical palace adjoining to the cathedral, till they were brought to a better understanding.

Hence arose the custom which has since prevailed, of shutting up the cardinals in a single palace, till they have elected the pope.

Such was the origin of the *conclave*, as related by Onuph. Panvinius, Ciaconius, and Papebroch.

CONCLAVE is also used for the place wherein the election of the pope is performed; which is, now, at St. Peter's in the vatican; tho' Gregory X. and Clement V. appointed it should always be held in the place where the last pope should die.

While the affair is in hand, if it be in winter, the walls and windows are all mured up, excepting only a single pane, to give a little light: in summer the windows are not closed; but the great door of the hall is secured with four locks, and four bolts; an aperture being, however, left, to supply the imprisoned prelates with victuals through.

In the hall, which is very ample, there are cells or stalls erected for as many cardinals as are to be present at the election; the cells being only separated by deal boards.

The cells are marked with letters of the alphabet, and are distributed to the cardinals by lot: each cardinal puts his arms on the cell that falls to his share.

After the assembly has continued three days, they are only allowed one dish for a meal; and after five days, only bread and water: though this rule is not over-religiously regarded.

Each cardinal is allowed two *conclavists*, or servants to attend him, and to be shut up with him.

Matthew Paris says, the word *conclave* antiently signified the pope's wardrobe.

It is a popular proverb in Italy, *chi entra papa, esce cardinale*; he who enters pope, comes out cardinal; *q. d.* he who according to common report will be elected pope, ordinarily is not.

CONCLUSION, in logic, the last part of an argument; or the

consequence drawn from something either assumed or proved before.

The *conclusion* of an argument contains two parts: the *consequent*, which is the matter of it; and the *consequence*, which is its form, and which, of a simple absolute proposition, renders the *conclusion* relative to the premises whence it is drawn.

The question, and *conclusion*, say the schoolmen, are the same ideas, only considered in different views, or relations: in the question they are considered as doubtful; in the *conclusion* as void of doubt.

CONCLUSION, in oratory, consists of two parts; the *recapitulation* or *enumeration*, and the *passion*.

The *recapitulation* consists in a repetition of the principal arguments. See *RECAPITULATION*.

CONCLUSIVE *Conjunctions*. See the article *CONJUNCTION*.

CONCOCTION, in medicine, the change which the food undergoes in the stomach, &c. to become chyle.

This change consists in destroying the texture and cohesion of the parts of the food; preparing part of it for some particular service of the animal frame, and the rest to be carried off as excrements, by proper emunctories.

The antients gave the term *coction*, or *concoction*, to what we now ordinarily call *digestion*; from a notion of the food's being, as it were, boiled in the stomach; and its nutritious juice expressed by the heat of the adjacent parts.

They assigned two *concoctions*, viz. one in the stomach, and a second in the small intestines, &c. which latter they attributed to the admixture of the bile and pancreatic juice.

The several *concoctions* in the body, with regard to the propagation of the species, and the preservation of the individual, have been since reduced to five; these are *chylasis* for chyle, *chymosis* for chyme, *hematosis* for blood, *pneumatosis* for spirits, and *spermatisis* for seed. See *CHYLOSIS*, *CHYMOSIS*, *HÆMATOSIS*, &c. see also *COCTION*.

CONCOMITANT, in theology, something that accompanies, or goes along with, another.

Concomitant grace, is that which God affords us during the course of our actions to enable us to perform them; and as the Romish schoolmen say, to render them meritorious.

Concomitant grace differs, at least with regard to its effect, from preventing grace: the latter is given us to prevent an action, the former to accompany it.

According to the Romish doctrine, the blood of Jesus Christ is under the accidents of wine, as his body is under the accidents of bread, by *concomitance*.

CONCOMITANT *Necessity*. See the article *NECESSITY*.

CONCORD, in grammar, that part of syntax, or construction, whereby the words of a sentence agree among themselves, *i. e.* whereby nouns are put in the same case, number, gender, &c. and verbs in the same number and person with nouns and pronouns.

The rules of *concord* are generally the same in all languages, as being of the nature of what is in use almost every where for the better distinguishing of discourse.

Thus, the distinction of the two numbers singular and plural, obliges us to make the adjective agree with the substantive in number; that is, to put the one either in this or that number, according as the other is: for the substantive being the thing confusedly, tho' directly marked by the adjective; if the substantive word mark several, there are several subjects of the form marked by the adjective, and of consequence this should be in the plural; as *homines docti*, &c.

Again, the distinction of masculine and feminine, renders it necessary to put the substantive and adjective in the same degree.

And verbs should have *concord* or agreement with nouns and pronouns in number and person.

If any thing occur apparently contrary to those rules, it is by a figure, *i. e.* something is implied, or the ideas are considered more than the words themselves.

CONCORD, in law, is the agreement between two parties who intend the levying a fine of lands to one another, how and in what manner it shall pass.

CONCORD is also an agreement made upon any trespass committed, (betwixt two, or more) and is divided into *concord executory*, and *concord executed*.

Plowden observes, that the first binds not; being imperfect; but the latter is perfect, and binds the party.

Others are of opinion, that *concord*s executory are perfect, and bind no less than those executed.

CONCORD, in musick, denotes the relation of two sounds that are always agreeable to the ear, whether applied in succession or consonance.

If two single sounds be in such a relation, or have such a difference of tune, as that being sounded together, they make a mixture, or compound sound, which affects the ear with pleasure; that relation is called *concord*: and whatever two sounds make an agreeable compound in consonance, those same will always be pleasing, in succession, or will follow each other agreeably.

The reverse of a *concord*, is what we call a *discord*; which is a denomination of all the relations or differences of tune that have a displeasing effect. See *DISCORD*.

Concord and harmony are, in effect, the same thing; though custom has applied them differently. As *concord* expresses the agreeable effect of two sounds in consonance; so harmony expresses the same sort of agreement in a greater number of sounds in consonance: add, that harmony always implies consonance; but *concord* is sometimes applied to succession: though never but when the terms will make an agreeable consonance: whence it is that Dr. Holder, and some other writers, use the word *consonance* for what we call *concord*.

Unisonance, then, being the relation of equality between the tones of two sounds, all unisons are *concord*s, and in the first degree: but an interval being a difference of tone, or a relation of inequality between two sounds, becomes a *concord* or discord, according to the circumstances of that particular relation. Indeed, some restrain *concord* to intervals, and make a difference of tone essential thereto; but that is precarious: and Mr. Malcolm thinks, that as the word implies agreement, it is applicable to union in the first degree.

It is not easy to assign the reason or foundation of *concordance*: the differences of tone, we have elsewhere observed, take their rise from the different proportions of the vibrations of the sonorous body, i. e. of the velocity of those vibrations in their recurses; the frequenter those recurses are, the more acute will be the tone, and *vice versa*.

But the essential difference between *concord* and discord lies deeper: there does not appear any natural aptitude in the two sounds of a *concord*, to determine it to give us a pleasing sensation, more than in the two sounds of a discord: these different effects are merely arbitrary, and must be resolved into the divine good pleasure.

We know by experience what proportions and relations of tone afford pleasure, and what do not; and we know also how to express the difference of tone by the proportion of numbers; we know what it is pleases us, though we do not know why: we know, *v. gr.* that the ratio of 1 : 2 constitutes *concord*, and 6 : 7 discord; but on what original grounds agreeable or disagreeable ideas are connected with those relations, and the proper influence of the one on the other, is above our reach!

By experience, we know that the following ratios of the lengths of chords are all *concord*, *viz.* 2 : 1, 3 : 2, 4 : 3, 5 : 4, 6 : 5, 5 : 3, 8 : 5; that is, take any chord for a fundamental, which shall be represented by the number 1, and the following divisions thereof will be all *concord* with the whole, *viz.* $\frac{1}{2}$, $\frac{2}{3}$, $\frac{3}{4}$, $\frac{4}{5}$, $\frac{5}{6}$, $\frac{5}{8}$.

So that the distinguishing character between *concord*s and discords, must be looked for in these numbers, expressing the intervals of sound; not abstractedly, and in themselves, but as expressing the number of vibrations.

Now, unisons are in the first degree of *concord*, or they have the most perfect likeness or agreement in tune; and therefore have something in them accessory to that agreement which is found, less or more, in every *concord*: but it is not true, that the nearer two sounds come to an equality of tone, the more agreement they have; therefore, it is not in the equality or inequality of the numbers that this agreement lies.

Further, if we consider the number of vibrations made in any given time by two chords of equal tone; on the principle laid down, they are equal: and therefore the vibrations of the two chords coincide, or commence together as frequently as possible, i. e. they coincide at every vibration; in the frequency of which coincidence, or united mixture of the motions of the two chords, and of the undulations of the air occasioned thereby, it is, that the difference of *concord* and discord must be sought.

Now, the nearer the vibrations of two strings approach to a coincidence as frequent as possible, the nearer they should approach that condition, and consequently the agreement, of unisons; which is confirmed by experience.

For if we take the natural series 1, 2, 3, 4, 5, 6, and compare each number to the next, as expressing the number of vibrations in the same time of two chords, whose lengths are reciprocally as those numbers; the rule will be found exact, for 1 : 2 is best, then 2 : 3; after 6 the consonance is unalterable; the coincidences being too rare: though there are other ratios that are agreeable, besides those found in that continued order, *viz.* 3 : 5, and 5 : 8, which, with the preceding five are all the *concord*ing intervals within, or less than an octave, or 1 : 2; that is, whose acute term is greater than half the fundamental.

On this principle, 3 : 5 will be preferable to 4 : 5; because those being equal in the number of vibrations of the acuter term, there is an advantage on the side of the fundamental in the ratio 3 : 5, where the coincidence is made at every third vibration of the fundamental, and every fifth of the acute term: so also the ratio 5 : 8 is less perfect than 5 : 6; because, though the vibrations of each fundamental that go to one coincidence are equal; yet in the ratio 5 : 6, the coincidence is at every sixth of the acute term, and only at every eighth in the other case.

Thus, we have a rule for judging of the preference of *concord*s, from the coincidence of their vibrations: agreeable to which rule, they are disposed into the order of the following table; to which the names of the *concord*s in practice, the ratio of their vibrations, the lengths of the chords, and the number of coincidences in the same, are expressed.

	Ratio's, or vibrations.		Coincid.
	Grave Term.	Acute Term.	
Unison	1	1	
Octave, 8ve	2	1	60
Fifth, 5th	3	2	30
Fourth, 4th	4	3	20
Sixth, gr.	5	3	20
Third, gr.	5	4	15
Third, lesser	6	5	12
Sixth, lesser	8	5	12
	Grave Lengths.	Acute Lengths.	

Though this order be settled by reason, yet it is confirmed by the ear. On this bottom, *concord*s must still be the more perfect, as they have the greatest number of coincidences, with regard to the number of vibrations in both the chords; and where the coincidences are equal, the preference will fall on that interval, whose acute term has fewest vibrations to each coincidence: which rule, however, is in some cases contrary to experience; and yet it is the only rule yet discovered.

F. Merfenne, indeed, after Kircher, gives us another standard for settling the comparative perfection of intervals with regard to the agreement of their extremes in tune: and it is this.

The perception of concordance, say they, is nothing but the comparing of two or more different motions which in the same time affect the auditory nerve: now we cannot make a certain judgment of any consonance, till the air be as oft struck in the same time by two chords, as there are unites in each member expressing the ratio of that *concord*, *v. gr.* we cannot perceive a fifth, till two vibrations of the one chord, and three of the other are accomplished together; which chords are in length as 3 to 2: the rule then is, that those *concord*s are the most simple and agreeable, which are generated in the least time; and those, on the contrary, the most compound and harsh, which are generated in the longest time.

For instance, let 1, 2, 3, be the lengths of 3 chords 1 : 2 is an octave; 2 : 3 a fifth; and 1 : 3 an octave and fifth compounded, or a twelfth. The vibrations of chords being reciprocally as their lengths, the chord 2 will necessarily vibrate once, while the chord 1 vibrates twice, and then exists an octave; but the twelfth does not yet exist, because the chord 3 has not vibrated once, nor the chord 1 thrice, which is necessary to form a twelfth.

Again, for generating a fifth, the chord 2 must vibrate thrice, and the chord 3 twice; in which time, the chord 1 will have vibrated 6 times; and thus the octave will be thrice produced, while the twelfth is only produced twice; the chord 2 uniting its vibrations sooner with the chord 1, than with the chord 3; and they being sooner consonant than the chord 1 or 2 with that 3. Whence, that author observes, many of the mysteries of harmony, relating to the performance of harmonious intervals and their succession, are easily deduced.

But this rule, upon examining it by other instances, Mr. Malcolm has shewn defective, as it does not answer in all positions of the intervals with respect to each other; but a certain order, wherein they are to be taken, being required: and there being no rule, with respect to the order, that will make this standard answer to experience in every case: so that at last we are left to determine the degrees of *concord* by experience and the ear.

Not but that the degrees of *concord* depend much on the more or less frequent uniting the vibrations, and the ear's being more or less uniformly moved, as above; for that this mixture or union of motion, is the true principle, or, at least, the chief ingredient in *concord*, is very evident: but because there seems to be something further in the proportion of the two motions, necessary to be known, in order to fix a catholic rule for determining all the degrees of *concord*, agreeable to sense and experience, The result of the whole doctrine is summed up in this definition.

—*Concord* is the result of a frequent union, or coincidence of the vibrations of two sonorous bodies, and, by consequence, of the undulating motions of the air, which, being caused by these vibrations, are like and proportionable to them; which coincidence, the more frequent it is, with regard to the number of vibrations of both bodies, performed in the same time, *cæteris paribus*, the more perfect is that *concord*: till the rarity of the coincidence, in respect of one or both the motions, commence discord. See some of the remarkable phenomena of sounds accounted for from this theory, under the word UNISON; see also INTERVAL, &c.

M. Carre, in the memoirs of the royal academy of sciences, lays down a new general proposition, to determine the proportion which cylinders are to have, in order to form the *concord*s or consonances of music. And it is this—that the solid cylinders, whose sounds yield those *concord*s, are in a triplicate and inverse ratio of that of the numbers which express the same *concord*s. Suppose, *e. gr.* two cylinders, the diameters of whose bases and lengths, are as 3 to 2; it is evident their solidities will be in the ratio of 27 to 8, which is the triplicate ratio of 3 to 2: we say then, that the sounds of those two cylinders will produce a fifth, which is expressed by those numbers; and that the big-

gest and longest will yield the grave sound, and the shallowest the acute one.—And the like of all others.

Concords are divided into *simple*, or original, and *compound*.

A *simple*, or *original concord*, is that whose extremes are at a distance less than the sum of any two other *concords*.

On the contrary, a *compound concord* is equal to two or more *concords*.

Other musical writers state the division thus: an octave 1 : 2 and all the inferior *concords* above expressed, are all *simple* and *original concords*; and all greater than an octave, are called *compound concords*; as being composed of, and equal to the sum of one or more octaves and some single *concord* less than an octave; and are usually, in practice, denominated from that *simple concord*.

As to the composition and relations of the original *concords*, by applying to them the rules of the addition and subtraction of intervals, they will be divided into *simple* and *compound*, according to the first and more general notion; as in the following table.

Simple Concords		Compound Concords		3ve. com- posed of	5th 4th or 6th g. 3d l. or 3d g. 3d l. 4th.
5	: 6 a 3d lef.	5th	3d g. and 3d l.		
4	: 5 a 3d gr.	6th l.	4th		
3	: 4 a 4th.	6th g.	4th		

The octave is not only the first *concord* in point of perfection, the agreement of whose extremes is greatest, and the nearest to union; inasmuch that when founded together, it is impossible to perceive two different sounds; but it is also the greatest interval of the seven original *concords*; and as such, it contains all the lesser, which derive their sweetness from it, as they arise more or less directly out of it; and which decrease gradually, from the octave to the lesser sixth, which has but a small degree of *concord*.

What is very remarkable, is the manner wherein these lesser *concords* are found in the octave, which shews their mutual dependencies.

For, by taking both an harmonical and arithmetical mean between the extremes of the octave, and then both an harmonical and arithmetical mean betwixt each extreme, and the most distant of the two means last found; viz. betwixt the lesser extreme and the first arithmetical mean, and betwixt the greater extreme and the first harmonical mean; we have all the lesser *concords*.

Thus, if betwixt 360 and 180 the extremes of octave, we take an arithmetical mean, it is 270; and an harmonical mean is 240; then, betwixt 360 the greatest extreme, and 240 the harmonical mean, take an arithmetical mean, it is 300; and an harmonical mean, is 288. Again, betwixt 180 the lesser extreme of the octave, and 270 the first arithmetical mean, it is 225, and an harmonical one 216.

Thus have we a series of all the *concords*, both ascending towards acuteness from a common fundamental, 360; and descending towards gravity from a common acute term 180: which series has this property, that taking the two extremes, and any other two at equal distances, the four will be in geometrical proportion.

The octave, by immediate division, resolves itself into a fourth and fifth; the fifth, again, by immediate division, produces the two thirds; and the two thirds are therefore found by division, though not by immediate division: and the same is true of the two sixths. Thus do all the original *concords* arise out of the division of the octave; the fifths and fourths immediately and directly, the thirds and sixths mediately.

From the perfection of the octave arise this remarkable property, that it may be doubled, tripled, &c. and yet still will preserve a *concord*, i. e. the sum of two or more octaves are *concord*; though the more compound will be gradually less agreeable: but it is not so with any other *concord* less than octave; the doubles, &c. whereof, are all discords.

Again, whatever sound is *concord* to one extreme of the octave is *concord* to the other also: and if we add any other *simple concord* to an octave, it agrees to both its extremes; to the nearest extreme it is a *simple concord*, and to the farthest a compound one.

Another thing observable in this system of *concords*, is, that the greatest number of vibrations of the fundamental cannot exceed five; or that there is no *concord* where the fundamental makes more than five vibrations, to one coincidence with the acute term. It may be added, that this progress of the *concords* may be carried on to greater degrees of composition, even in infinitum; but still the more compound, the less agreeable.

So a single octave is better than a double one, and that than a triple one; and so of fifths, and other *concords*. Three or four octaves is the greatest length we go in ordinary practice: the old scales went but to two; no voice or instrument will well go above four. See THIRD, FOURTH, and FIFTH.

CONCORDANCE, a dictionary or index to the bible, wherein, all the words, used in the course of the inspired writings, are ranged alphabetically; and the various places where they occur referred to; to assist in finding out passages, and comparing the several significations of the same word.

Cardinal Hugo de St. Charo is said to have employed 500 monks at the same time in compiling a Latin *concordance*: be-

side which, we have several other *concordances* in the same language; one, in particular, called the *concordance* of England, compiled by J. Darlington of the order of predicants; another more accurate one, by the jesuit de Zamora.

R. Mordecai Nathan has furnished us with a Hebrew *concordance*, first printed at Venice in 1523; containing all the Hebrew roots branched into their various significations, and under each signification all the places in scripture wherein it occurs: but the best and most useful Hebrew *concordance* is that of Buxtorf, printed at Basil in 1632.

The Greek *concordances* are only for the new testament: indeed we have one of Conn. Kircher's on the old; but this is rather a concordantal dictionary than a *concordance*; containing all the Hebrew words in an alphabetical order; and underneath, all the interpretations or senses the seventy give them; and in each interpretation, all the places where they occur in that version.

Calafius, an Italian cordelier, has given us *concordances* of the Hebrew, Latin, and Greek, in two columns; the first, which is Hebrew, is that of R. Mordecai, word for word, and according to the order of the books and chapters: in the other column is a Latin interpretation of each passage of scripture quoted by R. Mordecai: this interpretation is Calafius's own; but in the margin he adds that of the seventy and the vulgate, when different from his. The work is in four volumes folio, printed at Rome in 1621.

CONCORDANT, *verbes*, such as have several words in common; but which, by the addition of other words, convey an opposite, at least, a different meaning. Such are those,

Et Canis { *in silva* { *venatur* } *Et amia* { *servat*.
 Lupus } *nutritur* } *ugnat*.

CONCORDAT, in the canon law, denotes a covenant, or agreement concerning some beneficiary matter, as a resignation, permutation, promotion, or the like.

The council of Trent, sess. vi. de reform. cap. 4. speaking of *concordats* made without the authority and approbation of the pope, calls them *concordias quæ tantum suos obligant auctores, non successores*. And the congregation of cardinals, who have explained this decree, declares also, that a *concordat* cannot be valid so as to bind successors, unless confirmed by the pope.

CONCORDAT is also used, absolutely, among the French, for an agreement concluded at Bologna in 1516, between pope Leo I. and Francis I. of France, for regulating the manner of nominating to benefices.

The *concordat* serves in lieu of the pragmatic sanction, which had been abrogated; or, rather, it is the pragmatic sanction softened and reformed.

There is also a German *concordat*, made between pope Nicholas V. and the emperor Frederick III. and the princes of Germany, in 1448, relating to beneficiary matters.

CONCOURSE, or CONCURRENCE, the reciprocal action of divers persons, or things, co-operating toward the same effect, or end.

Divines generally hold, that the actions and operations of all creatures are continually dependent on the immediate concurrence of the divine mind: for second causes to act, or produce effects, God himself must concur, and by his influence give them the efficacy they themselves are destitute of: if they did not need the immediate concurrence of God to make them act, they would have a sort of independency, which must be injurious to the immediate creator to suppose. See CAUSE.

The schoolmen distinguish two kinds of concurrence, viz. *mediate*, which consists in giving a power or faculty to act; and *immediate*, which is a contemporaneous influence of one cause along with another, to produce an effect:—Thus, the grandfather concurs *mediately* to the production of a grandson, as he originally gives the power of generating to the father: but the father concurs *immediately* with the mother to the production of the same child. Now it is allowed that God concurs *mediately* with all his creatures, to enable them to act: but whether this be sufficient; or whether it be farther required that he concur with them *immediately* by a new influence, for the production of every act, in the same manner as the father concurs with the mother toward producing the child, is controverted!—The generality of scholastic writers are for the affirmative; Durandus and his followers maintain the negative.

Point of CONCURRENCE. See the article Focus.

CONCRETE, in the school philosophy, an assemblage, or compound. See COMPOUND.

Physical CONCRETE, or a CONCRETE body, may denote any mixed body, or body composed of different principles; and consequently, all sensible bodies whatever, as all bodies arise from a coalition of divers elements, or at least of divers principles, matter and form.

But, in strictness, *concrete* is only used for those compounds wherein the ingredients still retain their distinct natures, nor are wholly converted into any new common nature.

Authors distinguish *natural concretes* and *artificial ones*: antimony is a *natural concrete*, and soap a *facitious concrete*.

Logical CONCRETE, or a CONCRETE word, called also *paronymum*, is that which has a compound signification, as denoting both the subject,

subject, and some quality or accident of the subject, which gives it its denomination.

Such, e. gr. are, *man, learned, white*; for *man* signifies as much as *having human nature*; *learned*, as much as *having learning*, &c. Hence, the word *concrete* is chiefly used to express the union of qualities or quantities with the bodies or subjects, without any separation even in idea.

The opposite term, whereby things are separated in thought, is *abstract*.

Concrete properly signifies a subject accompanied with its form or quality; as *pious, hard, white*: *abstract*, on the contrary, expresses the form and quality without the subject, as, *piety, hardness, whiteness*.

CONCRETE numbers, are those which are applied to express or denote any particular subject; as, two men, three pounds, two thirds of a shilling, &c.

Whereas, if nothing be connected with a number, it is taken abstractedly or universally; thus, three signifies only an aggregate of three units; let those units be men, pounds, or what you please.

CONCRETION, the act whereby soft bodies are rendered hard: or, an insensible motion of the particles of a fluid or soft body, whereby they come to a coiffidence.

The word is used indifferently for *induration, condensation, congelation, and coagulation*.

CONCRETION is also used for the coalition of several little particles into a sensible mass, called a *concrete*; by virtue of which union, the body acquires this or that figure, and these, or those properties. See **CONCRETE**.

CONCUBINAGE, sometimes expresses a criminal, or prohibited commerce between the two sexes; in which sense it comprehends *adultery, incest, and simple fornication*.

In its more restrained sense, *concubinage* is used for a man's and a woman's cohabiting together in the way of marriage; without having passed the ceremony thereof.

Concubinage was antiently tolerated: the Roman law calls it an allowed custom, *licita consuetudo*. When this expression occurs in the constitutions of the Christian emperors, it signifies what we now call a *marriage in concience*.

The *concubinage* tolerated among the Romans in the time of the republick, and of the Heathen emperors, was that between persons not capable of contracting marriage together: nor did they even refuse to let inheritances descend to children which sprung from such a tolerated cohabitation.

Concubinage between such persons they looked on as a kind of marriage, and even allowed it several privileges: but then this *concubinage* was confined to a single person, and was of perpetual obligation, as much as marriage itself.

Hottoman observes, that the Roman laws had allowed of *concubinage* long before Julius Cæsar made that law whereby every one was allowed to marry as many wives as he pleased. The emperor Valentinian, Socrates tells us, allowed every man two. See **MARRIAGE**.

CONCUBINAGE is also used for a marriage performed with less solemnity than the formal marriage; or a marriage with a woman of inferior condition, and to whom the husband does not convey his rank, or quality.

Cujas observes, that the antient laws allowed a man to espouse, under the title of *concubines*, certain persons, such as were esteemed unequal to him, on account of the want of some qualities requisite to sustain the full honour of marriage. He adds, that though *concubinage* was beneath marriage, both as to dignity and to civil effects; yet was *concubine* a reputable title, very different from that of *mistress* among us.

The commerce was esteemed so lawful, that the *concubine* might be accused of adultery in the same manner as a wife.

This kind of *concubinage* is still in use in some countries, particularly in Germany, under the title of a *half-marriage, morgengabic marriage, or marriage with the left hand*; alluding to the manner of its being contracted, viz. by the man's giving the woman his left hand instead of the right. See **MARRIAGE**.

This is a real marriage, though without solemnity: the parties are both bound for ever; though the woman be thus excluded from the common rights of a wife, for want of quality or fortune.

CONCUBINE, a woman whom a person takes to cohabit with him, in the manner, and under the character of a wife, without being authorized thereto by a legal marriage. See **CONCUBINAGE**.

CONCUBINE is also used for a real, legitimate, and only wife, distinguished by no other circumstance, but a disparity of birth or condition, between her and the husband.

Dr Cange observes, that one may gather from several passages in the epistles of the popes, that they antiently allowed of such *concubines*. The seventeenth canon of the first council of Toledo, declares, that he who with a faithful wife, keeps a *concubine*, is excommunicated; but that if the *concubine* served him as wife, so that he had only one woman, under the title of *concubine*, he should not be rejected from communion: which shews that there were legitimate wives under the title of *concubines*.

In effect, the Roman laws did not allow a man to espouse whom

he pleased; there was required a kind of parity, or proportion, between the conditions of the contracting parties: but a woman of inferior condition, who could not be espoused as a wife, might be kept as a *concubine*; and the laws allowed of it, provided the man had no other wife.

The children of *concubines* were not reputed either legitimate or bastards, but natural children, and were capable only of donations.

They were deemed to retain the low rank of the mother; and were on this ground unqualified for inheriting the effects of the father.

It is certain the patriarchs had a great number of wives, and that these did not all hold the same rank; some being subaltern to the principal wife; which were what we call *concubines*, or half-wives. The Romans prohibited a plurality of *concubines*, and only had regard to the children issuing from a single *concubine*, because the might become a legitimate wife. Solomon had 700 wives, and 300 *concubines*: the emperor of China has sometimes two or three thousand *concubines* in his palace. Q. Curtius observes, that Darius was followed in his army by 305 *concubines*, all in the equipage of queens.

CONCUPISCENCE, among divines, an irregular desire, appetite, or lust after carnal things, inherent in human nature ever since the fall.

F. Malebranche defines *concupiscence*, to be a natural effort, which the traces or impressions of the brain make on the mind, in order to attach it to sensible things. The dominion or prevalence of *concupiscence*, according to him, is what we call *original sin*. See **ORIGINAL sin**.

The origin of *concupiscence* he ascribes to those impressions made on the brain of our first parents at their fall; which are still transmitted and continued on those of their children: for as animals produce their like, and with like traces in the brain; (whence the same sympathies and antipathies in the same kind; and whence the same conduct on the same occasions:) so our first parents, after their fall, received such deep traces in the brain, by the impression of sensible objects, that they might well be supposed to communicate them to their children.

The schoolmen use the term *concupiscible appetite*, for the desire we have of enjoying any good; in opposition to *irascible appetite*, whereby we elchew what is evil.

CONCURRENCE. See the article **CONCOURSE**.

COND, **CON**, or **CONN**, in the sea language, signifies to guide or conduct a ship in her right course.

He that *conds* her, stands aloft with a compass before him, and gives the word of direction to the man at helm how he is to steer. See **STEERING**.

If the ship go before the wind, or, as they call it, betwixt the sheats, the word is either *starboard*, or *port the helm*; according as the *condor* would have the helm put to the right or left side of the ship, upon which the ship always goes the contrary way.

If he says, *helm a mid-ship*, he would have the ship go right before the wind, or directly between her two sheats.

If the ship sail by a wind, or on a quarter wind, the word is, *aloof, keep your luff, fall not off, ever no more, keep her to, touch the wind, have a care of the lee-latch*: all which expressions are of the same import, and imply that the steersman should keep the ship near the wind.

On the contrary, if he would have her sail more large, or more before the wind, the word is, *ease the helm, no near, bear up*.

If he cries *steady*, it means, *keep her from going in and out, or making yaws*, (as they call it) howsoever the sails, whether large or before a wind: and when he would have her go just as she does, he cries, *keep her thus, thus, &c.*

CONDEMNATION, the act of passing, or pronouncing sentence, or giving judgment against a man; whereby he is subjected to some penalty or punishment; either in respect of fortune, reputation, or life. See **SENTENCE**, and **PUNISHMENT**.

CONDEMNATION to the galleys. See **GALLEY**.

CONDENSATION, the act whereby a body is rendered more dense, compact, and heavy.

Condensation consists in bringing the parts closer to each other, and increasing their contact: in opposition to *rarefaction*; which renders the body lighter and looser, by setting the parts further asunder, and diminishing their contact, and of consequence their cohesion.

Wolffius, and some of the more accurate writers, restrain the use of the word *condensation* to the action of cold: what is done by external application, they call *compression*.

Air easily *condenses*, either by cold, or by art: water congeals, but never *condenses*; can never be brought into a less space, but will even penetrate the most solid body, even gold, rather than lose of its bulk.—A syrup *condenses* in ebullition.

It was found, in the observatory of France, during the great cold of the year 1670, that the hardest bodies, even metals, glass, and marble itself, were sensibly *condensed* by the cold, and became much harder, and more brittle than before; till their former state was retrieved by the ensuing thaw.

Water alone seems to expand by cold; inasmuch as when congealed, the ice takes up more space than the water did before. But this must be rather owing to the intromission of some foreign matter;

matter; as the nitrous particles of the ambient air, than to any proper rarefaction of the water by the cold.

The Cartesians, indeed, taking it for granted that there is no vacuum, deny that there can be any such thing as proper *condensation*, or rarefaction. According to them, when a body takes up more space than it it before, its parts are diffended by the destruction of a subtle matter through its pores: and when its bulk, again, is reduced into less space, this is owing to the extrusion or egress of that matter through the same pores; by virtue whereof, the parts of the body, though not the parts of matter, come nearer each other.

For as extension and matter, according to them, are the same thing; a body can never take up more or less place, any other-wise than by the accession or diminution of matter: and thus they conclude there is no vacuum.

Now, that, in the rarefactions of gross bodies, their parts are diffended by the accession of air, is frequently manifest; but this does not follow from the plenitude of the world, but from the fluid and elastic nature of air; or from its gravity and pressure. That there is such a thing as *condensation*, without the loss of any matter, is evident from Galileo's experiment: a cock, being with a female screw fitted to a hollow brass ball, or cylinder, so as that a syringe, by means of a male screw, may be applied to it; by working the syringe, the air will be forced into the ball, and turning the cock, it will be retained; inasmuch, that upon examining the vessel by the balance, its weight will be found increased. If the cock be re-turned, the air will burst out with violence, and the ball will sink to its former weight. From the experiment it follows, 1^o. That air may be crowded into a less volume and bulk than it ordinarily takes up, and is therefore compressible.—For the quantity of its compression, see COMPRESSION.

2^o. That from the recovery of its weight, just so much air is expelled as was injected; and that, therefore, compressed air returns to its primitive expansion, if the compressing force be removed; and it has therefore an elastic force.

3^o. That it is a certain sign of compression, if, upon opening the orifice of a vessel, any portion of air be observed to fly out.

4^o. That since the weight of the vessel is increased by injecting air; the aerial mass must have a nifus downwards, in lines perpendicular to the horizon; and is therefore heavy, and presses subject bodies in lines perpendicular to the horizon; according to the conditions of gravity.

Condensed air, has effects just opposite to those of rarefied air; birds, &c. appear brisker and more lively therein than in the common air, &c. See VACUUM, RAREFACTION, &c.

CONDENSER, a pneumatic engine, whereby an unusual quantity of air may be crowded into a given space. See AIR.

They can by this bring in 2, 3, 4, 5, or 10 atmospheres into the condenser, i. e. twice, thrice, four, &c. times as much air as there would be in the same compass without the engine. See CONDENSATION.

CONDERS, in our customs, are persons who stand on high places near the sea coast, in time of herring-fishing, to make signs with boughs, &c. to the fishers which way the shoal of herrings passes: their course being more discernable to those who stand on high cliffs, by means of a blue colour they cause in the water, than to those aboard the vessels. They are also called *huers*, *hawkers*, *directors*, &c.

CONDIGNITY.—*Merit of CONDIGNITY*. See MERIT.

CONDITION, in the civil law, an article of a treaty, or contract; or a clause, charge, or obligation, stipulated in a contract, or added in a donation, legacy, testament, &c. The donee does not lose his donative, if it be charged with any difticult or impossible conditions. Lawyers distinguish three kinds of conditions, under which a legacy or donation may be made: these are the *casual*, which depends merely on chance; the *potestative*, which is absolutely in our power; and the *mixed condition*, which is both casual and potestative together.

CONDITION, in common law, is a manner, quality, or restriction annexed to an act; qualifying or suspending the same; and making it precarious and uncertain, whether or no it shall take effect.

In a lease there may be two sorts of conditions, *condition collateral*, and *condition annexed to the rent*.

Collateral CONDITION is that annexed to a collateral or foreign act; as, *v. gr.* that the lessee shall not go to Paris. *Condition* is also divided into *condition in deed*, and *condition implied*.

CONDITION in deed, is that knit and annexed by express words to the feoffment, lease, or grant, either in writing, or without.—As if I infeoff a man in lands, reserving a rent to be paid at such a feast; upon condition, if the feoffee fail of payment, it shall be lawful for me to re-enter.

CONDITION implied, called also *condition in law*, is when a man grants to another the office of a steward, bailiff, keeper of a park, &c. for life: though there be no condition expressed in the grant, yet the law makes one covertly; which is, that if the grantee do not justly execute all things belonging to his office, it shall be lawful for the grantor to discharge him.

CONDITION without which, sine qua non, is used in philosophy, in speaking of some accident or circumstance, which is not essen-

tial to the thing, but is yet necessary to its production.

Thus, light is a condition without which a man cannot see objects, though he have good eyes; and thus fire, though considered in itself may burn without wood; yet is its presence a condition without which the wood cannot be burnt.

CONDITIONAL, something not absolute, but subject to limitation and conditions. See CONDITION.

Conditional legacies are not due till the conditions are accomplished. The right of conquest does not suppose any conditional consent on the part of the people.

The Arminian divines maintain, that all the decrees of God, relating to the salvation and damnation of man are truly conditional; and the Calvinists, that they are all absolute. See ARMINIAN, &c.

In logic, conditional propositions admit of all kinds of contradictions, *v. gr.* if my Transalpin mule flew, my Transalpin mule had wings.

CONDITIONAL conjunctions, in grammar, are those which serve to make propositions conditional.—*As, if, unless, provided that, in case of, &c.*

CONDITIONAL propositions, are such as consist of two parts, connected together by a conditional particle. Of these, the first, wherein the condition lies, is called the antecedent, and the other the consequent.

Thus, if the soul be spiritual, it is immortal; is a conditional proposition, wherein, if the soul, &c. is the antecedent, and is immortal the consequent.

CONDITIONAL estate. } See the articles } ESTATE.

CONDITIONAL resignations. } RESIGNATION.

Science of CONDITIONALS, i. e. of conditional truths, imports that knowledge which God has of things, considered, not according to their essence, their nature, or their real existence; but under a certain supposition, which imports a condition never to be accomplished.

Thus, when David asked of God whether the people of Keilah would deliver him up to his enemies; God, who knew what would befall in case David should continue at Keilah, told him that they would deliver him: which he knew by the science of conditionals.

Some of the schoolmen deny that God has the knowledge of conditionals: the Thomists maintain, that God's knowledge of conditionals depends on a predetermining decree: others deny it.

F. Daniel observes, that the truths which compose the knowledge of conditionals, being very different from those which compose the knowledge of intuition, and that of understanding; a third class must be added, and the knowledge of God be divided into intuitive, intellectual, and conditional. See KNOWLEDGE.

CONDORMIENTES, religious sectaries, whereof there have been two kinds.—The first arose in Germany, in the thirteenth century; their leader was a native of Toledo. They held their meetings near Cologne; where they are said to have worshipped an image of Lucifer, and to have received answers and oracles from him: the legend adds, that an ecclesiastick having brought the eucharist to it, the idol broke into a thousand pieces; which put an end to the worship. They had their name from their lying all together, men and women, young and old.

The other species of condormientes, were a branch of Anabaptists in the sixteenth century; so called, because they lay, several of both sexes, in the same chamber; on pretence of evangelical charity.

Safe-CONDUCT. See SAFE-CONDUCT.

CONDUCTOR, the name of a surgeon's instrument, which being put up into the bladder, serves to guide or conduct the knife, in the operation of cutting for the stone. See LITHOTOMY.

CONDUCTOS *ad proficiendum*. See CAPIAS.

CONDUIT, a canal, or pipe, for the conveyance of water, or other fluid matter. See TUBE, &c.

In the earth are several subterraneous conduits, through which the waters pass that form springs; and through which also pass the vapours, which form metals and minerals. See SPRING, METAL, &c.

Artificial conduits for water, are made of lead, stone, cast iron, potter's earth, &c. See PIPE, and PLUMBERY.

In the province of New Mexico, there is said to be a subterraneous conduit, in form of a grotto, extending 600 miles in length. See DUCT.

CONDYLOMA, in anatomy. See CONDYLYS.

CONDYLOMA*, in medicine, is a soft, painless tumor, of the cedematous kind, arising on the internal coat of the anus, and the muscles of that part, or in the neck of the matrix.

* The word comes from *condyla* &c.; in regard the condylole has usually rugae, or wrinkles, like the joints of the body.

The condylole, by long continuance, grows fleshy, and shooting out as from a stalk, takes the denomination *ficus*. See FIGUS.

Condylole are frequently the effect of venereal ailments, and, if neglected, sometimes prove cancerous: their cure depends on mercurialunctions, and proper escharotics to consume them; though extirpation either by ligature or incision, if the nature of the part will admit, is the most expeditious.—A salivation is often necessary, in order to facilitate and complete the cure.

CONDYLYS,

CONDYLUS, *Κονδύλος*, a name which anatomists give to a little round eminence, or protuberance at the extremity of a bone.—See *Tab. Anatomy*, (Osteol.) fig. 2. lit. n. Such is that of the lower jaw, received within the cavity of the os petrosum.

When this eminence is large, it is called the *head* of the bone. **CONE**, in geometry, a solid body, having a circle for its base, and terminated a-top in a point, or vertex.—See *Tab. Conicæ*, fig. 2. The cone is generated by the motion of a right line, KL, round an immovable point K, called its *vertex*, along the circumference of a plane, called its *base*, MN: or it may be conceived as generated by the revolution of the triangle KLM, about the right line KL, which is called the *axis* of the cone, and KM its latus, or side. See *AXIS*, &c.

If the axis be perpendicular to the base, it is said to be a *right cone*; and if inclined, or oblique, a *scaleneus cone*.—*Scaleneus cones* are again divided into *obtusè-angled*, and *acute-angled*.

Euclid defines a cone a solid figure, whose base is a circle, as CD (fig. 3.) and is produced by the entire revolution of the plane of a right-angled triangle CAB, about the perpendicular leg AB. If this leg, or axis, be greater than CB, half the base; the solid produced is an *acute-angled cone*: if less, it is an *obtusè-angled cone*; and, if equal, a *right-angled cone*.

But, Euclid's definition only extends to a *right cone*: that is, to a cone whose axis is at right angles to the base; and not to oblique ones, whose axis is not at right angles to the base.

For a more general and comprehensive description of a cone, which may take in both right and oblique ones, suppose, an immovable point A, (fig. 4.) without the plane of the circle BDEC; and suppose a right line AE, drawn through that point, and produced infinitely both ways, to be moved quite about the circumference of the circle; the two superficies that will arise from this motion, are each called *conic superficies*; but, taken conjunctly, they are called *superficies vertically opposite*, or *only opposite superficies*. See *OPPOSITE*. The immovable point A, common to both the superficies, is called the *vertex*; the circle BDEC the *base*; the right line AC, drawn through the vertex A and C, the *center of the base*; and if infinitely produced, the *axis*; and the solid comprehended under the conical superficies and the base, is a cone.

Properties of the CONE.—1°. The area or surface of every right cone, exclusive of its base, is equal to a triangle whose base is the periphery, and its height the side of the cone.

Or, the curve superficies of a right cone, is to the area of its circular base, as A C, (fig. 3.) the length of the hypotenuse of the right-angled triangle describing it, is to C B, the base of the same triangle: that is, as the slant height of the cone, to the semidiameter of the base.

Hence, the surface of a right cone is equal to a sector of a circle described on the side of the cone, as a radius, whose arch is equal to the periphery of the cone; and has therefore the same proportion to its periphery, which the diameter of the base has to the side of the cone.

Hence we have a method of describing a rete or cage that shall just cover a cone.—Thus, with the diameter of the base A B, (Tab. Conicæ, fig. 6.) describe a circle, and produce the diameter to C, till A C be equal to the side of the cone. To 2 A C and A B, determined in numbers, and 360°, find a fourth proportional; and with the radius CA, on the center C, describe an arch DE equal to the number of degrees found: the sector CDE with the circle A B will be a rete for the right cone.

If, then, the side of a truncated cone be set off from A to F, and an arch GH be described with the radius CF; by finding a fourth proportional to 360°, to the number of degrees of the arch GH, and to F C; and thence determining the diameter of the circle I F, we shall have a net or cover for the truncated cone.

For CDBAE is a net for the entire cone; CGFIH for the cone cut off; therefore, DBEHIG for the truncated cone.

2°. Cones and pyramids, having the same bases and altitudes, are equal to each other.

Now, it is shewn, that every triangular prism may be divided into three equal pyramids; and therefore, that a triangular pyramid is one third of a prism, standing on the same base, and having the same altitude.

Hence, since every multangular body may be resolved into triangular ones, and every pyramid is a third part of a prism having the same base and altitude; since a cone may be esteemed an infinite-angular pyramid, and a cylinder an infinite-angular prism; a cone is a third part of a cylinder, which has the same base and altitude.

Hence we have a method of measuring the surface and solidity of a cone and a cylinder.—Thus, for the *solidity*: find the solidity of a prism, or cylinder, having the same base with the cone, or pyramid. Which found, divide by 3: the quotient will be the solidity of a cone, or a pyramid.—Thus, v. gr. if the solidity of a cylinder be 605592960, the solidity of the cone will be found 201864320.

For the *surfaces*; that of a right cone is had by multiplying the semi-periphery of the base into the side, and adding the product to the base.

Suppose, e. gr. the diameter of the cone NM, (fig. 2.) 56, its

VOL. I.

periphery will be 17584', and the base 246176". Suppose the altitude of the axis KL, 246'; since LM = NM = 28', and KM = KL + LM = 60516' + 781' = 61300', KM = 2474". Consequently, the superficies of the cone, exclusive of the base, is 42' 310' 28' 16"; and the whole together 455645760.

As to the measure of the surface, and solidity of a truncated cone, ABCD, (fig. 7.) Its altitude CH, and the diameters of its bases AB and CD being given, find their circumferences. To the square of the altitude CH, add the squares of the semi-difference of the radii AH, and from the aggregate extract the square root, which will give the side AC: the semi-sum of the peripheries, multiplied by that side, gives the superficies of the truncated cone.

To find the *solidity*: As the difference of the semidiameter AH is to the altitude of the truncated cone CH, so is the greater semidiameter AF, to the altitude of the entire cone FE. This being found, subtract the altitude of the truncated cone GF, which will leave that of the cone taken off EG.

Find the solidity of the cone CED and AED; subtract the other from this; the remainder will be the solidity of the truncated cone A C D B.

For the sections of the CONE, see *CONIC SECTION*.—For the ratio of CONES and cylinders, see *CYLINDER*.—For the centers of gravity and of oscillation of a CONE, see *CENTER*.

CONES of the higher kinds, are those whose bases are circles of the higher kinds; and are generated by supposing a right line fixed in a point, on high, though conceived capable of being extended more or less, on occasion; and moved or carried round a circle.

CONE of rays, in optics, includes all the several rays which fall, from any point of a radiant, on the surface of a glass. See *RAY*.

CONFARRATION, a ceremony among the antient Romans used in the marriage of persons whose children were destined for the honour of the priesthood.

Confarration was the most sacred of the three manners of contracting marriage among that people; and consisted, according to Servius, in this, that the pontifex maximus and flamen dialis joined and contracted the man and woman, by making them eat of the same cake of salted bread.

Ulpian says, it consisted in the offering up of some pure wheaten bread; rehearsing, withal, a certain formula, in presence of ten witnesses. Dionysius Halicarnassensis adds, that the husband and wife did eat of the same wheaten bread, and threw part on the victims.

CONFECTION, in pharmacy, a kind of compound remedy of the confidence of a lofty elucary.

There are several elucaries, which bear the name of *confessionis*; some whereof, in the physicians languages, are *corroborative*, and others *purgative*.

Of the number of the corroborative *confessiones* are those of *alkermes*, of *hyacinth*, and the *anacardine*: a purgative one is the *confession hamech*. The *confession of alkermes*, has its name from the principal ingredient therein; which is the *kermes*, or *alkermes*, or *scarlet-grain*.—The other ingredients are pearls, musk, cinnamon, ambergris, leaf gold, juice of pippins, and rose-water.—It is ranked among the best cardiacks, and is frequently used for the palpitation of the heart, or syncope; and sometimes in the small-pox and measles.

The *confession of hyacinth* has nearly the same virtues with that of *alkermes*; but, beside, it is frequently used as an astringent.—It consists of near triple the number of drugs; whereof the precious stone, called the *hyacinth*, is esteemed the principal; the chief of the rest are red coral, bole armoniac, terra sigillata, myrrh, the santals, burnt hartshorn, camphire, sapphires, emerald, topaz, and most of the ingredients of the *confession of alkermes*.

The *anacardine confession*, now diffused in England, is composed chiefly of *anacardiuns*, whence the name.—The other drugs are long pepper, black pepper, most kinds of myrobals, castoreum, &c.—It is used to purge the blood, and is proper in cold diseases.

The *confession hamech* takes its name from that of its inventor, an Arabian physician.—Its ingredients are polypody, myrobals, agaric, senna, tamarinds, red roses, manna, colocynth, &c. It is applied as a drastic for the purging of the grosser humours and vicidities; it is also of some reputation in vertiges and cancers.

CONFECTOR, among the antient Romans, a sort of gladiator, hired to fight in the amphitheatre against beasts; thence also denominated *bestiarius*. See *GLADIATOR*.

The *confestores* were thus called à *conficiendis bestijs*, from their dispatching and killing beasts.

The Greeks called them *Παραδοτοί*, q. d. daring, rash, desperate; whence the Latins borrowed the appellations *parabolani*, and *parabolarii*. See *PARABOLANI*.

CONFECTS, or **CONFITS**, a denomination given to fruits, flowers, herbs, roots, and juices, when boiled and prepared with sugar, or honey, to dispose them to keep, or render them more agreeable to the taste.

The antients only confited with honey; at present, sugar is more frequently used.—*Confects half sugared*, are those only covered with a little sugar, to leave more of the natural taste of the fruit.

2 R 5

Confects

Confects are reduced to eight kinds, *viz.* liquid *confects*, marmalades, jellies, pasts, dry *confects*, conserves, candies, and dragees, or sugar-plumbs.

Liquid *confects* are those whole fruits, either whole, in pieces, in seeds, or in clusters, are *confited* in a fluid transparent syrup, which takes its colour from that of the fruits boiled in it.—There is a good deal of art in preparing these well; if they be too little sugared they turn; and if too much, they candy. The most esteemed of the liquid *confects* are plums, especially those called mirabels, berberries, quinces, apricots, cherries, orange-flowers, little green citrons from Madera, green cassia from the Levant, myrobalans, ginger, cloves, &c. Marmalade is a kind of past, almost liquid, made of the pulp of fruits, or flowers, that have some consistence; such as apricots, apples, pears, plumbs, quinces, oranges, and ginger.—Marmalade of ginger is brought from the Indies by way of Holland: it is esteemed good to revive the natural heat in old men. See MARMALADE.

Jellies are juices of several fruits, wherein sugar has been dissolved, and the whole, by boiling, reduced into a pretty thick consistence; so as, upon cooling, to resemble a kind of thin transparent glue, or size. Jellies are made of various kinds of fruits, especially gooseberries, apples, and quinces: there are other jellies, made of flesh, fish, hartshorn, &c. but they are not to be kept, being very subject to corrupt.

Pasts are a kind of marmalades, thickened to that degree by a proper boiling, as to assume any form, when put into little molds, and dried in the oven. The most in use are those of gooseberries, quinces, apples, apricots, and orange-flowers: those of pistachoes are much esteemed; those of ginger are brought from the Indies. Dry *confects*, are those whole fruits, after having been boiled in the syrup, are taken out again, drained, and put to dry in an oven.—These are made of so many kind of fruits, that it would be hard to explain them all: the most considerable are citron and orange-peel, plumbs, pears, cherries, apricots, &c.

Conserves are a kind of dry *confects*, made with sugar, and pasts of flowers or fruits, &c. the most usual among these are those of roses, mallows, rosemary, of heps, of orange-flowers, violets, jessamin, pistachoes, citrons, and floss.

Note, the apothecaries, under the title of *conservees*, comprehend all kind of *confects*, both dry and liquid; whether of flowers, fruits, seeds, roots, barks, or leaves, prepared with sugar or honey, to preserve, &c.

Candies are ordinarily entire fruits, candied over with sugar, after having been boiled in the syrup; which renders them like little rocks, crystallized; of various figures and colours, according to the fruits included within them.—The best candies are brought from Italy. See CANDY.

Sugar-plumbs, are a kind of little dry *confects*, made of small fruits, or seeds, little pieces of bark, or odoriferous and aromatic roots, &c. incrustrated and covered over with a very hard sugar, ordinarily very white.—Of these there are various kinds, distinguished by various names: some made of raspberries, others of berberries, melon-seeds, pistachoes, filberds, almonds, cinnamon, orange-peel, corianders, aniseed, carraways, &c.

CONFEDERACY, an alliance or league between divers princes and states.

CONFEDERACY, in law, is when two or more persons combine to do any damage to another, or to commit any unlawful act.

Confederacy is punishable, though nothing be put in execution: but then it must have these four incidents: 1^o. That it be declared by some matter of prosecution; as by making of bonds or promises to one another: 2^o. That it be malicious, as for unjust revenge: 3^o. That it be false, *i. e.* against the innocent: and lastly, that it be out of court, voluntary.

CONFESSION, in a civil sense, a declaration, or acknowledgment of some truth, though it be against the interest of the party who makes it; whether it be in a court of justice, or out of it. It is a maxim, that in civil matters, the *confession* is never to be divided; but always taken entire. And that a criminal is never condemned on his simple *confession*, without other collateral proofs: nor is a voluntary extrajudicial *confession* admitted as any proof.—A person is not admitted to accuse himself, according to that rule in law, *non auditur perire volens*.

CONFESSION, in a theological sense, is a declaration of a person's sins, made to a priest, in order to obtain absolution for the same. The Romish church makes *confession* a part of the sacrament of penance.

Confession was antiently publick and general, in the face of the church; though the Romanists have since altered it, and made it private, and auricular.

Confessions are to be buried in eternal silence, under pain of the last punishment to the priest who reveals them.

Bellarmin, Valentia, and some other Romish controversy-writers, endeavour to trace up auricular *confession* to the earliest ages; and thus contend for a point given up by the rest. M. Fleury owns that the first instance of auricular *confession* he can meet with, is that of S. Eloi, who being grown old, made a *confession* to a priest of all his sins from his youth upwards.

The Indians, according to Tavernier, have a kind of *confession*;

and the same may be said of the Jews: these last have formulas for those who are not capable of making a detail of all their sins: the ordinary form is in alphabetical order, each letter containing a capital sin. This they usually rehearse on Mondays and Thursdays, and on fast days, and other occasions; some, every night and morning. When any of them find themselves near death, he sends for ten persons, more or less, one of them a rabbin; and in their presence recites the *confession*. See Leo de Modena.

CONFESSION of *faith*, denotes a list, or enumeration and declaration of the several articles of belief, in a church.

The Augsburg *confession* is that of the Lutherans; it was presented to Charles V. in 1530.

In the council of Rimini, the catholic bishops found fault with dates in a *confession of faith*, and observed that the church never used to date them.

CONFESSIOAL, or CONFESSORY, in church-history, a place in churches, usually under the main altar, wherein were deposited the bodies of deceased faithful, martyrs, and confessors.

CONFESSIOAL is also used in the Romish church for a little box, or desk in the church, where the confessor takes the confessions of the penitent.

CONFESSO.—*Pro CONFESIO*. See the article *Pro*.

CONFESSOR, a Christian who has made a solemn, and resolute profession of the faith, and has endured torments in its defence.

A meek saint is called a *confessor*, to distinguish him from the roll of dignified saints; such as *apostles*, *martyrs*, &c.

In ecclesiastical history, we frequently find the word *confessor* used for martyrs: in after-times, it was confined to those, who after having been tormented by the tyrants, were permitted to live and die in peace. At last it was also used for those, who after having lived a good life, died under an opinion of sanctity. According to S. Cyprian, he who presented himself to torture, or even to martyrdom, without being called thereto, was not called a *confessor*, but a *professor*: and if any out of a want of courage abandoned his country, and became a voluntary exile for the sake of the faith, he was called *extorris*.

CONFESSOR is also a priest, in the Romish church, who has a power to hear sinners in the sacrament of penance, and to give them absolution.

The church calls him in Latin *confessarius*, to distinguish him from *confessor*, which is a name consecrated to saints.

The *confessors* of the kings of France, from the time of Henry IV. have been constantly Jesuits: before him, the Dominicans and Cordeliers shared the office between them. The *confessors* of the house of Austria have also, ordinarily, been Dominicans and Cordeliers, but the latter emperors have all taken Jesuits.

CONFIGURATION, the exterior surface, that bounds bodies, and gives them their particular figure.

That which makes the specific difference between bodies, is the different *configuration*, and the different situation of their parts.

A short, or a long sight, depend on the different *configuration* of the crystalline.

CONFIGURATION of the planets, in astrology, is a certain distance, or situation of the planets in the zodiac, whereby they are supposed to aid, or oppose each other. See ASPECT.

CONFIRMATION, the act of ratifying, or rendering a title, claim, pretension, report, or the like, more sure and indubitable.

CONFIRMATION, in law, is particularly used for the strengthening or homologating an estate of one already in possession of it by a voidable title.

Thus, if a bishop grant his chancellorship by patent, for term of the patentee's life; this is no void grant: yet it is voidable by the bishop's death, except it be strengthened also by the dean and chapter's *confirmation*.

CONFIRMATION, in rhetoric, is the third part of an oration, wherein the orator undertakes to prove, by laws, reasons, authorities, and other arguments, the truth of the propositions advanced in his narration.

Confirmation is either *direct*, or *indirect*; the first confirms what the orator has to urge for strengthening his own cause: the second, properly called *confutation*, refutes the opposite arguing of the adversaries. The two parts together are sometimes placed under the head or title of *contention*.

The *confirmation* is, as it were, the life and soul of the oration: in this the main stress of the argumentation lies. Whence Aristotle, properly enough, calls it *ovis*, *fides*.

CONFIRMATION, in theology, the ceremony of laying on of hands, for the conveyance of the Holy Ghost.

The antients called it *chrism* and *unction*; among them it was conferred immediately after baptism; and was esteemed, in some measure, to be a part thereof: whence the fathers call it the *accomplishment* of baptism.

Among the Greeks, and throughout the East, it still accompanies baptism; but the Romanists make it a distinct independent sacrament.

It appears that *confirmation* has all along been ordinarily conferred by the bishop: S. Cyprian, and most of the fathers, speak of it in such terms as imply it to have been confined to the bishop alone; and Fleury, and most of the moderns, from them, lay it down as a distinguishing character between the offices of a priest or

er deacon, and that of a bishop, that the former might baptize, but the latter alone might anoint and confirm; by virtue of their succession to the apostles, to whom it originally belonged. But from some passages in S. Gregory, &c. others gather, that the priests, on occasion, had likewise the power of confirming. It is certain, among the Greeks, the priest who baptizes also confirms: which practice, Lucas Holstenius shews, is of so old a standing among them, that it is now generally looked on as belonging properly and of right to the priest: though some will have it to have been borrowed by them from the bishops.

Hence, some of the Latin divines acknowledge, that though the bishop be the ordinary minister of confirmation, yet, that the priest, in his absence, may also confer it, in quality of minister extraordinary.

The council of Rouen, held in 1072, decrees, that confirmation must be conferred fasting, both on the side of the giver and that of the receiver.

CONFISCATE*, in law, is applied to goods forfeited to the exchequer, or publick treasury.

* The word is derived from *ficus*, a hamper, panier, or basket, wherein the emperor's money used to be kept.

The title to goods which are not claimed by any other, is given by law to the king. If a man indicted for stealing the goods of another, in which case they become, in effect, the proper goods of him indicted, be asked about them in court, and disclaim them; he thereby loses the goods, though he be afterwards acquitted of the theft, and the king shall have them as *confiscate*: but otherwise, had he not disclaimed them.

CONFISCATION, a legal adjudication of goods or effects to the fisc, or treasury.

Thus, the bodies and effects of criminals, traitors, &c. and merchandizes that are contraband, prohibited, or brought aboard or ashore without paying the duties, when seized, are *confiscated*.

It is an axiom in law, that he who *confiscates* the body, *confiscates* also the effects, to the profit of the king, or the lord of the fee; i. e. he who is condemned to lose his life, must also lose his goods: yet the widows of criminals do not lose their dowries, nor their share in the goods of the community, by the forfeiture of their husbands.

CONFLAGRATION, a general burning of a city, or other considerable place.—In which sense, Nero is said to have procured the christians to be accused of the *conflagration* of Rome, which was done by his own order.

But the word is more ordinarily restrained to that grand period, or catastrophe of our world, wherein the face of nature is to be changed by a deluge of fire, as it was antiently by that of water. The antient Pythagoreans, Platonists, Epicureans, and Stoicks appear to have had a notion of the *conflagration*; though whence they should derive it, unless from the sacred books, is difficult to conceive; except, perhaps, from the Phœnicians, who themselves had it from the Jews.

Seneca, says expressly, *tempus advenit quo sidera sideribus incurrent. Et omni flagrant materia uno igne, quicquid nunc ex deposito lucet, ardebit*. This general dissolution the Stoicks call *extremum ære*, *æreosis*. Mention of the *conflagration* is also several times made in the books of the Sibyls, Sophocles, Hyfaspes, Ovid, Lucan, &c.

Dr. Burnet, after F. Tachard and others, relate that the Siamese believe that the earth will at last be parched up with heat; the mountains melted down; and the earth's whole surface reduced to a level, and then consumed with fire. And the Bramins of Siam do not only hold that the world shall be destroy'd by fire; but also, that a new earth shall be made out of the cinders of the old. Various are the sentiments of authors on the subject of the *conflagration*; the cause whence it is to arise, and the effects it is to produce.—Divines ordinarily account for it metaphysically; and will have it take its rise from a miracle, as a fire from heaven. Philosophers contend for its being produced from natural causes; and will have it effected according to the laws of mechanics: Some think an eruption of the central fire sufficient for the purpose; and add, that this may be occasioned several ways, viz. either by having its intention increased; which, again, may be effected either by being driven into less space by the encroachments of the superficial cold, or by an increase of the inflammability of the fuel wherein it is fed; or by having the resistance of the imprisoning earth weakened; which may happen, either from the diminution of its matter, by the consumption of its central parts, or by weakening the cohesion of the constituent parts of the mass by the excess or the defect of moisture.

Others look for the cause of the *conflagration* in the atmosphere; and suppose, that some of the meteors there engendered in unusual quantities, and exploded with unusual violence, from the concurrency of various circumstances, may be made to effect it, without seeking any further.

The astrologers account for it from a conjunction of all the planets in the sign Cancer; as the deluges, say they, was occasioned by their conjunction in Capricorn.

Lastly, others have recourse to a still more effectual and flaming machine, and conclude the world is to undergo its *conflagration* from the near approach of a comet, in its return from the sun. Those wandering bodies do indeed seem to menace us a little; being able, both by their transverse motion across the earth's

way, by the hugeness of their size, and the intense fire wherewith they glow in their recess from the perihelion, to produce the most signal changes and revolutions in the system of things. See **COMET**.

Mr. Whiston has shewn, that they are extremely well fitted to produce the phenomena of the deluge; and has gone a good way towards proving, that the comet of 1668 was the very body to which that event was owing; as being then in its approach towards the sun, and its atmosphere crouded with the watery vapours it had gathered in those inconceivable cold regions, into which it had fled off in its apheilion.

This same comet, Sir Isaac Newton has calculated, when in its perihelion, December the 8th, was heated by the vicinity of the sun, to a degree 2000 times more hot than red-hot iron: he shews likewise, that it would scarce be cool again in 50000 years.

This same comet, again, Dr. Halley observed November 11, was not above a semidiameter of the earth from the earth's way: so that had the earth at that time been in that part of its orbit, something very extraordinary might have been apprehended: but whether in the way of fire or water, may, perhaps, to some, leave room to doubt: to us it is none; it being scarce conceivable that the comet should bring any vehement degree of heat, out of those bleak regions it comes from, whatever heat it might carry thither.

CONFLUENCE, CONFLUX, the place where two rivers join, and mix their waters. See **RIVER**.

CONFLUENT, in medicine, an epithet given to that species of small-pox wherein the pustules run into one another. See **Small-Pox**.

CONFORMATION, the particular texture and consistence of the parts of any body, and their disposition to make a whole.

We say, light of different colours is reflected from bodies according to their different *conformation*; in opposition to the Cartesianians, who pretend, that reflected light becomes of different colours, according to the different *conformation* of the bodies that reflect it. The *conformation* of the members of an embryo, is not perfect enough to allow of dissection.

CONFORMATION, in medicine, is used to express that make and construction of the human body which is peculiar to every individual.

Hence, a *mala conformatio* signifies some fault in the first rudiments; whereby a person comes into the world crooked, or with some of the viscera, or cavities unduly framed, or proportioned.—Many are subject to incurable asthma's, from a too small capacity of the thorax, and the like original vicious *conformations*.

CONFORMITY, in the schools, is the congruency, or relation of agreement between one thing and another: as between the measure, and the thing measured; the object, and the understanding; the thing, and the conception; the thing, and the division thereof, &c. See **CONGRUENCY**.

Occasional Conformity. See **OCCASIONAL CONFORMITY**.

CONFRONTATION, the act of bringing two persons in presence of each other, to discover the truth of some fact which they relate differently.

The word is chiefly used in criminal matters; where, the witnesses are *confronted* with the accused; the accused with one another, or the witnesses with one another.

CONFUSED *Notion*. See the article **NOTION**.

CONFUSION, in a general sense, is opposed to order; in a perturbation whereof, *confusion* consists: e. g. when things prior in nature do not precede; or posterior do not follow, &c. See **ORDER**. In a logical sense, *confusion* is opposed to *distinctness*, or *perspicuity*; and may happen, either in words, as when misconstrued or misapplied; or in ideas, as when the idea of any thing presents something along with it, which does not properly belong to that thing.

In a physical sense, *confusion* is a sort of union, or mixture by mere contiguity.—Such is that between fluids of contrary nature, as oil and vinegar, &c. See **UNION** and **MIXTURE**.

CONFUTATION, in rhetoric, &c. a part of an oration, wherein the orator seconds his own arguments, and strengthens his cause, by refelling and destroying the opposite arguments of the antagonist.

Confutation makes a branch of what we call the *confirmation*.—The confirmation and *confutation* are sometimes called *contention*. See **CONFIRMATION**.

CONGE*, in the French law, a license, or permission, granted by a superior to an inferior, which gives him a dispensation from some duty to which he was before obliged.

* The word is French: Menage derives it from the Latin *commixtus*, used for *commestus*, and *commensare*, often seen among ancient writers: the Italians say *congeda*.

A woman cannot obligate herself without the *conge* or the license of her husband: a monk cannot go out of his convent, without the *conge* of his superiors.

CONGE d'Elire, is the king's permission royal to a dean and chapter, in time of a vacancy, to chuse a bishop. See **CHAPTER**, **CANON**, and **COLLATION**.

Gwyn observes, that the king of England, as sovereign patron of all bishopricks and other benefices, had antiently the *free appointment* of all ecclesiastical dignities; investing, first, per

baucum & *annulum*; and afterwards by letters patent: but that, in process of time, he made the election over to others, under certain forms and conditions: as, that they should at every vacancy, ere they chose, demand of the king *conge d'elire*, i. e. leave to proceed to election; and after election to crave his royal assent, &c.—He adds, that king John was the first who granted this; which was afterwards confirmed by *stat. Westm.* and again in the *articuli cleri*.

CONGE, in architecture, denotes a moulding either in form of a quarter-round, or of a cawetto; which serves to separate two members from one another.—See *Tab. Archit. fig. 6.* Such is that which joins the shaft of the column to the cincture, called also *apophye*; which, in Greek, signifies escape; the column seeming to spring hence: by the Latin it is called *scapus*, the shaft of the column.

CONGELATION, *Freezing*; the act of fixing the fluidity of any liquid, by cold, or the application of cold bodies: in which it differs from *coagulation*, which is produced by other causes. Salt-petre *congeals* water in summer. See **ICE**. Metals and minerals are said to be juices *congealed* in the veins of the earth, by their mixing with one another, or with other heterogeneous bodies, or by the consumption and evaporation of their finest parts.

Rock crystal was by the antients held to be nothing but water *congealed* in the mountains. See **CRYSTAL**.—The bites of aspics become mortal, by the sudden *congelation* which they induce on the blood, which stops its circulation.

CONGERIES, a Latin word, sometimes used for a collection, or heap of several particles, or bodies, united into one mass, or aggregate.

CONGESTION, in medicine, a mass, or collection of humours, crowded together, and hardened, in any part of the body; and there forming a preternatural tumor.

Congestion is effected by little and little; in which it differs from *defusion*, which is more sudden.

CONGIARIUM*, **CONGIARI**, among medalists, a gift, or donative represented on a medal.

* The word comes from the Latin *congius*; in regard, the first presents made the people of Rome confisted in wine and oil, which were measured out to them in *congiis*. See **CONGIUS**.

The *congiary* was properly a present made by the emperors to the people of Rome.—Those made the soldiers were not called *congiaries*, but *donatives*.

The legend on medals representing *congiaries* is **CONGIARIUM**, or **LIBERALITAS**.

Tiberius gave a *congiary* of three hundred pieces of money to each citizen: Caligula twice gave three hundred sesterces a head: Nero, whose *congiaries* are the first that we find represented on medals, gave four hundred. See **SESTERCE**.

CONGIUS, an ancient Roman measure for things liquid; containing six sesterces; equal to seven pints English wine measure. The *congius* has also been used in England, as appears by a charter of king Edmund in 946.

CONGLOBATE Glands, in anatomy, those glands whose substance is not divided, but firm, entire, and continued; and their surface smooth and uniform.

They are thus called, in opposition to *conglomerate* glands.

Conglobate glands have each of them an artery which brings them blood, a vein which carries it back again, after the proper juice has been filtrated; and several excretory ducts.

Some of them have a cavity in the middle, with lymphatic vessels, which discharge themselves into a common reservoir, or canal. See **LYMPHATICS**.

CONGLOMERATE glands, are those which are composed of several little ones; or they are several glandulous bodies joined together under the same common membrane. See **GLAND**. Such are the salival glands, lachrymal glands, the pancreas, &c. which see under their proper articles.

The *conglomerate glands*, besides their arteries, veins, and nerves, are also each furnished with an excretory vessel, ramified throughout their own substance; by means whereof they discharge the liquors they have filtrated into reservoirs.

CONGLUTINATION, the act of gluing, or fastening two bodies together, by the intervention of some third, whose parts are unctuous and tenacious, in the nature of a glue, *gluten*; from whence the word is formed.

In the animal oeconomy, the parts of the body are said to be *conglutinated* by means of their natural moisture; by the help of bandages, as in several cases of surgery; or by the supply of viscid particles.—In which last acceptance, *conglutination* differs little from *accretion*, or *nutrition*.

CONGREGATION, an assembly of several ecclesiasticks, united so as to constitute a body.

The term is principally used for assemblies of cardinals, appointed by the pope, and distributed into several chambers, for the discharge of certain functions and jurisdictions, after the manner of our offices and courts.

The first is the *congregation* of the holy office, or the inquisition: the second, that of jurisdiction over bishops and regulars: the third that of councils; this has power to interpret the council of Trent: the fourth that of customs, ceremonies, precedences, canonizations, called the *congregation of rites*: the fifth that of

St. Peter's fabrick, which takes cognizance of all causes relating to piety and charity, part whereof is due to the church of St. Peter: the sixth, that of waters, rivers, roads: the seventh, of fountains and streets: the eighth that of the index, which examines the books to be printed or corrected: the ninth that of the government of the whole state of the church: the tenth *de bono regimine*; of which two last, the cardinal-nephew is chief: the eleventh that of money: the twelfth that of bishops; wherein those who are to be promoted to bishopricks in Italy are examined: this is held before the pope: the thirteenth that of consistorial matters; the chief whereof is the cardinal-dean. There is also a *congregation* of alms, which takes care of every thing that relates to the subsistence of Rome, and the state of the church.

CONGREGATION is also used for a company or society of religious; cantoned out of this or that order; and making, as it were, an inferior order, or a subdivision of the order itself. Such are the *congregations* of the oratory, and those of Cluny, &c. among the Benedictines.

The word is also used for assemblies of pious persons, in manner of fraternities; frequent among the jesuits, in honour of the virgin, &c.

CONGREGATION of Penitence. } See { **PENITENCE**.

CONGREGATION of the holy Trinity. } See { **TRINITY**.

CONGREGATION of the immaculate Conception. See the article **IMMACULATE**.

CONGREGATION of the Lateran. See the article **LATERAN**.

CONGREGATION, in physics, is used by Dr. Grew for the least and lowest degree of mixture; or that wherein the parts of the mixt do not conflict with, or adhere to each other, but only touch in one point.

That author declares himself of opinion, that the particles of all fluids only touch in this manner; or that their cohesion only amounts to a *congregation*. See **FLUID**, and **COHESION**.

CONGRESS, **CONGRESSUS**, is used for an assembly of commissioners, deputies, envoys, &c. from several courts, meeting to concert matters for their common good.

The *congress* at the Hague, which held during the course of the war terminated in 1697 by the treaty of Rastwick, was composed of the envoys of all the princes in the confederacy against France.

CONGRESS is also used in an obscene sense, for an essay, or trial, made by appointment of a lay or a spiritual judge, in the presence of surgeons and matrons, to prove whether or no a man be or be not impotent; in order for the dissolving of a marriage. See **IMPOTENCE**.

Neither the civil nor canon law make any mention of this trial of virility by *congress*: it had its origin in France, from the boldness of a young fellow, who in open court, being hard pressed by his wife, demanded the *congress*. The judge, surprized with the novelty of the demand, found it could not be denied, as being the surest evidence the case could admit of.

In time it became a branch in the French jurisprudence, and was authorized by decrees and arrests. It obtained for about the space of 120 years, and was annulled by an arrest of parliament in 1677, as being found precarious; some having failed under the experiment out of mere modesty and shame, which is found to have the same effect with actual impotency.

CONGRUITY, or **CONGRUENCY**, in the schools, a suitability or relation of agreement between things; whereby we come at the knowledge of what may be expected therefrom.

The system of *congruity* in matters of grace consists in this; that God, who knows perfectly the nature of grace, and the dispositions of the will in all the circumstances that shall befall a man, give graces, wherewith, by virtue of their *congruity* with the will of man, considered in those circumstances, man will always infallibly, but not necessarily, do, what God would have him do: in regard, the will, in the language of the *congruists*, does always infallibly, though voluntarily, chuse what appears best.

CONGRUITY, in geometry, is applied to figures, lines, &c. which exactly correspond when laid over one another; as having the same terms, or bounds.

Those things between which there is a *congruity*, are equal, and similar.

Euclid, and by his example, most other geometricians, demonstrate all their elements from the sole principle of *congruency*: M. Leibnitz, and after him Wolfius, substitute the notion of similitude in lieu of that of *congruency*. See **SIMILITUDE**.

CONGRUITY, in a lax sense, is used to express an aptitude in some bodies, to unite, or incorporate; by reason of some similitude or fitness of their figures: as *incongruity* denotes an unfitness of their surfaces for joining together.

Thus, quicksilver will unite with gold, and many other metals, but will roll off from wood, stone, glass, &c. and water, which will wet salt, and dissolve it, will slip off from tallow without adhering to it; as also from a duty surface, and from the feathers of water-fowl.

Two drops of water, or of mercury, will, on contact, immediately join and coalesce; but oil of tartar, poured upon quicksilver, and spirit of wine and oil of turpentine on that, and air

over all, will remain in the same vessel without any manner of union, or mixture with each other.

And the cause hereof, is, that the figures of some bodies will not admit other bodies near enough to be within their spheres of attraction, whence they cannot join, and cohere; but where their fineness of figure will let them approach near enough to feel each others attractive power, then they close and hold together. See COHESION.

CONIC Section, a curve line arising from the section of a cone by a plane.

The conic sections are three, viz. the *ellipse*, *hyperbola*, and *parabola*; beside the *circle*, and the *triangle*, which though they arise from the section of a cone, are not usually considered in that capacity.

That the triangle is a conic section, as well as the other four, is shewn by Apollon. in Con. l. 1. p. 3. For the circle it arises either from the section of a cone by a plane parallel to the basis, or from the subcontrary section of the scalene cone.—Vid. Apoll. Con. lib. 1. prop. 5.

Though the equations, genesis, and many of the properties, with the ratios, dimensions, &c. of each of the conic sections, be separately given under their respective articles in this work, *ELLIPSIS*, *HYPERBOLA*, and *PARABOLA*; yet, to make the doctrine of conics, which is so considerable a part of the higher geometry, and of such frequent use in the new astronomy, the motion of projectiles, &c. more complete, we shall here put the whole in a new light, and bring it together into one contracted view.

The common intersection, then, of any plane with a conic superficies, we observe, is called a *conic section*: and this section varies, and acquires a different name, according to the different inclinations of the cutting plane. For,

1st, If a cone be any way cut by a plane, through the vertex; and again by another plane parallel to the former plane: then, the section, made in the superficies thereof, is called an *hyperbola*; the plane of which being produced to meet the opposite superficies, will make another section, which is likewise called an *hyperbola*: and both of these, conjunctly, are called *opposite sections*.

2^{dly}, If through the vertex of a cone, a plane passes without the superficies thereof, that is, neither cutting nor touching it; and the cone be again cut by another plane parallel to the former; the section made in the superficies thereof, is called an *ellipse*.

3^{dly}, If a plane touch the superficies of a cone, and the cone be cut by a plane, the section is a *parabola*.

But instead of considering these curves as arising by section of the cone itself, their description, nature, and properties, are found more easy of conception, when considered as drawn on a plane: for which reason, after Des Cartes and most of the later writers, we shall rather chuse to lay them down in this second manner.

Genesis, or construction of the Ellipsis.—To conceive the production and nature of an ellipse, let H and I, (fig. 12.) be two points, nails, or little pegs, about which put a thread BHI, then putting your finger to the thread, and keeping the same always in an equal tension, move the finger round from the point B, till you return to the same point B again.

By this revolution of the point B, will be described the curve line called the *ellipse*; which differs from the delineation of a circle only in this, that a circle hath only one center, but the ellipse two: though if the points H and I should come together, into one, the elliptic curve would become perfectly circular. But by how much greater the distance is betwixt those points, the same length of the thread fill remaining; by so much the farther is this figure removed from the circular. So that according to the divers proportion of the distance HI to the thread BHI, or to the line DK, which is equal to the same thread, divers species of ellipses will be described.

But then, if the length of the thread be increased or diminished, in the same proportion as the distance of the points H and I is increased, or diminished, there will indeed be described divers ellipses, but all of the same species: whence it appears, that ellipses are not only innumerable in magnitude, but in species also; and reach from a circle to a right line: for, as when the points H and I meet together, the ellipse becomes a circle; so, when they are removed from each other half the length of the thread, it becomes a right line, both sides meeting together.

Whence also it appears, that every species of ellipses is no less different from any other, than the extremes of them are different on this side from a circle, and on that from a right line. It also appears from this delineation, that if from a point taken at pleasure in the elliptick periphery, as the point B, you draw two lines to the two central points; these two lines BH and BI, taken together, will be equal to the greatest diameter DK; and consequently, that the sum of them is always given.

In the ellipse DFKR (fig. 14.) the point C is called the *center*, the points H and I the *foci*, DK the *greater axis*, or *transverse axis*, or the *principal diameter*, or *latus transversum*; and FR the *lesser axis*: all the right lines passing through the center C are *diameters*; and all right lines terminated at the periphery, and divided into two equal parts by any diameter, are called *ordinates*. That part of every diameter intercepted betwixt the vertex thereof, and the ordinate, as M μ , is called the *abscissa* thereof. A line drawn from the vertex of the diameter, parallel to the ordinates thereof, as a θ , is a *tangent* to the ellipse.

is in that vertex. A diameter parallel to the ordinates of another diameter, is termed a *conjugate diameter*; and the ordinate to the greater axis, which passes through either of the foci, as MA, (fig. 13.) is termed the *principal latus rectum*, or the *parameter* of the greater axis. See CENTER, FOCUS, AXIS, DIAMETER, ORDINATE, PARAMETER, &c.

Properties of the Ellipsis.—1^o. The ordinates of every diameter are demonstrated to be parallel to each other.

2^o. The ordinates of the diameters or axes are perpendicular to the axes themselves; but the ordinates of the rest of the diameters are oblique to their diameters; and in ellipses of divers species, are so much the more oblique, at equal distance from the axis, by how much the proportion of the greater axis to the lesser is the greater; but in the same ellipse, so much the more oblique, by how much the more remote the diameters are from the axes.

3^o. There are only two conjugate diameters, which are equal each to other; viz. those whose vertices are at equal distances from the vertices of the axes: thus, the diameter VT (fig. 14.) is conjugate, and equal to that other GM; where VF is equal to MF, and VD equal to MK.

4^o. The obtuse angle VCM of these two diameters, which are conjugate and equal, is greater, and the acute angle VCG is less than every other angle contained under the rest of the diameters that are conjugate to each other.

5^o. If the lines μ P and ν B be semi-ordinates to any diameter, as MG, the square of the semi-ordinate μ P is to the square of the semi-ordinate ν B, as is the rectangle M μ \times ν G, to the rectangle M ν \times ν G; that is, ν P g is to the rectangle comprehended under the two parts, into which the diameter is divided by the ordinate KP, as ν B g is to the rectangle under the parts of the diameter made by the ordinate AB.

6^o. The parameter, or latus rectum of any diameter, is a third proportional to that diameter and its conjugate: that is, (in fig. 13.) if the diameter DK is to its conjugate diameter EF, as EF is to Y; then Y is the parameter or latus rectum of the diameter DK: whence AM, an ordinate to the axis through the focus, is, as above, equal to the principal parameter, and is a third proportional to the greater and lesser axis.

7^o. The square of every semiordinate, as MI, is always less than the rectangle made of any abscissis whatever, as IK, drawn into the latus rectum of its own diameter, or than IK \times Y. And in figure 14. P μ g is less than the rectangle made of the abscissis M μ , and the latus rectum of MG: from which defect, or excess, this section hath its name.

8^o. If from any point, as B, in figure 13. you draw the right lines BH and BI to the foci, the sum of them will be equal to the greater axis, as was shewed above: and if the angle IBH, comprehended by those lines, be bisected by the right line θ a, the line a is perpendicular to the tangent VB in the point B; that is, to the curve in the point of contact.

9^o. The distance of a body turned round in an ellipse, about the focus H, from the same focus, is the greatest of all in the point K; least of all in the point D; and mean in the points E and F; and that mean distance HF is equal to the greater half-axis DC or CK; as is manifest from the production of the ellipsis.

10^o. The vanishing subtense of the angle of contact, parallel to the distance from the focus, at an equal perpendicular interval from that distance, always remains given and unvaried in the same ellipse, yea, and in the same parabola and hyperbola too. Thus if dZ be always given, g d also will always remain given in a distance infinitely small.

11^o. The area of the ellipse is to the area of the circle circumscribed, as the lesser axis is to the greater; and so are all correspondent parts whatsoever among themselves, as MI K, m I K: and the ordinates to the greater axis, as MI, are divided by the elliptick periphery always in the same proportion, so that MI is to m I always in the same proportion; to wit, that of the lesser axis to the greater. And we are to reason in the same manner concerning a circle inscribed in an ellipse.

12^o. All parallelograms described about the conjugate diameters of the ellipse, and comprehending the ellipsis, are equal. Thus, the parallelogram a g γ d, fig. 14. is equal to the other parallelogram e ζ θ b; and thus it is every where.

13^o. If a right line always passing through one of the foci be so moved, that the elliptic area described by the same, is proportional to the time; the angular motion of a right line drawn from the other focus to the former line, will be almost equable: thus, in figure 13. if the angular motion of the line HB be so tempered, that the same being according to the reciprocal proportion of the distance accelerated or retarded, describes the area DHB, proportional to the time; the angular motion KIB about the other focus I, will be almost proportional to the time, and consequently without any notable acceleration or retardation, and nearly equable; that is to say, where the ellipse does not differ much from a circle.

Genesis of the Parabola.—Let DI be an infinite right line, and IL another perpendicular to it; (fig. 15.) then, taking in the line DI, any point F, let the line FI be bisected in the point T; and let there be taken two threads joined together in the point T, one TI, the other TF: and let a pin fixed to the threads in the point T be moved to the right and left, in such a manner, that

when the pin is in any other position, as in P, the thread T I, which here becomes P L, be always perpendicular to I L; or, which is the same thing, parallel to D I, but equal to the thread T F; which in this case becomes P F, ever passing through the point F.

The curve thus generated by the pin, infinitely produced both ways, is a parabola: in which $g P i T$ is $R o$, is called the *periphery*; I D the *axis*, or *principal diameter*; F the *focus*; the point T the *principal vertex*.

An ordinate to the axis through the focus, is equal to the principal latus rectum: all right lines $n i$, or R Z, parallel to the axis, are diameters, as dividing the lines $i b$ and K T, which are parallel to the tangents at their vertices, into two equal parts; and they are called diameters belonging to the vertices in which they terminate, as T, i.

Properties of the Parabola.—1°. Every diameter, or right line parallel to the axis, bisects all the lines within the figure, which are parallel to the tangent of the vertical point: and these bisected lines are called *ordinates*.

2°. The ordinates of the axis are perpendicular thereto; but the ordinates of the rest of the diameters are oblique to their diameters; and so much the more oblique, by how much the vertex of the diameter is further removed from the principal vertex of the parabola.

3°. The latus rectum, or parameter to every diameter, is a third geometrical proportional to any absciss, and its semi-ordinate; that is, if the latus rectum of the diameter $i n$, or that of the vertex i , be y ; then, as the absciss $i g$ is to the semi-ordinate $g k$, so is that semi-ordinate $g k$ to y .

4°. The principal latus rectum, or that belonging to the axis, is equal to the ordinate $b i$ passing through the focus; and quadruple of F T, the least distance of the focus from the principal vertex.

5°. The latus rectum belonging to any vertex or diameter, is also quadruple of the distance of that vertex from the focus: thus, the latus rectum of the vertex i is quadruple F i , and so it is every where.

6°. The distance of any vertex or point in the parabola whatever, from the focus, is equal to the least distance of the same from the line L L, which is perpendicular to the axis; and is distant from the principal vertex, by a quarter of the principal latus rectum.

7°. The square of every semi-ordinate, as $g k$, is equal to a rectangle made of the latus rectum, of the same vertex as Y, and $i g$ the absciss of the diameter of the vertex. And from the equality of the *περὶ τὸν ἀξὸς*, or comparison in the figure, betwixt the rectangle and the square of the semi-ordinate, without any excess or defect, the name of the section is derived.

8°. Since therefore the latus rectum in any diameter is given, the absciss will be as the squares, or in the duplicate ratio of the semi-ordinates. Thus, T F is to T G as i F g is to $g G$, and so likewise $i g$ to $i r$, as the square of $g T$ is to the square of $r l$: and thus every where. From whence, also, when the absciss of the axis is equal to the principal latus rectum, or fourfold of the distance from the vertex, it will be equal to its semi-ordinate.

9°. The angle, comprehended by any tangent whatever, and a line from the focus, is equal to an angle comprehended by the same tangent, and any diameter, or the axis. Thus, the angles I i F, and $p i n$ are equal: whence, by the way, all the rays of light which fall on the concave part of the surface, produced by the convolution of the parabola about the axis, which fall, we say, on the same parallel to the axis; will be reflected from a concave paraboloid figure to the focus F, and there beget a most vehement burning: from which property, the point F has the name *focus*, and has communicated the same to the like points in the hyperbola and ellipsis.

10°. A parabola, like an hyperbola, does not inclose a space, but stretches out in infinitum.

11°. A parabolic curve always tends more and more, in infinitum, to a parallelism with its diameters; but can never arrive thereat.

12°. If two parabolas be described, with the same axis and vertex; the ordinates to the common axis will be cut off by the parabola in a given proportion; and the areas comprehended by the same axis and ordinate, and the respective curves, will be in the same given proportion to one another.

13°. Every parabolic space comprehended betwixt the curve and the ordinate, is to the parallelogram made of the same base and altitude, in a subquadrilateral proportion; that is, as 2 is to 3; and to the external space in a duplicate proportion, or as 2 is to 1: so $g i T$ is to $g i I$, as 2 is to 3; and to I T as 2 is to 1. From whence it becomes easy to square the parabola.

14°. The distance between the vertex of the axis, and the point where any tangent intersects it, as I, is equal to the absciss of the axis which belongs to the ordinate applied from the point of contact: so T I is equal to T F; and thus it is every where.

15°. All parabolas are like, or of the same species; as are also all circles.

16°. If a diameter be continued through the point of concurrence of two tangents; this diameter will bisect the line that joins the contacts: which property of the parabola may likewise be understood of the ellipsis, and hyperbola.

Genesis of the Hyperbola.—Suppose a staff or rule of a sufficient length, as I B, (fig. 16.) let I and H be two central points, answering to the foci of an ellipsis, in which let nails be fastened; then, there being tied to one end of the stick, a rope or thread as long again as the stick, let the other end thereof be bored through, and so fixed upon the nail I; and fix the other end of the rope, by a knot, upon the other nail H: which done, laying your finger on the point B, where the rope and staff are tied together, let your finger defend so long, till you have thereby applied, and joined the whole rope to the staff, or rule; the staff having been in the mean while, as it needs must, wheeled about the centre I. Thus, with the point B, the vertex of the angle H B I, you will have described a curve line X B D, which is part of an hyperbola; the whole consisting of that curve which will result from the curve X B D, which hath added to it the curve Y D, the produce of the rule and work, as turned to the other side.

Further, transferring the hole, or knot of the rope to the nail I, and fastening the end of the staff on the nail H, you will describe another hyperbola, vertically opposite to the former, which will be altogether like and equal thereto. But if, without changing any thing in the rule and nails, you only apply a longer rope; you will have an hyperbola of a different species from the former: and if you still lengthen the rope, you will have still other sorts of hyperbolas; till at length, making the rope double the length of the rule, you will have the hyperbola changed into a right line.

But if you alter the distance of the nails, in the very same proportion in which you change the difference betwixt the length of the rope, and that of the stick; in this case you will have hyperbolas marked out, which are altogether of the same species, but have their similar parts differing in magnitude.

Lastly, if the length of the rope and rule be equally increased, their difference in the mean while, and the intervals of the nails remaining the same; not a different hyperbola, either as to species or magnitude, will be described, nor any other than a greater part of the same hyperbola.

It must be owned, however, that many properties of an hyperbola are better known from another manner of generating the figure, which is as follows: Let L L and M M, (fig. 17.) be infinite right lines intersecting each other at any angle whatever, in the point C: from any point whatever, as D or e , let D c D d be drawn parallel to the first lines; or $e c e d$; which, with the lines first drawn, make the parallelograms, as D c C d, or $e c C d$. Now, conceive two sides of the parallelogram, as D c D d, or $e c e d$, to be so moved, this way and that way, that they always keep the same parallelism; and that at the same time the areas always remain equal; that is to say, that D c and $e c$ remain always parallel to M M; and D d or $e d$ always parallel to L L; and that the area of every parallelogram be equal to every other, one side being increased in the same proportion wherein the other is diminished: by this means, the point D or e will describe a curve-line within the angle comprehended by the first lines; which is altogether the same as that described above. So also in the angle vertically opposite will be described a like and equal hyperbola; if the parallelogram C c K d, equal to the former, be supposed to be moved, in the same manner as before: which hyperbolas are, as was said before, called *opposite sections*, or *opposite hyperbolas*.

In each figure, D K is the *transverse axis*, or *transverse diameter* of the hyperbola or the opposite sections; the point C the *centre*; H and I the *foci*. In the latter figure, all the lines passing through the centre C, as $i b$, are *diameters*: but if hyperbolas be described in the following angles, as L C M, M C L, those sections will be called *following sections*: and if the distance of the primary vertex of those hyperbolas from the common centre C, as C B, or C γ , be equal to the semi-tangent K γ or K α , at the primary vertex of these, those sections are called *conjugate sections*: and all the figures together form the *hyperbolic system*.

Further, $i b$ the ordinate to the axis through the focus, is equal to the principal latus rectum, or the parameter of the axis; and an indeterminate diameter which is parallel to the ordinates of any determinate diameter, is called the *conjugate diameter* of the same.

Properties of the Hyperbola.—1°. Any diameter or right line passing through the centre, bisects all its ordinates; that is, all the right lines which are terminated on both sides by the hyperbolic periphery.

2°. The ordinates of the axis are perpendicular to the same; but the ordinates of the rest of the diameters are oblique to their diameters: and so much the more in divers species, at equal distances from the axis, by how much the difference of the angles including the hyperbola's is the greater: and in the same hyperbola, so much the more oblique, by how much the diameters are further removed from the axis.

3°. If any lines, as H b and Q γ , be semiordinates to any diameter whatever, as K D; the square of the semi-ordinate H γ , is to the square of the semi-ordinate Q γ , as the rectangle K H D H is to the rectangle K Q D Q; and so the square $b n$ is to the square $a K$, as the rectangle $i b b \gamma$ is to the rectangle $i a b a$: and thus every where.

Fig. 30 Hyperbola

4^o The latus rectum, or parameter of every diameter, is a third geometrical proportional to the diameter, and the conjugate thereof (or its tangent, which is equal to it): that is, if the latus rectum of any diameter, as DK, be y ; then, as the diameter DK is to its conjugate $\beta\gamma$, or is equal $\alpha\gamma$; so is that conjugate $\beta\gamma$, or that tangent $\alpha\gamma$ to y . And as the ordinate to the axis through the focus is the principal latus rectum, so it is more than double of the least distance of the focus from the vertex.

5^o The square of any semi-ordinate, as Qr, is greater than a rectangle made of the absciss DQ, drawn into the latus rectum of its own diameter, as y : and, in like manner, the square of the semi-ordinate bn , is greater than the rectangle of the absciss ib , into the latus rectum of the diameter bi . From which $\alpha\gamma\beta\alpha n$, or excels, this section hath its name.

6^o If from any point of the hyperbola, as B, (fig. 16.) there be drawn right lines to both the foci, as BH, BI, the difference of these lines will always be equal to the axis DK; as will easily appear from the delineation itself.

7^o If the angle HBI, comprehended by lines drawn to the foci, be bisected by the right line EB, that right line will be a tangent to the hyperbola in the point B.

8^o The right lines LL and MM, (fig. 17.) which inclose the hyperbola's, are asymptotes of the hyperbola's; that is, they are such, to which, on both sides, the curve approaches nearer and nearer, but is never able to touch or coincide therewith.

9^o The species of hyperbola's are various, according to the different magnitude of the angle LCM, comprehended by the asymptotes; but that angle remaining the same, the species of the hyperbola remains unchanged: yet according to the different magnitudes of the parallelograms, by which hyperbola's are described, hyperbola's of divers magnitudes do arise: if the angle contained by the asymptotes be a right angle, the hyperbola is called *equilateral*, or *rectangular*; and the latus rectum of all the diameters will (as in a circle) be equal to the diameters.

Lastly, if hyperbola's be described about the same axis in divers angles of the asymptotes, the right lines perpendicular to the axis will be cut off in a given proportion by them all; and the spaces likewise inclosed by the right lines, or ordinates, the produced axis, and the curves, will be in the same given proportion.

10^o If the distances from the center of the hyperbola, be taken in a geometrical proportion in one of the asymptotes, so that CI, CH, CH, CIV, CV, CVI, be in continued geometrical proportion; and if from those points there be drawn parallel to the other asymptote the lines, I 1, II 2, III 3, IV 4, V 5, VI 6, the spaces I 2, II 3, III 4, IV 5, V 6, will be equal among themselves. And consequently, if that asymptote CM be supposed to be divided, according to the proportion of number exceeding one another in a natural series, those spaces will be proportional to the logarithms of all those numbers.

Common properties of all the CONIC Sections.—From the whole it may be gathered, 1^o That the *conic sections* are in themselves a system of regular curves, naturally allied to each other; and that one is changed into another perpetually, when it is either increased, or diminished, in *infinitum*.

Thus, the circle, the curvature thereof being never so little increased or diminished, passes into an ellipse; and the ellipse, its centre going away infinitely, and the curvature being by that means diminished, is turned into a parabola, and when the curvature of the parabola is never so little changed, there ariseth the first of the hyperbola's; the species whereof, which are innumerable, will all of them arise orderly by a gradual diminution of the curvature; till the curvature vanishing away, the last hyperbola ends in a right line perpendicular to the axis. From whence it is manifest, that every regular curvature, like to that of a circle, from the circle itself to a right line, is a conical curvature, and is distinguished with its peculiar name, according to the divers degrees of that curvature.

2^o That the latus rectum of a circle, is double to the distance from the vertex: that all the latera recta of ellipses, are in all proportions to that distance betwixt the double and quadruple, according to their different species: that the latus rectum of the parabola is just quadruple of that distance; and, lastly, that the latera recta of hyperbola's are in all proportions beyond the quadruple, according to their various kinds.

3^o That all diameters in a circle and ellipsis, intersect one another in the centre of the figure within the section: that in the parabola they are all parallel amongst themselves, and to the axis; but that in the hyperbola they intersect one another, but this without the section, in the common centre of the opposite sections.

4^o That the curvature, with respect to the focus, in all these figures, is increased or diminished proportionally.

CONICKS, that part of the higher geometry, or geometry of curves, which considers the cone, and the several curve lines arising from the sections thereof. See **GEOMETRY**.

Similar CONIC sections. See the article **SIMILAR**.

CONIFEROUS, a term applied to such trees, shrubs, or herbs, as bear a squamous or scaly fruit, of a woody substance, and a figure approaching to that of a cone; in which there are usually many seeds, and when they are ripe, the several cells or partitions in the cone gape or open, and the seeds drop out.—

Of this kind are the fir, the pine, beech, and the like.

CONJOINT, or **CONJUNCT**, is applied in the antient musick, in the same sense as *consonant*, to two or more sounds heard at the same time. See **CONSONANCE**.

CONJOINT degrees, two notes which immediately follow each other in the order of the scale; as *ut* and *re*.

CONJOINT tetrachords, are two tetrachords, where the same chord is the highest of the one, and the lowest of the other. See **CHORD**.

CONISOR, or **COGNISOR**, in law, is used in the passing of fines, for him that acknowledges the fine. See **FINE**.

He to whom the fine is acknowledged, is called the *cognizer*, or *confee*.

CONJUGATE diameter, or *axis*, in conicks, is a right line bisecting the transverse diameter. See **DIAMETER**, **CONIC section**, and **AXIS**.

CONJUGATE axis, of an ellipsis, is the shortest diameter, or axis, bisecting the longer, or transverse axis.—Such is F F, Tab. *Conicks*, fig. 31.

It is demonstrated, 1^o. That in an ellipsis, the *conjugate axis* is a mean proportional between the transverse axis and the parameter. 2^o. The square of the *conjugate axis*, is to that of the transverse, as the square of the semi-ordinate is to the rectangle of the segments of the axis. 3^o. That a right line drawn from the focus to the extremity of the semi-conjugate axis, is equal to the transverse semi-axis.

Hence, the *conjugate axes* being given, the focus is easily determined. See **FOCUS**. And the ellipsis thence easily described.

CONJUGATE axis, in an hyperbola, is a mean proportional between the transverse axis and the parameter.

It is thus called, because the *conjugate axis* of an ellipsis has the same ratio.—In an hyperbola, the square of the *conjugate axis*, is to the square of the transverse, as the parameter to the transverse axis.

CONJUGATION, in grammar, an orderly distribution of the several parts, or inflexions of verbs, in their different moods and tenses, to distinguish them from each other.

The Latins have four *conjugations*, distinguished by the terminations of their infinitive, *are, ere, ere, ire*; and most of the French grammarians reduce the *conjugations* of their language to the same number; ending in *er, re, ir, and sir*.

In English, where the verbs have scarce any natural inflections, but derive all their variations from additional particles, pronouns, &c. we have hardly any such thing as strict *conjugations*. See **MOOD**.

CONJUGATION, in anatomy, is understood of a pair of nerves; or two nerves, arising together, and serving for the same operation, sensation, or motion; there being scarce any nerve in the body without its fellow. See **NERVE**.

The ancient physicians only knew of seven pairs, or *conjugations* of nerves; the moderns have discovered thirty new ones. See **CONJUNCT**. See the article **CONJOINT PAIR**.

CONJUNCT sentence. See the article **SENTENCE**.

CONJUNCTION, in astronomy, the meeting of two stars, or planets, in the same optical point of the heavens, *i. e.* in the same degree of the zodiac.

If the two bodies meet both in the same degree of longitude and latitude, a right line drawn from the eye through the centre of one of them, passes through that of the other; and the *conjunction* is said to be *true*.

If the lower hides the upper, the *conjunction* is said to be *corporal*; and if the same right line, continued back from the two centres through the eye, do also pass through the centre of the earth, the *conjunction* is said to be *central*.

If the line pass wide of the centre of the earth, the *conjunction* is said to be *partile*.

If the bodies do not meet precisely in the same degree, but are joined with some latitude, the *conjunction* is said to be *apparent*.

—Thus, when a right line, supposed to be drawn through the centres of two planets, does not pass through the centre of the earth; but through the eye of the spectator: it is said to be an *apparent conjunction*.

Conjunctions are also divided into *great* and *greatest*: *great conjunctions* are those which only happen at considerable distances of time from each other; as that of Saturn and Jupiter, which happens every twenty years.

Greatest conjunctions are those which happen in times very remote; as the *conjunction* of the three superior planets, Mars, Jupiter, and Saturn, which only return once in 500 years. But this division has little place in astronomy; being founded on the notion of the particular influences, &c. of the heavenly bodies in such and such aspects.

Astrologers maintain, that the deluge was owing to a *conjunction* of all the planets in Capricorn; and that the conflagration will be occasioned by their *conjunction* in Cancer: whence they pretend to foretel the end of the world.

The *conjunction* is the first, or the principal of all the aspects; and that whence the other aspects commence; as opposition is the last, where they terminate.

The moon is in *conjunction* with the sun every month. See **MOON**, and **MONTH**.—Her *conjunctions* and oppositions are called by a general name, *syzygies*.

Eclipses of the sun never happen, but when there is a *conjunction* of the sun and moon in the nodes of the ecliptic.

CONJUNCTION, in grammar, a particle which expresses a relation or dependance between words, and phrases; thus called, because serving to join, or connect the parts, or members of a discourse.

The *conjunction* is the sixth of the eight vulgar parts of speech.

Conjunctions render the discourse more smooth and fluent; and serve very good purposes in the argumentative, and narrative style; but they must ever be omitted where a person speaks with emotion, as only serving to weaken and enervate it. Boileau observes, that nothing gives more warmth and life to a discourse, than to drop the *conjunctions* or copulatives: a passion, adds he, embarrassed with *conjunctions* and useless particles, loses all the fire and vehemence it would get in its progress.

Conjunctions are of various kinds.—*Copulative* or *conjunctive* **CONJUNCTIONS**, are those which express a relation of union, or comparison between things: as, *and*, *et*; *only*, *tantum*; *as much as*, *tantum quantum*; *in the same manner as*, *quemadmodum*; *neither more nor less*, *tantumdem*; *inasmuch as*, *quippe*; *not only*, *but also*, *non modo*, *sed etiam*, &c.

CONJUNCTIONS adversative, those which express a restriction, or contrariety.—*As*, *but*, *sed*; *nevertheless*, *tamen*; *although*, *etiamsi*; *far from*, *adeo non*.

CONJUNCTIONS causal, those which shew that the reason of something is brought.—*As*, *for*, *nam*; *because*, *quia*; *seeing*, *quippe*; *the rather since*, *eo magis quo*; *inasmuch as*, *quatenus*.

CONJUNCTIONS conclusive, those which denote a consequence drawn.—*As*, *for which reason*, *quapropter*; *but then*, *atque*; *of consequence*, *ideoque*; *so that*, *ita ut*, &c.

CONJUNCTIONS conditional, are those which import a condition.—*As*, *if*; *si*; *if not*, *si minus*; *on condition that*, *ea lege ut*; *provided that*, *admodum*; *in case of*, *si vero*.

CONJUNCTIONS continuative, those which express a succession, or continuation of the discourse.—*As*, *in effect*, *reipsa*; *even*, *etiam*; *whatever it be*, *quicquid sit*.

CONJUNCTIONS disjunctive, those which express a relation of separation or division.—*As*, *neither*, *neq*; *whether*, *sive*; *or*, *vel*. See **DISJUNCTIVE**.

CONJUNCTIONS dubitative, those which express some doubt, or suspension of opinion.—*As*, *if*; *that is to say*, *id est*, &c.

EXCEPTIVE CONJUNCTIONS are, *if it be not*, *nisi si*; *unless that*, *nisi*, &c.

CONJUNCTIVA, *tunica*, *adnata*, or *albaignea*, in anatomy, the outermost coat, or membrane of the eye; so called, because it incloses all the rest; or because it fastens the eye in its orbit.

It is very smooth, when found, and is of a white colour, like alabaster; whence it is ordinarily called the *white of the eye*.

It is said to have its rise from the pericranium, and to be only a continuation or extension thereof.

It does not invest the globe of the eye intire; but terminates at the edge of the scleroticæ.

It is covered with a vast number of fine veins and arteries, which never appear, unless when the motion of the blood is more than usually rapid, as in ophthalmia's; or when the vessels are more full and distended than ordinary, as in drunkenness.

CONJURATI fratres. See the article **FRATRES**.

CONJURATION, magic words, characters or ceremonies, whereby evil spirits, tempests, &c. are supposed to be raised, or driven away.

The Romish priests pretend to expel devils, by preparing holy water in a particular manner, and sprinkling it over the possessed, with a number of *conjurations*, and exorcisms.

Some authors make the difference between *conjuratio* and *witchcraft* to consist in this; that the former effects its end by prayers, and invocation of God's name, &c. to compel the devil to do what is desired; so that the conjuror is supposed to be at war with the devil, and that evil spirit to act merely out of constraint: whereas the latter attains its end by an immediate application to the devil himself; and the devil's compliance is supposed to be the consequence of some compact between them: so that the devil and the witch have a good understanding with one another.

But these, again, differ from *enchantment* and *sorcery*; in that these latter are pretended to operate secretly, and slowly, by spells, charms, &c. without ever calling on the devil, or having any conference with him. See **CHARM**, &c.

CONN, in the sea-language. See **COND**.

CONNECTION, or **CONNEXION**, a relation whereby one thing adheres to, or depends on another.

Euclid's propositions have such a *connection* among themselves, that the latter cannot subsist without the former.—Philosophers are at a loss as to the manner of the *connection* between soul and body; between causes and effects, &c.

CONNECTION, or *continuity* in the drama, consists in the joining of the several scenes together.

When the scenes of an act succeed one another immediately, and are so joined as that the stage is never left empty, the *connection* is said to be observed.

CONNER.—**ALE-CONNER**. See the article **ALE-CONNER**.

CONNIVENTES *valvulae*, in anatomy, wrinkles, or corrugations in the inner coat, or membrane of the two large intestines, the jejunum and ileum.

They are formed as the rugæ of the stomach, *viz.* by the inner coat's being larger than the outer.

These folds, or corrugations, some anatomists imagine in some measure to do the office of valves; by straitening the passages, and consequently impeding the motion of their contents: by which means, the lacteals have the more time to imbibe the chyle. See **LACTEAL**, **CHYLE**, and **DIGESTION**.

CONNOISSEUR, a French term, of late used in English: it literally denotes a person well seen and versed in any thing; being formed of the verb *connoître*, to know, understand.—Hence it comes to be used in our language for a critic, or person who is a thorough judge, or master in any way; particularly in matters of painting, and sculpture.

CONOID, **CONOIDES**, in geometry, a solid body, resembling a cone, except in this, that instead of a perfect circle for its base, it has an ellipsis, or some other curve approaching thereto.

The *conoid* is produced by the entire circumvolution of a conic section around its axis; and according to the denomination of the section from whence it is generated, it is differently denominated: if, *v. gr.* the solid be produced by the motion of a parabola, it is called a *parabolic conoid*; if by that of an hyperbola, an *hyperbolic conoid*; and an *elliptic conoid*, or a *spheroid*, when produced by the rotation of an ellipsis, around one of its axes.

The famous solid of the least resistance, Sir Isaac Newton, M. Fatio, and the marquis de l'Hopital, have demonstrated to be a *conoid*.

CONOIDES, or **CONARIUM**, is a name given by anatomists to a gland found in the third ventricle of the brain, resembling a pine-apple; whence M. Des Cartes called it *pinealis*; and has fixed there the seat of the rational soul. See **PINEAL gland**.

CONSANGUINITY, the relation of kinship, between persons of the same blood, or sprung from the same root.

Marriage is prohibited by the church, to the fourth degree of *consanguinity*, inclusive; but by the law of nature, *consanguinity* is no obstacle to marriage, except it be in the direct line.

Consanguinity terminates in the sixth and seventh degree, excepting in the succession to the crown; in which case, *consanguinity* is continued to infinity.

The civilians call *fratres consanguinei*, those born of the same father; in opposition to *fratres uterini*, who are, only born of the same mother.

According to the common opinion, these were not allowed to complain of an inofficious testament, *i. e.* of being disinherited without cause; excepting from the turpitude of the person appointed heir in their place. But Van Water endeavours to shew the contrary; and urges, that the *consanguinei* might plead inofficiousity, even where the testament was not made in favour of a person incapable.

CONSCIENCE, **CONSCIOUSNESS**, in ethics, a secret testimony or judgment of the soul, whereby it gives its approbation to things it does that are naturally good; and reproaches itself for those that are evil.

Or, *conscience* is a dictate of the understanding power, concerning moral actions; considered as it has the knowledge of laws; and consequently as conscious of what is to be done, or not done, with regard to the legislator.

In the more popular sense of the word, *conscience* is a judgment, either true or false, whereby we pronounce a thing good or evil. This makes what we call the *inner forum*, or tribunal. Some divines maintain, that *conscience* is infallible; and hold it to be that immutable law whereby God will judge men: they deny that the understanding can be the source of errors, and lay them all at the door of the will. A man, say they, may secure himself from error, by forbearing to judge of things till he have a clear and distinct perception thereof.

Some of the schoolmen distinguish between the *conscience* antecedent to an action, and that consequent thereto: the first, called *antecedent conscience*, determines what is good and what evil; and consequently prescribes what is to be done, and what avoided.

Consequent conscience is a kind of secondary or reflex judgment, with regard to the goodness, &c. of things already done or committed.

The rule of *conscience* is the will of God, so far as it is made known to us, either by the light of nature, or by that of revelation.

With respect to the knowledge of this rule, *conscience* is said to be *rightly informed*, or *mistaken*; *firm*, or *wavering*, or *scrupulous*, &c.—With respect to the conformity of our actions to this rule when known, *conscience* is said to be *good*, or *evil*, &c.

Philosophers, in lieu of the word *conscience*, which seems appropriated to theological matters, ordinarily use that of *consciousness*; whereby they mean an inner sentiment of a thing, whereof one may have a clear and distinct notion.—In this sense, they say, that we do not know our own soul, nor are assured of the existence of our own thoughts, otherwise than by *self-consciousness*.

CONSCRIPT, **CONSCRIPTUS**, a popular term in the Roman history, used in speaking of senators, who were called *conscript fathers*, *patres conscripti*; by reason that their names were written in the register, or catalogue of the senate.

Livy, l. i. c. 1. tells us, that when Brutus filled up the places of the senators cut off by Tarquin, with others chosen out of the equestrian order, those new senators only had the appellation given them of *patres conscripti*. But it is certain, that in after-times, all the senators were called *patres conscripti* without any distinction.

CONSECRATION, the act of converting, or setting apart any profane, or common thing, to a pious purpose; with certain ceremonies, prayers, benedictions, &c. appropriate thereto.

Consecration is the reverse of sacrilege and profanation, which consist in perverting a thing set apart for a pious purpose, to a profane and popular one.

The bishop *consecrates* a church, or a chalice; the pope *consecrates* medals, agnus dei's, &c. and grants indulgences to those who bear them about them with devotion.

The *consecration* or dedication of a church, is an episcopal ceremony, consisting in a great number of benedictions, with aspersions and unctions of chrism, &c. on the walls, both within and without.

The custom of *consecrating* persons, temples, altars, vestments, utensils, &c. is very ancient; and all the ceremonies thereof are prescribed under the old law. Under the new law, when those *consecrations* relate to men, and are performed by appointment of Jesus Christ, they are properly called *ordinations*; excepting those performed to bishops and kings, which still retain the name of *consecration*.

Those which only consist in a ceremony instituted by the church, are more properly called *benedictions*. See **BENEDICTION**.

When they regard churches, altars, vessels, &c. they are properly called *dedications*. See **DEDICATION**.

CONSECRATION is particularly used for the benediction of the elements in the eucharist.

The Romanists define it, the conversion of the bread and wine into the real body and blood of Jesus Christ: and that this is the sentiment of their church, is evident from the priest's elevating the host immediately after *consecration*, for the people to adore it. See **ELEVATION**, &c.

There is a great controversy between the Latin and Greek churches, touching the words of *consecration*: the common opinion among the Romanists, agreeable to St. Thomas and the schoolmen, is, that the *consecration* of the bread and wine consists in these words, *This is my body; this is my blood*. The Greeks, on the contrary, attribute the change of the elements to a certain prayer which they call the *invocation of the Holy Ghost*, rehearsed after the words *this is my body, this is my blood*, which the Greeks maintain are only necessary in the process of the *consecration*, as they contain the history of the institution; not as they contribute any thing to the change.

CONSECRATION, among medalists, is the ceremony of the apotheosis of an emperor; or his translation into heaven, and reception among the gods: the process whereof, see under **APOTHEOSIS**.

On medals, the *consecration* is thus represented; on one side is the emperor's head, crowned with laurel, sometimes veiled, and the inscription gives him the title of *divus*: on the reverse is a temple, a bustum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus: at other times the emperor is seen in the air, born up by the eagle; the inscription always, **CONSECRATIO**.

These are the usual symbols: yet on the reverse of that of Antoninus, is the Antonine column.—In the apotheosis of emperors, instead of an eagle there is a peacock.

For the honours rendered these princes after death, they were explained by the words *consecratio*, *pater*, *divus*, and *deus*.—Sometimes, around the temple or altar are put, *memoria felix*, or *memoria eterna*: for princelices, *aeternitas*, and *sideribus recepta*; on the side of the head, *dea*, or *Dea*.

CONSECTARY, a proposition that follows, or is deduced from some preceding definition, lemmata, axioms, conclusions, or the like.—Some rather chuse to call it a *consequence*; and others a *corollary*, &c.

CONSECUTIVELY, **CONSECUTIVE**, in the school-philosophy, is sometimes used in opposition to *antecedently*, and sometimes to *effectively*, or *causally*.

Thus, say the schoolmen, the corruption of one thing is the generation of another, not *effectively*, but *consecutively*: that is, since matter cannot be without form, it is necessary that the generation of one thing follow upon the corruption of another.

CONSENT of parts, in the animal oeconomy, a certain agreement, or sympathy, by means whereof, when one part is immediately affected, another, at a distance, becomes affected in like manner.

This mutual accord, or *consent*, is doubtless effected by the commerce of the nerves, and their artful distribution and ramification throughout the body.

The effect is so sensible, as even to come under the physicians

cognizance: thus, the stone in the bladder, by vellicating the fibres there, will pain and draw them so much into spasm, as to affect the coats of the bowels in the same manner, by the inter-mediation of nervous threads, and make a colic there; and also extend their twitches sometimes as far as the stomach, and occasion grievous vomitings: the remedy, therefore, in such cases, is to regard the part originally affected, how remote and grievous soever may be the consequences and symptoms in other places.

The fifth conjugation of nerves branched to the parts of the eye, the ear, those of the mouth, cheeks, præcordia, and parts adjacent, &c. is supposed by naturalists to be the instrument of that particular and extraordinary *consent* between those parts. Hence it is, that a savoury thing seen or smelt, excites the appetite, and affects the glands and parts of the mouth; that a shameful thing seen or heard, affects the cheeks with blushes; on the contrary, if it please, it affects the præcordia, and excites the muscles of the mouth and face to laughter; if it grieve, it affects the glands of the eyes, so as to occasion tears, and the muscles of the face, putting them into an aspect of crying.

Dr. Willis, quoted by Mr. Derham, imputes the pleasure of kissing, and its effects in exciting love, and even lechery, to this pair of nerves; which being branched both to the lips and the genital parts, when the former are affected, an irritation is occasioned in the latter: and Dr. Sachs judges it to be from the *consent* of the labia uteri with the labia oris, that a breeding lady, frightened with the sight of scabby lips, had puffsules of the like kind broke out in the labia uteri.

CONSEQUENCE, in philosophy, the conclusion of a reasoning, or argument.

The two premises of a syllogism being granted, the *consequence* must also be granted.

In a more restrained signification, *consequence* is used for the relation or connection between two propositions, whereof one follows, or is inferred from the other.—Thus: *It is an animal, and therefore feels*.

CONSEQUENT, the last proposition of an argument; being something deduced or gathered from a preceding argumentation. An enthymeme only contains two propositions, the *antecedent*, and *sequela*, or *consequent*: if the antecedent be absurd, the *consequent* must be so too.

CONSEQUENT, in a more precise sense, is used for the proposition which contains the conclusion, considered in itself, and without any regard to the antecedent: in which sense, the *consequent* may be true, though the consequence be false. For instance; virtue ought to be rewarded; therefore temperance is a virtue.

CONSEQUENT of a ratio, in arithmetick, the latter of the two terms of a ratio; or that to which the antecedent is referred. See **RATIO**, and **PROPORTION**.

Thus, in $a : b$, or $a \text{ to } b$, b is the *consequent*, a the antecedent.

CONSERVATIVE Suture. See the article **SUTURE**.

CONSERVATOR, an officer established for the security and preservation of the privileges granted some cities, and communities; or, a person who has a commission to judge of, and decide, the differences arising among them.

In most catholic universities, there are two *conservators*; the *conservator* of royal privileges, or those granted by kings; and the *conservator* of apostolical privileges, or those granted by the pope.

The first takes cognizance of personal and mixt causes, between the regents, students, &c. and the latter of spiritual matters between ecclesiastics.

Antiently, there were appointed *conservators* of treaties of peace between princes; which *conservators* became judges of the infractions made on a treaty, and were charged with the procuring satisfaction to be made. These were usually the feudatories of the several powers.

In lieu of *conservators*, princes now have recourse to other indifferent princes to guarantee their treaties. See **GUARANTEE**.

CONSERVATOR of the peace, in our antient customs, was a person who had an especial charge, by virtue of his office, to see the king's peace kept.

Till the erection of justices of the peace by king Edward III. there were several persons who by common law were interested in keeping the same: some having that charge as incident to other offices; and others simply, or of itself, called *custodes*, or *conservators of the peace*. See **JUSTICE**.

The chamberlain of Chester is still a *conservator* in that county; and petty constables are, by the common law, *conservators*, &c. in the first sense.

CONSERVATORY, in gardening. See **GREEN-HOUSE**.

CONSERVE, in pharmacy and confectionary, a dry confect, or form of medicine, or food, contrived to preserve the flowers, leaves, roots, peels, or fruits of several simples, as near as possible to what they were when fresh gathered; and to give them an agreeable taste.

Physicians, under the name of *conserves*, commonly comprehend all kinds of confects of flowers, fruits, roots, seeds, barks, &c. both liquid and dry.

Conferues are made by beating up the thing to be preserved, with sugar; viz. a triple quantity thereof to those which are most moist, and corruptible, and a double quantity to such as are least so.

Thus, e. gr. to make *conferus* of roses, rosemary flowers, sage-flowers, or the like; they pound them in a stone mortar, and when pounded, put to them fine sugar, and beat the whole well together. For fruits, as currants, &c. they set them on the fire to make them yield their juice, then drain and strain them, and thicken what comes from them over the fire, and add to it the sugar. This last sort of *Conferus* is particularly called a jelly.

CONSIDERATION, in law, the material cause, or quid pro quo of any contract, and without which no contract is obligatory or binding.

This *consideration* is either *expressed*; as if a man bargain to give ten guineas for a horse; or *implied*, when the law it self enforces a *consideration*; as if a man coming into an inn, take meat, drink, and lodging for himself and horse, the law presumes he intends to pay for them, though there be no express contract between him and his host; and if he discharge not the house, the host may stop his horse.

CONSIGNMENT, or **CONSIGNATION**, the depositing any sum of money, bills, papers, or commodities, in sure hands; either by order of a court of justice, in order to their being delivered to the persons to whom they are adjudged; or voluntarily, in order to their being remitted to the persons they belong to, or sent to the places they are destined for.

CONSIGNMENT of Goods, is the delivering, or making them over to another.—Thus, goods are said to be *consigned* to a factor, when they are sent to him to be sold, &c. or when a factor sends back goods to his principal, they are said to be *consigned* to him. See **FACTOR**.

CONSIMILI Casu. See the article **CASU**.

CONSISTENCE, a state of rest, wherein things capable of growth, or decrease, continue for some time at a stand, without either.

The term is particularly used with regard to trees, for the acme, or age beyond which they do not grow, and yet at which they do not decline.

Thus we distinguish three states or stages of a tree; its growth, *consistence*, and return: and these are common to all trees, even fruit-trees.

The *consistence* of an oak, is from 50 to 160 years: some, however, hold that their *consistence* only commences from 100 years; asserting that they grow till that time, and that they continue in that state of perfection to 200 years of age.

CONSISTENCE, in physics, is that state of a body wherein its component particles are so connected, or entangled among themselves, as not to separate or recede from each other.

Consistence only differs from *continuity* in this, that *consistence* implies a regard to motion or rest, which continuity does not; it being sufficient to denominate a thing *continuous*, that its parts are contiguous to each other.

CONSISTENCE is particularly used with regard to bodies considered as they are more soft, or more hard, more liquid, or more dry.

Forms of medicines, as electuaries, lambatives, bolus's, syrups, unguents, &c. differ chiefly in *consistence*.

CONSISTENT Bodies, is a term much used by Mr. Boyle for such as we ordinarily call *firm*, or *fixed bodies*; in opposition to *fluid* ones.

That author has a particular essay of the *atmosphere of consistent bodies*; wherein he shews, that all, even solid, hard, ponderous, and fixed bodies, do exhale or emit effluvia to a certain space all around them.

CONSISTORIAL Advocate. See the article **ADVOCATE**.

CONSISTORY*, or **Roman CONSISTORY**, denotes the college of cardinals; or the pope's senate, and council, before whom judiciary causes are pleaded.

* Du Cange derives the word from *consistorium*, i. e. *locus ubi consistitur*; used chiefly for a vestibule, gallery, or antechamber, where the courtiers wait for admission; and called *à consensu* *multitudine*.

The *consistory* is the first court, or tribunal of Rome: it never meets but when the pope pleases to convoke it: the pope presides in it in person, mounted on a magnificent throne, and habited in his pontificalia; on the right are the cardinal-bishops and priests, and on the left the cardinal-deacons. See **CARDINAL**.

The place where it is held, is a large hall in the apostolical palace, where princes and ambassadors of kings are received.

The other prelates, protonotaries, auditors of the rota, and other officers, are seated on the steps of the throne; the courtiers sit on the ground; ambassadors on the right, and *consistorial* and fiscal advocates behind the cardinals.

Besides the public *consistory*, there is also a private one, held in a retired chamber, called the chamber of *papegay*; the pope's throne here being only raised two steps high.

No body is here admitted but the cardinals, whose opinions are collected, and called *sentences*. Here are first proposed and passed all bulls for bishopricks, abbeys, &c.

Hence bishopricks and abbeys, are said to be *consistorial benefices*; in regard, they must be proposed in the *consistory*, the annates be paid to the pope, and his bulls taken.

Antiently they were elective; but by the concordat which abolishes elections, they are appointed to be collated by the pope alone, on the nomination of the prince.

CONSISTORY was also the name of a court under Constantine, where he sat in person, and heard causes: the members of this court were called *comites*. See **COUNT**.

CONSISTORY is also used among the reformed, for a council or assembly of ministers and elders, to regulate their affairs, discipline, &c.

CONSISTORY, or **Court Christian**, in the English laws, is a council of ecclesiastical persons, or the place of justice in an ecclesiastical or spiritual court.

Every archbishop and bishop has a *consistory-court*, held before his chancellor or commissary, either in his cathedral, in some chapel, aisle, or portico belonging thereto; or in some other convenient place of his diocese, for ecclesiastical causes.

The spiritual court was antiently, in the time of the Saxons, joined with the county or hundred court: and the original of the *consistory* court, as divided from those courts, is found in a law of the conqueror, quoted by my lord Coke.

CONSOLATION, one of the places in rhetoric, wherein the orator endeavours to abate, and moderate the grief, or concern of another.

In *consolation*, a principal regard is to be had to the circumstances, and relations of the parties. Scaliger considers this exceeding well, *de arte poetica*: 'The *consolator*, says he, is either a superior,

'an inferior, or an equal; with regard, either to preferment,

'honour, wealth, wisdom, or age. Livia is therefore to comfort Ovid, in a manner very different from that wherein Ovid comforts Livia. Thus, as to authority, a father and son,

'Cicero and Pompey, are to conduct their *consolations* very differently: so in wealth; as if a client should undertake to

'comfort Crassus: in wisdom; as when Seneca comforts Polybius and his mother: as to age, there need no examples.

'A superior may interpose his authority, and may even chide: a wife man may even dispute; sentences will become him. Art

'inferior is to shew respect and affection, and own he had this from some wife or learned person: an equal to appeal to their

'common friendship.'

CONSOLE*, in architecture, a part or member projecting in manner of a bracket, or shoulder-piece; serving to support a cornice, bust, base, beam, little vault, or the like. See **Tab. Architecture**, fig. 51.

* The word is derived from the French *consolider*, to reunite, join, &c. agreeable to the office of this member.

Consoles are also, upon occasion, called *mutules*, *modillions*, &c. according to their form.

Some of them are striated or fluted; others in form of cartouches; others have drops, in the manner of triglyphs.

Vitruvius calls all those of gates *prothyrides*; of *thyra*, gate. See **PROTHYRIS**.—Those made of the end of a plank of wood, cut triangular-wise, are called *ancones*.

Consoles are frequently used as keys of arches, projecting out, to support a vane, or other ornament.

CONSOLIDATION*, in law, the combining and uniting two benefices into one.

* The term is borrowed from the civil law; where it properly signifies an union of the possession, or occupation, with the property.—Thus, if a man have by legacy *usum fructum fundi*, and afterwards buy the property, or fee-simple of the heir; this is called a *consolidation*.

CONSOLIDATION, in medicine, expresses the action of uniting broken bones, or the lips of wounds, by means of *consolidating remedies*, as they are called; which cleansing with a moderate heat and force, taking corruption out of the wounds, and preserving the temperature of the parts, cause the nourishment to be fitly applied to the part affected. See **WOUND**, and **FRAC-TURE**.

CONSONANCE, in musick, is ordinarily used in the same sense with *concord*, viz. for the union or agreement of two sounds produced at the same time, the one grave, the other acute; which mingling in the air, in a certain proportion, occasion an accord agreeable to the ear.

Dr. Holder, on this principle, defines *consonancy*, 'A passage of several tunable sounds through the medium, frequently mixing

'and uniting in their undulated motions, caused by the well-proportioned commensurate vibrations of the sonorous bodies, and

'consequently arriving smooth, and sweet, and pleasant to the ear; as, on the contrary, *dissonancy*, he maintains to arise from

'disproportionate motions of sounds, not mixing, but jarring

'and clashing as they pass, and arriving in the ear grating and offensive.'

Which notion of a *consonance*, exactly quadrates with that we have already laid down for a *concord*. Accordingly, most authors confound the two together: though some of the more accurate distinguish them; making *consonance* to be what the word implies, a mere *sound* of two or more notes together, or in the

same time; in contradistinction to the motion of those founds in *succession*, or one after the other.

In effect, the two notions coincide; for two notes, thus played in *consonance*, constitute a concord; and two notes that please the ear in *consonance*, will likewise please it in *succession*. Notes in *consonance* constitute harmony, as notes in *succession* constitute melody.

In the popular sense, *consonances* are either *simple*, or *compound*, &c. The most perfect *consonance* is unison; though many, both among the antients and moderns, discard it from the number of *consonances*; as conceiving *consonance* an agreeable mixture of different founds, grave and acute; not a repetition of the same found.

The second *consonance* is the octave; then the fifth, the fourth, the thirds, and the sixths: the rest are multiples, or repetitions of these.

CONSONANCE, in grammar, denotes a like cadence, or close of words, periods, &c.

Consonances are ordinarily faults in discourse, especially in English prose; though the ancients make a figure of them, which they call *ἁρμονία*. Too great a *consonancy* in the rhymes has always an ill effect.

CONSONANT *, a letter which produces no found alone, or without some other letter, either vowel or consonant, joined along with it.

* And hence the name *con-sonant*, q. d. *quæ sonant cum alia*.

A *consonant*, considering it philosophically, is nothing else but the modification of a found, produced by means of the organs of the voice, not a production of found itself: thus, *v. gr.* the founds signified by the characters *a, e, i, o, u, &c.* are differently modified when we say *ab*, than when we say *ac* or *ca*, *ad* or *da*; and those modifications are called *consonants*.

The letters of the alphabet are divided into vowels and consonants. Consonants, again, are divided into *singles*, as *b, h, m, g, &c.* and *double*, as *x* in *axillary*, corresponding to the ξ of the Greeks.

Consonants, again, are divided into *liquid*, as *l, r, m, n*; and *mute*, as *b, d*, and the rest: these last make no found at all without a vowel.

But the most natural division of *consonants* is that of the Hebrew grammarians; who have been imitated therein by the grammarians of other oriental languages: these divide the *consonants* into five classes, with regard to the five principal organs of the voice; which all contribute, it is true, but one more notably than the rest, to certain modifications, which make five general kinds of *consonants*. Each kind, or class, comprehends several *consonants*, which result from the different degrees of the same modification, or from the different motions of the same organs.

These organs are the *throat, palate, tongue, teeth, and lips*; whence the five classes of *consonants* are denominated *guttural, palatal, lingual, dental, and labial*.

We account sixteen *consonants* in the English alphabet, *viz.* *b, c, d, f, g, h, k, l, m, n, p, q, r, s, t, x, z*; to which there are three others to be added, *viz.* the *h, the j consonant, and v consonant*, which makes the whole number of *consonants* nineteen: one whereof is *guttural*, *viz.* the aspirate *h*; five *palatal*, *viz.* *c*, as when pronounced before *a, o, and u*, as in *ca-vern, corn, curiosity*; *g*, as in *geneva*; *j* consonant in *julep*; *k* in *kernel*; and *q* in *query*.

The four *lingual consonants* are *d, l, n, t*; the four *dental*, are *r, s, x, z*, the three last whereof are hisfers: and five *labial*, *b, f, m, p, and v* consonant.

With regard to which division, it may be observed, that tho' the *g* be modified in three different manners, as it comes before an *a*, an *o*, or a *u*; yet it is still a *consonant* of the palate; that the *j* consonant differs in nothing but its figure from the *g* before *e* or *i*; that *t* has the same pronunciation with the *c*; that *x* comprehends the found of two letters in its found, *viz.* *e* or *i*, and *f* or another *c*, as in *Alexander*, and *Alexis*, which we pronounce as if wrote *Alec-fander*, and *Alec-cis*, or *Alec-fis*; and that the *c* before an *e* or *i*, is no *consonant* of the palate, because in that case it loses its proper found, and assumes the hissing found of the *f*.

The abbot Dangeau thinks the nature of the division of the Hebrew grammarians to be very reasonable; but he does not acquiesce in the distribution they have made of them: to find a natural and just division of the *consonants*, he observes, no regard must be had to the characters that represent them; nor any thing be considered but their found, or the modification they give the found.

On this principle, the same author finds in the French, five *labial consonants*, *b, p, v, f, and m*; five *palatal ones*, *d, f, g, h, n*; four *hisfers*, *s, z, x, ch*; two *liquids*, *l* and *r*; two that run into and mix with each other, as *ll*, and *gn*; which last, however, is peculiar to the French language; and the *b* aspirate.

He adds, 1^o. That *m* and *n* are properly two nasal *consonants*; the *m*, a *b* passed through the nose, and the *n* a *d*, in like manner, pronounced through the nose; and in effect, people in a cold pronounce *barket* for *market*, *deed* for *need*, &c.

2^o. That among the *consonants*, some are *weak*, other *strong*;

their difference consisting in this, that the former are preceded with a small emission of the voice which softens them; which the latter have not. The weak are *b, c, d, g, z, i*; the strong, *p, f, t, k, s, ch*.

It may be here observed, that when we speak of a person's talking *through the nose*, it must be understood in a sense quite different from what the words seem naturally to import: since the nose in this case concurs less to the pronunciation than when we do not speak through the nose; in regard the air not being able to make its way through the nose; is returned into the mouth, where it forms a dull obtuse found, called *nasal*.

From the whole we may conclude, that the excess of *consonants* in one language above another only consists in this, that there are more modifications of found received and established in the one than in the other: for all men having the same organs, may form the same modifications; so that it is entirely owing to custom, nothing to nature, that the English have not the *s* of the Greeks, the *ain* and *beth* of the Hebrews, the *ch* of the Germans, the *gu* of the French, the *gl* of the Italians, the *ll* of the Welch, &c.

Also, that the Chinese have no *r*, the Iroquois no labial *consonants*, the Hurons have abundance of aspirates, and the Arabs and Georgians abundance of double *consonants*: which last is owing to this, that they make several organs concur strongly and equally to the modification of a found; whereas, in the rest, only one organ is moved very strongly and sensibly, and the rest weakly.

It is hence also visible, that in all languages the aspirates, or guttural letters, are real *consonants*; since the throat modifies the found as much as the palate, tongue, or lips.

Lastly, to find all the *consonants* that may be formed in any language; there needs nothing but to observe all the modifications that the sounds of speech will admit of, by which we shall have all the *consonants* practicable.

CONSORT, in music. See the article CONCERT.

QUEEN-CONSORT. See the article QUEEN.

CONSPIRACY, in law, is taken for a combination or confederacy to do something evil, or illegal: though in the original sense of the word, and in its use in other languages, it signifies merely an agreement, whether for good, bad, or matters indifferent. See CONFEDERACY.

In our statutes and law-books, *conspiracy*, in a general sense, is frequently confounded with *maintenance*, and *champarty*.

CONSPIRACY, in its special signification, is used for a confederacy of two, at least, falsely to indict one, or procure one to be indicted of felony.

The punishment of this *conspiracy*, at the king's suit, antiently was: that the party attained lose his frank-law; to the end that he may not be impeached on juries, and the like; that his lands, goods, and chattels be effreighted; his trees raised, and his body committed to prison.

Even *conspiracies*, or combinations in cases of less moment, as those of victuallers, touching selling of victual, shall be grievously punished. 37 Hen. VIII.

CONSPIRING powers, in mechanics, are all such as act in directions not opposite to one another. See POWER, and MOTION.

CONSTABLE *. Lord High CONSTABLE, is an antient officer of the crown, now disused in England, but still subsisting in France, where the *constable* commands the marshals, and is the first officer in the army.

* Some derive the word from the Saxon, and make it originally signify the *say*, or hold of the *king*, or king: others, with more probability, derive it from *comes stabuli*, the master of the stables, or perhaps of the horse, and suppose that the dignity which at first was civil, in time became military, and the master of the stables was made general of the army.

The function of the *constable* of England, consisted in the care of the common peace of the land, in deeds of arms, and matters of war. To the court of the *constable* and that of the marshals, belonged the cognizance of contracts, deeds of arms without the realm, and combats, blazonry of arms, &c. within it.

The first *constable* of England was created by the conqueror: the office continued hereditary till the thirteenth of Hen. VIII. when it was laid aside, as being too powerful as to become troublesome to the king. Since that time, the *constable* is only created occasionally.

From those mighty magistrates, the *constables* of England, are derived those inferior ones, since called the *constables of hundreds and franchises*; these were first ordained in the thirteenth year of Edward I. by the statute of Winchester; which for the conservation of the peace, and view of armour, appointed that two *constables* should be chose in every hundred and franchise.

These are what we now call *constabularii capitales*, or *high constables*; in regard, continuance of time and increase of people, &c. have occasioned others of like nature, but inferior authority, in every town, called *petty-constables*, or *sub-constabularii*.

—The appointing of a *petty-constable* belongs to the lords of divers manors, *jure feudi*.

Besides these, we have *constables* denominated from particular places, as *constable of the Tower*, of *Dover-castle*, of *Windsor-castle*, of *the castle of Caernarvon*, and many other of the castles of Wales; whose office is the same with that of the Castellani, or governors of castles.

Provost of the Constable. See *PROVOST*.

CONSTANT winds. See the article *WIND*.

CONSTANT, in law, a certificate given out of the court of exchequer, of all that there is upon record relating to any matter in question.

It is also used for an exemplification, or copy of the enrolment of letters patent.

CONSTELLATION, in astronomy, an assemblage or system of several stars, expressed and represented under the name and figure of some animal or other thing: this assemblage is by some called also an *asterism*.

The antients portioned out the firmament into several parts, or *constellations*; reducing a certain number of stars under the representation of certain images, in order to aid the imagination and the memory to conceive and retain their number, disposition, and even to distinguish the virtues which they attributed to them: in which sense a man is said to be born under a happy *constellation*, i. e. under a happy configuration of the heavenly bodies.

The division of the heavens into *constellations* is very antient; and for ought that appears, as old as astronomy itself; at least, it was known to the most antient authors extant, whether sacred or profane. In the most antient book of Job, mention is made of the names of some of them; witness that sublime expostulation, *Canst thou restrain the sweet influence of the Pleiades, or loosen the bands of Orion?* And the same may be observed of the oldest among the heathen writers Homer and Hesiod.

The division of the antients only took in the visible firmament, or so much as came under their notice: this they distributed into 48 *constellations*; twelve whereof took up the zodiac: the names they gave them are *Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpius, Sagittarius, Aquarius, Capricornus, Pisces*: from whence the signs of the ecliptic and zodiac take their names; though now no longer contiguous to the *constellations* which denominate them. See *SIGN*.

The other stars, on the northern side of the zodiac, were disposed into 21 *constellations*, viz. *Ursa major and minor, Draco, Cepheus, Bootes, Corona septentrionalis, Hercules, Lyra, Cygnus, Cassiopeia, Perseus, Andromeda, Triangulum, Auriga, Pegasus, Equuleus, Delphinus, Sagitta, Aquila, Ophiuchus or Serpentarius, and Serpens*: to which have been since added *Antinous, and Coma Berenices*.

The stars on the southern side of the zodiac, were distributed into 15 *constellations*; their names are, *Cetus, Eridanus fluvius, Lepus, Orion, Canis Major and Minor, Argo, Hydra, Crater, Corvus, Centaurus, Lupus, Ara, Corona meridionalis, and Piscis australis*: to which have been since added twelve others; viz. *Phoenix, Grus, Indus, Pavo, Piscis australis, Piscis volans, Tucan, Hydrus, and Xiphius*. See each constellation, and the stars contained in it, under its proper head, *ARIES, TAURUS, &c.* Of these *constellations*, the 15 last, with the greatest part of *Argo novis, Centaurus, and Lupus* are not visible in our horizon.

The other stars, not comprehended under these *constellations*, yet visible to the naked eye, the antients called *informes*, or *sporades*, some whereof the modern astronomers have since reduced into new figures, or *constellations*. See *INFORMES* and *SPORADES*.

Thus, *Hercules, v. gr.* between *Leo* and *Ursa major*, make *Leo minor*; and between *Ursa minor* and *Auriga*, over *Gemini*, makes *Lynx*; under the tail of *Ursa major*, *Canes venatici, &c.*

In these *constellations*, the stars are ordinarily distinguished by that part of the image wherein they are found. Bayer distinguishes them further by the letters of the Greek alphabet: and many of them, again, have their peculiar names, as *Arcturus*, between the feet of *Bootes*; *Gemina*, or *Lucida*, in the *Corona septentrionalis*; *Pollitiam*, in the *Bull's eye*; *Pleiades* in the back, and *Hyades* in the forehead of the *Bull*: *Caster* and *Pollux* in the heads of *Gemini*; *Capella*, with the *Hædi* in the shoulder of *Auriga*; *Regulus*, or *Cor Leonis*; *Spica Virginis* in the hand, and *Vindematrix* in the shoulder of *Virgo*; *Antares*, or *Cor Scorpii*; *Fomalhaut*, in the mouth of *Piscis australis*; *Regel*, in the foot of *Orion*; *Sirius*, in the mouth of *Canis major*; and the *pole-star*, the last in the tail of *Ursa minor*.

The Greek and Roman poets, from the ancient theology, give us wild and romantick fables about the origin of the *constellations*; which may be seen in Hyginus, Natalis Comes, and Ricciolus. Hence, some out of a vain zeal, rather than any love for the science, have been moved to alter either the figures of the *constellations*, or at least their names.

Thus, venerable Bede, instead of the profane names and figures of the twelve *constellations* of the zodiac, substituted those of the twelve apostles; whose example being followed by Julius Schilerius, in 1627, he completed the reformation, and gave scripture-names to all the *constellations* in the heavens.

Thus, *Aries*, or the ram, became converted into *St. Peter*; *Taurus*, or the Bull, into *St. Andrew*; *Andromeda* into the sepulchre of Christ; *Lyra* into the manger of Christ; *Hercules* into the Magi coming from the East; *Canis major* into David,

&c. Weigelius, professor of mathematicks in the university of Jena, made a new order of *constellations*; converting the firmament into a *cælum heraldicum*; and introducing the arms of all the princes in Europe, by way of *constellations*.

Thus, *Ursa major*, he transformed into the elephant of the kingdom of Denmark; the *Swan* into the *Ruta* with swords of the house of Saxony; *Ophiuchus* into the Crofs of Cologne; the *Triangle* into the compalles, which he calls the *symbol of artificers*; and the *Pleiades* into the *Abacus Pythagoricus*, which he calls that of merchants, *&c.*

But the more knowing among astronomers never approved of these innovations; as serving no purpose but to introduce quarrels and confusion into astronomy. The old *constellations*, therefore, are still retained; both because better could not be substituted, and likewise to keep up the greater correspondence and uniformity between the old astronomy and the new.

CONSTIPATION, in medicine, a hardness of the alvus, or belly, with a difficulty of discharging the same; otherwise called *costruensis*.

Riding post, eating of medlars, or quinces, several preparations of milk, hard-roasted eggs, *&c.* *constipate* the belly.

A *constipation* of the belly, if it continue long, sometimes degenerates into the iliac passion, or twisting of the guts.

Most persons of a hot and dry constitution are afflicted with a costiveness, or *constipation*: but this is seldom attended with any ill consequences.

The proper remedy for a *constipation* is a clyster; if this fail, lenient catharticks; and when they also fail, others must be exhibited of a more drastic or powerful nature.

CONSTITUTION, an establishment, ordinance, decision, regulation, or law, made by authority of a prince or other superior, ecclesiastical or civil. See *LAW, &c.*

The *constitutions* of the Roman emperors make a part of the civil law. See *CIVIL LAW*.—The *constitutions* of the church make a part of the canon law. See *CANON LAW*. Some of the papal *constitutions* are in form of bulls, others of briefs.

Apostolical CONSTITUTIONS, denote a collection of regulations attributed to the apostles, and supposed to have been collected by S. Clement, whose name they likewise bear.

These are divided into eight books; consisting of a great number of rules and precepts, relating to the duties of christians, and particularly to the ceremonies and discipline of the church.

Authors are divided about their genuineness: the generality hold them spurious, and endeavour to prove them posterior to the apostolick age; maintaining they were unknown till the fourth century: which, if so, shews S. Clement had no hand in them.

Mr. Whiston has ventured to oppose the general opinion; and with some reason, much learning, and more warmth, asserted the *apostolical constitutions* to be one of the sacred writings, dictated by the apostles in their meetings, written down from their mouths by S. Clement, and intended as a supplement to the new testament; or, rather, as a scheme and system of christian faith and polity. See his *essay on the apostolical constitutions*, and his *historical preface*; wherein the several steps he made in his fancied discovery are traced.

What makes the *constitutions* more suspected by the orthodox, is, that they seem to favour of Arianism.

CONSTITUTION, is also used in a physical sense, for the temperament of the body, or for that disposition of the whole arising from the quality and proportion of its parts.

Physicians consider the *constitution*, as depending chiefly on the humours or juices of the body; and hence, as this, or that humour is supposed to predominate, the bile, *e. gr.* or the blood, phlegm, choler, or spirit; the person used to be denominated of a *bilious, sanguine, phlegmatic, choleric, or mercurial constitution*.

CONSTRUCTION*, the act of binding, or drawing the parts of a thing close together.

* The word is compounded of *con*, together; and *stringere*, to tie or close-up.

CONSTRUCTOR *labiorum*, or *orbicularis*, a muscle proper to the lips.—See *Tab Anat.* (myol.) fig. 1. n. 8. See also the article *LIP*. Its fibres make a kind of (*orbis*) ring about the mouth (whence it is also called *orbicularis*) and serve to constrict, and draw up the lips, as in kissing, *&c.* whence some call it *basiatur*, and *oculatur*.

This, Verheyen will not have to be one muscle, but a pair, whose fibres meet and join at both corners of the mouth; each acting on one lip only, though concurrently.

Other authors are unanimous in calling it one muscle; and will have it of the sphincter kind; though Dr. Drake thinks improperly: in regard, it is not like the other sphincters in constant action, but at the command of the will: the distinguishing mark between a sphincter and another muscle. See *SPHINCTER*.

CONSTRUCTOR palpebrarum. See *ORBICULARIS*.

CONSTRICTORES nasi, a pair of muscles common to the alæ of the nose, and the upper lip.

They arise fleshy from the forepart of the fourth bone of the upper jaw; and after a strait ascent, are inserted into the roots of the alæ nasi, and superior parts of the upper lip.

Their use is to draw the alæ downwards, nearer each other: and

and at the same time draw the upper lip also downwards: an action which we use in taking of snuff, or in smiling at any thing.

CONSTRUCTION, in geometry, the art or manner of drawing, or describing a figure, scheme, the lines of a problem, or the like. The equality of the lines of such a triangle, &c. is demonstrated from their construction.

CONSTRUCTION of equations, is the method of reducing a known equation into lines, and figures; whereby the truth of the rule, canon, or equation, may be demonstrated geometrically. See **EQUATION**.

The method of *constructing* equations is different, according to the diversity of equations. For simple and quadratick equations the methods shall be here subjoined; as to cubic equations, geometrical *constructions* are of no use, in practice; their intent being much better answered by the method of extracting roots by approximation.

To *construct a simple equation*: the whole mystery consists in this; that the fractions, to which the unknown quantity is equal, be resolved into proportional terms: the method of which will be better shewn by examples than it can be taught by many rules.

1^o. Suppose $x = \frac{ab}{c}$; then will $c : a :: b : x$, to be determined by the method of finding a fourth proportional.

2^o. Suppose $x = \frac{abc}{de}$; let $d : a :: b : \frac{ab}{d}$. This fourth proportional found, being called g ; $x = \frac{gc}{e}$ which is therefore found as in the former case.

3^o. Suppose $x = \frac{aa-bb}{c}$. Since $aa-bb = (a+b)(a-b)$; $c : a+b :: a-b : x$.

4^o. Suppose $x = \frac{a^2b-bc^2}{ad}$. By the first case we find $g = \frac{ab}{d} = \frac{a^2b}{ad}$ and $h = \frac{bc}{d}$; again, by case 1, $i = \frac{bc}{d}$ and $x = g-i$, the difference of the lines g and i .

5^o. Suppose $x = \frac{ab}{c} + \frac{ad}{bc}$. Find, as in the preceding case, $g = \frac{ab}{c}$, and $f = \frac{ad}{bc}$. Then will $x = g+f$ be the sum of the lines g and f .

6^o. Suppose $x = \frac{a^2b+bc^2}{af+cg}$. Seek $\frac{cg}{a}$, and let $f + \frac{cg}{a} = b$; then will $a f + cg = ab$; consequently, $x = \frac{a^2b+bc^2}{ab}$. Thus is the present case brought to the preceding one.

7^o. Suppose $x = \frac{a^2b-b^2a}{af+bc}$. Find $\frac{af}{b}$, and make $\frac{af}{b} + c = b$; then will $a f + bc = bb$. Hence, $x = \frac{a^2b-b^2a}{bb} = \frac{a-b}{b}$.

Consequently, $b : a :: a - d : x$.

8^o. Suppose $x = (a^2 + b^2) : c$. Construct the triangle ABC, (Tab. Algebra, fig. 1.) whose side AB = a , BC = b ; then will AC = $\sqrt{a^2 + b^2}$. Let AC = m ; then will $a^2 + b^2 = m^2$. And therefore $x = \frac{m^2}{c}$; consequently, $c : m :: m : x$.

9^o. Suppose $x = \frac{a^2-b^2}{c}$. On AB, (fig. 2.) = a describe a semicircle, and therein set off AC = b . Since the triangle ACB is rectangular; CB = $\sqrt{a^2 - b^2}$. Let CB = m ; then will $x = \frac{m^2}{c}$; consequently, $c : m :: m : x$.

10^o. Suppose $x = \frac{a^2b+bc^2}{af+bc}$. Say, $b : a :: f : \frac{fa}{b}$; and let $\frac{fa}{b} + c = b$; then will $b c + a f = b b$. Hence, $x = \frac{a^2b+bc^2}{bb} = \frac{a^2+c^2}{b}$. Find betwixt AC = c , (fig. 3.) and CB = d , a mean proportional CD = \sqrt{cd} . Let CE = a ; then will DE = $\sqrt{a^2 - cd}$. Call this m ; then will $x = \frac{m^2}{b}$; consequently, $b : m :: m : x$.

To *construct a quadratic equation geometrically*. Since quadratic equations may be reduced to simple ones, (see **EQUATION**;) those may likewise be constructed from the methods already laid down: for if the equation be pure, $x^2 = ab$; then will $a : x :: x : b$; wherefore, we shall find $x = \sqrt{ab}$; if between AC = a , and BC = b , we find a mean proportional DC. If the equation be affected, $x^2 + ax = b^2$; then will $x = \frac{1}{2}a + \sqrt{\frac{1}{4}a^2 + b^2}$ that is, either $x = \frac{1}{2}a + \sqrt{\frac{1}{4}a^2 + b^2}$ or, $x = \sqrt{\frac{1}{4}a^2 + b^2} - \frac{1}{2}a$, or, $x = \frac{1}{2}a + \sqrt{\frac{1}{4}a^2 - b^2}$ or, $x = \sqrt{\frac{1}{4}a^2 - b^2} - \frac{1}{2}a$.

The whole mystery, therefore, of *constructing* quadratics comes to this: that the value of $\sqrt{\frac{1}{4}a^2 + b^2}$, and also the value of $\sqrt{\frac{1}{4}a^2 - b^2}$ be found; both of which are shewn in the preceding article. For, if in the rectangular triangle, (fig. 1.) AB = $\frac{1}{2}a$ and BC = b ; then will AC = $\sqrt{\frac{1}{4}a^2 + b^2}$. But if on AB = $\frac{1}{2}a$, (fig. 2.) be described a semicircle; and therein

applied AC = b ; CB = $\sqrt{\frac{1}{4}a^2 - b^2}$, as was shewn in the article preceding. See **EQUATION**; see also **CURVE**.

CONSTRUCTION, in grammar, *syntax*; or the arranging and connecting the words of a sentence, according to the rules of the language.

The *construction* is generally more simple, easy, and direct in the modern tongues than in the antient: we have very few of those inversions which occasion so much embarrass and obscurity in the Latin; our thoughts are usually delivered in the same order wherein the imagination conceives them: the nominative case, for instance, always precedes the verb, and the verb goes before the oblique cases it governs.

The Greeks and Latins, M. St. Evremont observes, usually end their periods, where, in good sense and reason, they should have begun them; and the elegance of their language consists, in some measure, in this capricious arrangement, or rather in this transposal and disorder of the words.

Construction is either *simple* or *figurative*.—*Simple*, is that wherein all the terms, or parts of the discourse are placed in their natural order.

Figurative construction, is that wherein we recede from this simplicity, and use certain expressions, shorter, and more elegant than nature affords.

The *syntax*, or *construction* of words, is distinguished into two parts, *concord*, and *regimen* or *government*. See **CONCORD**, and **REGIMEN**.

CONSUALIA, feasts which were held among the antients, in honour of the god *Consus*, i. e. *Neptune*; different from those other feasts of the same deity called *neptunalia*.

They were introduced with a magnificent cavalcade, or procession on horseback; by reason *Neptune* was reputed to have first taught men the use of horses; whence his surname of *ἵππιος*, *equus*.

Evander is said to have first instituted this feast: it was re-established by Romulus, under the name of *Consus*; in regard it was some god under the denomination of *Consus*, that suggested to him the rape of the Sabines.

It is said, that it was with a view to this rape, that he made that establishment. This, however, is certain, that it was to this feast all his neighbours were invited; when, taking advantage of the solemnities and sacrifices, he seized the women. To draw the greater concourse of people, he gave out, that he had found an altar hid under ground, which he intended to consecrate, with sacrifices to the god to whom it had been originally erected.

Those who take upon them to explain the mysteries of the heathen theology, say, that the altar hid under ground is a symbol of the secret design of Romulus to seize his neighbours wives. The *consualia* were of the number of feasts called *sacred*; as being consecrated to a divinity.—Originally they were not distinguished from those of the circus: whence it is, that Valerius Maximus says, that the rape of the Sabines was effected at the games of the circus.

Plutarch observes, that during the days of this solemnity, horses and asses were left at rest, and were dressed up with crowns, &c. on account of its being the feast of *Neptunus Equestris*.—Festus says, the cavalcade was performed with mules; it being an opinion, that this was the first animal used to draw the car. Servius gives us to understand, that the *consualia* fell on the thirtieth of August; Plutarch in Romulus places them on the 18th, and the old Roman calendar on the 21st day of that month.

CONSUBSTANTIAL, in theology, a term of like import with *co-essential*; denoting something of the same substance with another.

The orthodox believe, the Son of God to be *consubstantial* with the Father.

The term *ὁμοουσιος*, *consubstantial*, was first adopted by the fathers of the councils of Antioch and Nice, to express the orthodox doctrine the more precisely, and to serve as a barrier and precaution against the errors and subtilties of the Arians; who owned every thing excepting the *consubstantiality*.

The Arians declared that the Word was God, as having been made God; but they denied that he was the same God, and of the same substance with the Father: accordingly, they exerted themselves to the utmost to abolish the use of the word. The emperor Constantine used all his authority with the bishops, to have it expunged out of the symbols; but it still maintained itself, and is at this day, as it was then, the distinguishing criterion between an Athanasian and an Arian.

Sandius will have it, that the word *consubstantial* was unknown till the time of the council of Nice; but it is certain it had been before proposed to the council of Antioch, wherein Paulus Samosatensis had been condemned; though it had there the fortune to be rejected. Cancellæus on the other hand, maintains, that it was an innovation in doctrine in the council of Nice, to admit an expression, the use whereof had been abolished by the council of Antioch.

According to S. Athanasius, the word *consubstantial* was only condemned in the council of Antioch, inasmuch as it implied the idea of a pre-existent matter, prior to the things formed thereof: now, in this sense, it is certain, the Father and the Son are not *consubstantial*, there having been no pre-existent matter.

CONSUBSTANTIATION, a tenet of the Lutheran church, with regard to the manner of the change made in the bread and wine in the eucharist.—The divines of that profession maintain, that after consecration, the body and blood of our Saviour are substantially present, together with the substance of the bread and wine; which is called *consubstantiation*, or *impanation*. See **IMPANATION**, **TRANSUBSTANTIATION**, and **LUTHERANISM**.

CONSUETUDINIBUS *servituti*, in law, a writ of right, which lie against the tenant that deforceth his lord of the rent, or service due to him.

CONSUL, the chief magistrate of the Roman commonwealth. The *consuls* were the head of the senate; they commanded the armies of the republic, and were supreme judges of the differences between the citizens. In regard, however, that they had made some abuse of this power, it was allowed, by the Valerian law, for the party aggrieved to appeal from their tribunal to the people; especially in cases where the life of a Roman citizen was concerned.

In progress of time, the *consuls* being too much taken up with the grand affairs of state, or at the heads of armies, there were other magistrates created for the distribution of justice to the people, in lieu of the *consuls*.

After the Romans had expelled their kings, they were governed by two *consuls*, established in the year of Rome 240; having their name *à consulendo*. Brutus and Collatinus were the first, elected by an assembly of the people: their office was to hold a year; and if either of them died in the course of the year of their *consulate*, a new one was to be elected.

To be elected *consul*, it was regularly required that the candidate should be at least 43 years old; though we meet with some few exceptions from this rule. The election was held in the month of January, in the Campus Martius; and afterwards in the Capitol.

Consuls were even continued under the emperors, after the republic was destroyed: but *consul* was here little more than an honourable title; which, however, the people were fond of keeping up; as esteeming it some remain of their ancient liberty. It dwindled for a long time; and at last, became absolutely extinct in the time of Justinian: after whom, no emperor either created any *consul*, or assumed the dignity himself. Basil is the last in the consular list, for the year 241. By this time, the dignity was depreciated to that degree, that it was conferred on the meanest persons: indeed, Justinian endeavoured to retrieve it 25 years after, and created himself *consul*, but without effect.

From the establishment of the republic, and the *consulate* under L. Jun. Brutus and L. Tarq. Collatinus, to the *consulate* of Basil, i. e. from the year of Rome 244 or 245, 509 years before Jesus Christ; to the year of Rome 1294, the space of 1049 years, the years were accounted by the *consuls*: but from the time of Basil, in the year of Christ 541, we find no mention made of *consuls* or *consulates*; but the time was then computed by the years of the emperors reigns, and the indictions.

Indeed, for some time after the *consulate* of Basil, the years are marked thus; *post consulatum Basilii*, 1, 2, 3, &c. See the *fasti consulares* of M. d'Almeida. That author reckons 1060 pairs of *consuls*, beside the substitute *consuls*, *suffecti*, elected to supply vacancies by death; and yet there were but 1049 years, and consequently only 524 *consulates*.

The perpetual *consulates* of the eastern emperors, which compose the *Fasti Bizantini*, commenced in the year of Christ 567, and ended in 668, in the last year of Constantine. Constantine Pogonates would have the *consulate* inseparable from the empire; which it continued to be till the time of Constantine Porphyrogenetus.

In this form of government, the empire and *consulate* were so closely united, that the empress Irene would needs assume the *consulate*, when she was only regent of the empire.

But the French kings, those of Italy, and the Saracen princes who commanded in Spain, taking on them the title of *consuls*, as well as emperors of Constantinople; these last despised it, and laid it aside: so that the name was only continued to the magistrates of some cities, and certain other officers, as is shewn by F. Pagi.

Under the emperors there were *ordinary consuls*, *honorary consuls*, and *suffecti*, which last were also on foot in the time of the republic.

In the middle age, we find the word *consul* used for *comes*, count, and *proconsul* or *viconsul*, for *viscount*; as is observed by Spelman, and de Marca. See **COUNT**.

CONSUL, at present, is used for an officer established by virtue of a commission from the king, and other princes, in the ports and factories of the Levant, on the coasts of Africa, Barbary, Spain, and other foreign countries of any considerable trade; to facilitate, and dispatch business, and protect the merchants of the nation.

These commissions are never granted to persons under the age of thirty years. When the *consulate* is vacant, the most ancient of the deputies of the nation are to discharge the function thereof, till the vacancy be filled up by the king.

The *consuls* are to keep up a correspondence with the ministers of

England residing in the courts whereon their *consulates* depend. Their business is to support the commerce, and the interest of the nation; to dispose of the sums given, and the presents made to the lords and principals of places; to obtain their protection, and prevent the insults of the natives on the merchants of the nation. There are also *consuls* of other nations established in the Levant, especially French and Dutch.

CONSULS also denote judges, elected among merchants and dealers, in ports and trading towns chiefly in France; to terminate, *gratis*, and on the spot, without any process, such differences and demands as may arise relating to their merchandizes, bills of exchange, and other articles of commerce.

The first jurisdiction of *consuls* established in France, is that of Tholouse; the edict of whose establishment bears date 1549, under the reign of king Henry II. that of Paris followed fourteen years afterwards. By degrees, they were established in most of the considerable trading towns in that kingdom.

CONSUL*, in our ancient law-books, signifies an earl or count, *comes*. See **EARL**, and **COUNT**.

* According to some, what we now call a *county*, *comitatus*, was by the ancient Britons named *consulatus*, *consulatus*; and those now called *viconsul*, *viconsul*, were then called *vite-consul*.

CONSULAR *comitia*. See the article **COMITIA**.

CONSULAR *Medals*. See the article **MEDAL**.

CONSULTATION, in law, a writ whereby a cause formerly removed by prohibition from the ecclesiastical court to the king's court, is returned thither again.

If the judges of the king's court, upon comparing the libel with the suggestion of the party, find the suggestion false, or not proved; and therefore the cause to be wrongfully called from the court-christian: then, upon such deliberation, or *consultation*, they decree it to be returned again. And the writ obtained hereon is called a *consultation*.

CONSUMMATION, the end, period, or completion of any work.—Thus, we say, the *consummation* of all things, meaning the end of the world. By the incarnation, all the prophecies are said to be *consummated*.

Consummation of marriage, denotes the last act of marriage, which makes its accomplishment; or the most intimate union between the married pair.

CONSUMPTION, *tubercle*, in medicine, a disease arising from a defect of nourishment; or, a preternatural decay of the body, by a gradual waste of muscular flesh.

It is frequently attended with an hectic fever; and is divided by physicians into several kinds according to the variety of its causes; as *universal*, or *scorbatic consumption*, where it arises from a cacochymia, or scorbutic habit; and *pulmonic consumption*, or *consumption of the lungs*, where it arises from some cause in the lungs, properly called a *phthisis*. See **PHTHISIS**, **SCORBUTUS**, &c.

A *consumption* may either be *accidental*, *natural*, or *hereditary*.—*Accidental consumptions* may arise, 1^o. From ulcers, chalky stones, or polypus in the lungs, caused by something that obstructs the circulation in the pulmonary vessels, or renders the blood viscid, as a suppression of any natural evacuation. 2^o. From intemperance, occasioning either a cacochymia, or plethora. 3^o. From peripneumonies, pleuritis, asthma, coughs, catarrhs, diarrhæas, venereal disorders, and excess of venery. 4^o. From grief, hard study, &c.

Natural consumptions may arise from the straitness of the thorax, or an ill conformation of the parts.

An *hereditary consumption* may be communicated from the parents without any other visible cause.

A *consumption* usually begins with flying pains, and stitches; a troublesome pain at the pit of the stomach, or in the diaphragm; frequent spitting, loss of appetite, a quick pulse, a sweetness or saltness in the saliva, heat and flushings in the face and palms of the hands after meals, an hectic fever toward the evening, heaviness, faintness, night-sweats; and where the lungs are first disordered, a cough, catarrh, or asthma usually precede it.

When these symptoms are violent, it is confirmed; and then comes on an expectoration of purulent or bloody matter, and the vomica pulmonum; at length, the feet swell, the expectoration stops, a diarrhæa comes on; and then the facies hippocratica, and death. The cure of an *universal*, or *muscular consumption*, depends principally upon removal into a proper air, and the using of a regular nourishing diet: the appetite is to be excited by proper bitters, and other stomachics.

In a *pulmonary consumption*, or *phthisis*, balsamics, and oleaginous medicines, are usually added.

Dr. Wainwright, indeed, takes the particles of oily medicines to be too gross and viscid to enter the small orifices of the lacteals; and thinks, that their operation or effect being confined to the first passages, they are not only of no service in the cure, but are apt to pall the appetite, occasion obstructions in the mouths of the lacteals, and diarrhæas.

But this seems contrary to common experience: that their particles are small enough to enter the lacteals, is evident from the sudden relief nephritic persons find in violent paroxysms of the stone by the passages being relaxed soon after their exhibition. That diarrhæas, and blunting the appetite; in some constitutions, will be the consequence of their continuance, or exhibition in too great

great quantities, must be allowed; but then this is either accidental to some kinds of constitutions, or arises from some error in using them.

As to the lacteals being obstructed by their use, it seems a mere notion, and as much unsupported by experience as that other hypothesis, which a late author, Dr. Quincy, has been fond of asserting, viz. that the use of butter is apt to foul the glands. See *Supplement, article PHTHISIS*.

CONTACT, the relative state of two things that touch each other, or whose surfaces join to each other without any interstice. The *contact* of two spherical bodies, is only in one point: and the same holds of a tangent and the circumference of a circle.—Hence, because very few surfaces are capable of touching in all points, and the cohesion of bodies is in proportion to their *contacts*; those bodies will stick fastest together, which are capable of the most *contact*.

Angle of CONTACT, is the angle HLM, (Tab. *Geometry*, fig. 43,) formed by the arch of a circle ML, with the tangent HL, at the place of the *contact*.

Euclid demonstrates, that the right line HL, standing perpendicular on the radius CL, touches the circle only in one point: nor can there be any other right line drawn between the tangent and the circle.

Hence, the angle of *contact* is less than any rectilinear one; and the angle of the femicircle between the radius CL and the arch ML, is greater than any rectilinear acute angle.

This paradox of Euclid has exercised the wits of mathematicians: it was the subject of a long controversy between Peletarius and Clavius; the first of whom maintained the angle of *contact* heterogeneous to a rectilinear one; as a line is heterogeneous to a surface: the latter maintained the contrary. Dr. Wallis has a formal treatise on the *angle of contact*, and of the femicircle; where, with other great mathematicians, he approves of the opinion of Peletarius. See *TANGENT*.

CONTAGION, *infection*, or the communicating, or transferring a disease from one body to another.

Contagion, in some diseases, is only effected by an immediate contact, or touch: as the madness of a dog, which is communicated by biting; and the venom of the pox, which is transmitted from the infected person in the act of copulation. In others it is conveyed by infected clothes; as the itch.—In others the *contagion* is transmitted through the air to a great distance, by means of steams or effluvia expiring from the sick; as in the plague, and other pestilential distempers: in which case, the air is even said to be *contagious*, i. e. full of *contagious* particles. See *PLAGUE*, and *POISON*.

CONTEMPLATION, an act of the mind, whereby it applies itself to consider, reflect on, and admire the wonderful works of God, nature, &c.

CONTEMPLATION, among mystick divines, is defined a simple, amorous view of God, as present to the soul.—This *contemplation* is said to consist in acts so simple, so direct, so uniform and peaceful, that there is nothing for the mind to take hold on, whereby to distinguish it.

In the *contemplative* state, the soul is to be entirely passive, with regard to God; to be in a continual repose, without any perturbation, or motion; free from the activity of unequal minds, which must agitate themselves, to have their operation sensible.—Hence, some call *contemplation* a prayer of silence and quietude. *Contemplation* is not a ravishment, or an extatic suspension of all the faculties of the soul; but it is something passive, it is peace and infinite pliancy; leaving it perfectly disposed to be moved by the impressions of divine grace, and the fitter to follow the divine impulse.—*Contemplation* is the height of perfection of the mystic divines.

CONTEMPORARY, or *COTEMPORARY*, a person, or thing of the same time, or that existed in the same age with another.—Socrates, Plato, and Aristophanes were *contemporaries*: the best histories are those of *contemporary* authors.

CONTENEMENT, a word in our antient law-books, about whose signification authors are not rightly agreed.—According to some, it should signify the countenance, credit, or reputation a person has, from, and by reason of, his freehold. In which sense it is used in the stat. 1 Edw. III. &c. where it stands as synonymous with *countenance*.

Others will have it signify what is necessary for the support and maintenance of men, according to their several qualities, conditions, or states of life.—Thus, Spelman, *contenementum est estimatio & conditionis forma qua quis in republica subsistit*.

CONTENT, in mathematics, a term frequently used for the capacity of a vessel, or the area of space; or the quantity of any matter or space included in certain bounds.

The *content* of a tun of round timber is 43 solid feet. A load of hewn timber contains 50 cubic feet: in a foot of timber are contained 1728 cubic or square inches, and as often as 1728 inches are contained in a piece of timber, be it round or square; so many foot of timber are contained in the piece. See *TIMBER*.

In gauging, the gallon for beer and ale is allowed to contain 282 cubic inches, and the wine gallon 231: the gallon of dry measure 272.

Hence, as oft as 282 cubic inches are contained in any vessel round or square, so many gallons of ale or beer it holds, and the like may be observed of the other measures.

Multiply, therefore, one side of a square or oblong into the other; and divide by one of those numbers, according to the quality of the liquor; the quotient gives the area in gallons, upon an inch deep.

Though the work may be considerably shortened by only multiplying the sides of squares, or the diameters of rounds into themselves; the product is the number of gallons, and parts the vessel contains, upon an inch in depth: and when that receives an augmentation, by being two, three or four inches deep, it then commences a solid body, and contains as many gallons and parts, as it is inches and parts deep.

A cubic foot contains six gallons, and almost a pint, of ale and beer; and seven gallons, two quarts of wine. A cubic foot of dry measure contains six gallons and a half, and something more. A bushel of falt contains 56 pound averdupoise.

CONTENTIOUS jurisdiction, in law, *forum contentiosum*, denotes a court, or assembly, which has a power to judge and determine differences between contending parties.

The lords chief justices, judges, &c. have a *contentious jurisdiction*: but the lords of the treasury, the commissioners of customs, &c. have none; being merely judges of accounts, and transactions.

CONTEXT, among divines and critics, that part of scripture, or other writing, which lies about the *text*, before, or after it, or both. See *TEXT*.

To take the full sense of the text, the *context* should be regarded.

CONTIGNATION, in the antient architecture, the art or act of flooring, by laying tigna, rafters, together. See *FLOORING*, and *RAFTER*.

CONTIGUOUS, a relative term, understood of things disposed so near each other, that they join their surfaces, or touch.

The houses in antient Rome were not contiguous as ours are, but all insulated.

CONTIGUOUS angles, in geometry, are such as have one leg common to each angle; otherwise called *adjoining angles*.—In contradistinction to those produced by continuing their legs through the point of contact, which are called *opposite* or *vertical* angles. See *ANGLE*.

CONTINENT, in geography, a terra firma, main-land, or a large extent of country, not interrupted by seas: so called, in opposition to *island*, *peninsula*, &c. See *EARTH*, *OCEAN*, &c. Sicily is said to have been antiently torn from the *continent* of Italy; and it is an old tradition, which some of our antiquaries have still a regard to, that Britain was formerly a part of the *continent* of France.

The world is ordinarily divided into two grand *continents*, the old and the new: the old comprehends Europe, Asia, and Africa: the new the two America's, north and south.

The antient *continent* is also called the *upper continent*, from a vulgar opinion, that it possesses the upper part of the globe.

It is doubted whether Japan be an island, or joined to the *continent*; the same may be said of California.—Some authors are of opinion, the two grand *continents* are in reality no more than one; imagining the northern parts of Tartary to run out and meet those of N. America.

CONTINENT cause of a distemper, is that whereon the disease depends so immediately, that it continues so long as that remains, and no longer.

Thus a stone in the bladder may be the *continent cause* of a suppression of urine.

CONTINENT fever, is that which goes on to a crisis without either intermission, or remission. See *FEVER*.

CONTINGENT, something casual, or uncertain. See *CHANCE*.

Future CONTINGENT, in logic, denotes a conditional event, which may, or may not happen, according as circumstances fall out.

The Socinians maintain, that God cannot foresee *future contingents*, because depending on the free motions of the will of man. See *PRESCIENCE*.

CONTINGENT is also a term of relation for the quota that falls to any person upon a division.

Each prince of Germany, in time of war, is to furnish so many men, so much money, and munition for his *contingent*. By the new treaty of Hanover it is stipulated, that in case of a rupture with the emperor, the kings of Great Britain and Prussia may furnish their *contingents*, as feils of the empire, at the same time they are at war therewith.

CONTINGENT use, in law, is an use limited in a conveyance of land, which may, or may not, happen to vest, according to the *contingency* expressed in the limitation of such use.

CONTINGENT line, or *line of CONTINGENCY*, in dialing, is a line that crosses the substyle at right angles. See *SUBSTYLE*, and *DIALING*.

CONTINGENTS is sometimes also used by mathematicians in the same sense as *tangents*. See *TANGENT*.

CONTINUAL claim. See *Continual CLAIM*.

CONTINUANCE, in law, is much the same as *prorogation* among the civilians. See **PROROGATION**, and **DISCONTINUANCE**.

CONTINUANCE of a writ, or *Assisa*, is its holding in force from one term to another, in a case where the sheriff has not returned, or executed a former writ issued out in the same action.

CONTINUANCE of assise. If a record in the treasury be alleged by one party, and denied by the other; a *certiorari* shall be sued to the treasury and chamberlain of the exchequer: who, if they certify not that the said record is there, or likely to be in the tower; the king shall then send to the justices, repeating the certificate, and will them to *continue the assise*.

CONTINUANDA assisa. See the article **ASSISA**.

CONTINUANDO, in law, a term used where a plaintiff would recover damages for several trespasses in the same action.

To avoid multiplicity of suits, a man may in one action of trespass recover damages for forty, or more trespasses; laying the first to be done with a *continuance* to the whole time wherein the rest of the trespasses were done: which is done in this form, *continuando transgressionem predictam, &c. a predicto die, &c. usque, &c.*

CONTINUANDO Processum. See the article **PROCESSUM**.

CONTINUANS Punctum. See the article **PUNCTUM**.

CONTINUATION of motion. See **MOTION**, and **PROJECTILE**.

CONTINUATIVE conjunctions. See the article **CONJUNCTION**.

CONTINUAL, or CONTINUED fever, is such an one as sometimes remits, but never intermits, or goes entirely off, till its period. See **FEVER**.

A *continual fever*, may be defined to be the continuance of an increased velocity in the circulation of the blood, beyond what is natural to the constitution. See **BLOOD**, and **CIRCULATION**.

If this velocity often decreases, and rises again to the same height, it is called a *continual periodical fever*.

And if it entirely cease in the space of a day, or two, it is called an *epidemic*.

A *continual fever*, then, may remit, or abate and increase again, alternately; but not intermit, which would constitute it an intermitting fever, or ague.

CONTINUED Quantity. } See **CONTINUUM**, **CONTINUITY**, and **QUANTITY**.

CONTINUED Body, &c. } See **CONTINUUM**, **CONTINUITY**, and **QUANTITY**.

CONTINUED, or thorough, bass, in musick, is that which continues to play constantly; both during the recitatives, and to sustain the choir, or chorus.

CONTINUED Proportion, in arithmetick, is that wherein the consequent of the first ratio is the same with the antecedent of the second—as 3 : 6 :: 6 : 12. See **PROPORTION**.

On the contrary, if the consequent of the first ratio be different from the antecedent of the second, the proportion is said to be *discrete*; as, 3 : 6 :: 4 : 8. See **DISCRETE**.

Attic CONTINUED. } See the articles } **ATTIC**.
CONTINUED Community. } **COMMUNITY**.
CONTINUED Pedestal. } **PEDESTAL**.
CONTINUI Solutio. } **SOLUTIO**.

CONTINUITY, is usually defined among schoolmen, the immediate cohesion of parts in the same *quantum*.—Others define it a mode of body, whereby its extremes become one: and others, a state of body resulting from the mutual implication of its parts.

There are two kinds of *continuity*, *mathematical* and *physical*.—The first is merely imaginary, and fictitious; since it supposes real or physical parts where there are none.

Physical continuity, is, strictly, that state of two or more parts or particles, wherein they appear to adhere, or constitute one uninterrupted quantity, or *continuum*; or between which we perceive no intermediate space.

The schoolmen distinguish two other sorts of *continuity*, *viz. homogeneous* and *heterogeneous*.—The first, where our senses do not perceive the bounds, or extremes of the parts; and this agrees even to air, water, &c.—The second, where our senses do indeed perceive the extremes of certain parts, yet at the same time observe the same parts closely linked to each other; either in virtue of their situation or figure, &c. and this is chiefly attributed to the bodies of animals and plants.

The *continuity of bodies*, is a state merely relative to our sight and touch: *e. gr.* if the distance of two separate objects be such, as that the visual angle they subtend is insensible to the eye, which it will be if less than 16 seconds, the two separate bodies will then appear *contiguous*.

Now, the result of several *contiguous* objects is a *continuity*; so that any number of visible objects, being placed so as that their distances subtend angles of less than 16 seconds, they will appear to form one *continuum*.

And hence, as we can determine the distance at which any given magnitude becomes invisible; it is easy finding at what distance any two bodies, however remote from each other, will appear as *contiguous*; and several, as forming one *continuum*.—For the *physical cause of Continuity, or cohesion*. See **COHESION**.

CONTINUUM, or **CONTINUED Quantity**, in physics, denotes

a quantity or coextension, whose parts are not divided, but joined and connected together; so as to leave no room to determine where one begins, and another ends. See **CONTINUITY**.

It is controverted among philosophers, whether a *continuum* be infinitely divisible, *i. e.* divisible into infinite proportionable parts?

The antients attributed the rise of water in pumps to the love of *continuity*, and the abhorrence of a vacuum; in regard the weight and pressure of the air was not then known.

See **VACUUM**.
Mathematicians divide quantity into *continued* and *discrete*. See **QUANTITY**.

Continued quantity is that expressed by lines, and makes the subject of geometry.

Discrete quantities, are those expressed by numbers, which make the subject of arithmetic.

In medicine and chirurgery, wounds, ulcers, fractures, &c. are expressed by the phrase *solutio continua*, or *solution of continuity*.

In a critical sense, we say, there ought to be a *continuity*, *i. e.* a connection, between the parts of a discourse.

In the Epic poem, particularly, the action should have a *continuity* in the narration; though the events or incidents be not continued. As soon as ever the poet has opened his subject, and brought his persons on the stage, the action is to be *continued* to the end: every character must be at work; and no such thing as an idle person to be seen.

F. Boffu observes, that by retrenching dull languishing incidents, and intervals void of action, which break the *continuity*, the poem acquires a *continued force*, which makes it run equally throughout.

CONTOBABBITES, Κοτοβαβιται, a sect of hereticks in the VIIth century.—Their first leader was Severus of Antioch, who was succeeded by John the grammarian, surnamed Philoponus, and one Theodosius; whose followers were also called *Theodosians*.

Part of them, who were willing to receive a book composed by Theodosius on the trinity, made a separate body, and were called *Contobabbites*, from I know not what place, which Nicophorus does not mention, but which must apparently have been the place where they held their assemblies.

The *Contobabbites* allowed of no bishops; which is the only circumstance that historian gives us concerning them.

CONTORSION, the action of twisting; or wresting a member of the body out of its natural situation.

Rope-dancers accustom themselves to *contorsions* of their limbs from their youth, to render the fibres of their articulations lax, and supple to all kinds of postures.

CONTORSION is also used passively for the state of a thing, *v. gr.* for a member that is a-wry.

The *contorsion of the neck*, is usually occasioned, according to Nucke, by a relaxation, or paralysis of one of the mastoid muscles: for hence it happens that its antagonist, whose power is now no longer balanced, contracting with its proper force, draws the head towards that side.

He adds, that this disorder cannot be remedied too speedily; and prescribes from the beginning, liniments capable of relaxing and softening the fibres, to be used, not only to the muscle in contraction, but also and principally to the paralytick muscle, which is the seat of the disorder.

CONTOUR, *Outline*; that which terminates, and defines a figure.

A great part of the skill of the painter consists in managing the *contours*.

The *contour of a figure*, makes what we call the *draught*, or *design*. The *contour of a face*, the Italian painters ordinarily call the *lineaments* thereof.

CONTOURNE, in heraldry, is used when beasts are represented standing or running with their face to the sinister-side of the escutcheon; they being always supposed to look to the dexter-side, unless it be otherwise expressed.

CONTOURNIATED, a term applied among antiquaries to a kind of medallions, which have a broad, rising rim on each side; and figures that have scarce any relieve, in comparison with the true medallions.

They have their name from their edges, which appear as if turned in the lathe.—All we have remaining of these *contourniated* medals seem to have been struck about the same time. F. Hardouin conjectures them not to be earlier than the XIIIth century: other antiquaries go back as far as the fifth; and others find instances of them as ancient as the time of Nero.

This sort of work seems to have had its origin in Greece, and to have been appropriated to honour the memories of great men; principally, those who had bore away the prize at the solemn games: such as those remaining of Homer, Solon, Euclid, Pythagoras, Socrates, Apollonius Tyaneus, and several Athletes, whose victories are expressed on them by palms and chariots, either bigae, or quadrigae.

CONTRA, or **COUNTER**, in composition. See **COUNTER**.

CONTRA formam collationis, is a writ that lies where a man has given lands in perpetual alms, to a religious house, hospital, school

school, or the like, and the governor or managers, have alienated the lands, contrary to the intention of the donor.

CONTRA formam feoffamenti, is a writ for a tenant who is infeoffed by the lord's charter to make certain feal and service to his court; and is afterwards distrained for more than is contained therein.

CONTRABAND *, in commerce, a prohibited commodity; or a merchandize bought or sold, imported or exported, in prejudice and contrary to the laws and ordinances of a state, or the public prohibitions of the sovereign.

* The word comes from the Italian *contrabando*, of *contra*, and *banda*, q. d. contrary to edict, or publication of prohibition.

Contraband goods are not only liable to confiscations themselves; but do also subject all other allowed merchandises found with them in the same box, parcel, or bale, together with the horses, waggons, &c. which conduct them to the same.

There are *contraband* goods, which besides confiscation, are prohibited on pain of death; as *v. gr.* in France, India and China stuffs, linens, &c.

In England there are two principal *contrabands* for exportation, wools and live sheep, which all strangers are prohibited from carrying out, on pain of having the right hand cut off; the other that of sheep-skins and calf-skins, which all foreigners are in like manner prohibited from exporting, on pain also of having the right hand cut off; yet, the subjects of England are allowed to transport the same from France to England.

Other *contrabands* for exportation are raw horns, white ashes, stocking looms, or any part thereof, fuller's earth, and all raw hides, or skins.

Of goods *contraband* as to the import, there are above 50 in the lists made in 1662; and yet there are 25 of them which now stand in the tariff; the non-execution of the acts of parliament whereby they were imposed, seeming to have restored them to the freedom of importation.

The chief of those still *contrabanded*, and not tariffed, are woolen caps, woolen cloths, saddles and harness, dice, billiards, all sorts of tanned or dressed hides, dressed furs, all sorts of shoemakers ware, locks, and divers sorts of cutlers ware; all painted goods, except paper; wires, buckles, gold and silver leaf, and horns for lanterns.

Since the year 1662, several other commodities have been made *contraband*; particularly silk and gallons, laces, embroidery, fringes, buttons, and other silk and thread manufactures; black taffeties, called *alamodes*, or lutefting.

In 1719 and 1720, an attempt was made in parliament to pass a bill for putting gold and silver, whether in coined species or otherwise, among the number of *contraband* goods for exportation; but in vain, by reason of the strong opposition made by those who enrich themselves by the export of these metals; which, by the laws of the kingdom, are allowed to be sent away, upon entering them, paying the duty of the export, and making oath of their being foreign, *i. e.* of their not being the coin, or the plate of the kingdom melted down.

It may be judged whether those who promoted the bill, were for the interest of the nation, from this, that in the single month of September 1720, there were entered at the customhouse in London 468119 ounces of gold, and 28988 ounces of silver; *viz.* 34302 ounces of gold, and 4000 ounces of silver for Holland; 12320 ounces of gold for France; 197 ounces of gold, and 5648 ounces of silver for Portugal; and 19340 ounces of silver for the East-Indies: exclusive of what was exported fraudulently, by private persons, without paying the duties.

This shews, indeed, the plenty of gold and silver in England; but it shews, at the same time, the danger it is in of being, at length, exhausted.

CONTRACT, a mutual consent of two, or more, parties, who promise and oblige themselves voluntarily, to do something, pay a certain sum, or the like.

Sales, exchanges, donations, leases, &c. are so many different species of *contracts*. See **EXCHANGE**, and **DONATION**.

CONTRACT is particularly used in common law, for an agreement or covenant between two, with a lawful consideration or cause.

As, if I sell my horse for money; or covenant, in consideration of 20*l.* to make you a lease of a farm; these are good *contracts*, because there is quid pro quo.

Nude CONTRACT. } See the articles } **NUDE**,
Quasi CONTRACT. } **QUASI CONTRACT**.

Usurious CONTRACT, is a contract to pay more interest for money than the laws allow.

It is a devastavit in executors to pay a debt upon an usurious *contract*.

In marriage, the Romanists distinguish the civil *contract*, which is the consent of the parties, from the sacrament, which is the benediction of the priest.

Those *contracts* are said to be *null* which the law prohibits the making of; such are all *contracts* between persons incapable of *contracting*, as minors, religious, lunatics, wives without consent of their husbands, &c.

CONTRACT is also used for the instrument in writing, which serves as a proof of the consent granted, and the obligation passed between the parties.

Among the antient Romans, *contracts*, and all voluntary acts, were wrote, either by the parties themselves, or by one of the witnesses, or by a domestick secretary of one of the parties, whom they call a *notary*; but who was no publick person, as among us.

The *contract*, when finished, was carried to the magistrate, who gave it a publick authority by receiving it *inter acta*, into the number of the acts under his jurisdiction; giving each of the parties a copy thereof, transcribed by his clerks or domestick registers, and sealed with his seal.—Which practice passed into France, where it obtained a long time. See **ACT**, &c.

CONTRACTILE Force, that property or power inherent in certain bodies, whereby, when extended, they are enabled to draw themselves up again, to their former dimensions.

For the cause of this property, which is of the utmost consequence to a right understanding of the animal economy; see **FIBRE**.

CONTRACTION, in logicks, a species of reduction, wherein the thing that reduces, does also abridge, or bring the thing reduced into a lesser compass.

The design of *contraction* is to bring things, which before were too lax and diffusive, nearer together; that so their mutual relation may appear the more clearly, and they may better strengthen and support each other.

Thus, the following argumentation, 'From that proposition, therefore, now I am standing, follows this other, therefore, now I am existing;' may be thus *contracted*: *ex se sequitur sum, standum implies existing*.

To this head are referred the arguments, as they are called, of poems and orations; the titles and summaries of chapters, &c.

CONTRACTION, in physics, denotes a diminishing of the extent or dimensions of a body; or a bringing of its parts closer to each other: upon which it becomes heavier, harder, &c. See **CONDENSATION**.

Contraction, in this sense, stands opposed to *dilatation*.

All bodies *contract* by cold, and dilate or rarely by heat. See **COLD**, **HEAT**, and **RAREFACTION**.

CONTRACTION, is frequently used by anatomical writers, to express the shrinking up of a fibre, or an assemblage of fibres, when extended.

Convulsions and spasms proceed from a preternatural *contraction* of the fibres of the muscles of the part convulsed.

On the contrary, paralytick disorders generally proceed from a too great laxness of the fibres of the parts affected; or from the want of that degree of *contraction* necessary to perform the natural motion or action of the part.

In the first, therefore, the animal spirits are supposed to flow, either in too great a quantity, or irregularly; and in the last, the animal spirits are either denied a free passage into the part affected, or the tension of the fibrillæ is supposed insufficient to promote the circulation.

Contraction evidently appears to be the true natural state of all the muscles: for if a muscle be at any time freed from the power of its antagonist, it is immediately freed from *contraction*; and is not by any diction of the will or the spirits, to be reduced to a state of dilatation.

CONTRACTION of the Heart, Arteries, Lungs, &c. See **SYSTOLE**, **HEART**, **ARTERY**, **PULSE**, &c.

CONTRACTION, in grammar, the reduction of two vowels or syllables into one: as, *maynt*, for *may not*; *shouldst*, for *shouldest*, &c.

The Greeks abound in *contractions*, both in their verbs and their nouns; as, *μιῶν* of *μῆναι*, *facio*; *ἐὼν* of *εἶναι*, *clamo*; *χευόμεν* of *χεύωμαι*, *inauro*; *πατέω* of *πατεῖν*, *ambulo*; *ματῆς* of *ματῆρ*, *ambulas*; *ἀνυπόδυνος*, of *ἀνυπόδυνος*.

The French have something like it too, at least in their pronunciation; as in *sauleur*, *baailler*, *paan*, which they pronounce *sauler*, *bailier*, *pan*.

CONTRADICENTE. See **NEMINE Contradicente**.

CONTRADICTION, a species of direct opposition, wherein one thing is found diametrically opposite to another.

The schoolmen usually define it, *oppositio inter ens, et non-ens medio carens*: where, by *ens*, and *non-ens*, are understood any two extremes, whereof one affirms, and the other denies: and it is said to be *medio carens*, to distinguish it from the other species of opposition; the extremes, here, neither agreeing in subject, as is the case in privation; nor in essence and kind, as in contrariety. See **PRIVATION**, and **CONTRARIETY**.

Freedom of CONTRADICTION. See the article **FREEDOM**.

Imply a CONTRADICTION. See the article **IMPLY**.

CONTRADICTIONARY, in a legal sense, a person who has a right or title to contradict, or gain say.

An inventory of the effects of a minor ought to be made in presence of his guardian, or trustee, who is the legal *contradictor*: a decree against a farmer has no effect on the landlord, the first not being the legitimate *contradictor*.

CONTRADICTIONARY Propositions, are opposites, one of which imports a mere, and naked, denial of the other.

Of these, therefore, one must be positive, and the other negative;

gative; as sitting, and not sitting; white, and not white.—*Contradictory* propositions mutually destroy each other.

To have two propositions truly *contradictory*, they must be opposite both in quantity and quality, i. e. one must be universal and the other particular, which makes the opposition of quantity; and the one affirmative and the other negative, which makes the opposition in quality.—Thus, *v. gr.* *All use of wine and silver is evil*; false: *Some use of wine and silver is not evil*; true.

To this it is necessary that the one deny, and the other affirm the same thing, of the same subject, considered in the same circumstances: unless the question be about an essential attribute, in which case, no regard is had to circumstances; every thing having always its own essence.—This the logicians express by *affirmare & negare idem, de eodem, secundum idem*.

There may likewise be *contradictory* propositions on a particular subject, *e. gr.* an individual.—These are called *single contradictory propositions*: as *Peter is innocent*; *Peter is not innocent*, or *is a criminal*. Now, to have these propositions *contradictory*, Peter must be considered at the same time; without which they may be both true: since there may be a time wherein Peter was innocent, and another wherein he was a criminal.

CONTRA-FISSURE, **CONTRA-FISSURA**, **ΑΝΤΙΣΣΥΣΤΗ**, in medicine, a term applied to that species of fracture, or fissure, in the skull, where the side opposite to that where the blow was received, is cracked.

This species of fracture is taken notice of by Celsus, l. 8. c. 4. yet Aegineta denies the possibility of it; and is herein followed by Goræus, and many of the moderns. Their chief argument is, that the skull is not one uniform continuous bone, but is divided by several sutures, which prevent the effects of a stroke from being communicated to the opposite part, and confine the mischief to the part struck.—Here, say they, if a skull be found crack'd on the opposite side, or any where but in the place where the blow is immediately received, this must proceed from a 2d or a 3d blow, which perhaps, the patient being stunned, does not remember.—But there are so many cogent instances on the other side of the question, that the reality of *contra-fissures* is now generally allowed. *Vid.* à Meckren. *Obl. Medic. Chirurg.* c. 1. p. 20. *Dion. ap. Bibl. Anat. Med. T. 1. p. 560.*

The usual symptoms attending a *contra-fissure*, are a delirium, sometimes a bleeding at the nose and mouth, stupidity, and involuntary passing of the urine and excrements, and convulsions. If these happen, and after search made in the part where the injury was received, no fracture or depression of the skull be found, there is suspicion of a *contra-fissure*; especially if the patient be apt to point to that part.

If the symptoms be by intervals, and not to a great degree, or there be reason to believe the fissure to have reached only through one of the tables, it is sufficient to bare the bone, and use a raspatory; then to fill the rima, or crack with proper powders, as of iris, gum, myrrh, powder of diapente, &c. and above all apply a pledget dipped in the tincture of euphorbium, or equal parts of spirit of wine, and honey of roses.—If these fail, the trepan must be had recourse to.

CONTRA-HARMONICAL Proportion, that relation of three terms, wherein the difference of the first and second, is to the difference of the second and third, as the third is to the first. Thus, *e. gr.* 3, 5, and 6, are numbers *contra-harmonically* proportional; for 2 : 1 :: 5 : 6 : 3.

To find a mean *contra-harmonically proportional* to two given quantities: the rule is, divide the sum of the two squared numbers by the sum of the roots; the quotient is a *contra-harmonically* mean proportional between the roots.

CONTRA-INDICATION, is an indication which forbids that to be done which the main scope of a disease points out. See INDICATION.

Suppose, *e. gr.* in the cure of a disease a vomit were judged proper; if the patient be subject to a vomiting of blood, it is a sufficient *contra-indication* as to its exhibition.

CONTRAMANDATIO Placiti, in our ancient law-books, signifies a respite, or giving the defendant farther time to answer: or, an imparlance, or countermanning of what was formerly ordered. See COUNTERMAND.

CONTRAMANDATUM, a lawful excuse, which the defendant by his attorney alledges for himself, to shew that the plaintiff has no cause to complain, *si dies placiti sit contramandatus*. 11 Hen. 1. See COUNTERMAND.

CONTRAMURE, in fortification, an outwall, built about the main wall of a city. See WALL, and RAMPART.

CONTRAMURE, in civil architecture. See COUNTERMURE.

CONTRAPOSITION, in logicks. See CONVERSION.

CONTRARIENTUM Rotulus. See the article ROTULUS.

CONTRARIETY, that which denominates two things *contrary* to each other.

Contrariety consists in this, that one of the terms imports a negation of the other, either mediately or immediately; so that *contrariety* may be said to be the contrast or opposition of two things, one of which implies the absence of the other.

Freedom of CONTRARIETY. See the article FREEDOM.

CONTRARIES, are positive opposites; which being of the same kind, or same common nature, and subsisting by turns in the same subject, are as remote from each other as possible, and mu-

tually expel each other.—Such are whiteness and blackness, cold and heat, &c. See OPPOSITES.

Hence, properly speaking, only qualities can be *contraries*: *contrariety*, in effect, only agrees to qualities *per se*; to other things it agrees *per accidens*, or in *ordine ad qualitatem*.

CONTRARY, however is often used in a more extensive signification, *viz.* for any incoherence or difference between the nature and qualities of things.—It is a popular maxim in philosophy, that *contraria juxta se posita magis elucescunt*; *contraries* set off one another.

In this sense the word *contrary* used in the schools: and hence, an argument *à contrario*: *v. gr.* if bodies whose surfaces are rugged do not reflect any light, polished bodies must, by the rule of *contraries* reflect it.

This method of proving things *à contrario*, is much used, and with good success, by F. Bourdaloue in his sermons.

The schools also use the word *contraries* in a more precise signification, as implying two positive things which cannot subsist together in the same subject, but destroy or expel each other, as heat and cold, dryness and moisture.

CONTRARY, in rhetoric. F. de Colonia lays down three kinds of *contraries* in rhetoric, *viz.* *adversatives*, *privatives*, and *contradictories*.

Adversatives are those that differ much in the same things, as virtue and vice, war and peace: thus Tully, *si stultitiam fugimus, sapientiam sequamur*; & *bonitatem, si malitiam*. And Quintilian, *malum causa bellum est, erit emendatio pax*. Drances argues thus in Virgil, *nulla salus bello: pacem te poscimus omnes*.—*Privatives* are habits, and their privations. *Contradictories* are those, one whereof affirms, and the other denies the same thing, of the same subject.

Point of CONTRARY flexure. See the article POINT.

CONTRAST *, in painting and sculpture, expresses an opposition, or difference of position, attitude, &c. of two or more figures; contrived to make a variety in a painting, &c.

* The word comes from the Italian *contrastare*, to oppose, or thwart; and that, according to M. Huet, from the latin *contra statio*.

Thus, when in a group of three figures, one appears in front, another shews his kind-parts, and a third is placed sideways, there is said to be a *contrast*.

M. de Piles defines *contrast* an opposition between the lines which form the objects; by means whereof they tend to set off one another.

A *contrast* well managed, is one of the greatest beauties of a painting.—The *contrast* is not only to be observed in the position of several figures, but also in that of the several members of the same figure: thus, if the right arm advance the furthest, the right leg is to be hindmost; if the right eye be directed one way, the right arm is to go the contrary way, &c. The *contrast* must be pursued even into the drapery.

To **CONTRAST**, in architecture, is to avoid the repetition of the same thing, in order to please by variety; as is done in the great gallery of the Louvre, where the pediments are, alternately, arched and angular.

CONTRAT-Wheel, in clock-work. See WHEEL; see also CLOCK, and WATCH.

CONTRAVALLATION. *Line of CONTRAVALLATION*, in fortification, is a trench guarded with a parapet; made by the besiegers, betwixt them and the place besieged, to secure themselves on that side, and stop the sallies of the garrison.

It is without musket-shot of the town, and sometimes goes quite round it, sometimes not, according as the general finds occasion.

The army forming a siege, lies between the lines of *circumvallation* and *contravallation*. See CIRCUMVALLATION.

CONTRAVENTION, a man's failure of performing or discharging his word, obligation, or duty, or the laws and customs of the place.—The penalties imposed in cases of *contravention*, only pass for comminatory.

In a more limited sense, *contravention* implies the non-execution of an ordinance, or edict.

Contravention is supposed to be a degree below prevarication; and to be only the effect of negligence or ignorance. See PREVARICATION.

CONTRA-YERVA, a root brought from Peru, esteemed a very great alexiterial, and a sovereign antidote against poison.

It is said to take its name from *yerva*; which in the Spanish signifies white hellebore, a plant whose juice is a violent poison, and is used by the Peruvians to poison their arrows withal: in which sense, *contra-yerva* signifies counter-poison.

The root is smaller than that of the iris, reddish without and white within, knotty and fibrous. To be good, it must be new, heavy, and of a dusky red colour.—In smell it resembles fig-leaves; its taste is aromatick, accompanied with somewhat of acrimony. There is an official composition which takes its name from this root, prepared with it, mixed with the testaceous powders, called *lapis contrayervæ*. Both the root and lapis are of great efficacy in the small pox, measles, fevers, and in all cases where either a diaphoresis or perspiration is required: its success being much more to be depended on than the Galcoigns powder; which, among the more knowing, is now very much despised.

It is agreed on, by the generality of writers, that the *contra-yerva* root is one of the best anti-epidemics yet known. Dr. Hodges, in his treatise of the last London plague, has a receipt which he says was attended with great success, and of which this root was one of the chief ingredients. See PLAGUE. There

There is another kind of *contra-jerva*, brought from Virginia, more ordinarily called *serpentaria*, this is very aromatic; it is but seldom prescribed singly, though said to have the same success against poisons and venoms with the *contra-jerva* of Peru. See *SERPENTARIA*.

CONTRE-BEND, in heraldry. The bar is called a *contrebend*, or *counter-band*, because it cuts the shield contrary, and opposite ways.

They also say, *contre-chevron*, *contre-pal*, &c. when there are two ordinaries of the same nature opposite to each other; so as colour be opposed to metal, and metal to colour. And the coat is said to be *contre* or *counter-paled*, *counter-banded*, *counter-fesse*, *counter-compound*, or *counter-barred*, when so divided.

Counter-quartered, is when one of the quarters is quartered again: hence also *counter-flowered*, *counter-coloured*, &c. — Animals are said to be *counter-passant*, when one passes on one side, and another on another.

in heraldry. See

CONTRIBUTION, the payment of each person's quota, or the part he is to bear in some imposition, or common expence.

Contributions are either *involuntary*, as those of taxes and imposts; or *voluntary*, as those of expences for carrying on some undertaking for the interest of the community.

CONTRIBUTIONS, in a military sense, are impositions paid by frontier countries to secure themselves from being plundered, and ruined by the enemy's army.

The peasants till their ground under the faith of *contributions*, as securely as in time of profound peace.

CONTRIBUTIONE facienda, a writ which lies where several persons are jointly bound to the same thing, and one or more of them refuse to contribute their share.

If tenants in common, or joint, hold a mill *pro indiviso*, and equally share the profits thereof; the mill falling to decay, and one or more of them refusing to contribute to its repair, the rest shall have the writ *de contributione facienda* to compel them. And if there be three coparceners of land that owe suit to the lord's court, and the eldest performs the whole; then may she have this writ to compel the refusers to a contribution.

CONTRITION, in theology, expresses a real sorrow, resulting from the thought of having offended God; from the sole consideration of his goodness; without any regard to the punishment the sin is intitled to.

Some of the Romish doctors avow, notwithstanding the practice of their church, that *contrition* is valid, and carries with it every thing necessary to obtain pardon, without the ceremony, or, as they call it, the sacrament of confession and absolution.

And in this they make the difference between *contrition* and attrition to consist. See *ATTRITION*.—This doctrine was lately maintained by F. Seguenot upon St. Augustin; but it was censured by the faculty of Paris.

CONTROL, **COMPTROL**, or **CONTROLE**, is, properly, a double register, kept of acts, issues, &c. of the officers or commissioners in the revenue, army, &c. in order to perceive the true state thereof, and to certify the truth, and the due keeping of the acts subject to that enregistrement. See *REGISTER*.

Hence, **CONTROLLER**, or **COMPTROLLER**, an officer established to control, or over-see publick accounts, and to certify, on occasion, whether things have been controlled, and examined, or not.—Thus, we have a *CONTROLLER of the king's household*, or of the accounts of the board of green cloth. *Controller-general* of the customs. *Controller of the navy*. *Controller of the mint*. *Controller of the excise*. *Controller of the accounts of the army*; of the chamber, &c. See *CHAMBER*.

CONTROLLER of the Hanaper, is an officer in chancery, attending the lord chancellor daily in term and seal time.

This officer is to take all things sealed from the clerk of the hanaper, inclosed in bags of leather, and to note the just number and effect thereof; to enter them in a book, with all the duties belonging to the king and other officers for the same, and so charge the clerk of the hanaper with them. See *HANAPER*.

CONTROLLER of the Pipe, an officer of the exchequer, who writes out summons twice a-year, to levy the farms and debts of the pipe. See *PIPE*, and *EXCHEQUER*.

He was antiently called *duplex ingrossator*. **CONTROLLERS of the Pell**, are officers of the exchequer, whereof there are two, viz. two chamberlains clerks, who keep a control of the pell of receipts, and goings-out: originally they took notes of other officers accounts, in order to discover if they did amiss. See *EXCHEQUER*, &c.

CONTROVER, in law, he who of his own head devises or invents false, or feigned news.

CONTROVERSIAL divinity. See *POLEMICAL divinity*.

CONTUMACY, in law, a refusal to appear in court when legally summoned; or a disobedience to the rules and orders of a court having power to punish such offence.

The word is used in civil, as well as criminal matters; but more rarely in the first, wherein the words *default*, and *contempt*, ordinarily supply its place: the refunding of the charges of a contempt judged at the hearing is also the penalty of *contumacy*.

In a criminal sense, the *contumacious* is condemned, not because the crime is proved on him, but because he is absent.

By the Roman laws, there was no process in case of *contumacy*, during the first year of absence: they only took an inventory of the goods of the fugitive, and if he died in the year, he died *intestatus*; but after the year was expired he was deemed culpable.

In England, *contumacy* is to be prosecuted to outlawry.—In France, all *contumacies* are annulled, if the accused make his appearance in five years; if he die in that time, his relations are permitted to purge his memory.

CONTUSION, *bruise*, in medicine, a solution of continuity, either in flesh or bone, occasioned by a fall, a blow, or a violent pressure, whereby the flesh is damaged, but without any external rupture, or any manifest loss of substance; and an effusion of blood ensues, from several little broken vessels, so as to discolour the skin, though it do not make its way through the pores thereof.

Or, *contusions* may be defined a particular sort of tumors, attended with a stagnation of the blood in the part affected; and, generally, with an inflammation, discoloration, and pain.

Contusions are either *internal*, or *external*. When from any external injury, there proceeds an internal disorder, *e. gr.* an asthma, spitting of blood, or the like, the *contusion* is said to be *internal*. If only external symptoms appear, as a tumor, blackness, &c. it is termed *external*.

In case of inward *contusions*, bleeding the patient is always necessary, and balsamicks must be given internally; such are sperma ceti, powder of rhubarb, Irish slate, oleaginous and pectoral medicines, &c. Externals proper for *contusions*, are liniments or ointments of marshmallows, oil of sweet almonds, spirit of wine with camphire; proper fomentations and strengthening emplasters, as that of oxycroceum, &c. according as the nature of the *contusion* and part *contused* requires.

CONVENT*, a monastery of religious, of the one or the other sex. See *MONASTERY*.

* The word comes from the Latin *conventus*, meeting, of *convener*, to come together.

CONVENT A palia. See the article *PACTA*:

CONVENTICLE, a diminutive of *convent*; denoting, properly, a cabal, or secret assembly of a part of the monks of a *convent*, to make a brigue in the election of an abbot.

From the ill use of these assemblies, the word is come into disrepute; and now stands for any mischievous, seditious, or irregular assembly.—F. Doucine observes, the occidentals always esteemed the fifth general council an unlawful *conventicle*. See *COUNCIL*.

—The term *conventicle* is said by some to have been first applied in England, to the schools of Wicliff; it at present is applied to the meetings of nonconformists.

CONVENTION, a treaty, contract, or agreement between two or more parties.

Every *convention* between men, provided it be not contrary to honesty and good manners, produces a natural obligation, and makes the performance a point of conscience.

Every *convention* has either a name, and a cause or consideration, or it has none: in the first case, it obliges civilly and naturally; in the latter only naturally. See *CONTRACT* and *CONSIDERATION*.

CONVENTION is much used both in antient and modern pleadings for an agreement, or covenant.

In the book of rolls of the manor of Hatfield in Yorkshire, we have a record of a pleasant *convention*, Anno 11 Ed. III. between Robert de Roderham and John de lthen, the latter of whom sold the devil in a string for three-pence halfpenny to the former, to be delivered on the fourth day after the *convention*: when, the purchaser making his demand, the seller refused to give him livery; to the great loss (as the record represents it) of forty shillings to the purchaser, &c. But it appearing to the court that such a plea does not lie among Christians; the parties were adjourned to hell for judgment.

CONVENTION is also the name given to an extraordinary assembly of parliament, or of the states of the realm, held without the king's writ.

The *convention* of estates, in 1688, after the retreat of king James II. upon mature deliberation, came to a conclusion, that king James, by his practices here, and his sight hence, had abdicated the kingdom; and that the throne was vacant; and therefore devolved upon king William and queen Mary. Upon this, their assembly expired as a *convention*, and was converted into a parliament. See *ABDICATION*.

There was a *convention* of the like kind in Scotland, and with the like effect.

CONVENTIONAL subrogation. See *SUBROGATION*.

CONVENTIONE facienda, in law, is a writ which lies for the breach

branch of any covenant in writing. Fitzherbert calls it a writ of covenant.

CONVENTUAL, something belonging to a convent. See CONVENT, and COENOBITE.

CONVENTUAL, is particularly used for a religious who actually resides in a convent; in contradistinction to those who are only guests, or are entertained there, or are in possession of benefices depending on the house.

CONVENTUAL prior, differs from a *claustral prior*, in that the former has the full right and authority of an abbot; the only difference between them being in the name: whereas the claustral prior is a dependant of the abbot, and derives all his authority from him.

The *conventual prior* is obliged to take priests orders in a year, or at most in two years, from the day of his admission: in default whereof, the benefice becomes vacant.

Some priories are actually *conventual*, i. e. they are stocked with religious; others are only *conventual in habitu*, v. gr. where there have been no religious during the space of 40 years: the continuance of one single religious, keeps the priory *conventual* *in*; for in default of one, the priory becomes simple.

By a declaration of the king of France, in 1680, it is decided, that a *conventual* never degenerates, or ceases, while there are regular places subsisting in it for twelve religious, with revenues for their support. See **PRIORY**.

CONVENTUAL auditors. See the article AUDITOR.

CONVERGING, or **CONVERGENT lines**, in geometry, are those which continually approximate, or whose distance becomes continually less and less.

In opposition to *divergent lines*, whose distance becomes continually greater. Lines that *converge* one way, diverge the other.

CONVERGING rays, in dioptricks, are those rays which in their passage out of one medium, into another of a different density, are refracted towards one another; so, as if far enough continued, they will meet in a point, or focus.

All convex lenses make the rays *converge*, and concave ones diverge, i. e. the one inflects them towards a center, and the other deflects them from it; and the more, as such lenses are portions of smaller spheres. On which properties, all the effects of lenses, microscopes, telescopes, &c. depend.

Rays coming *converging* out of a denser medium into a rarer, become more *convergent*, and concur sooner than if they were to continue their motion through the first. See **MEDIUM**.

Rays coming *converging* out of a rarer into a denser medium, *converge* less, and concur later, than if they had continued their motion through the first medium.

Parallel rays, passing from a denser into a rarer medium, v. gr. from glass into air, the surface of the glass being towards the air, will become *convergent*, and concur in a focus. See **PARALLEL**.

Diverging rays, or rays coming from a point, under the same circumstances, become *converging*, and meet in a focus; and as the radiant point comes nearer, the focus recedes further off: if the radiant be near, the focus will be infinitely distant; i. e. the rays will be parallel: and if the point be brought nearer still, the rays will diverge.

CONVERSE series, in mathematicks. See the article **SERIES**.

CONVERSE, in geometry, &c. A proposition is said to be the *converse* of another, when, after drawing a conclusion from something first supposed, we proceed to suppose what had been before concluded, and to draw from what it had been supposed. Thus, it is demonstrated in geometry, that if the two sides of a triangle be equal; the two angles opposite to those sides are equal also: the *converse* of the proposition is, that if the two angles of a triangle be equal, the two sides opposite to those angles are equal also.

In astrology, **CONVERSE direction** is used in opposition to *direct* direction; i. e. by the latter, the promoter is carried to the significator, according to the order of the signs: by the former it is carried from East to West, contrary to the order of the signs.

CONVERSION, in a moral sense, a return from evil to good; resulting from a sense, either of the natural deformity of the one, and amiableness of the other; or of the advantages and disadvantages that await the one, and the other.

Or, it is a change of the heart, with regard to the morals, passions, desires, and pursuits; and of the mind, with regard to the sentiments, &c. See **REGENERATION**.

CONVERSION, **CONVERSIO**, in logicks, a circumstance or affection of propositions, wherein the order of the terms, or extremes is changed; so that the subject comes into the place of the predicate, and the predicate into that of the subject; without any alteration in the quality of either.

As, *No virtue is vice; No vice is virtue*: in which we see the subject of the former, made the predicate of the latter, and the predicate the subject; yet both true.

Conversion is usually defined a due change of the order of the extremes, i. e. under such a habitude and coherence with respect to each other, that the one is rightly inferred from the other. Hence, in every legitimate *conversion* two things are required; 1^o. A communication, or reciprocation of terms; not in respect

of words, but of order. 2^o. The inference of one proposition from the other.

Aristotle makes two kinds of *conversion*; the one *simple*, by others called *universal*; wherein nothing is changed beside the order of extremes, i. e. the terms are transposed, without altering either the quality or quantity thereof: as, *No mind is body, No body is mind*.

The 2^o. *per accidens*, called also *particular*; wherein, beside changing the places of the terms, there is a change of an universal sign into a particular one: as, *Every good man studies the welfare of his country; some man that studies the welfare of his country is good*.

To these, some of Aristotle's followers add a third kind of *conversion*, called *by-contraposition*: as, *Every man is an animal, every no-animal is no-man*.

CONVERSION, in rhetoric, &c. is understood of arguments which are returned, retorted, and shewn on opposite sides, by changing the subject into the attribute, and the attribute into the subject. There are *conversions* of arguments, from one figure to another, and also from general propositions to particular ones.—Thus Cicero against Anthony; *Doleatis tres exercitus P. R. interfectos? interfecit Antonius. Desideratis clarissimos viros? eosque vobis eripuit Antonius. Auctoritas hujus ordinis afflicta est? afflicta Antonius*.

CONVERSION, in war, is when the soldiers are ordered to prevent their arms to the enemy who attack them in flank, whereas they were before supposed to be in front: the evolution necessary thereto is called *conversion*, or *quarter-wheeling*. See **QUARTER-WHEELING**.

CONVERSION of equations, in algebra, is when the quantity sought, or any part thereof, being in fractions, the whole is reduced to one common denomination; and then, omitting the denominators, the equation is continued in the numerators only.

Thus, suppose $a - b = \frac{aa + cc}{d} + h + b$; multiply all by d , and

it will stand thus, $da - db = aa + cc + d h + db$.

In arithmetick, we use the term *proportion by conversion of ratio*, for a comparison of the antecedent, and consequent in two equal ratios.

Thus, as there is the same ratio between two and three, as between eight and twelve; it is concluded there is the same ratio between two and one, as between eight and four.

Center of CONVERSION in mechanics. See **CENTER**.

CONVERSOS. See the article **CONVERT**.

CONVERT, a person who has undergone a *conversion*. See **CONVERSION**.

CONVERT is chiefly used in respect of changes from one religion or religious sect to another.

Converts with relation to the religion turned to, are denominated *apostates*, with regard to that they have relinquished.

The Jews formerly converted to Christianity in England, were called *conversos*. Henry III. built them a house in London, and allowed them a competent subsistence for their lives; which house was called *domus conversorum*. But the number afterwards increasing, they grew a burden to the crown; upon which they were distributed among the monasteries: and after the expulsion of the Jews under Edward III. the *domus conversorum* was given for keeping of the rolls.

CONVERTS, in a monastic sense, are lay-friars, or brothers, admitted for the service of the house; without orders, and not allowed to sing in the choir.

Till the eleventh century, the word was used for persons who embraced the monkish life at the age of discretion; by which they were distinguished from those devoted in their childhood by their parents, called *oblats*.

But in the eleventh century, when they began to receive into monasteries illiterate persons, incapable of being clerks, and only destined for bodily labour; the signification of the word was necessarily changed. F. Mabillon observes, that it was John first abbot of Vallombrosa, who first introduced these *brothers-converts*, distinguished by their state from the monks of the choir, who were then either clerks, or capable of becoming so.

CONVEX.

CONVEX freeze.

CONVEX lens.

CONVEX mirror.

CONVEX superficies.

CONVEXITY.

FREEZE.

LENS.

MIRROR.

SUPERFICIES.

CONVEXITY, the exterior surface of a *convex*, i. e. gibbous and globular thing; in opposition to *concavity*, or the inner surface, when hollow or depressed.

The word is of particular import in catoptricks and dioptricks; where it is applied to mirrors and lenses.

A *convex mirror* represents its images smaller than the objects; as a concave one represents them larger: a *convex mirror* reflects the rays from it, diverging; and therefore disperses and weakens their effect: as a concave one reflects them converging, so as they concur in a point, and have their effect increased: and by how much the mirror is a portion of a smaller sphere, by so much does it diminish the objects, and disperse the rays the more. See **MIRROR**.

A *convex lens* is either *convex* on both sides, called a *convexo-convex*;

convex; or it is plain on one side, and *convex* on the other, called a *plano-convex*: or concave on one side, and *convex* on the other, called a *convexo-concave*, or *convexo-convex*, as the one or the other surface prevails; i. e. as this or that is a portion of a smaller sphere. All *convex* lenses infect the rays of light in their passage, i. e. send them out from their *convex* surface converging; so as that they concur in a point, or focus.

Hence, all *convex* lenses magnify, i. e. represent their images larger than their objects; and this the more, as they are portions of smaller spheres. See *LENS*, and *REFRACTION*.

CONVEYANCE, in law, a deed, or instrument, by which lands, &c. are conveyed, or transferred by the proprietor, or owner thereof, to some other person. See *DEED*.

CONVICT, in common law, one who is found guilty of an offence, by the verdict of a jury.

According to Crompton, a person is also a *convict*, or said to be convicted, when, after having been outlawed, he appears and confesses.—*Conviction* and *attainder* are frequently confounded. See *ATTAINDER*, and *ATTAINTE*.

CONVICT recusant, he who has been legally presented, indicted, and convicted for refusing to come to church to hear the common prayer, according to the statutes 1 and 32 Eliz. and 3 Jac. I. This is commonly understood to be a popish recusant; though any others who refuse coming to church on the same account are as properly denominated *recusants*. See *RECUSANT*.

CONVICTION, in theology, expresses the first degree of repentance; wherein the sinner becomes sensible of his guilt, of the evil nature of sin, and of the danger of his own ways.

CONVICTION, in law. See the article *CONVICT*.

CONVIVUM banquet, in our ancient customs, and law-books, signifies the same thing among the laity, as *præcursio* among the clergy; viz. when the tenant was obliged, in virtue of his tenure, to provide meat and drink for his lord once, or often in the year. See *PROCURATION*.

CONVOCACTION, a general assembly of the clergy of a province, summoned by the king's writ to consult of the more weighty affairs of the church, as oft as a parliament is convoked to consult of those of the state.

The king's writ is directed to the archbishop of each province, requiring him to summon all bishops, deans, archdeacons, cathedral and collegiate churches, &c.

Upon which, the archbishop directs his mandate to his dean provincial, first citing him peremptorily; then willing him, in like manner, to cite all the bishops, deans, &c. and all the clergy of his province; but directing, withal, that one proctor sent for each cathedral and collegiate church; and two for the body of the inferior clergy of each diocese may suffice: which the dean accordingly does.

The place where the *convocation* of the province of Canterbury has been usually held is St. Paul's church; whence, of late, they have been prorogued to St. Peter's in Westminster, in the chapel of Henry VII. or the Jerusalem-Chamber, where there is an upper and lower house. Chamberlayne.

The upper house, in the province of Canterbury, consists of 22 bishops, whereof the archbishop is always president; all, at the opening of a *convocation*, are in their scarlet robes and hoods.

The lower house consists of 22 deans, 24 prebendaries, 54 archdeacons, and 44 clerks, representing the diocesan clergy.

Things are first usually proposed in the upper house; then communicated to the lower. All the members of both houses have the same privileges for themselves and menial servants as the members of parliament have.

The archbishop of York, at the same time, holds a *convocation* of the clergy of his province, after the like manner, at York; and, by constant correspondence, debates and concludes of the same matters as are debated by that of Canterbury. Not that the northern province is obliged to follow what the southern one does.

The English clergy, antiently, had their representatives in the lower house of parliament; as appears by the record much prized by my lord Coke.

CONVOLUTION, a winding or turning motion, proper to the trunks of some plants; as the convolvulus, or bind-weeds, and the claspers of vines, and briony.

Dr. Grew thinks, that all those plants whose roots are twisted, have such a *convolution*: and he assigns two great efficient causes of this winding motion, the sun and the moon.

It is very easy to try whether there be any such *convolution* or not in the trunks of plants; which may be done, as he hints, by tying a little bit of paper to any of the branches which are exactly north, south, &c. and then seeing whether it will change its position, or not, in respect of the point of the compass.

CONVOY, *Escort*, a sea term, signifying one, or more vessels of war, intrusted with the conducting of a fleet of merchants; serving as a watch, and a shelter from the insults of the enemies of the state, or of pirates.

Convoy is also used in speaking of military affairs by land; where it signifies a body of forces sent to guard a supply of provisions, arms, or ammunition, going to a camp, or the like.

CONVUSANCE. } See the articles } *COGNISANCE*.
CONUSOR. } } *COGNISOR*.

CONVULSION, *spasmus*, in medicine, a continued involuntary contraction of some parts of the body, otherwise accustomed to move according to the direction of the will.

It owes its origin to a contraction of the muscles of the part, occasioned by a too copious and violent influx of the nervous juice: of which there may be infinite causes in the blood, arteries, meninges, brain, nerves, muscles, cranium, &c.

If the *convulsion* be universal, attended with violent motions, foaming at the mouth, and periodical; it is usually called an *epilepsy*. See *EPILEPSY*.

The usual evacuations and medicines proper for the cure of *convulsions*, are phlebotomy, emetics, catharticks, epispasticks, and proper cephalicks; as sal volat. oleof. spirit of lavender, spirit of hartshorn, tincture of castor, cinnabar of antimony, casumunar root, valerian root, volatile salt of amber, &c. given in different forms.—In periodical universal *convulsions*, a salivation sometimes answers, after other courses have failed.

Women and children are particularly liable to *convulsions*: women after delivery; as upon a stoppage of the lochia, or a violent extraction of the placenta. See *Supplement*, article *SPASM*.

CONVULSIVE, in medicine, is applied to those motions which, naturally, should depend on the will; but which, by some external cause, become involuntary.

A *convulsive* motion, is a contraction made by fits and intervals; wherein it differs from a *convulsion*, which is a continued contraction.

Convulsive motions arise from a disorder in the origin of the nerves. A *convulsive* tension of the solids, is one of the principal causes which destroy the equilibrium that should obtain between the solids and the fluids. *Journ. de Sav.*

CONVULSIVE is also used for any thing that occasions a *convulsion*, or *convulsive* motion.

Wounds of nerves are said to be *convulsive*; white hellebore is *convulsive*.—Children are very liable to *convulsive* disorders from various causes; as repletion, curdling of the blood in the stomach or intestines, worms, dentition, &c.—The cramp is a *convulsive* contraction of some muscular part of the body. See *CRAMP*.

CONVULSIVE asthma. See the article *ASTHMA*.

COOK-ROOM, in a ship, is where the cook and the mate dress and deliver out the meat, &c.—See *Tab. Ship*, fig. 2. n. 32.

COOLERS, in medicine, remedies so called: which may be considered under these two divisions:—1^o. Those which produce an immediate sense of cold; which are such as have their parts in less motion than those of the organs of feeling.

2^o. Such as by a particular viscosity, or grossness of parts, give a greater consistency to the animal fluids than they had before; whereby they are disabled from moving so fast, and will therefore have less of that intestine force on which their heat depends.

Of the former kind are fruits, and all acid liquors.—To the latter belong cucumbers, and all substances producing viscosity.

COOM, a term for soot that gathers over an oven's mouth: also for that black greasy substance which works out of the wheels of carriages.

Coom, or soot, is sometimes used in medicine, infused in wine with other ingredients, as an antihysterick, and against palpitations of the heart, &c.—The spirit of foot is also used for the same intentions, and in cephalick cases.

COOMB, or *COMB* of corn, is a dry measure, containing four bushels, or half a quarter. See *MEASURE*; see also *BUSHEL*, &c.

COOPERIRE pallio. See *PALLIO*.

COORDINATE, something of equal order, rank, or degree with another. See *ORDER*, &c.

COORDINATION, in respect of causes, denotes an order of causes, wherein several of the same kind, order, and tendency, concur to the production of the same effect.

COPAL, a gum, or resin of an agreeable smell, resembling that of frankincense; it is brought from New Spain, where it oozes out from incisions made in the bark of a large tree; much after the manner in which the vine yields its sap, when cut in the spring.

The Indians use it to burn on their altars: among the Europeans, it is used against disorders of the breast, having a warming, resolving, and humectating power. It is very rare; when good, it is of a fine transparent yellow; and melts easily, either in the mouth, or on the fire.

In defect of this is brought another kind from the Antilles, which is almost the only one known among the druggists; and its chief consumption is in the making of varnish.

COPARCENARY, the share, or quota of a *coparcener*. See *COPARCENERS*.

COPARCENERS, or *Parceners*, such as have equal portions in the inheritance of their ancestor.

Coparceners are so either by *law*, or *custom*. *Coparceners by law*, are the issue female; which, in default of a male heir, come equally to the lands of their ancestor.

Coparceners by custom, are those who by some peculiar custom of the country, challenge equal parts in such lands; as in Kent, by the custom of Gavelkind.—The crown of England is not subject to *coparcenary*.

COPE, an ecclesiastical ornament, usually wore by chantors and sub-chantors, when they officiate in the church-solemnity. It is also wore by the Romish bishops and other ordinaries: it reaches from the shoulders to the feet. The antients called it *phœbele*.

S. Martin's COPE, was a relic, formerly in great esteem among the French kings; and was often carried with them to war as their standard.

COPERNICAN *sphere*. See the article SPHERE.

COPERNICAN *system*, or *hypothesis*, is that system of the world, wherein the sun is supposed at rest in the center; and the planets with the earth, to move in ellipses round him. See SYSTEM. The heavens and stars are here supposed at rest; and that diurnal motion which they appear to have from east to west, is imputed to the earth's motion from west to east.

This system was asserted by many of the antients; and particularly Ephantus, Seleucus, Aristarchus, Philolaus, Cleanthes, Samius, Hicetas, Heraclides Ponticus, Plato, and Pythagoras; from which last it was antiently denominated the *pythagoric system*.

It was also held by Archimedes, in his book *de granorum arena numero*; but after him it became neglected, and even forgotten, for many ages; till about 250 years ago, when Copernicus revived it; from whom it took the new name of the *copernican system*. Nich. Copernicus, now a name so popular, was born at Thorn, in Polish Prussia, in the year 1472, according to Junctinus, or 1473 according to Mœstlinus. After the usual domestick education, he was sent to the university of Cracow; where he applied himself to philosophy and physics, and at length commenced doctor in medicine. In the mean time, having a strong propensity to mathematics, he diligently attended the lectures of Albert. Brudzevius, and even learnt of him at home. After he had here attained to the use of the astrolabe, and was entering upon astronomy, he took Regiomontanus for his guide: though he run through all the mathematics of the age, yet he seemed most taken with perspective; on occasion whereof he learned painting, in which he is said to have excelled. When 23 years of age, being at Bologna, he became acquainted with that eminent mathematician Dom. Maria Ferrariensis; and was admitted to share with him in making of astronomical observations. Here, in the year 1497, Copernicus first observed an occultation of palicium by the moon. Going on to Rome, he taught publicly, and made some considerable observations; and at his return to Cracow, he was made canon of the church of Wermeland, or Ermeland, and at length vicar-general.

The course he took in prosecuting astronomy, which has rendered his name immortal, was as follows: Observing how the astronomers of those times were grieved to make the planets move equally in circular orbits, viz. to suppose them to move, not about their own center, but that of the equant; and that they could no way make out a tolerably regular system, out of all their shifts and hypotheses; he resolved to try what he could do. With this view he perused the writings of all the philosophers and astronomers extant; and picked out of each what appeared probable and elegant. In this review he was chiefly taken with two almost similar opinions; (the one attributed to Martianus Capella, the other to Apollonius Pergeus:) which give a very good account of the motions of Venus and Mercury; and explain the cause of their directions, stations, and retrogradations very happily: the latter, withal, performing the same in the three superior planets. But, then, in both these hypotheses, the earth is supposed the center; Copernicus chose rather to adopt the opinion of the Pythagoreans; to remove the earth out of the center of the world, and to give it, not only a diurnal motion round its own axis; but also an annual one round the sun.

On this footing he began to observe, calculate, compare, &c. and at length, after a long solicitous disquisition, found himself in a condition to account for the phenomena and motions of all the planets; and to make an orderly arrangement, or disposition of the whole heavens: wherein nothing could be altered, or displaced, without bringing the utmost confusion into the whole. These things he began to write down about the year 1507. He then proceeded to furnish himself with some new apparatus; particularly a parallactick instrument, and some Ptolemaic rulers, wherewith to observe the altitude of the stars, and determine the periods of the sun and moon: and without other means, composed his six books *de orbium coelestium revolutionibus*; containing the whole of astronomy, delivered after the example of Ptolemy, in a geometrical method. We have already observed that he began it in 1507; he finished it in 1530. Five years after he polished and improved it. He died of a dysentery, and a palsy on his right side, in the year 1543.—See the *order, and disposition of the heavenly bodies*, as laid down by him, compared with those in the other systems, under the head SYSTEM.

COPERNICUS, is the name of an astronomical instrument, contrived by Mr. Whifton, for the calculation and exhibition of eclipses, and of the motions of the planets, both the primary and secondary ones, &c.

It was so called by the inventor, as being built on the *copernican system*; or as representing the heavenly bodies agreeable thereto. It consists of several concentric circles of wood; upon which are inscribed numbers, transferred either from the astronomical

tables: by the various dispositions of these circles, which are made so as to slide within each other, questions are solved; and thus long calculations are saved, and the work of many hours brought into a few minutes.

For the exhibition of eclipses, there is a peculiar apparatus, consisting of a terrestrial globe, so disposed, as that being turned round its axis, the light of the sun, or a candle, is projected through a glass plane, marked out into concentric circles, expressing digits of the eclipse; and thus is the path of the eclipse, with its degree or quantity in every part of its path, agreeably and accurately represented.

The instrument not being very common, a particular description were superfluous. The author of it has wrote a book expressly to explain it.

COPHTI*, COPHITS, or COPTI, a name given to the christians of Egypt; who are of the sect of Jacobites.

* The crickers are extremely divided about the origin, and orthography of the word: some write it *cophti*, others *cophtites*, *cophtite*, *copht*, &c. Scaliger derives the name from *coptus*, an antiently celebrated town of Egypt, the metropolis of the Thebaid. Kircher refutes this opinion, and maintains, that the word originally signifies *cut*, and *circumcid*; and was given these people by the Mahometans, by way of reproach, in regard of their practice of circumcising: but P. Sollier, another Jesuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the word from *Ar-y-ueg*, the antient name of Egypt, by retrenching the first syllable: but this opinion, too, P. Sollier disputes. John de Leo and others say, that the Egyptians antiently called their country *elchibth* or *ciibth*, from *Cibth* their first king, whence *cophtite*, &c. others say from Cobtem second king of Egypt. Vanlæbe derives the word *copht* from Copt son of Misraim, grandson of Noah.—All these etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called *cophti*; whereas, in effect, none but the Christians, and among those none but the Jacobites bear the name; the Melchites not being comprehended under it.—Hence he chuses to derive the word from the name *Jacobite*, by retrenching the first syllable; whence *coibte*, *coibta*, *coptia*, and *cophtia*.

The *Cophts* have a patriarch, who resides at Cairo, but he takes his title from Alexandria: he has no archbishop under him, but eleven or twelve bishops. The rest of the clergy, whether secular or regular, is composed of the orders of S. Anthony, S. Paul, and S. Macarius, who have each their monasteries.

Beside the orders of priests, deacons, and subdeacons, the *Cophts* have likewise archimandrites, the dignity whereof they confer with all the prayers and ceremonies of a strict ordination.

This makes a considerable difference among the priests; and besides the rank and authority it gives them with regard to the religious, it comprehends the degree and functions of arch-priests. By a custom of 600 years standing, if a priest elected bishop be not already archimandrite, that dignity must be conferred on him before episcopal ordination.

The second person among the clergy, after the patriarch, is the titular patriarch of Jerusalem, who also resides at Cairo, by reason of the few *Cophts* at Jerusalem; he is, in effect, little more than bishop of Cairo: only he goes to Jerusalem every Easter, and visits some other places in Palestine near Egypt, which owns his jurisdiction. To him belongs the government of the *cophtic* church, during the vacancy of the patriarchal see.

To be elected patriarch, it is necessary the person have lived all his life in continence; and even that he be a virgin: it is he confers the bishopricks. To be elected bishop, the person must be in the celibate; or, if he have been married, it must not be above once.

The priests and inferior ministers are allowed to be married before ordination; but are not obliged to it, as Ludolphus mistakenly observes. They have an infinity of deacons, and even confer the dignity frequently on children. None but the lowest rank among the people commence ecclesiastics; whence arises that excessive ignorance found among them: yet the respect of the laity towards the clergy is very extraordinary.

Their office is longer than the Roman office, and never changes in any thing: they have three liturgies, which they vary occasionally.

The monastick life is in great esteem among the *Cophts*: to be admitted into it, there is always required the consent of the bishop. The religious *Cophts* make a vow of perpetual chastity; renounce the world, and live with great austerity in deserts: they are obliged to sleep in their cloths and their girdle, on a mat stretched on the ground; and to prostrate themselves every evening 150 times, with their face and breast on the ground. They are all, both men and women, of the scum of the people; and live on alms. The nunneries are properly hospitals; and few enter but widows reduced to beggary.

F. Roderic reduces the errors and opinions of the *Cophts* to the following heads: 1°. That they put away their wives, and espouse others while the first are living. 2°. That they have seven sacraments, viz. baptism, the eucharist, confirmation, ordination, faith, fasting, and prayer. 3°. That they deny the holy spirit to proceed from the son. 4°. That they only allow of three oecumenical councils; that of Nice, Constantinople, and Ephesus. 5°. That they only allow of one nature, will, and operation in Jesus Christ after the union of the humanity with the divinity. For

For their errors in discipline, they may be reduced, 1°. To the practice of circumcising their children before baptism, which has obtained among them from the twelfth century. 2°. To their ordaining deacons at five years of age. 3°. To their allowing of marriage in the second degree. 4°. To their forbearing to eat blood: to which some add their belief of a baptism by fire, which they confer by applying a hot iron to their forehead or cheeks.

Others palliate these errors, and shew that many of them are rather abuses of particular persons, than doctrines of the sect. This seems to be the case with regard to their polygamy, eating of blood, marrying in the second degree, and the baptism of fire: for circumcision, it is not practised as a ceremony of religion; nor as of any divine appointment, but merely as a custom which they derive from the Ishmaelites; and which, perhaps, may have had its origin from a view to health and decency in those hot countries.

The *Cophts*, at different times, have made several re-unions with the Latins; but always in appearance only, and under some necessity of their affairs. In the time of pope Paul IV. a Syrian was dispatched to Rome from the patriarch of Alexandria, with letters to that pope; wherein he acknowledged his authority, and promised obedience; desiring a person might be dispatched to Alexandria, to treat about a re-union of his church to that at Rome: pursuant to which, Pius IV. successor to Paul, chose F. Roderic, a Jesuit, whom he dispatched in 1561, in quality of apologetic nuncio.

But the Jesuit, upon a conference with two *Cophts* deputed for that purpose by the patriarch, was made to know, that the titles of *father of fathers*, *paster of pastors*, and *master of all churches*, which the patriarch had bestowed on the pope in his letters, were no more than mere matters of civility and compliment; and that it was in this manner the patriarch used to write to his friends: they added, that since the council of Chalcedon, and the establishment of several patriarchs independent of one another; each was chief and master of his own church. This was the answer the patriarch gave the pope, after he had received a sum of money remitted to him from Rome, by the hands of the Venetian consul.

COPHTIC, or **COPTIC**, the language of the *Cophts*.

This is the ancient language of the Egyptians, mixed with a great deal of Greek; the characters it is written in being all Greek.

F. Kircher is the first who published a grammar, and vocabulary of the *Cophtic*. There is not known any book extant in the *Cophtic*, except translations of the holy scriptures, or of ecclesiastical offices; or others that have relation thereto, as dictionaries, &c.

The ancient *Cophtic* is now no longer found, but in books: the language now used throughout the country is Arabic.

The old *Cophtic*, which Kircher maintains to be a mother-tongue, and independent of all others, had been much altered by the Greek: for besides that it has borrowed all its characters from the Greek, with a very little variation, a great number of the words are pure Greek.

Vossius, indeed, asserts that there was no *Cophtic* language till after Egypt became subject to the Arabs. The language, according to him, is a mixture of Greek and Arabic: the very name thereof not being in the world till after the Arabs were masters of the country. But this, M. Simon observes, proves nothing; except that what was antiently called *Egyptian*, has since by the Arabs been called *Cophtic*, by a corruption of speech. There are, it is true, Arabic words in the *Cophtic*; yet this by no means proves but that there was a language before that time, either *Cophtic* or Egyptian. Pietro de la Valle observes, that the *Cophts* have entirely lost their antient tongue; that it is now no longer understood among them; that they have nothing extant therein but some sacred books; and that they still say mass in it: *solo hanno in essa alcuni libri sacri, dicendo ancora la massa in quella lingua*.

All their other books have been translated into Arabic, which is their vulgar tongue; and this has occasioned the originals to be lost: it is added, that they rehearse the epistles and gospels in the mass, twice; once in Arabic, and once in *Cophtic*. Indeed, if we believe F. Vanlebe, the *Cophts* say the mass in Arabic, all but the epistles and gospels, which they rehearse both in that and *Cophtic*: *La massa celebrano in lingua Arabica, eccetto l'Evanglio & alcune altre cose che sogliono leggere nella lingua Cophta & Araba*.

COPHTIC bible. See the article **BIBLE**.

COPIA libelli deliberanda, a writ which lies in case where a man cannot get the copy of a libel at the hands of the ecclesiastical judge.

Cornu Copia. See **CORNUCOPIA**.

COPIATA, under the western empire, a *grave-digger*.—In the first ages of the church, there were clerks defined for this employment. In the year 357, Constantine made a law in favour of the priests *copiatæ*, i. e. of those who had the care of interments; whereby he exempts them from the lustral contribution which all other traders paid.

It was under him also that they first began to be called *copiatæ*, q. d. clerks destined for bodily labour, from *copæ*, of *copæ*.

findo, cado, ferio, I cut, beat, &c. Before that time they were called *decani* and *léitcarli*; perhaps, because they were divided by decads or tens, each whereof had a bier or litter for the carriage of the dead bodies. Their place among the clerks, was the next in order before the chantors.

COPING of a wall, the top or cover of a wall, made sloping to carry off the wet.

COPING over, in carpentry, a fort of hanging over, not square to its upright, but bevelling on its under side till it end in an edge.

COPIVI, **CAPIVI**, **COPAYBA**, or **CUPAYBA**, a balm or balsam, oozing out of incisions made in a tree of Brazil; not taken notice of but by very late writers; at least, not under this name.

It is of a thinner consistence than common turpentine, but much more fragrant, and deterfive. It is extremely quick in passing off by urine, and mightily cleanses those passages; by which it has obtained very much in gonorrhæas, seminal weaknesses, the whites, and all obstructions, and ulcerations of those parts. It is likewise a powerful balsamick, and is good in many distempers of the breast, especially in catarrhs, tickling coughs, spitting of blood, &c. In dysenteries and diarrhæas of long continuance, where the mucus that lines the intestines is by the acrimony of the humours abraded, it is of great service in supplying its place by its balsamick quality. It mixes intimately with the yolk of an egg.—The Jews use it to stop the flux of blood after circumcision.

COPPEL, **COPEL**, or **CUPPEL**, a vessel used by refiners, and essayers, to try, and purify their metals.

The *coppel of assay*, is a little flat vessel, made of vegetable ashes, and bones of sheeps feet, calcined and lixiviated, to separate the salts, which would otherwise make it crack. At the bottom of the vessel is a little cavity filled with a kind of white varnish, composed of hartshorn, or pike-bones, calcined and diluted in water: the use of this liquor is, that the gold or silver to be essayed may be more conveniently lodged, and that the button of the essay may be separated the more easily.

Note, Though metals may be tried otherwise than by *coppelling*: and though the touchstone, graver, &c. are of some service to the goldsmith in judging of their purity; yet, without the *coppel*, it is difficult, not to say impossible, to know their precise degree of purity.

The *refiner's coppel*, is a large freestone vessel, lined within with a kind of plaster made of ashes well lixiviated, cleaned, dried, beaten and sifted.

In this kind of *coppel* it is that they purify their gold and silver, by adding lead to it, and exposing the whole to a violent fire. See **Supplement**, article **COPPEL**.

COPPER, a hard, heavy, ductile metal; found in mines, in several parts of Europe, but most abundantly in Sweden.

Copper is of all metals the most ductile and malleable after gold and silver; and it abounds very much in vitriol and sulphur.

The chymists call it *venus*; as supposing it to have some more immediate relation to that planet. By an analysis it appears composed of a sulphur ill digested, a yellowish mercury, and a red salt.

Copper is found in gables or stones of various forms and colours; which are first beaten small and washed, to separate them from the earthy, &c. parts wherewith they are mixed.

After washing they are melted, and the melted matter run into a kind of moulds, to form large blocks, by some called *saïmons*, and by others *cakes of copper*. This is the ordinary *copper*.

To render it more pure and beautiful, they melt it again once or twice; some of its coarse earthy parts being left behind at each fusion, and a quantity of tin and antimony added in each. In this state it is called *rose copper*, in Latin *æs pelosum*.

Copper is sometimes also found native and pure in the mines, either in form of threads, or in flakes, plates, grains, or other masses and lumps.—This is called *virgin copper*.

Of a mixture of *copper* and lapis calaminaris, is formed brass, which the French call *cuivre jaune*, *yellow copper*, in contradistinction to natural *copper*, which they call *cuivre rouge*, *red copper*. See **BRASS**.

Copper melted together with 22 or 23 pounds of fine tin per quintal, makes bell metal. See **BELL metal**.

Copper and brass melted in equal quantities, make what the French call *bronzé*, used for figures, statues, &c.

Copper turns white by an unction of spirit of wine and orpiment: Pliny says there is a *copper* naturally white, found underneath the silver mines. See **Supplement**, article **CUPRUM**.

Engraving on COPPER. } See the articles **ENGRAVING**.

Refining of COPPER. } **REFINING**.

Chymists give the denomination *saffron of copper*, or *crucis venis*, to a preparation of *copper* plates stratified with decrepitated salt, in a crucible; after having extinguished them in water, and scraped them with iron instruments. It is very red, and is used in emplasters to cleanse wounds, and ulcers. Some chymists have pretended that the spirit of *copper* is a real alkaliest, capable of dissolving wholly pearls, corals, crabs eyes, &c. without any diminution of its force; but experience has shewn the contrary.

Æs ustum, sometimes also called *saffron of venus*, is nothing but *copper* calcined in a violent fire.

Verdigrease

Verdigrease is a rust of *copper*. See VERDIGREASE.—Becher observes, that the drinking of acid liquors, even out of common silver plate, is very unwholesome, by reason of the mixture of *copper* therein; much more is it so out of vessels of *copper*.

COPPERAS, a name given to vitriol, particularly to vitriol of iron.

Copperas is purified and prepared in the same manner as allum and salt-petre, by passing through several lixiviums, till it be wholly reduced to crystals.

Some make *copperas* to be the chalcitis of the antients. But the more common opinion is, that their chalcitis was a stone, not a pure salt.

There is *copperas* of England, of Pisa, Germany, Cyprus, Hungary, and Italy, which differ from each other in colour, richness, and perfection.

White *copperas*, is a vitriol of iron, with a mixture of some other mineral, brought from Germany in cakes of 40 or 50 pound each: such are those brought from Goslar in Saxony.

The English *copperas* is of a fine green; that of Cyprus and Hungary is of a sky blue, and has copper for its basis. It is in pieces cut like the point of a diamond. That of Pisa and Italy is likewise green; and the last as transparent as glass.

The English green *copperas* is of considerable use in many preparations; but especially in dying. The haters also use it in their dye; and this and galls are the ingredients that compose writing-ink.

The ordinary English *copperas* is made of a kind of stones found on the sea-shore in Essex, Hampshire, and so westward, ordinarily called *gold stones*, from their colour: they abound much in iron.

To prepare the *copperas* from them, they are exposed to the weather in beds above ground, and receive the rains and dews, which in time break and dissolve the stones: the liquor that runs off is pumped into boilers, in which is first put old iron, which in boiling dissolves. When the boiling is finished, the liquor is drawn off into coolers, where it shoots into crystals.

The works at Deptford for making it, are known to most people.—Many chymists dissolve this, and shoot it again, to sell it for the common salt of steel.

COPPICE, or CORPSE, a little wood, consisting of under-woods; and such as may be raised either by sowing, or planting.

COPULA, in logic, a verb that connects any two terms in a proposition, either negative or affirmative: as, *A rose is sweet*; where *is* is the *copula*.

COPULATION. See the articles COITION, CONGRESS, and CONSUMMATION.

COPULATIVE Propositions, are those which include several subjects, or several attributes joined together by an affirmative or negative conjunction.

Thus, *v. gr. power and riches do not make a man happy*. Where *and* is the conjunction that couples *power* and *riches*.

Conjunction COPULATIVE. See CONJUNCTION.

COPY, in a law-sense, a transcript of a writing or instrument, made for the use and satisfaction of some of the parties concerned; or in order to preserve the memory thereof. See COPIA.

Such a *Copy* was taken from the original; has been collated with the original. Antient documents do now few of them subsist otherwise than in *copies*.

Copy is also used for an imitation of any original work; particularly a painting, draught, figure, &c.

Copy, among printers, denotes the manuscript, or original of a book given to print from.

In this sense, they say, the press stands still for want of *copy*: such an author's *copy* is good, i. e. it is fair, legible, orderly, &c. and such another's otherwise.

In the bookseller's language, a *good copy* is that which produces a saleable book.

To cast off a *copy*, is to make a computation of the number of sheets a manuscript will make in print.

Tenant by COPY of court-roll. See TENANT.

COPY-HOLD, is a tenure for which the tenant has nothing to shew but the *copy* of the roll made by the steward of the lord's court.

The steward of the court is, among other things, to enroll and keep a register of all such tenants as are admitted to any parcel of land, or tenement belonging to the manor; and the transcript is called the *copy of the court-roll*, which the tenant keeps as his own evidence.

This tenure is called a *bare tenure*, because the tenant holds, in some sort, at the will of the lord. Fitzherbert says, it was formerly called *tenure in villenage*; and that *copy-hold* is but a modern name. However, it is not simply at the lord's will, but according to the custom of the manor; so that if the *copy-holder* doth not break that custom, and forfeit his tenure, he seems not to stand at the lord's courtesy.—These customs are infinite; varying in one point or other almost in every manor.

Copy-holders, upon admittance, pay a fine to the lord; which fines are in some manors certain, in others not; but yet, if the

lord exceeds two years value, the court of chancery, king's bench, &c. have, in their several jurisdictions, power to reduce the fine.

In many places, the *copy-holds* are a kind of inheritance, and termed *customary*, because the tenant dying, and the hold becoming void, the next of blood paying the customary fine, as two shillings an acre, or the like, may not be denied his admission. Some *copy-holders* have by custom the wood growing upon their own land; some, again, hold by the verge in ancient demesne, so that though they hold by *copy*, they are yet accounted a kind of freeholders: lastly, some others hold by common tenure, called *mere copy-hold*; whose land, upon felony committed, escheats to the lord of the manor.

This is the land which the Saxons called *folkland*, as being held *sine scriptis*, in contradistinction to *bockland*, or charter-land, *terra ex scriptis*, and now free-land. See CHARTER-LAND, and FREE-HOLD.

COPY-HOLDER, is defined by West, a person admitted tenant of any lands, or tenements within a manor, which, time out of mind, by the use and custom thereof, have been devisable to such as will take the same by *copy* of court-roll, according to the custom of the said manor.

COQ, *ad med. conjuncti*, an abbreviation among physicians, signifying that the thing is to be boiled till half of it be consumed.—*Coq. in S. 2. Ag.* implies it to be boiled in a sufficient quantity of common water.

COR, in anatomy. See the article HEART.

COR *caroli*, in astronomy, an extra constellation star in the northern hemisphere, situated between the comae berenices and uria major; so called by Dr. Halley in honour of king Charles.

COR *hydræ*, in astronomy, a star of the second magnitude, in the heart of the constellation hydra; the twelfth in order in Ptolemy's catalogue; the eleventh in Tycho's; and the twenty-fifth in the Britannic. Its longitude is $22^{\circ} 57' 59''$, its latitude $22^{\circ} 24' 32''$ south.

COR *lewis*, or *regulus*, a fixed star of the first magnitude, in the constellation leo. See LEO.

CORACOBRACHIALIS, a muscle which arises from the process coracoides of the scapula, by a tendinous beginning; and passing over the articulation of the humerus, is inserted into the middle and internal part of that bone, and with the deltoideus and supra-spinatus, lifts the arm upwards; and alone, obliquely outwards.—See Tab. Anat. (myol.) fig. 1. n. 23.

CORACOYOIDÆUS *, in anatomy, a muscle which has its origin from the process coracoides of the omoplate; or rather, according to Keil, from the upper edge of the scapula, near its neck; whence ascending obliquely under the maitoidæus, it is inserted into the os hyoides; which it serves to pull obliquely downwards.—See Tab. Anat. (myol.) Fig. 2. lit. o. fig. 1. n. 17. See also HYOIDES.

* The word is formed from *coracoides* and *hyoides*, the two parts. It is also called *digestivus*, as having two bellies at its two extremities, and a tendon in the middle to give room for the passage of the carotid and inner jugular artery. See DIGASTRIC.

CORACOIDES *, in anatomy, a small, sharp process of the scapula; so called from its resembling a crow's bill.—See Tab. Anat. (Osteol.) fig. 3. n. 5. 5. See also PROCESS, and SCAPULA.

* The word comes from the Greek *κρως*, *κρως*, *corvus*, and *ειδος*, *imago*.

The *coracoides* is placed in the upper part of the neck, and projects over the head of the bone of the arm.—It serves to strengthen the articulation of the shoulder; and gives origin to one of the muscles of the arm.

CORAL, in natural history, a production of the sea, usually ranked among the number of marine plants *.

* The nature of coral must needs be very difficult to determine: for the antients, without hesitation, took it for a stone; most of the moderns hold it a vegetable; of late days, M. de Reaumur maintains it partly plant, partly stone; while another curious and able naturalist, who has much studied the productions of the sea, almost ranks it in the number of animals, as imagining it the work of certain sea insects. Vid. Hist. Acad. R. Scienc. an. 1728. p. 50. mem. p. 378.

The opinion of its being a vegetable, is, however, now so well established, that all other sentiments seem almost precluded. P. Kircher supposes entire forests of it, at the bottom of the sea; and M. Tournefort, an able botanist, maintains that it evidently multiplies by seed; and the count de Marigli has even discovered some parts therein which seem to serve the purpose of seeds and flowers.

Coral, then, being established a plant, has, in that quality roots, wherewith it is fastened to the rock whereon it grows: these roots are covered with a bark, often beset with stony pores, which traverse them from top to bottom. Above the roots is the ligneous part of the plant, if we may so call a substance that rather seems to resemble stone than wood. It is divided into branches like other plants; having white streaks therein, which seem to represent a kind of fibres. The extremities of the plant are rounded with little bowls, ordinarily divided into six cells, filled with a humour somewhat like milk, fatty, sharp, and astringent.

Lastly,

Laffly, that nothing may be wanting to constitute a real plant, these bowls are esteemed a kind of pods, or capulæ, containing the seed of the coral. It is even said, that in what place, or on what matter soever this juice be shed, it carries fecundity with it, and produces a plant of coral: whence it is, that in the cabinets of the curious, we find some of it on dead mens skulls, pieces of earthen ware, and other kinds of solid bodies, which chance and the working of the sea have thrown into some of F. Kircher's forests. Coral, M. le Comte de Marigli observes, grows chiefly in grottoes whose mouth or aperture is towards the south, and their vault, or concave arch nearly parallel to the surface of the earth. For its growth, it is necessary the sea be as quiet as a pond: it vegetates the contrary way to all other plants; its foot adhering to the top of the grotto, and its branches shooting downwards. The foot takes the exact form of the solid it grows to, and even covers it, like a plate, to a certain extent; which M. de Marigli thinks a proof that its substance was originally fluid: and what confirms the thought, is, that the same substance shall sometimes line the inside of a shell, which it could never have entered but in form of a fluid.

Upon a nice examen of the several parts of coral, M. de Marigli gathers, that all its organism, with regard to vegetation, consists in its rind; that the tubules of this rind filtrate a juice which fills the cellulæ, and runs along the canals as far as the extremities of the branches*; and that this juice being petrified, both in the cells encompassing the coralline substance, and in those of the extremities of the branches whose substance is not yet formed, makes the plant grow both in height and bulk.

* It was held a paradox in 1710 to assert, that all that appears organic in coral, with regard to vegetation, consisted in its rind, and in the surface of the proper coralline substance immediately covered with this rind.—But M. de Reaumur has lately adopted and fortified this opinion.—He takes for a plant the coarse visible rind of coral, which is very different from what we properly call coral; and also another much finer rind which the eyes do not distinguish from the proper coralline substance covered by it: and all the rest, that is, almost the whole coralline substance, he takes for a mere stone without any organization. There are many plants which cannot grow without being supported: this is under the same necessity. But whereas others go out in search of supports, and meet with foreign bodies already formed: coral forms itself a support within itself, and invests it with its own substance. Hist. Acad. R. Scienc. An. 1727. p. 51.

The ancients believed that coral was soft while it continued at the bottom of the water; and that it only became hard and solid by the impression of the air. But the moderns are convinced of the contrary from experience; and know that there was more of imagination than truth in the name *gorgonium*, which they gave it, to shew that Medusa's head did not convert objects into stone, more surely than coral became petrified as soon as it appeared in the air.

There are, properly, but three kinds of coral, red, white, and black: the black is the rarest and most esteemed; but it is the red that is ordinarily used in medicine. It must be chosen thick, smooth, and shining, and of a beautiful red, not covered with any tartareous matter.

There is a kind of white coral pierced full of holes, and a black coral, named *antipates*; appearing of a different nature from the rest: but there are of no use.—The chymists draw a magisterial tincture from coral, and a salt.

Coral gives title to an official composition, called *syrup of coral*, sometimes prescribed by physicians; as is likewise the powder of coral finely ground, and afterwards levigated on a marble, and made up into a proper form. But there are few except those who are fond of medicines with gems in them that make use hereof. By means of its exceeding hardness, it is suspected to take away with it a great deal of the levigating stone.

The virtues attributed to coral and its preparations, are that it is astringent, and therefore of use in diarrheas, too large fluxes of the menstria, and floodings; of service in the fluor albus, and to prevent miscarriages; beside its use in common as a testaceous powder in childrens diseases, &c.

Some also attribute to coral the immediate stopping of blood, the securing of houses from thunder-bolts, the keeping away of evil spirits, and the promoting of dentition. It is added that coral appears redder wore on a man than on a woman; that it becomes pale and livid when wore by a sick person; and that the changes in the plant correspond with those in the disease. But for these, and many more fancies of the same kind, *credat Judeus apella*.—Its chief use we know of, is in chaplets, beads, and other toys.

CORAL Fishery. The time for fishing coral is from April to July: the places are the Persian Gulf, Red Sea, coasts of Africa towards the Bastion of France, the Isles of Majorca and Corfica, and the coasts of Provence and Catalonia.

The method of fishing is nearly the same in all places: that used at the Bastion of France, where there is an established fishery, under the direction of a company at Marfeilles, is as follows.

Seven or eight men go in a boat, commanded by the patron or proprietor; the cater throws his net, if we may so call the machine wherewith he uses to tear up the coral from the bottom of

the sea; and the other six manage the boat. The net is composed of two beams tied across, with a leaden weight to press them down: to the beams is fastened a great quantity of hemp loosely twilled round, among which they mix some strong nets.

In this condition the machine is let down into the sea; and when the coral is pretty strongly embarrassed in the hemp and the nets, they draw it out by a rope; which they unwind according to the depth, and which sometimes requires half a dozen boats to draw. If the rope happen to break, the fishermen are in great danger of drowning.

Before the fishermen go out, they agree on the price of the coral, which is ordinarily at the rate of 4s. 6d. per pound.

When the fishery is over, which in a season usually amounts to 25 quintals of coral each boat; it is divided into 13 parts; the patron whereof, or master coraller, has four, the cater two, and each of the six companions one: the 13th being reserved for the company, &c.

Artificial CORAL, is made of cinnabar well beaten; a layer whereof is applied on a piece of wood well dried, and polished, first moistened with size: the whole is then again polished; and for varnish, rubbed over with the white of an egg.

CORALLINE, *Sea Moss*; a plant found adhering to rocks, shells, and even to coral.—It has no stem, but its branches shoot immediately out of the root. Its use in medicine is not very considerable: yet it is supposed of some effect to destroy worms in children when taken in powder; and is also used as an ornament in rock-work. The best is greenish; the worst ash-coloured; the red is not much better.

CORALLINUM Arcanum. See the article ARCANUM.

CORAM non Judice, in law, is when a cause is brought into a court whereof the judges have no jurisdiction.

CORBAN, a scripture term, signifying an oblation, or offering to God on the altar.

CORBAN, also denotes a ceremony in use among the Mahometans, yearly performed at the foot of mount Ararat in Arabia, near Mecca.—It consists in slaying a great number of sheep, and distributing them among the poor.

CORBELS, in fortification, little baskets, about a foot and an half high, eight inches wide at the bottom, and twelve at the top; which being filled with earth, are frequently set one against another upon the parapet, or elsewhere; leaving certain port-holes, from whence to fire upon the enemy under covert, without being seen by them.

CORBEL, in architecture, the representation of a basket, sometimes seen on the heads of Caryatides.

The word is also used for the vase or tambour of the Corinthian column; so called from its resemblance of a basket; or because it was first formed on the model of a basket.

CORBEL, or **CORBIL,** is also used in building for a short piece of timber placed in a wall, with its end sticking out six or eight inches; as occasion serves, in manner of a shoudering-piece.

The under part of the end thus sticking out, is sometimes cut into the form of a bouldin; sometimes of an ogee, and sometimes of a face, &c. according to the workman's fancy; the upper side being plain and flat.

These corbels are usually placed for strength immediately under the semi-girders of a platform, and sometimes under the ends of camber-beams: in which latter case, they are commonly placed a foot or two below the beam, and have a piece of timber standing upright close to the wall from the corbel to the beam.

CORBEL is also used by some architects for a niche, or hollow left in walls for images, figures, or statues to stand in.

CORD*, or **CHORD,** an assemblage of several threads of hemp, cabled or twisted together by means of a wheel.

* The word comes from the Greek *χορδον*, which properly signifies an intestine, or gut, whereof cords may be made. See CHORD.

CORD of S. Francis, a kind of rope adorned with knots, wore by the brothers of the fraternity instituted in honour of that saint. Some, as the cordeliers, capuchins, minorites, and recolets, wear it white; others, as the pique-puces, black.—Its design is to commemorate the bonds wherewith Jesus Christ was bound.

The society of the **CORD**, includes a great number of people besides religious. To obtain indulgences, they are only obliged to say five pater's, five ave marys and gloria patri's, and to wear this rope, which must have been first blessed by the superiors of the order.

CORD of Wood, a certain quantity of wood for burning; so called, because formerly measured with a cord.

It is now measured between two stakes of wood, four foot high, and eight foot apart; and is to be four foot broad, or deep.

CORD-Wood, is properly new wood; and such as when brought by water comes aboard a vessel, in opposition to that which is floated. All burning wood not exceeding 18 inches circumference, is deemed cord-wood.

CORD, in geometry, music, &c. See CHORD.

CORDAGE, in the sea-language, is used in general for all the ropes and cords, big and small, used in the rigging and fitting out of a vessel. See ROPE and RIGGING.

The word is also used for the art of preparing and manufacturing the ropes, &c.

The *cordage* is said to be *baked*, when having passed a stove or other hot place, it is drained of all its moisture.

White cordage, is that not yet pitched. — *Cordage pitched in the stove*, is that which is passed through hot pitch as it comes out of the stove. Each quintal of *cordage* may take up about 20 pounds of pitch. The *cordage* is sometimes pitched in the thread.

When a rope is said to be of *six inches*, it is understood of six inches around, or in circumference. The commerce of *cordage* is very considerable at Amsterdam: that made of Coningsberg hemp is valued at 20 per cent. more than that of Mulcovy hemp. They are sold by weight.

The number of ropes required in fitting out a vessel is almost inconceivable: each has its particular name and use.

The Spaniards make a kind of shoes of *cordage*, which they call *alpargates*, whereof they use great quantities at home, and yet drive a very considerable commerce to the Indies; so as to send away whole ship-loads thereof. — The Indians make their *cordage* of the bark of cocos, maguay, and other trees.

As to the strength of ropes, or *CORDAGE*, M. Reaumur takes occasion, in the memoirs of the royal academy, to consider the question, whether a rope composed of several twists or strands interwoven, *v. gr.* ten, have more strength to sustain a weight, than the ten twists would have separately, placed parallel over one another: or, which is the same thing, whether if each twist be capable of sustaining the weight of a pound, the whole *cord* be able to sustain more than ten?

There, indeed, appears no great difficulty in the question; the evidence seems strong on the side of the affirmative: For 1°. by virtue of the twisting, the diameter of the rope is made larger than are those of the ten twists together; but, it is apparently by its thickness that a rope sustains a weight or resists a fracture. 2°. Twisted strands have not all, as when parallel, a vertical direction with regard to the weight: several of them, and even the greatest part, have oblique directions, and of consequence do not bear all the share of the burden they would otherwise bear. In effect, they are inclined planes that are only pressed with a part of the load.

Hence it would follow, that the surplus of the strength of the twists, might be employed in raising a larger weight.

On the other hand, it is true, that in twisting the strands, some are stretched, and others left more loose; and the new tension given the former, serves to weaken them, and has of itself the effect of a weight: thus they become less able to sustain one so large. Those more lax, on the contrary, evade in some measure the action of the weight. For the action is distributed equally on the ten supposedly equal twists; and if some, by reason of their particular disposition, receive less than their quota, the weight will act more forcibly on the rest, and will break them first, as being more tense; after which it will easily dispatch the rest, as not being in sufficient number to oppose it.

This is the sum of what can be urged for and against the twisting. To decide between them M. Reaumur had recourse to experiment. The result was, that contrary to all expectation, he still found the twisting diminished the strength of the rope: whence it is easily inferred, that it diminishes it the more, as the rope is the thicker: for inasmuch as the twisting diminishes; the more twisting, the more diminution.

The resistance or friction of *CORDAGE*, is very considerable; and by all means to be considered in calculating the power of machines. M. Amontons observes, in the memoirs of the royal academy, that a rope is so much the more difficult to bend, 1°. As it is stiffer, and more stretched by the weight it draws. 2°. As it is thicker; and, 3°. As it is to be more bent; *i. e.* as it is to be coiled, for instance, into a smaller ring.

The same author has thought of ways to prove in what proportion these different resistances increase: that arising from the stiffness or rigidity occasioned by the weight which draws the rope, increases in proportion to the weight; and that arising from its thickness, in proportion to the diameter. Lastly, that arising from the smallness of the gyres, or pulleys about which it is to be wound, is indeed greater for smaller circumferences than large ones, but does not increase so much as in the proportion of those circumferences.

On this footing, the loss a machine sustains by the *cordage* being estimated in pounds, becomes, as it were, a new weight, to be added to that which the machine is to raise. This augmentation of weight will render the *cords* still the more stiff: which exceeds is to be computed as before.

Thus we shall have several sums still decreasing: which are to be added together, as in the article of friction; and it will be surprising to see what a sum they will amount to. See *FRICTION*. Where ropes are used in a machine, all the resistance resulting from their stiffness is to be put together; and all that occasioned by the friction: which will make so considerable an augmentation to the difficulty of the motion, that a power which to raise a weight of 3000 pound, by means of a fixed and a moveable pulley, needed only 1500 pound; must, according to M. Amontons, have 3942 pounds, on account of the frictions, and the resistance of the *cordage*.

CORDED, in heraldry. A cross *CORDED*, some authors take for a cross wound or wrenched about with *cords*: though others, with more probability, take it for a cross made of two pieces of *cord*.

CORDELIER, a Franciscan, or religious of the order of S. Francis. See *CORD*.

The *cordeliers* are clothed in thick grey cloth, with a little cowl, a chaperon, and croke of the same; having a girdle of rope or *cord*, tied with three knots: whence the name. See *CORD*.

The *cordeliers* are otherwise called *minor friars*, their original name. The denomination *cordelier* is said to have been first given them in the war of S. Louis against the Infidels; wherein the *friars minor* having repulsed the Barbarians, and that king having enquired their name; it was answered they were people *cordeliers*, tied with ropes. — The *cordeliers* are, to a man, professed Scotts. See *SCOTTIST*.

CORDIAL, *Cardiac*, in medicine, a comforting, or refreshing remedy, that gives a sudden strength, and cheerfulness, by raising the spirits when depressed by too much exercise, some disease, or the like cause.

Cordials act by giving a springiness and force to the fibres, and by some of their fine particles directly entering the tubuli, or pores of the nerves and minute vessels, and so mixing immediately with the fluids.

Thus, some of the particles of the spirit of lavender, when dropped into sugar and taken, are supposed to enter the nerves of the palate directly. Spirituous liquors, as brandy, cinnamon-water, &c. are supposed also to act immediately on the palate; but especially on the nervous coat of the stomach, and not by the common current of the circulation: by which means they often prove an immediate *cordial*.

In faintings, where the circulation of the blood is languid, *sal volatile oleum*, or spirit of hartshorn dropt in cold water and drank immediately, occasion a contraction of the fibrillæ, the last by its coldness, and the first by entering the small vessels; and thus they instantly augment the circulation, or in other words, prove *cordial*. — In official compositions, the four *cordial* flowers are burrage, bugloss, roses and violets.

The four *cordial* waters are those of burrage, bugloss, endive, and chicory; some add those of *carduus benedictus* and *scorzonera*, *scabiosa*, *forrel*, &c.

CORDIS Capsula.
CORDIS Fovea. } See the articles } *CAPSULA*.
CORDIS Mucro. } *FOVEA*.
CORDIS Septum. } *MUCRO*.
 SEPTUM.

CORDON, in fortification, a row of stones jutting out between the rampart and the basis of the parapet, like the tore of a column. The *cordons* ranges round the whole fortress; and serves to join the rampart, which is *alope*, and the parapet, which is perpendicular, more agreeably together.

In fortifications raised of earth, this space is filled up with pointed stakes instead of a *cordon*.

*CORDWAINERS**, or *CORDINERS*, the term whereby the statutes denominate *shoe-makers*.

* The word is formed from the French *cordonnier*, which Menage derives from *cordouan*, a kind of leather brought from *Cordoua*, whereof they formerly made the upper-leathers of their shoes. Others derive it from *corde*, rope, because antiently shoes were made of cords; as they still are in some parts of Spain, under the name of *alpargates*. See *CORDAGE*. But the former etymology is better warranted: for, in effect, the French workmen who prepare the *cordouans* are still called *cordouanniers*.

In Paris they have two pious societies, under the titles of *freres cordonniers*, brothers shoemakers; established by authority towards the middle of the seventeenth century; the one under the protection of S. Crispin, the other of S. Crispianus, two saints who had formerly honoured the profession. They live in community, and under fixed statutes and officers; by which they are directed both in their spiritual and secular concerns.

The produce of their shoes goes into a common stock, to furnish necessaries for their support; the rest to be distributed among the poor.

Benedict Baldwin, a native of Amiens, the son of a *cordwainer*, and himself a workman in his father's shop, has among other learned writings, published a treatise *de calceis antiquis & mystico*, to do honour, as he himself owns, to his antient trade. John Battista Gallo, a shoemaker of Florence, has published some fine pieces in the Italian language; and among others, dialogues in imitation of Lucian.

CORED herrings. See the article *HERRING*.

CORIANDER, the seed of a plant of the same name.

Both the taste and the smell of the seed is very agreeable; yet both in the plant are extremely nauseous. Besides the confections made of the *coriander*-seed, it is of use in medicine as a carminative, and a corrective to some sorts of catharticks. It is much used by the brewers both in England and Holland, to give a flavour to their strongest beer. The antients had a notion that the juice of *coriander* would deprive people of their senses, and even of life.

*CORIDOR**, or *CORRIDOR*, in fortification, a road or way along the edge of the ditch, withoutside; encompassing the whole fortification.

* The word comes from the Italian *coridore*, or the Spanish *coridor*. It is also called the *covert way*; because covered with a glacis, or esplanade, serving it as a parapet. See *COVERT way*. — The *corridor* is about 20 yards broad.

CORRIDOR, is also used in architecture for a gallery, or long aisle, around a building, leading to several chambers at a distance from each other.

CORINTHIAN order, the fourth, or as Scamozzi and M. le Clerc make it, the fifth, and last of the orders of architecture; being the noblest, richest, and most delicate of them all. See *Tab. Archit.* fig. 26.

The invention of this order most of the moderns, after Vitruvius, ascribe to Callimachus a Corinthian sculptor, who passing by the grave of a young lady, over which her nurse had placed a basket with some of her play-things, and covered it up from the weather with a tile; the whole having been placed on a root of acanthus; as it sprung up, the branches encompassed the basket, and bending down atop under the corners of the tile, formed a kind of volutes. Hence Callimachus took his hint: the basket he imitated in the vase of his column; the leaves in the volutes; and the tile in the abacus of his order. See **ABACUS**, **ACANTHUS**, &c.

Villalpandus treats this story of Callimachus as a fable; and will have the Corinthian capital to have taken its origin from an order in Solomon's temple, the leaves whereof were those of the palm-tree.

The Corinthian order has several characters whereby it is distinguished from the rest: its capital is adorned with two rows of leaves, between which rise little stalks, or caulicoles, whereof the volutes are formed, which support the abacus, and which are in number sixteen.

It has no ovolo, nor even abacus properly speaking; for the member which goes by that name is quite different from the abacus in the other orders; being cut with a sweep, in the middle of which is carved a rose, or other ornament.

Vitruvius observes, that the Corinthian order has no particular ordonnance for its cornice, or any of the other ornaments of its entablature; nor does he give it any other proportions than those of the Ionic order: so that if it appears higher than the Ionic, it is purely owing to the excess of the height of its capital.

He also makes the rest of the entablature the same; and the Attic base he uses indifferently for the one and the other.

But Vitruvius differs widely in this order from all the examples now remaining of antiquity; the most beautiful whereof have a particular base, and the whole order twenty modules in height: whereas the Ionic has but eighteen. Again, its capital is higher than that of Vitruvius by one third of a module; and its entablature, which has modillions, and sometimes dentils together with modillions, is very different from the Ionic entablature.

Most of the modern architects set aside Vitruvius's Corinthian ordonnance, and follow that of the ancient buildings; selecting from them according to their several tastes: so that the modern Corinthian is a kind of composite; differing from any of the ancient buildings, and much more from Vitruvius's rules.

Vignola and M. le Clerc make the Corinthian order 20 modules high; yet Serlio only makes it 18; and M. Perrault 18 $\frac{2}{3}$; retrenching something from the 19 of Vitruvius.

The height of the shaft M. Perrault makes less than that of the Ionic, by reason of the excess of its capital. See **COLUMN**.

CORINTHIAN brass. See the article **BRASS**.

CORK, the bark of a tree of the same name, a species of the ilex or holm oak.

Its leaves are green above, and white underneath; and its fruit a real acorn, which feeds much more than that of the oak. It is found in great abundance in Spain, Italy, France, &c.

To take off the bark they make an incision from the top to the bottom of the tree, and at each extremity another round the tree, perpendicular to the first. When stripped from the tree, which does not therefore die, the bark is piled up in a pond or ditch, and loaden with heavy stones to flatten it, and reduce it into tables: hence it is taken, to be dried; and when sufficiently dry, put in bales for carriage.—If care be not taken to strip the bark, it splits and peels off of itself; being pushed up by another bark formed underneath.

The bark of *cork*, as well as the acorn, are of some use in medicine; being both reputed astringents, after being burnt and powdered, when used externally; but the chief employ of the former, is to put in shoes, slippers, &c. and to stop bottles.—The Spaniards burn it to make that light kind of black we call *Spanish black*, used by painters.

CORN, a plant, or rather genus of plants, which produce a grain fit for bread, the ordinary food of man.

CORN is also used for the grain, or seed of that plant, separated from the spike, or ear.

In the commerce of grain, they distinguish three kinds, viz. *corn* properly so called, or *wheat*; *rye*, which is a species very different, and of a quality far inferior; and a third kind resulting from a mixture of the two, and called *maslin*.

The farmers, indeed, rank among the number of *corns* several of the grains sowed in March; as barley, oats, and even pulse, as peas, vetches, &c. which, however, they sometimes distinguish by the denomination, *smaller corn*. Malt and farrafin

are numbered among the *corns*; the first called *Turkey and Indian corn*, the second *French*, or *black corn*.

Europe, in every part of it; Egypt, and some other cantons of Africa, particularly the coasts of Barbary; and some parts of America cultivated by the Europeans, particularly New-England, New-France, and Accadia, are the places which produce *corn*. Other countries have maize and rice in lieu of it; and some parts of America, both in the islands and continents, simple roots, such as potatoes, and manioc.

Egypt was antiently the most fertile of all other countries in *corn*; as appears both from sacred and profane history: it furnished a good part of the people subject to the Roman empire, and was called the dry nurse of Rome and Italy. England, France and Poland seem now in the place of Egypt, and with their superfluities support a good part of Europe.

For the first discovery and culture of *corn*, authors are much divided: the common opinion is, that in the first ages men lived on the spontaneous fruits of the earth; as acorns, and the nut or mast produced by the beech, which, they say, took its name *fagus* from the Greek *φάγος*, I eat. It is added, that they had not either the use of *corn*, nor the art of preparing or making it eatable. See **BAKING**.

Ceres has the credit of being the first that shewed the use of *corn*, on which account she was placed among the gods. Others give the honour to Triptolemus: others share it between the two; making Ceres the first discoverer, and Triptolemus the first planter and cultivator of *corn*.

Diodorus Siculus ascribes the whole to Isis; in which, Polydore Virgil observes, he does not differ from the rest; Isis and Ceres being in reality the same. The Athenians pretend it was among them the art began, and the Cretans or Candiots, Sicilians, and Egyptians lay claim to the same. Some think the title of the Sicilians best supported, that being the country of Ceres; and authors add, she did not teach the secret to the Athenians, till she had first instructed her own country-men. Others say, Ceres passed first into Attica, thence into Crete, and last of all into Sicily. Many of the learned, however, maintain it was in Egypt the art of cultivating *corn* first began; and it is certain there was *corn* in Egypt and the East, long before the time of Ceres.

For the preservation of *corn*: It must be well dried and cleaned; the granary must have its openings to the North or East, and ventholes a-top. For the first six months it must be well stirred every fifteen days; afterwards it will be sufficient to stir it once per month: after two years it heats no more; nor is there any thing to fear, but from the air and foreign moisture.

A little time after the siege of Metz under Henry II. of France, the duke d'Espernon laid up vast stores of *corn* in the citadel; which was preserved in good plight to the year 1707, when the French king and his retinue passing that way cat bread baked thereof.

The chief thing that contributes to the preservation of *corn*, is a crust which forms on its surface, by the germination of the grain next underneath, to the thickness of an inch and half. On that at Metz people walked, without its giving the least way. At Sedan was a granary cut in a rock, wherein a heap of *corn* was preserved 110 years: it was covered with a crust a foot thick. At Chalons they have granaries where they still keep *corn* thirty or forty years: over the heap they strew quicklime, in fine dust, to the thickness of three inches, and sprinkle this over with water, whence arises a crust. The grain near the surface sprouts to the height of a foot and half: these the winter kills; and the heap is left untouched till necessity obliges them to it. See *Supplement*, article **GRANARY**.

CORN measure.	} See the articles {	MEASURE.
Sharpen CORN.		SHARPING.
Trug-CORN.		TRUG-corn.
Wood-CORN.		WOOD-corn.

CORNACHINE powder, a purging powder, called also *earl's of Warwick's powder*, and *pulvis de tribus*.

It is composed of equal parts of antimonium diaphoreticum, diagrydium, and cream of tartar.

CORNAGE, an antient tenure, the service whereof was to blow a horn, when any invasion of the Scots was perceived. See **SERVICE**.

This tenure was very frequent in the northern counties, near the Picts wall. But by stat. 12 Car. II. all tenures are converted into free, and common socage.

An old Rental calls *cornage*, *newgeld*; q. d. *neat-geld*. My lord Coke says, in old books it is called *horngeld*.

CORNEA, *Horny*: from cornu, a horn.

CORNEA tunica, in anatomy, the second coat of the eye; so called from its substance resembling the horn of a lantern.

It is situated in the fore part; and is surrounded by the sclerotica. It has a greater convexity than the rest of the globe of the eye, and is composed of several parallel laminae, which are nourished by many blood-vessels, so fine, as not to hinder even the smallest rays of light from entering the eye. It has a most exquisite sense, to the end that upon the least pain, the tears may be squeezed out of the lachrymal gland, to wash off any filth, which, by sticking to the cornea, might render it cloudy or dim.

In the memoirs of the royal academy, M. Gandolphe gives us an instance of incisions designedly made in the *cornea*, to discharge a quantity of blood settled there by a violent blow on the eye, by means whereof the sight had been almost entirely extinguished.

The extravasated blood, it seems, was in too great a quantity to be dissipated by topical medicines; besides, that the process would have been so tedious, that the aqueous humour would have been in danger of being quite ruined in the mean time.—The *cornea*, therefore, was opened by three incisions, all made acrois; the blood was discharged; the eye bound up with compresses steeped in a mixture of four ounces of plantain water, and two of vulnerary water. In eight days the eye resumed its natural transparency; and there remained no scar after the incisions.—After the cure, the pupil of that eye continued dilated much beyond its natural dimensions. See EYE.

CORNELIAN *, or **CARNELIAN**, **CARNEOLUS**, a precious stone, ordinarily red, bordering on orange; called also *farjardis*, or the fardian stone.

* The *cornelian* is otherwise called *carneola* and *corneola*; the Italians call it *corniolus*; it is said from *corneo*, horn; on account of the resemblance it bears to horn in its transparence.

It cuts easily; and we find most of the fine gravings of antiquity, whether in relieve, or indented, are on this stone. It bears the fire admirably. The finest *cornelians* are those brought from near Babylon; the next are those of Sardinia; the last those of the Rhine, Bohemia, and Silesia.—To give these stones the greater lustre, in setting them they usually lay a piece of silver leaf underneath.

The principal use made of *cornelians* is in seals; by reason they grave well, and take a fine polish.—The author of the book usually, but falsely, attributed to Albertus Magnus, gives the *cornelian* virtues which, were they real, would make it inestimable. See *Supplement*, article *SARDA*.

CORNER-PYLES. See the article *TYLE*.

CORNET, **CORNU**, a horn, or musical instrument used by the antients in their wars.

Vegetius informs us, that the legions had trumpets, *cornets*, and buccinæ: that when the *cornets* sounded, only the ensigns regarded; none of the soldiers: that when the ensigns were to march alone without the soldiers, the *cornet* alone was sounded; as, on the contrary, when the soldiers were to move without the ensigns, the trumpets alone were sounded: that the *cornets* and buccinæ sounded the charge and retreat; and the *cornets* and trumpets during the course of the battle.

CORNET, in the modern war, denotes an officer in the cavalry, who bears the ensign or colours of a troop.

The *cornet* is the third officer in the company, and commands in the absence of the captain and lieutenant. He takes his title from his ensign which is square, and is supposed to be called by that name, from *cornu*; because placed on the wings, which form a kind of points or horns of the army.

Others derive the name from *coronet*; alleging that it was the ancient custom for these officers to wear coronets or garlands on their heads.

CORNICHE *, **CORNISH**, or **CORNICE**, in architecture, the uppermost member of the entablature of a column; or that which crowns and finishes the order.

* The word is formed from the Latin *cornis*, a crowning. The *corniche* is the third grand division of the trabeation, commencing from the freeze and ending with the cymatium. The *corniche* is different in the different orders: in the Tuscan order it is the most plain. Vignola makes it to consist of an ovum or quarter-round, an astragal or baguette, a reglet or fillet, a larmier, and a talon.—See *Tab. Archit.* fig. 24.

In the Doric, he uses capitals to the triglyphs of the freeze with their bandelletes, a talon, mutules, or dentils, a larmier with its gutte underneath, a talon, fillet, cavetto, and reglet.—See *Tab. Archit.* fig. 28.

In the Ionic, the members are in most respects the same as in the Doric; except that they are frequently enriched with carving, and there are always dentils.—See *Tab. Archit.* fig. 32.

In the Composite there are dentils; its mouldings are carved, and there are channels under the fossil.—See *Tab. Archit.* fig. 30. The Corinthian *corniche* is the richest; and is distinguished by having both modillions and dentils: contrary to the opinion of Vitruvius, who looks on those two ornaments as incompatible; and of M. le Clerc, who regards the dentils as peculiar to the Ionic.—See *Tab. Archit.* fig. 26.

For the heights and projectures of the *corniches* in the several orders; Goldman makes the height of the Tuscan $1\frac{1}{2}$, and its projecture $2\frac{1}{2}$ modules: the height of the Doric $1\frac{1}{2}$, its projecture $2\frac{1}{2}$; height of the Ionic $1\frac{1}{2}$, its projecture $2\frac{1}{2}$; height of the Composite $1\frac{1}{2}$, projecture $2\frac{1}{2}$; height of the Corinthian $1\frac{1}{2}$, projecture $2\frac{1}{2}$.

Architrave CORNICHE, is that immediately contiguous to the architrave; the freeze being retrenched.

Mutilated CORNICHE, is that whose projecture is omitted, or else interrupted, right to the larmier, or reduced into a platband with a cymatium.

Cantaliver CORNICHE, a term used by the workmen for a *corniche* that has cantalivers underneath it. See *CANTALIVER*.

Modillion CORNICHE, a *corniche* with modillions under it. See *MODILLION*.

Coving CORNICE, a *corniche* which has a great cament, or hollow in it; ordinarily lathed and plaistered upon compasses, sprockets, or brackets.

CORNICHE is also used in the general, for any little projecture either of masonry, or joinery; even where there are no columns.—Thus, we say, the *corniche* of a chimney, a buffet, &c.

CORNICHE is also applied to the crownings of pedestals.—See *Tab. Archit.* fig. 24, 26, 28, 30, and 32.

This *corniche* is different in the different orders: in the Tuscan, according to M. Perrault, it has a platband which serves as a corona, and a cavetto with its fillet: in the Doric, it has a cavetto with a fillet, which bears a drip crowned with a square: In the Ionic, a cavetto with its fillet above, and a drip or pendant square crowned with an ogee and its fillet: in the Corinthian, an ogee with its fillet, a cymatium under the corona, which it hollows to make a drip, a corona, and an ogee with its fillet: Lastly, in the Composite, a fillet with a sweep over the die, an astragal, cyma with its fillet, corona, and ogee with its fillet: See each in its place.

Glacis of the CORNICE. See the article *GLACIS*.

CORNICE ring of a piece of ordnance, is that which lies next the trunnion ring; or the next ring from the muzzle backwards.

See *ORDNANCE*.

CORNICULARIS processus, the process or knob of the shoulder bone; thus called, as resembling the figure of a crow's beak.

CORNICULARIUS, in antiquity, an officer in the Roman army, whose business was to aid and assist the military tribune in quality of lieutenant.

The *cornicularii* went the rounds in lieu of the tribune, visited the watch, and were nearly what the aids major are in the French army.

The denomination *cornicularius* was given them from a little horn, called *corniculum*, which they used in giving orders to the soldiers: though Salmasius derives it from *corniculum* the crest of an head-piece; it being an observation of Pliny, that they wore iron or brass horns on their helmets; and that these were called *cornicula*. In the notitia imperii, we find a kind of secretary, or register of the same name: * his business was to attend the judge, and enter down his sentences and decisions.

* The crickets derive the word, in this sense, from *corniculum*, a little horn to put ink in.

CORNICULATE flower. See the article *FLOWER*.

CORNICULATE plants, are such as after they have blown into flower, produce many distinct and horned pods, or seed-vessels, called *siliquæ*; for which reason, the plants are also by some denominated *siliquous plants*.

Such are the fenum or fempervivum, telephium, juncus floridus, helleborus niger, pæonia, caltha palustris, althæa lutea, &c.

CORNISH. See the article *CORNICHE*.

CORNISH bug. See the article *HUG*.

CORNU ammonis, in natural history, an extraordinary kind of stone, some of which in vinegar, juice of lemons, &c. have a motion like that of an animal.

It is rough, knotty, of an ash-colour, and twisted in manner of a ram's-horn; such as those wherewith the antients represented Jupiter Ammon: whence its name.

It is disputed among naturalists, whether it be a native fossil, a nautilus, or a rock-plant? Camerarius maintains the first, urging that it is frequently dug out of the tops of mountains; and that it is seldom found near the sea-shore.

Dr. Woodward asserts it a shell, and of the number of the nautili, formed in the sea, and carried thence by the waters of the deluge into the countries whence it is dug. He argues, that if it be rarely found on the sea-coasts, it is because shells and other bodies lying in the bottom of the sea, as most kinds of the *cornua ammonis* must do, are only to be torn thence and driven ashore by tempests: but the most violent tempests never move the bottom of the sea, as the divers have put past doubt; so that it is no wonder if none of these *cornua* be thrown up: but in the overturning of the earth by the deluge, these, with a thousand more productions of the sea, might be thrown from the bottom of the waters to the places where they are now found.

The *cornua ammonis* are of different thickneses and lengths; some of them weigh twenty pounds. They are found in several places in Germany and elsewhere. From some experiments that have been made, some of them are found to contain a little quantity of gold, which sinks to the bottom upon pounding them small, and stirring them in a running water, till all the earthy parts be carried off.

Mr. Beaumont's account of them is this: 'The stone called *cornu ammonis* is frequent in the clay wherein the trochites and entrochi are found: the largest I have is seven inches in length, and four in circumference at the big end, and two and a half at the smaller; the tip being broke off. Tracing its origin, I find some little ones about the bigness of a young cock's spur, and very much like it: I have some in raw clay; and one growing of a white cawky stone. They generally become at last a whitish spar, and some milk white, as some of the trochites are.'

'There are of all intermediate proportions between these two; though very few of any bigness are to be found entire, but all broken

broken and imperfect pieces. The texture of the striae is thus: some have a massy spar in their infides, which takes up three parts of the stone; then from the sharp top there grow thin flat cells, or small pipes of spar flat edgewise one close to the other, which shoot towards the broad end, and appear outwardly like small ridges or seams. There are likewise rings running round it, tending in their growth towards the broad end, as in a ram's horn. Most of the lesser stones have very little spar within them, and some none, but have cells coming down inwardly from the top of the stone, resembling those in the flowers of coral that terminates its branches. Mr. Beaumont, in *Philosoph. Transact.* N° 129. See Supplement, article CORNU AMMONIS.

CORNU cervi, *bartsborn*; in medicine, makes one of the testaceous powders. See TESTACEOUS.

Among chymists, the same name is used for the mouth of an alembic.

CORNU Uteri. See the article UTERUS.

CORNUCOPIA, among the ancient poets, a horn out of which proceeded plenty of all things; by a particular privilege which Jupiter granted his nurse, supposed to be the goat Amalthea. The real sense of the fable is this; that in Libya there is a little territory shaped not unlike a bullock's horn, exceeding fertile, given by king Ammon to his daughter Amalthea, whom the poets feign to have been Jupiter's nurse.

In architecture and sculpture, the *cornucopia*, or horn of plenty, is represented under the figure of a large horn, out of which issue fruits, flowers, &c.—On medals, F. Joubert observes, the *cornucopia* is given to all deities, genii, and heroes.

CORNUCUTUM argumentum. See the article DILEMMA.

CORONA, *crown*, or *crowning*, in architecture, a large, flat, massive member of the cornice; so called, because it crowns not only the cornice, but the entablature, and the whole order.—See Tab. *Archit.* fig. 9.

The French call it *larmier*, our workmen the *drip*, as serving by its great projection, to screen the rest of the building from the rain.

Some Latin authors call it *supercilium*; but, that as it should seem by mistake for *filicidium*. Certain French writers call it *mouchette*; and certain Latin ones, *mentum*, chin; from its keeping off the weather from the parts underneath, as the chin does the sweat, &c. out of the neck.

Some call it absolutely the *corniche*, as being the principal member thereof. Vitruvius frequently uses the word *corona* for the whole cornice.

The *corona* is itself crown'd or finish'd with a reglet, or fillet.—There are sometimes two *corniche*'s in a cornice; as in the Corinthian of the Rotonda.

CORONA Borealis, *northern crown*, or *garland*, in astronomy, a constellation of the northern hemisphere; whose stars in Ptolemy's catalogue are 8; in Tycho's as many; in the *Britannic Catalogue* 21. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow.

Names and Situations of the Stars.	Sign.	Longitude.	Latitude. North.	Magnit.

Lucida CORONA. See the article LUCIDA.

CORONA Clericalis. See CROWN; see also COIF.

CORONÆ Jus. See Jus.

CORONÆ Placitorum Custos. See Custos.

CORONALE os, in anatomy, the bone of the forehead; called also *os frontis*, *os oppis*, and *verecundum*. See Os FRONTALIS.

CORONALIS, denotes the first future of the cranium, or skull.

See SUTURE.

The *coronal* future reaches transversely from one temple to the other; and joins the *os frontis*, with the *os parietalia*.—See Tab. *Anat.* (Osteol.) fig. 1. lit. g. and fig. 2. lit. n.

It is open, the breadth of a finger or two, in the middle, in

young children, but grows closer with age; though sometimes, by convulsion-fits, or a bad conformation, it not only closes in children, but the edges shoot over one another; which is what the women call *head-mould-shot*; after which they seldom live long.

CORONARIA Vasa, **CORONARY Vessels**, the arteries and veins which surround the heart to nourish and supply it with blood, &c.—See Tab. *Anat.* (Splanchn.) fig. 12. lit. cc. See also **CORONARY Arteries**, &c.

CORONARY arteries, are two arteries springing out of the aorta, ere it leaves the pericardium; and serving to carry the blood into the substance of the heart.

They are called *coronary*, because of their spreading into branches, and encompassing the basis of the heart, in manner of a crown or garland.—In their progress, they send out several branches lengthwise of the heart; and, as Ruych observes, to the auricles, and into the very substance of the heart: after encompassing the basis, and meeting again, they inculcate with each other.

CORONARY vein, is a vein diffused over the exterior surface of the heart.—It is formed of several branches arising from all parts of the vicius, and terminates in the vena cava, whither it conveys the remains of the blood brought by the *coronary arteries*.

At its rise out of the heart, there is a valve to hinder the reflux of the blood; first discovered by B. Eustachio, a native of San Severino.

Stomachic CORONARY, is a vein inserted into the trunk of the splenic vein; which by uniting with the mesenteric, forms the vena porta. See PORTA.

CORONE, in anatomy, a sharp-pointed eminence, or process of a bone.—See Tab. *Anat.* (Osteol.) fig. 2. lit. m. See also BONE. Of these there are several in the body, distinguished, according to their figures, by different names; e. g. one of the os petrosum, called *stylodes*, as being sloped like a bodkin: another called *mastoides*, from its resembling a nipple; another of the omoplate, called *coracoides*, as being of the figure of a crow's bill: lastly, another of the os sphenoides, called *pterygoides*, from its shape, which resembles the wings of a bat.

CORONER, an officer, whereof there are two in every county, whose business is to enquire, by a jury of twelve neighbours, how, and by whom any person came by a violent death; and to enter the same upon record.

This, being matter criminal, and a plea of the crown, it is hence they are called *crowners*, or *coroners*.—They are chosen by the freeholders of the county, by virtue of a writ out of chancery.

This officer, by the statute of Westminster, ought to be a knight; and there is a writ in the register, called *nisi sit miles*, whereby it appears to be a sufficient cause for removal of a *coroner* chosen, if he were not a knight, and had not 100 shillings per ann. freehold. Mention is made of this officer as early as the time of king Athelstan, anno 925.

The lord chief justice of the king's bench is the sovereign *coroner* of the whole realm, or whereof he abides.

There are also certain *special coroners* within divers liberties, as well as the ordinary officers in every county; and some colleges and corporations are empowered by their charters, to appoint their *coroner* within their own precincts.

CORONET electoral. See ELECTORAL coronet.

COROPITÆ. See AGONISTICI.

CORPORA cavernosa, in anatomy, two spongy bodies, called also *corpora nervosa*, and *corpora spongiosa*. See CAVERNOSA corpora, &c.

CORPORA olivaria. See OLIVARIA corpora.

CORPORA pyramidalia, are two protuberances of the under-part of the cerebellum, about an inch long; so called from their resemblance to a pyramid. See CEREBELLUM.

CORPORA striata, two protuberances of the crura of the medulla oblongata. See MEDULLA oblongata.

CORPORA habas, in law. See the article HABRAS.

CORPORAL*, an inferior officer in a company of foot, who has charge over one of the divisions; he places and relieves centinels, and keeps good order in the *corps de garde*; receiving, withal, the word, of the inferior rounds that pass by his *corps de garde*.—There are usually three corporals in each company.

* The word comes from the Italian *caporale*, which signifies the same thing; and that from *caput*, head, chief; the *corporal* being the first of the company.

CORPORAL of a ship, is an officer who hath the charge of setting the watch and centries, and relieving them; and who sees that all the soldiers and sailors keep their arms neat and clean: he also teaches them how to use their arms, and hath a mate under him.

CORPORAL oath. See the article OATH.

CORPORAL, **CORPORALE**, is also an ancient church term, signifying the sacred linen spread under the chalice in the eucharist and mass, to receive the fragments of the bread, if any chance to fall. Some say, it was pope Eusebius who first enjoined the use of the *corporal*; others ascribe it to S. Silvester. It was the custom to carry *corporals*, with some solemnity, to fires, and to heave them against the flames, in order to extinguish them. Philip de Comines says, the pope made Louis XI. a present of the *corporale* whereon my lord S. Peter sung mass.

CORPORATE county. See the article COUNTY corporate.

CORPORATION, a body politick, or incorporate; so called, because the several members thereof are formed into one body; and are qualified to take, purchase, grant, have a common seal, sue and be sued, &c. in their joint capacity. See INCORPORATION.

A corporation may be established three ways, *viz.* by prescription, by letters patent, and by act of parliament.

Corporations are either ecclesiastical, or lay.—Ecclesiastical are either regular, as abbies, priories, chapters, &c. or secular, as bishopricks, deaneries, archdeacons, parsonages, &c. to which add universities, colleges, hospitals, &c. see also HOSPITAL, &c.—Lay, as those of cities, towns, mayoralties, bailiwicks, companies or communities of commerce, &c.

Again, a corporation is either sole, or an aggregate of many; which last is what the civilians call a college. See COLLEGE; see also COMMUNITY.

CORPOREAL. See the article INCORPOREAL.

CORPOREAL qualities. See the article QUALITY.

CORPOREITY, the quality of that which is corporeal, or has body; or that which constitutes or denominates it such.

The corporeity of God was the capital error of the Anthropomorphites. Some authors reproach Tertullian with admitting a corporeity in the deity; but it is manifest, by body he means no more than substance.

The Mahometans reproach the Samaritans at this day, with a belief of the corporeity of God. Many of the antients believed the corporeity of angels.

Form of CORPOREITY. See the article FORM.

CORPORIFICATION, in chymistry, the operation of recovering spirits into the same body, or at least into a body nearly the same, with that which they had before their spiritualization.

CORPS de garde, a post in an army, sometimes under covert, sometimes in the open air, to receive a body of soldiery, who are relieved from time to time, and are to watch in their turns, for the security of a quarter, a camp, station, &c.

The word is also used for the men who watch therein.

It is usual to have, beside the great, a little corps de garde, at a good distance before the lines; to be the more readily advertised of the approach of the enemy.

CORPS de Bataille, is the main body of an army, drawn up for battle. See LINE and GUARD.

CORPS, in architecture, is a term borrowed from the French, signifying any part that projects or advances beyond the naked of a wall; and which serves as a ground for some decoration, or the like.

CORPULENCY, in medicine, the state of a person too much loaded with flesh, and fat.

CorpuleNCY amounts to the same with what physicians call obesity, and we popularly fatness.

Etmuller defines it to be such an increase both of the venter and limbs, as impedes the actions of the body, especially motion and respiration.

CorpuleNCY, or obesity, Boerhaave observes, does not consist in the folds of the body being increased, but in their being distended to a greater pitch by the abundance of humours collected in them.

CorpuleNCY, or fatness, arises from a laudable, copious, oily, soft blood, containing less than its share of salt.

Such a constitution of blood, occasioning but a feeble fermentation, there is less consumed, than is made; the lymph, which seems to be the matter of nutrition, preserves its viscid consistence longer; and by that means adheres the more plentifully to the divers parts of the body. Add, that there is more fat separated from the blood, than can well be deposited in the adipose cells. Hence the body grows very considerably, and the parts sometimes distend to a monstrous bulk.

CorpuleNCY is promoted by any thing that tempers and softens the blood, and renders it less sharp, and saline; such is want of exercise and motion, an indolent life, too much sleep, nourishing foods, &c. It is prevented, or removed, by the contrary causes; and particularly by the use of saline and acid meats, and drinks.

CorpuleNCY is the occasion of divers diseases, and particularly the apoplexy.—It was held infamous among the antient Lacedæmonians.

Etmuller affirms, that there is no better remedy against excessive fatness, than acetum scilliticum. Borelli recommends the chewing of tobacco; which Etmuller however dissuades, lest it induce a consumption.

Sennertus mentions a man that weighed six hundred pounds; and a maid, 36 years of age, who weighed 450. Chiapin Vitelli, marquis of Cerona; a noted Spanish general in his time, from an excessive corpuleNCY, is said to have reduced himself by drinking of vinegar, to such a degree of leanness, that he could fold his skin several times round him.

CORPUS, body, in anatomy, is applied to several parts in the animal structure; as corpus callosum, corpus glandulosum, corpus reticulare, &c.

CORPUS callosum, is the upper part, or covering of the two lateral ventricles of the brain, appearing immediately under the process of the dura mater, below the depth of all the circumvolu-

tions; being formed by the union of the medullary fibres of each side. See BRAIN.

CORPUS cavernosum urethrae. See CAVERNOSUM.

CORPUS glandulosum. See PROSTATA.

CORPUS pampiniforme. } See the articles { PAMPINIFORME.

CORPUS pyramidale. } PYRAMIDALE.

CORPUS reticulare. See RETICULARE corpus.

CORPUS, is also used in matters of learning, for several works of the same nature, collected, and bound together.

Gratian made a collection of the canons of the church, called corpus canonum. The corpus of the civil law is composed of the digest, code, and institutes; see also CODE and DIGEST.

We have also a corpus of the Greek poets; and another of the Latin poets. See BODY.

CORPUS cum causa, in law, a writ issuing out of chancery, to remove both the body, and record, touching the cause of any man lying in execution upon a judgment for debt, into the king's bench, &c. there to lie till he has satisfied the judgment.

CORPUS cepi. } See the articles { CEPI.

CORPUS habetas. } HABEAS.

CORPUSCULE, in physics, a diminutive of corpus, used to express the minute parts, or particles that constitute natural bodies.

Corpuscles amount to much the same with what the antients called atoms; and differ both from the elementary and hypostatical principles of the chymists, and the materia subtilis of the Cartesians.

Sir Isaac Newton shews a method of determining the sizes of the corpuscles whereof the particles that compose natural bodies consist, from their colours.

CORPUSCULAR philosophy, that scheme or system of physics, wherein the phenomena of bodies are accounted for, from the motion, rest, position, arrangement, &c. of the minute corpuscles, or atoms, whereof bodies are composed.

The corpuscular philosophy, which now flourishes under the title of the mechanical philosophy, is exceedingly antient. Leucippus and Democritus were the first who taught it in Greece; from them Epicurus received it, and improved it, inasmuch that it came at length to be denominated from him, and was called the Epicurean philosophy.

Leucippus, again, is said to have received it from Mochus, a Phœnician physiologist, before the time of the Trojan war, and the first who philosophized about atoms: though Gale, who borrows all profane philosophy from the sacred philosophy in the books of Moses, is of opinion that he might take the hint from the Mosiac history of the formation of man out of the dust of the earth.

Indeed, Cæsaubon takes Μοχ, or Μοχ, to be the name of a Tyrian, who among his own countrymen was called מוש מוש, or according to the method of writing which then obtained, Moses: whence it is conjectured that the Mofche, or Mochus of the Tyrians, was, in effect, the Moses of the Hebrews.

This appears to be the sentiment of Selden, Arcerius, &c. But the opinion of Bochart is more probable, who from Posidonius and others, takes Mochus for an inhabitant of Sidon, and his philosophy to be nothing else but a physiological or natural history of the creation.

After Epicurus, the corpuscular philosophy gave way to the peripatetic, which became the popular system.

Thus, in lieu of atoms, were introduced specific and substantial forms, qualities, sympathies, &c. which amused the world till Gallenus, Charleton, Des Cartes, Boyle, Newton, and others, retrieved the old corpuscularian hypothesis; which is now become the basis of the mechanical, and experimental philosophy.

Mr. Boyle reduces the principles of the corpuscular philosophy to the four following heads:

1^o. That there is but one catholic, or universal matter, which is an extended, impenetrable, and divisible substance, common to all bodies, and capable of all forms.

This, Sir Isaac Newton finely improves on: "All things considered, says that great author, it appears probable to me, that God, in the beginning, created matter in solid, hard, impenetrable, moveable particles; of such sizes and figures, and with such other properties, as most conduce to the end for which he formed them: and that these primitive particles, being solids, are incomparably harder than any of the sensible porous bodies compounded of them; even so hard as never to wear or break in pieces: no other power being able to divide what God made one in the first creation. While these corpuscles remain entire, they may compose bodies of one and the same nature and texture in all ages; but should they wear away, or break in pieces, the nature of things depending on them would be changed: water and earth, composed of old worn particles, and fragments of particles, would not be of the same nature and texture now, with water and earth composed of entire particles at the beginning. And therefore, that nature may be lasting, the changes of corporeal things are to be placed only in the various separations and new allocations of these permanent corpuscles." Opticks.

4°. That this matter, in order to form the vast variety of natural bodies, must have motion, in some or all its assignable parts; and that this motion was given to matter by God the creator of all things: and has all manner of directions and tendencies.

5° These *corpufcles*, says Sir Isaac Newton, have not only a vis inertie, accompanied with such passive laws of motion as naturally result from that force; but also are moved by certain active principles; such as that of gravity, and that which causes fermentation, and the cohesion of bodies.

3°. That matter must also be actually divided into parts; and each of these primitive particles, fragments, or atoms of matter, must have its proper magnitude, figure, and shape.

4°. That these differently sized and shaped particles, have different orders, positions, situations, and postures; from whence all the variety of compound bodies arises.

CORRECTION *calendar*. See **CALENDAR**.

CORRECTION, in printing, the act of retrenching the faults in a work; or the reading which the master, or in his place the corrector, gives the first proofs, to point out and amend the faults, to be rectified, in the forms, by the compositor.

The *corrections* are placed on the margin of each page, right against the line where the faults are found. There are different characters used to express different *corrections*, *o. gr.* *D* or *de*, for any thing to be effaced, or left out. When any thing is to be inserted, the place is marked in the line with a caret ^ and the insertion added in the margin. When a word, syllable &c. is to be altered, it is erased out of the proof, and that to come in its room written in the margin; always observing, if there be several in the same line, that they be separated by little bars or strokes, |. If a space be omitted, its place is marked with a caret, and the thing expressed on the margin with X. If a letter be inverted, it is expressed on the margin with J. If any thing be transposed, it is marked thus; *The shortest are the foliis best*; for, *The shortest foliis are the best*: and in the margin is added *tr* in a circle. If Roman characters are to be changed for *Italic*, or *vice versa*, a line is drawn under them thus, and *Roman* or *Italic* added in the margin.

CORRECTION, in rhetoric, a figure, whereby a person in a passion, fearing he has not expressed a thing fully, or strongly enough, calls it back again, as it were, by a stronger phrase, and corrects the error.

CORRECTION, in pharmacy, the qualifying of a medicine, in order either to moderate the too great violence of its action; as when glass of antimony is calcined with a little salt-petre: or, to prevent its raising some disorder in the body; as when salt of tartar is dissolved in an infusion of fenna, to prevent its giving the gripes.

CORRECTORS, in medicine, such ingredients in a composition as guard against, or abate the force, or dangerous qualities of others.

Thus, lixivious salts prevent the grievous vellications of refinous purges, by dividing their particles, and preventing their adhesions to the intestinal membranes, whereby when given alone they sometimes occasion intolerable gripings: and thus spices, and carminative feeds also, assist in the easier operation of some cathartics, by dissipating collections of wind.

In the making a medicine, likewise, such things are called *correctors*, as destroy or diminish a quality in it that could not otherwise be dispensed with: thus, turpentine may be called the *corrector* of quicksilver, by destroying its fluidity, and making it thereby capable of mixture: and thus rectified spirit of wine breaks off the points of some acids, so as to make them become safe and good remedies, which before were destructive.

CORRELATIVE, something opposed to another in any certain relation.

Thus, Father and Son are *correlatives*; *pater et filius sibi mutuo respondent*. Light and darkness, motion and rest, are *correlative* and opposite terms.

CORRIVAL, a relative term, signifying, originally, a person who derived water from the same source, or spring with another; by means of some common canal, which carried it to both their lands; and which proved the occasion of frequent disputes. Hence the word came to be used for those who have the same pretensions; whether to glory, to love, or the like: but use has abridged the word; and we now both write and pronounce, *rival*.

CORROBORANTS. See the article **STRENGTHENERS**.

CORROBORATIVE, in medicine, any thing that increases strength, or gives new force.

The word is likewise frequently applied to such medicines as are of use in particular weaknesses; as the fluor albus, gonorrhoeas, &c. Such are terebinths, &c.—All cardiacs are *corroborative*.

CORROSION, the act of *corroding*, or gnawing away, by little and little, the continuity of the parts of bodies.

Acids *corrode* most natural bodies; and arsenic only kills, because it *corrodes* the bowels with its sharp, pointed particles.

CORROSION is used both in chymistry, medicine, and natural philosophy; where it stands for a particular species of dissolution, by an acid, or saline menstruum. See **DISSOLUTION**.

What *corrosion* has peculiar to it, is, that it is mostly designed

for the resolution of bodies the most strongly compacted, as bones and metals; so that the menstruums employed require an uncommon moment, or force.

Now *corrosive* liquors, whether acid or urinous, are nothing but salts dissolved in a little phlegm: therefore, these being solid, and consequently containing a considerable quantity of matter, do both attract one another the more, and are also more attracted by the particles of the body which is to be dissolved. And as their attractions at equal distances are proportional to their bulks, *ceteris paribus*; so when the more solid bodies are put into saline menstruums, the attraction is stronger than in other solutions; and the motion, which is always proportional to the attraction, is more violent.

Hence we easily conceive, how they should drive those salts, like so many darts, into the pores of the bodies, and open and loosen the cohesion of them, though ever so firm. See **ACID**.

Again, we know, the more minute the particles of the menstruum are, the sooner they penetrate, and with the greater force: the motion produced by attraction, being always greatest in the least corpufcles, and next to nothing in the large ones. Add to this another advantage gained by this minuteness of the particles, *viz.* that they approach nearer the body to be dissolved; without which, the attractive force would be insensible. Hence, those very salts, which dissolved in water will hardly touch metals, if once turned into acid spirits, easily penetrate them: for in distillation, not only a greater quantity of water remains, but the saline bodies are so minutely broken, and divided by the fire, as to make them more readily capable of being moved by an attractive force; and therefore such a distilled menstruum is much more efficacious than any solution of salt made with water. See **MENSTRUUM**.

CORROSIVE *sublimato* of mercury. See **MERCURY**.

CORRUGATOR, or **CORRUGENS** *supericilli*, a muscle arising from the great canthus of the orbit of the eye, and terminating in the skin about the middle of the eyebrows. See the article **EYE**.

Its name declares its use; being formed of *con*, together; and *ra-ga*, wrinkle.

Some reckon this muscle only a prolongation of the frontales.

CORRUGENT *muscle*, the same as *corrugator supericilli*.

CORRUPTIBLE. See the article **INCORRUPTIBLE**.

CORRUPTICOLÆ, a sect of ancient hereticks, who arose out of the Eutychians in Egypt, about the year 531, under their chief, Severus, the pretended patriarch of Alexandria.

Their distinguishing doctrine, whence they derived their name, was, that the body of Jesus Christ was *corruptible*; that the fathers had owned it; and that to deny it was to deny the truth of our Saviour's passion.

On the other hand, Julian of Halicarnassus, another Eutychian, a refugee as well as Severus, in Alexandria, maintained that the body of Jesus Christ had been always incorruptible; that to say it was corruptible, was to make a distinction between Jesus Christ and the Word, and by consequence to make two natures in Jesus Christ.

The people of Alexandria were divided between the two opinions; and the partisans of Severus were called *corrupticolas*, *q. d.* worshippers of something *corruptible*: sometimes they were denominated *corruptibiles*; and the adherents of Julian *incorruptibiles*, or *phantasiastes*.—The clergy and secular powers favoured the first; the monks and the people the latter.

CORRUPTION, the extinction of any thing; or the act whereby it ceases to be what it was.

Thus, wood is justly said to be *corrupted*, when we do not see it remain wood any longer, but find fire in its stead. And thus the egg is *corrupted*, when it ceases to be an egg, and we find a chicken in its room.—Hence that axiom in philosophy, *The corruption of one thing is the generation of another*.

Corruption, differs from *generation*, as two contraries differ from each other.

It differs from *alteration* as a less from a greater, or a part from the whole; a thing being said to be *altered*, when it is not so far changed but it may be known, and still keeps its old name; both which it loses by *corruption*.

But, as in generation, no matter is produced that did not before exist; so in *corruption*, nothing is lost, but that particular modification which constituted its form, and made it to be of such a species.

Dr. Drake accounts for *corruption* in animal and vegetable bodies thus; 'The principle of *corruption* is, perhaps, the same which in a state of circulation is the principle of life; *viz.* the air, which is found mixed in considerable quantities with all sorts of fluids; as necessary to vegetable, as to animal life. Now this air has two motions, *viz.* an expansive one, from its natural elasticity, by means whereof it communicates that intestine motion which all juices have, and by which the containing parts are gradually extended and grow; and a circulatory or progressive motion, which is not essential to it, but is occasioned by the resistance of the solid parts of those bodies, which obliges it to take that course which is most free and open, which is thro' the vessels of animals and plants.'

* Now,

Now, this course being stopped, the expansive motion still remains, and continues to act, till by degrees it has so far overcome the including bodies, as to bring itself to an equal degree of expansion with the external air; which it cannot do without destroying the texture and continuity; or specific degree of cohesion of those solids: which is what we call a *state of corruption*.

This expansive or destructive quality of the air in bodies, may be promoted two ways, and therefore corruption may be accelerated in as many, viz. either by weakening the tone or cohesion of the including part, and so facilitating the work of the air; as is the case when fruit is bruised, which is found to corrupt much sooner there than in any other part: or by extending the expansive force of the air itself, by heat, or some other co-operating circumstance; and so helping it to overcome the resistance the fooder.

CORRUPTION of blood, in law, an infection accruing to a man's state, attainted of felony or treason, and to his issue.

For, as he loses all to the prince, or other lord of the fee, so his issue cannot be heirs to him, or to any other ancestor by him: and if he were noble, or a gentleman, he and his heirs are thereby ignobled and ungentled. See **ESCHEAT**.

The king's pardon cleanses the corruption of blood in those children born after the pardon, not of those born before it; these latter continuing still incapable of inheriting the land of their father, purchased before the time of the pardon.

But note, there are several offences now made treason by act of parliament which do not corrupt the blood; nor shall the criminal forfeit any thing thereby, beside what he has for life.

CORSAIR*, a pirate, or person who scours the seas, especially the Mediterranean, with a vessel arm'd for war, without commission from any prince, or power; to plunder merchant vessels.

* The word comes from the Italian *corsare*, of *corso*, or *à corsibus*, by reason of their courses or excursions.

A corsair is distinguished from a privateer in this, that the latter does it under a commission, and only attacks the vessels of those at war with the state whence his commission is derived.

The punishment of a corsair is to be hanged, without remission; whereas privateers are to be treated as prisoners of war.—All corsair vessels are good prizes. See **PRIZE**.

CORSELET, a little cuirasse, according to some: and according to others, a coat, or cover for the whole trunk, antiently worn by the pikemen, commonly placed in the front and flanks of the battle, for the better resistance of the enemies assaults, and the surer guard of the soldiers placed behind, or within them. See **CUIRASSE**.—Vaugelas observes, that the seamen were antiently armed with *corselets*.

CORSEPRESENT*, in our antient authors, denotes a mortuary.

* The word is formed of the French, *corps present*; and the reason of the denomination is probably this: that where a mortuary after any man's death became due, the best or second best beast was offered or presented to the priest, and carried along with the corpse.

CORSNED Bread, a superstitious manner of trial, used among our Saxon ancestors, by a piece of barley-bread, first execrated by the priest, then offered the suspected criminal to be swallowed, by way of purgation; from an opinion that a guilty person could not swallow a piece of bread so accursed, or if he did, that it would choke him.

The ceremony was accompanied with a prayer, beseeching God, 'That the criminal's jaws might be shut, his throat so narrow that he might not swallow, and that he might cast it out of his mouth.'

CORTES, a term purely Spanish, properly signifying the courts, i. e. the states, or assembly of the states, at Madrid.

CORTEX, a Latin name, denoting the bark, or outer coat of a tree, or shrub. See **BARK**.

CORTEX peruvianus, called also *quinaquina*, *kinkinna*, *quinaquina*, *pulvis patrum*, and popularly the *jesuit's bark*; is the bark of a tree growing in the West-Indies, called by the Spaniards *palo de calenturas*, q. d. *fever-wood*; by reason of its extraordinary virtue in removing all kinds of intermitting fevers and agues. See **FEVER**.

The Indians commonly call it the *fuddling tree*, from the property it has of intoxicating fishes, when either its wood or bark is beaten, and steeped in the water where they are.

The tree that yields this noble specific, is only found in Peru; in the province of San Francisco de Quitto, or Quinto, near the city of Loxa: though some say it is also found in that of Potosi; and F. Labat, in the island of Guadeloupe.—The bark, while on the tree, is streaked, of a whitish yellow withoutside, and a pale tan colour within.

It is about 80 years since this noble febrifuge was first known in England. It was first introduced into use by the cardinal de Lugo; whence, in France, it was first called from the name of that cardinal. Afterwards it became known by the name of the *jesuit's powder*, and the *jesuit's bark*; because sold by the jesuits, to whom that cardinal, who had been of their society, left great quantities of it.

When first introduced, it is said to have been sold for about eight shillings sterling the dose; which great price, with the little effects found from it, by reason of their ignorance of the manner of preparing and prescribing it, occasioned its being disused,

till about the year 1679, that Mr. Talbor, an English practitioner in physick, brought it into vogue again, by the great number of cures wrought about the court and city of Paris, with this powder, prepared after his manner: the secret whereof was soon after made publick by the munificence of Louis XIV. who rewarded Talbor for the communication, with 5000 crowns.

The quinquina is sold either in bark or in powder: those who buy it in the bark, must chuse it very dry and compact; such as has never been moistened, and which is not too easily reduced into powder by breaking. The small, fine, quilled barks, shagreened without, and reddish within, of a bitter disagreeable taste, are the most esteemed.—For the powder, it must be well sifted, and care be taken it be bought of persons that may be trusted; it being very easy to sophisticate it, and difficult to find it out.

The cortex is a bitter, absorbent, and astringent or styptic: from its bitterness, M. Renuaume observes it becomes fit to soften four acrimonious juices; for a sour and a bitter make a sweet. Again, as an absorbent it blunts the points of acids, and prevents their action; and of consequence preserves the fluidity of the juices, which acids would coagulate. As a styptic it must have earthy parts to absorb ferocities, by which the parts before moistened and relaxed, will contract themselves: and by this means, the cortex augments the spring and tension of the fibres. As a bitter it warms; and it facilitates perspiration, by warming and augmenting the fluidity of the juices. On these properties it is that its medicinal uses are ascertained.

Its chief use is in curing of agues, and intermitting fevers; for which purpose it is applied in all ages, and most constitutions. Dr. Cockburn says, it produces this effect better than any other medicine of the same intention, in the ratio of 365 to 1. It is usual to give a gentle emetic of ipecacuanha before the exhibition of the cortex: by thus preparing the passages, the cortex has not only more success, but also is not subject to cause these indispositions, viz. swelling in the belly, nausea, &c. which often arise when such preparation is neglected.

The cortex must never be exhibited in the paroxysm of an ague, or intermitting fever; but given in such a quantity at times between the paroxysms, as to prevent a return of the fit.

The cortex exhibited in continual fevers is held dangerous; and care must be taken, that the remission of a continual fever be not mistaken for its intermission: when there is a remission, it usually happens indifferently at any time; whereas an intermission happens at particular or stated times.

The cortex is given several ways, viz. in powder, in form of electuary, bolus, infusion, tincture, &c. The arcanum Talborianum is about two ounces of the cortex in powder, digested in a sand-bath, with about a quart of red wine: after digestion, the wine must be poured off, and two or three ounces given every three or four hours between the paroxysms, till the intention is answered. If the bark take downward, Venice treacle, diascordium, conserve of roses, terra japonica, doses of laudanum, &c. must be added to its preparations. When there happens to be an obstruction of the menes from the exhibition of the cortex, or to prevent it, it is advisable to add to its preparations the black hellebore, athiopis mineral, cinnamon, &c.—The cortex is often used for young children in agues, by way of clyster; and also applied to the wrists, and soles of the feet, wrought up into a stiff mass, with turpentine, Venice treacle, &c. which usually answers the purpose.

Dr. Helvetius, physician to the king of France, about 20 years ago, wrote a book entirely upon the subject of curing agues by giving the cortex clyster-wise: in which he pretends, that this is more safe, and no less certain than the cortex given by the mouth. Dr. Cockburn, in his treatise of *sea diseases*, asserts the contrary: he alleges that the cortex given inwardly is as safe, and by much more certain and expeditious; and notes that we know how to remedy all the inconveniences the cortex may occasion.

Dr. Sydenham, and after him M. Renuaume, and others, have prescribed the cortex with success in melancholic and hysterical affections, commonly called vapours.

CORTEX Winteranus, or *Winteri*, the bark of a tree brought from the streights of Magellan, by captain Winter, in his voyage with Sir Francis Drake.—Clusius calls the tree, *magellanica aromatica arbor*.

The bark is aromatick, and found of good use at sea against the scurvy: half a dram of it, boiled with some carminative seeds, sweats, and relieves scorbutic patients. It has also proved an antidote against a poisonous sort of seal, called a *sea lion*, frequent in those parts.

The bark sold in the shops under the name of *cortex winteranus*, or wild cinnamon, Dr. Sloane observes, is not the true *cortex winteranus*; they grow on different trees, and in different countries, and their appearance is very different: yet are they so like in taste, that he thinks they may be used as succedaneums to each other.

CORTEX Capparis. See the article **CAPER**.

CORTEX Cerebri, the cortical or cineritious substance of the brain. See **CORTICAL**, and **BRAIN**.

CORTICAL substance of the brain, in anatomy, the exterior part of the brain and cerebellum; or that part immediately under the pia mater; so called, because of its investing the inner or medullary part, as a bark does a tree. See **BRAIN**.

The fame is also called the *cineritious substance*, from its greyish or ash-colour.

Archangelo Piccolomini, a Ferrarese, first introduced this division of the brain into *cortical* or cineritious, and medullary or fibrous substance, in the year 1526.

The *cortical* substance is more soft and moist than the medullary; and follows or attends it through all its prominences and sinu's. It is formed, from the minute branches of the carotid arteries, interwove in the meninges, and thence continued hither in infinitely fine ramifications.

Most anatomists, after Malpighi, agree in its being glandulous, and that the medullary parts are only a continuation thereof; Ruysch alone excepted; who, from his admirable skill in injections, and the discoveries he has made thereby, maintains that it has nothing glandular in it.

CORTIN, in fortification. See the article CURTIN.

CORVET, or CURVET, in the mane, an air, in which the horse's legs are raised higher than in the demi-volt; being a kind of leap up and a little forwards, wherein the horse raises both his forelegs at once, equally advanced, (when he is going straight forward, and not in a circle) and as his fore-legs are falling, he immediately raises his hind-legs, equally advanced, and not one before the other: so that all his four legs are in the air at once; and as he sets them down, he marks but twice with them. See AIR.

Horses that are very dull, or very fiery, are improper for *corvets*; this being the most difficult air they can make, and requiring a great deal of judgment in the rider, as well as patience in the horse, to perform it.

CORUSCATION, *glittering*; a gleam of light emitted from any thing.

The term is chiefly used for a flash of lightning nimbly darting down from the clouds, in time of thunder. See THUNDER, &c.

CORVUS, *raven*; in astronomy, a constellation of the southern hemisphere; whose stars in Ptolemy's catalogue are 7; in Tycho's as many; in the Britannic catalogue 10. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and Situations of the Stars.	Signt.	Longitude.	Latitude South.	Magni.
That in the beak	1	0 55 35	21 44 26	4
In the neck nigh the head		7 21 38	19 39 41	4
Small one following these		8 0 16	20 37 40	6
In the preceding wing		6 25 58	14 29 0	3
In the breast		9 28 58	18 16 40	5
5				
Inferior over the wings		5 54 35	10 21 48	6
		11 16 15	20 23 42	6
Preced. of two in the hind wing.		9 9 13	12 9 47	3
subseq.		9 32 0	11 39 31	5
In the foot, common with <i>Hydra</i>	10	13 3 25	18 1 40	3

CORYBANTES, in antiquity, priests of Cybele, who danced and capered to the sound of flutes, and drums. See CROTALUM. Catullus, in his poem called *Atys*, gives a beautiful description of them; representing them as madmen. Accordingly, Maximus Tyrius says, that those possessed with the spirit of *corymbantes*, as soon as they heard the sound of a flute, were seized with an enthusiasm, and lost the use of their reason. And hence, the Greeks use the word *κορυμβαντας*, to *corymbantise*, to signify a persons being transported, or possessed with a devil. See ENTHUSIASM. Some say, that the *corymbantes* were all eunuchs; and that it is on this account Catullus, in his *Atys*, always uses feminine epithets, and relatives, in speaking of them.

Diodorus Siculus remarks, that Corybas son of Jason and Cybele, passing into Phrygia with his uncle Dardanus, there instituted the worship of the mother of the Gods, and gave his own name to the priests.—Strabo relates it as the opinion of some, that the *corymbantes* were children of Jupiter and Callopie, and the same with the *cabiri*.—Others say, the word had its origin from this, that the *corymbantes* always walked dancing (if the expression may be allowed) or tossing the head, *κορυμβαντας βασιλεως*.

CORYMBIFEROUS Plants, these are distinguished into such as have a *radiate* flower: as, the flos solis, calendula, &c.—and such as have a *naked* flower: as, the abrotanum femina, eupatorium, and artemisia—to which are added the *corymbiferis affines*, or those akin hereunto; such as scabious, dipascus, carduus, and the like.

CORYMBUS, in the general, signifies the top, or summit of any thing; but among the ancient botanists it was particularly used to express the bunches, or clusters of ivy berries, &c. Some also call the top of the stalk of a plant, when so subdivided and adorned with flowers or fruits, as to make a round spherical figure, by this name; as the tops of leeks, onions, and the like: others confound the word with *umbella*, which expresses the flowy tops of such plants as have their branches and flowers spread round, into the form of what the women now call an *umbrella*.

But among the modern botanists, *corymbus* is chiefly used for a compound discous flower, whose seeds are not pappous, or winged with down: such are the flowers of daisies, common marigold, &c.

V o l. I.

Mr. Ray, therefore, makes a distinct genus of plants of such as have a compound discous flower, but without any downy wings to carry off their seeds.

CORYPHÆUS *, in the antient tragedy, was the chief or leader of the company that composed the chorus.

* The word is formed from the Greek *κορυφή*, *tip of the head*.

The *coryphæus* spoke for all the rest, whenever the chorus took part in the action, in quality of a person of the drama, during the course of the acts.

Hence, *coryphæus* has passed into a general name for the chief or principal of any company, corporation, sect, opinion, &c. Thus, Eustacius of Antioch is called the *coryphæus* of the council of Nice; and Cicero calls Zeno the *coryphæus* of the Stoicks.

CORYZA, *Keuzas*, in medicine, a running at the nose; or a defluxion of sharp ferous humours from the glands of the head; arising from a diminution of perspiration, or catching of cold.

Proper evacuations, as bleeding, epispasticks, sternutatories, &c. are usual in cases of *coryza*'s.

COSCINOMANCY *, the art of divination, by means of a sieve.

* The word comes from the Greek *κοσκινόν*, *cridrum*, a sieve, and *μαντεία*, *divination*.

The sieve being suspended; after rehearsing a formula of words, it is taken between two fingers only; and the names of the parties suspected, repeated: he at whose name the sieve turns, trembles, or shakes, is reputed guilty of the evil in question.

This must be a very antient practice: Theocritus, in his third Idyllion, mentions a woman very skilful in it.—It was sometimes also practised by suspending the sieve by a thread, or fixing it to the points of a pair of shears, giving it room to turn, and naming, as before, the parties suspected: in which last manner, *coscinomancy* is still practised in some parts of England. It appears from Theocritus that it was not only used to find out persons unknown; but also to discover the secrets of those that were known.

CO-SECANT, in geometry, the secant of an arch, which arch is the complement of another arch to 90 degrees. See SECANT, and COMPLEMENT.

CO-SINE, is the right sine of an arch, which is the complement of another to 90 degrees. See SINE.

COSMETIC, a term in physick, used for any medicine, preparation, or means employed to beautify, and embellish the face, and preserve, or improve the complexion; as cerufs, and the whole tribe of fucus's washes, cold creams, lip-salves, &c. See WATER. The Indians use the water of green cacao-nuts as a grand *cosmetic*, which wonderfully improves their complexion.

COSMICAL, *Κοσμικόν*, something that refers, or has a relation to the world.

COSMICAL *Aspect*, among astrologers, is the aspect of a planet with respect to our earth. See ASPECT.

COSMICAL *Qualities* are used by Mr. Boyle in the same sense with systematical ones.

Though, in considering the qualities of natural bodies, we usually only take in the powers any particular one has of acting on, or its capacity of suffering from the action of, another, wherewith it is observed to have some manifest commerce, by a communication of impressions: yet there may be some attributes belonging to a particular body, and several alterations to which it may be liable, not barely on account of those qualities presumed to be evidently inherent in it, nor of the respects it bears to those other particular bodies, whereto it seems manifestly related; but on account of a system constituted as our world is, of such a fabric, that there may be many unheeded agents, which by unperceived means have great operations on the body we consider, and work such changes in it, and enable it to work such changes on other bodies, as are rather to be ascribed to those unheeded agents, than to those other bodies with which the body proposed is observed to be concerned. So that if many bodies that might be named, were placed together in some imaginary space, beyond the bounds of our system; tho' they would retain many of the qualities they are now endowed with, yet they could not possess them all: but by being restored to their former places in this world, they would regain a set of faculties and dispositions, depending on some unheeded relations, and impressions from the determinate fabric of the grand system, or world, whereof they are parts. And these are what Mr. Boyle calls *cosmical*, or *systematical* qualities.

To account for these *cosmical* qualities, the same author proposes some *cosmical* suspensions, as to some unobserved laws and orders of nature; and refers them principally to the action of certain effluvia hitherto unobserved.

COSMICAL, is also used in astronomy, to express one of the poetical fictions of a star.

A star is said to rise *cosmically*, when it rises together with the sun; or with that degree of the ecliptic wherein the sun then abides.

Cosmical setting is, when a star sets and goes down in the west, at the same time the sun rises in the east.

But, according to Kepler, to rise or set *cosmically*, is only to ascend above, or descend below the horizon.

COSMOGRAPHY *, the description of the world; or the art which teaches the construction, figure, disposition, and relation of all the parts of the world, with the manner of representing them on a plane.

- * The word comes from the Greek *κοσμος*, *mundus*, world, and *γραφω*, *scribo*, I describe.

Cosmography consists chiefly of two parts.—Astronomy, which shows the structure of the heavens and the disposition of the stars. And geography, which shews those of the earth.

COSMOLABE, an ancient mathematical instrument, serving to measure distances, both in the heavens and on earth.

The *cosmolabe* is in great measure the same with the *astrolabe*. It is also called *panacosm*, or the *universal instrument*, by L. Morgard, in a treatise expressly thereon, printed in 1612.

COSMOPOLITE, or **COSMOPOLITAN** *, a term sometimes used to signify a person who has no fixed living, or place of abode; or a man who is a stranger no-where.

- * The word comes from the Greek *κοσμος*, *mundus*, and *πολις*, *city*.

One of the ancient philosophers being interrogated what countryman he was; answered he was a *cosmopolite*, i. e. an inhabitant or citizen of the world.

COSTÆ, in anatomy. See the article **RIBS**.

COSTAL, in anatomy.—There are eight vertebræ distinguished by the name of *costales*, or *pleurites*; because serving to articulate the *costæ*, or ribs, which are lined with the *pleura*. See **VERTEBRÆ**.

These vertebræ are the eight which follow the second, called the *axillary*; and are therefore the third, fourth, fifth, and to the tenth inclusive.

COSTIVENESS, in medicine, a preternatural detention of the excrements, with an unusual hardness and dryness thereof; and, thence, a difficulty of discharging them.

This is the opposite to a *diarrhæa*, or looseness.

In the *Philosophical Transactions*, we have an uncommon instance of *costiveness* by Mr. Sherman: the patient, one Thomas Philips, for several years, never went to stool in less than 19 or 20 weeks: he generally eat and drank as well as his neighbours; and did all the while the office of a labouring man: yet was not any of the other evacuations sensibly greater than in other people. He died of it at 23 years old.

In *costiveness*, the usual remedies are gentle preparations of senna, lenitive electuaries, cream of tartar, laxative clysters, &c.

COSTUS Arabicus, the root of a tree resembling elder, brought from Arabia; whence its name.—Its chief use in medicine, is as an ingredient in Venice treacle.

The best is heavy, of a cineritious colour withoutside, a reddish one within, difficult to break, of a strong smell, and an aromatic taste.

This root was formerly called *costus verus*, and was divided into two kinds, the *sweet* and the *bitter costus*: both of which are now uncommon. M. Charas, and others, are of opinion, there is but one kind of *costus*, which proves more or less sweet or bitter, according to the soil where it is produced.

COSTUS Indicus, an American bark, called also *costus corticosus*, *costus corticus*, or *winter's bark*. The islands of Madagascar in Africa, of Domingo and Guadaloupe in America, are the places where the most and best is found.

COTAGE, or **COTTAGE**, antiently denoted 'a little house or habitation without land belonging to it. Stat. 4. Edw. I. By a later Statute, 31 of Eliz. no man may build a house without laying four acres of land to it: so that, properly, a *cottage* now, is a house without four acres of land to it.

CO-TANGENT, is the tangent of an arch, which is the complement of another arch to 90 degrees. See **TANGENT**.

COTHURNUS, *buskin*, a very high shoe, or patten raised on soles of cork; wore by the antient actors in tragedy, to make them appear taller, and more like the heroes they represented; most of whom were supposed to be giants.

It covered the greatest part of the leg, and was tied beneath the knee.—Sophocles is said to have invented the *cothurnus*.

COTICE, or **COTISE**, in heraldry, is the fourth part of the bend; which, with us, is seldom or ever born but in couples, with a bend between them: whence, probably, the name; from the French *coûte*, *side*; they being born, as it were aside of the bend. See **BEND**.

A bend thus bordered is said to be *cotised*, *coticed*.—He bears fable on a bend cotised argent three cinque foils. See **Tab. Herald. fig. 61**.

COTTON *, or **COTON**, a sort of downy matter, encompassing the seed of a tree of the same name.

- * *Ménage* derives the word from the Latin *cotonea*, the fine mofs growing on quinces, which resembles *cotton*: but Nicod says, the Arabs call it *cotum*, and *bombesum*; whence our *cotton*, and *bombazeen*.

The tree which produces this useful merchandise, grows common in several places of the Levant, and of the East and West-Indies, especially in the Antilles. Its fruit is of an oval form, about the size of a nut: as it ripens, it grows black withoutside; and by the heat of the sun opens in several places, discovering the *cotton* through the clefts, which is of

an admirable whiteness. In each fruit are found several little beans, which are the seed of the tree.

There is another kind of *cotton* plant, called, by botanists, *gossypium herbaceum*, which creeps along the ground, as the vine would do if unsupported; the *cotton* whereof is the most esteemed. And the late relations from the south mention two other kinds, the one in the terra firma of Brazil, the other in the Isle of St. Catherine.

The seed of the *cotton* being mixed, in the fruit, together with the *cotton* itself, they have invented little machines, which being play'd by the motion of a wheel, the *cotton* falls on one side, and the seed on the other; and thus they are separated.

Cotton makes a very considerable article of commerce: it is distinguished into *cotton in the wool*, and *spun cotton*. The first used for various purposes, as to be put between two stuffs, in quilts, night-gowns, &c. but it is the latter is more general; furnishing various cloths, muslins, calicoes, dimities, and hangings; besides that it is frequently joined with silk and flax, in the composition of other stuffs.

The first kind is ordinarily brought from Cyprus and Smyrna: near Smyrna its produce is greater than any where else: they sow the seed in June, and gather it in October; and the soil is so favourable that they can have three crops in a year. There are ordinarily brought from Smyrna 10000 bales of *cotton per annum*; and yet there is, at least, as much more spent in the manufactures of the country.

For the *spun cottons*, they are distinguished by various names, the best are those from Jerusalem, called *bazacs*; and those of Damascus, called *cottons of the ounce*. See **OUNCE**. Others are *demi-bazacs*, *baladins*, *payas*, *cottons josph*, *genegunfo*, &c. *Cotton* antiently only grew in Egypt, and was used by the priests and sacrificers for a very singular kind of gowns, wore by them alone.

Cotton, applied to wounds in lieu of linnen, produces an inflammation: Leewenhoek, examining into the reasons of this with a microscope, found its fibres to have each two flat sides; whence he concludes that each of its minute parts must have two acute angles, or edges; which acute edges being not only thinner and more subtle than the globules whereof the fleshy filaments consist, but also more firm and stiff than any of the globulous flesh; it follows, that upon the application of *cotton* to a wound, its edges must not only hurt and wound the globules of the flesh, but also cut incessantly the new matter brought to them to produce new flesh, and that with the more ease, as this matter, not having attained the firmness and consistence of flesh, is the less able to resist its attacks: whereas the linnen ordinarily used in wounds, being composed of little round parts, very close to each other, forms larger masses, and is thus incapable of hurting the globulous parts of the flesh.

COTTON Paper. See the article **PAPER**.

COTYLA, or **COTULA**, a liquid measure, in use among the antients, equal to the Roman *semi-fextary*. See **MEASURE**.

Savot adds, that the Roman *cotyla* contained twelve ounces of any liquor: upon which principle there must have been as many *cotylæ* as there were liquors ordinarily sold; which is nothing strange, since, in several countries, we still find measures of different capacity, called by the same name, when they contain the same weights, though under different bulks. Fannius says, the *cotyla* was the same thing with the *hemina*, which was half a fextary.

*At Cotylas, quas, si placeant, dixisse licet
Heminas, recipit geminas sextarius unas.*

Chorier observes, that the *cotyla* was used as a dry measure, as well as a liquid one; from the authority of Thucydides, who in one place mentions two *cotylæ* of wine, and in another two *cotylæ* of bread.

COTYLA, or **COTYLE**, or **COTYLOIDES**, in anatomy, is a name given the cavities at the extremities of large bones, encompassed with thick strong edges, which receive the heads, or apophyses of other bones articulated with them. See **BONE**.

Such is the cavity in the scion, or hip-bone, which receives the head of the bone of the thigh.—It is also called *acetabulum*, i. e. cup.

COTYLEDONES, in anatomy, little glands dispersed throughout the outermost membrane of the foetus, called *chorion*, and supposed to separate a nutritious juice for the subsistence of the foetus.

Cotyledones, in this sense are only found in sheep, goats, and some other animals; the placenta in the womb, supplying the place thereof in women. See **PLACENTA**.

Other authors use *cotyledones* for the apertures of the veins in the inner surface of the womb. See **MATRIX**.

COUARD, in heraldry. See the article **COWARD**.

COUCH, in painting, denotes a lay, or impression of colour, whether in oil or water, wherewith the painter covers his canvas, wall, waincoat, or other matter to be painted.

The word is also used for a lay or impression on any thing, to make it more firm, and consistent, or to screen it from the weather.

Paintings are covered with a *couch* of varnish: a canvas to be painted, must first have two *couches* of size ere the colours be laid:

two or three *couches* of white lead, are laid on wood ere the *couch* of gold be applied: the leather-gilders lay a *couch* of water and whites of eggs on the leather, ere they apply the gold or silver leaf.

The gold wire-drawers also use the word *couch* for the gold or silver leaf wherewith they cover the mals to be gilded or silvered, before they draw it through the iron that is to give it its proper thickness.

The gilders use *couch* for the quantity of gold or silver leaves applied on the metals in gilding or silvering. Each *couch* of gold is but one leaf, or two at most, and each of silver three; to gild: if the gilding be hatched, there are required from eight to twelve *couches*, and only three or four if it be without hatching. To silver there are required from four to ten *couches*, according to the beauty of the work.

COUCHANT, in heraldry, is understood of a lyon or other beast, when lying down; but with his head lifted up: which distinguishes the posture of *couchant* from *dormant*, wherein he is supposed quite stretched out and asleep.

COUCHANT and Levant, in law. See the article **LEVANT**.

COUCHE, in heraldry, denotes any thing laid all along: thus, a *chevron couché*, is a chevron lying sidewise with the two ends on one side of the shield, which should properly rest on the base.

COUCHING of Cataracts. See **CATARACT**.

COVENANT, the consent or agreement of two or more parties, to do or perform something.

A *covenant* seems to be much the same with a *pactum*, or *conventum* among the civilians.

Covenant is either in law, or in fact.

COVENANT in Law, is that which the law intends to be made, though it be not expressed in terms: as, if the lessor demise, and grant a tenement to the lessee for a certain term; the law intends a *covenant* on the lessor's part, that the lessee shall, during the term, quietly enjoy the lease against all lawful incumbrances.

COVENANT in Fact, is that which is expressly agreed between the parties.

There is also a *covenant merely personal*, and a *covenant real*. Fitzherbert defines a *COVENANT real* to be that whereby a man ties himself to pass a thing real, as lands or tenements, or to levy a fine on lands, &c.

COVENANT merely personal, is where a man covenants with another by deed to build him a house, or to serve him, &c.

Suit-COVENANT. See the article **SUIT**.

Ark of the COVENANT. See the article **ARK**.

COVERED Flank.

COVERED Fountain. } See the articles { **FLANK**,
COVERED Medals. } { **FOUNTAIN**,
 { **MEDAL**.

COVERING, in architecture, one of the principal parts of a building. See **ROOFING**.

CO-VERSED Sine, a term which some people use for the remaining part of the diameter of a circle, after the versed sine is taken from it. See **SINE** and **VERSED**.

COVERT, in law.—*Feme COVERT* denotes a woman married, and so covered by, or under the protection of, her husband.

COVERT Way, in fortification, a space of ground level with the adjoining country, on the edge of the ditch, ranging quite round the half-moons, and other works without-side the ditch.—See **Tab. Fortification**, fig. 21. lit. b, b, &c.

It is otherwise called *corridor*, and hath a parapet together with its banquette, and glacis, which form the height of the parapet. One of the greatest difficulties in a siege, is to make a lodgment on the *covert way*; because, usually, the besieged palliade it along the middle, and undermine it on all sides.

This is sometimes also called the *counterfarp*, because it is on the edge of the farp.

COVERTURE, in law, is particularly applied to the state and condition of a married woman; who, by the laws of our realm, is under *covert-barron*, or *sub potestate viri*; and therefore disabled to make bargains with any, to the prejudice of herself or her husband, without his consent or privity; or at least without his allowance and confirmation: and if the husband alien the wife's lands, during the marriage, he cannot gain say it during his life.

COUGH, **TUSSIS**, in medicine, a disease affecting the lungs, occasioned by a sharp ferous humour, vellicating the fibrous coat thereof, and urging it to a discharge by spitting, &c. See **LUNGS**.

When the humour is so subtle, that the lungs cannot lay hold of it, to throw it off; or when the humour is so thick that it will not give way, it is said to be a *dry cough*.

Dry coughs are the most dangerous.—Hippocrates says, the *cough* ceases, if the testicles swell.

Chin-COUGH. See the article **CHIN-cough**.

COVIN, a deceitful compact, or agreement between two or more, to deceive or prejudice a third person.

As, if a tenant for life conspire with another, that this other shall recover the land which the tenant holds, in prejudice of him in reversion.

Dr. Skinner takes the word to be a corruption of the Latin *conventum*, and therefore writes it *coven*. See **CONSPIRACY**.

COVING, in building. When houses are built projecting over

the ground-plot, and the turned projection arched with timber, lathed and plastered; the work is called *coving*.

COVINO cornice, is a cornice with a great casket, or hollow therein.

COUL,* or COWLE, a sort of monkish habit wore by the Bernardins, and Benedictines.

* The word is formed from the Latin *cucullus*, by confounding the two first syllables into one, as being the same twice repeated.

There are two kinds of *coul*; the one white, very large, wore in ceremony, and when they assist at the office: the other black, wore on ordinary occasions, in the streets, &c.

F. Mabillon maintains the *coul* to be the same thing in its origin with the scapular. The author of the apology of the emperor Henry IV. distinguishes two forms of *coul*; the one a gown reaching to the feet, having sleeves and a capuchon, used in ceremonies; the other a kind of hood to work in, called also a *scapular*; because it only covers the head and shoulders.

COUNCIL, or **COUNSEL**, an assembly, or meeting of divers considerable persons, or officers, to consider and concert measures touching the administration of publick affairs, rendering justice, or the like.

The king's *privy-council*, is the primum mobile of the civil government of England; and that from which all the inferior orbs derive their motion.

In the French polity, *councils* are very numerous: they have their *council of state*, *council of the finances*, *council of dispatches*, *council of directions*, *grand council*, *council of the regency*, *council of conscience*, &c.

Aulic COUNCIL. See the article **AULIC**.

COUNCIL, in church-history and policy, a synod, or assembly of prelates, and doctors, met for the regulating of matters relating to the doctrine, or discipline of the church.

Provincial COUNCIL, is an assembly of the prelates of a province, under the metropolitan. See **PROVINCE**, and **CONVOCAION**.

National COUNCIL, is an assembly of the prelates of a nation, under their primate, or patriarch. See **PRIMATE**.

Oecumenical or general COUNCIL, is an assembly of all the prelates of christendom. See **OECUMENICAL**.

Indeed, to constitute a *general council*, it is not required that all the prelates should be actually present; it is sufficient that the *council* be regularly appointed, and that they may be there, or are called thereto.

General councils are frequently called by ecclesiastical authors *plenary councils*.—The Romanists reckon eighteen *general councils*; whereof only the four first are admitted by the reformed. The number is made out thus: two of Nice, four of Constantinople, one of Ephesus, one of Chalcedon, five of the Lateran, two of Lyons, one of Vienne, one of Florence, and the last of Trent, which held from 1545 to 1563.—The *council of Trent* ordains *provincial councils* to be held every three years; yet the last held in France is that of Bourdeaux, 100 years ago.

There have been various collections of the canons or decrees of *councils*, as that of Dr. Merlin at Paris in 1524; one off Crabbé, a Franciscan, in 1536; another of Surius in 1567; another at Venice, in 1585; another at Rome, in 1608; one of Binius, canon of Cologne, in 1606, in ten volumes: another at the Louvre, in 1664, in thirty-seven volumes: another of F. Labbe and F. Cossart, Jesuits, in 1672, in seventeen volumes, more ample than the rest. Lastly, another by F. Hardouin. See **CANON**.

COUNCIL of war, is an assembly of the principal officers of an army, or fleet, occasionally called by the general, or admiral, to consider of the present state of things, and concert measures for their conduct, with regard to sieges, retreats, engagements, &c. The same term is sometimes also used for an assembly of the officers of a regiment, or ship; met to try soldiers or sailors accused of any crime.

Common COUNCIL, is a court or assembly, wherein are made all by-laws which bind the citizens of London.

It consists, like the parliament, of two houses; an *upper*, consisting of the lord-mayor and aldermen; and a *lower*, of a number of *common-council* men, chose by the several wards, as representatives of the body of the citizens.

COUNSELLORS of honour. See the article **HONOUR**.

COUNT, **COUNTEE**, **COMES**, a nobleman who possesses a domain erected into a *county*. See **COUNTY**, and **VICOUNT**.

English *counts* we distinguish by the title of *earls*; foreign ones still retain their proper name.

The dignity of a *count*, is a medium between that of a duke and a baron.

According to the modern use, most plenipotentiaries and embassadors assume the title of *counts*; though they have no county; as the *count d'Avaux*, &c.

Antiently, all generals, counsellors, judges, and secretaries of cities under Charlemaign were called *counts*; the distinguishing character of a duke and a *count* being this, that the latter had but one town under him, but the former several.

A *count* has a right to bear on his arms a coronet, adorned with three precious stones, and surmounted with three large pearls, whereof

whereof those in the middle and extremities of the coronet, advance above the rest.

Counts were originally lords of the court, or of the emperor's retinue, and had their name *comites*, à *comitando*, or à *commeando*: hence, those who were always in the palace, or at the emperor's side, were called *counts palatine*, or *comites à latere*. See *PALATINE*.—In the times of the commonwealth, *comites*, among the Romans, was a general name for all those who accompanied the proconsuls and proprietors into the provinces, there to serve the commonwealth; as the tribunes, prefects, scribes, &c. Under the emperors, *comites* were the officers of the palace. The origin of what we now call *counts*, seems owing to Augustus, who took several senators to be his *comites*, as Dion observes, *i. e.* to accompany him in his voyages and travels, and to assist him in hearing of causes; which were here judged with the same authority as in full senate. Gallienus seems to have abolished this council, by forbidding the senators being found in the armies; and none of his successors re-established it.

These counsellors of the emperor, were really *counts*, *comites*, *i. e.* companions of the prince; and they sometimes took the title thereof, but always with the addition of the emperor's name whom they accompanied: so that it was rather a mark of their office, than a title of dignity.

Constantine was the first who converted it into a dignity; and under him it was, that the name was first given absolutely. The name once established, was in a little time indifferently conferred, not only on those who followed the court, and accompanied the emperor, but also on most kinds of officers; a long list whereof is given us by Du Cange.

Eusebius tells us, that Constantine divided the *counts* into three classes; the first bore the title of *illustres*, the second that of *clarissimi*, and afterwards *spectabiles*; the third were called *perfectissimi*.

Of the two first classes was the senate composed; those of the third had no place in the senate, but enjoyed several other of the privileges of senators.

There were *counts* who served on land, others at sea; some in a civil, some in a religious, and some in a legal capacity; as, *comes ærarii*, *comes sacrarum largitionum*, *comes sacri consistorii*, *comes curiæ*, *comes capellæ*, *comes archiatrorum*, *comes commerciorum*, *comes vestiarii*, *comes horreorum*, *comes opsoniorum* or *annone*, *comes domesticorum*, *comes equestrum regionum*, or *comes stabuli*; *comes domorum*, *comes excubitorum*, *comes notariorum*, *comes legum*, or professor in jure, *comes limitum*, or *marcarum*; *comes portus romæ*; *comes patrimonii*, &c.

The Franks, Germans, &c. passing into Gaul and Germany, did not abolish the form of the Roman government; and as the governors of cities and provinces were called *counts*, *comites*, and *dukes*, *duces*, they continued to be called so.

These governors commanded in time of war; and in time of peace they administered justice. Thus, in the time of Charlemagne, *counts* were the ordinary judges and governors of the cities, all under one.

These *counts* of cities were beneath the dukes and *counts* who presided over provinces; the first being constituted in the particular cities under the jurisdiction of the latter. The *counts* of provinces were in nothing inferior to dukes, who themselves were only governors of provinces.

Under the last of the second race of French kings, they got their dignity rendered hereditary; and even usurped the sovereignty when Hugh Capet came to the crown: his authority was not sufficient to oppose their encroachments; and hence it is they date the privilege of wearing coronets in their arms: they assumed it then, as enjoying the rights of sovereigns in their particular districts, or *counties*. But, by degrees, most of the *counties* became re-united to the crown.

The quality of *count* is now become very different from what it was antiently; being now no more than a title, which a king grants upon erecting a territory into a county, with a reserve of jurisdiction and sovereignty to himself.

At first there was no clause in the patent of erection, intimating the reversion of the county to the crown in default of heirs male; but Charles IX. to prevent their being too numerous, ordained that dukes and counties, in default of heirs male, should return to the crown.

The point of precedence between *counts* and marquisses, has been formerly much controverted; the reason was, that there are *counts* who are peers of France, but no marquisses: but the point is now given up, and marquisses take place; though antiently, when *counts* were governors of provinces, they were on a level even with dukes.

William the conqueror, as is observed by Camden, gave the dignity of *counts* in fee to his nobles; annexing it to this or that county, or province, and allotting for their maintenance a certain proportion of money, arising from the prince's profits in the pleadings and forfeitures of the provinces. To this purpose he quotes an antient record, thus: Hen. II. *rex anglie his verbis comitem creavit; sciatis nos fecisse Hugonem Bigot comitem de Norf. &c. de tertio denario de Norwiche & Norfolke sicut aliquis comes anglie*, &c.

The Germans call a *count*, *graf*, or *graff*; which, according to

a modern critic, properly signifies *judge*; and is derived from *gravia*, or *graffio*, of *γρᾶφι*, I write.—They have several kinds of these *counts*, or *graffs*; as *landgraves*, *marchgraves*, *burggraves*, and *pallgraves*, or *counts palatine*.

These last are of two kinds; the one are of the number of princes, and have the investiture of a palatinate; the others have only the title of *count palatine*, without the investiture of any palatinate.

Some assert, that by publicly professing the imperial laws for twenty years, the person acquires the dignity of a *count palatine*; and there are instances of professors of law, who have assumed the title accordingly: but there are others who call this right in doubt.

COUNT, in law, denotes the original declaration in a real action; as the declaration is in a personal one: the libellus of the civilians answers to both.

Yet, *count* and declaration are sometimes confounded; and used for each other: as, *count in debt*, *count in appeal*, &c.

COUNT-WHEEL, in clock-work, a wheel which moves round in twelve hours; called also the *lacking-wheel*. See *CLOCK*.

COUNTER, of the Latin preposition *contra*, against, is used in the composition of divers words in our language; and generally implies the relation of opposition.—As,

COUNTER-ALLEYS in gardening. See *ALLEY*.

COUNTER-APPROACHES, in fortification, lines or trenches made by the besieged, when they come out to attack the lines of the besiegers in form.

Line of COUNTER-APPROACH, a trench which the besieged make from their covered-way to the right and left of the attacks, in order to scower or enfilade the enemy's works.

It should commence in the angle of the place of arms of the half moon that is not attacked, and of the bastion that is attacked; about 50 or 60 fathoms from the attacks; and continued as far as shall be found necessary in order to see the enemy in his trenches and parallels. This line must be perfectly enfiladed from the covered way and the half-moon, that if the enemy get possession of it, it may be of no service to him. In this line the governor must frequently in the night time send small parties of horse, or foot, to drive the workmen from their posts; and if possible carry off the engineers, who have the direction of the works. Savin. Nouv. Ecol. Milit. p. 280.

COUNTER-BARRY, or **CONTRE-BARRE**, is used by the French heralds, for what we more ordinarily call *bendy sinister per bend counterchanged*. See *BARRY*.

COUNTER-BATTERY, a battery raised to play on another, in order to dismount the guns. See *BATTERY*.

COUNTER-BENDY, or **CONTRE-BANDE**, in heraldry, is used by the French to express what we ordinarily call *bendy of six per bend sinister counterchanged*. See *BENDY*.

COUNTER-BOND, is a bond given to save a person harmless, who has given his bond for another.—This is also called *counter-security*.

COUNTER-BREAST-WORK, in fortification, a *fausse-braye*. See *FAUSSE-BRAYE*.

COUNTER-CHANGE, in commerce, &c. a mutual exchange between two parties. See *EXCHANGE*.

COUNTER-CHANGED, in heraldry, is when there is a mutual changing of the colours of the field and charge in an escutcheon, by means of one or more lines of partition.

Thus, in the coat of the famous Chaucer: he beareth, party per pale argent and gules, a bend *countercharged*; that is, that part of the bend, which is in that side of the escutcheon which is argent, is gules; and that part of it which is on the other, is argent. V. Tab. Heraldry, fig. 50.

COUNTER-CHARGE, is a reciprocal charge, or recrimination, brought against an accuser. See *RECRIMINATION*.

COUNTER-CHARM, a charm or spell, contrived to hinder the effect of another. See *CHARM*, *SPELL*, *LIGATURE*, &c.

COUNTER-CHEVRONED, denotes a shield *chevronny*, or parted by some line of partition.

COUNTER-COLOURED. See the article *CONTREBAND*.

COUNTER-COMPOUND, or **CONTRE-COMPONE**, or **COUNTER-COMPONY**, is when a bordure is compounded of two ranks of panes; as represented in Tab. Heraldry, fig. 51.—When it consists but of one rank, it is called *companded*; and when of more than two, *checky*. See *CHECKY*, &c.

COUNTER-DEED, a secret writing, or a private act, either before a notary, or under a privy seal; which destroys, changes, annuls or alters some more solemn and public act.

Counter-Deeds, are rather tolerated than permitted: in many cases they are actually prohibited; as being usually no better than frauds.—The custom of Paris annuls all *counter-deeds*, contrary to the tenor of a marriage.

COUNTER-DRAWING, in painting, &c. the copying a design or painting, by means of a fine linen cloth, an oiled paper, or other transparent matter; whereon the strokes appearing through, are followed and traced with a pencil, with or without colour.

Sometimes they *counter-draw* on glass, and with frames or nets divided into squares, with silk or with thread; and also by means of instruments invented for the purpose, as the parallelogram,

(C O U N T E R .

COUNTER-ERMINE. See the article *ERMINÉ*.

COUNTERFEAT *Architecture*. See the article *ARCHITECTURE*.

COUNTER-FISSURE. See the article *CONTRAFISSURE*.

COUNTER-FOLL, or COUNTER-SPOCK, is that part of a tally struck in the exchequer, which is kept by an officer of the court. See *TALLY*, and *EXCHEQUER*.

COUNTERFORTS, *Battresses*, or *Spurs*, are pillars of masonry, serving to prop or sustain walls or terraces, subject to bulge, or be thrown down.

These works are usually turned archwise, and placed at a distance from each other.

When any thing is built on the descent of a mountain, it must be strengthened with *counterforts* well bound to the wall, and at the distance of about twelve yards from each other.

COUNTER-FUGUE, in music, is when fugues proceed contrary to one another. See *FUGUE*.

COUNTER-GAGE, in carpentry, a method used to measure the joints, by transferring, *v. gr.* the breadth of a mortise to the place in the timber where the tenon is to be, in order to make them fit each other.

COUNTER-GUARD, in fortification. See *ENVELOPE*.

COUNTER-HARMONICAL. See the article *CONTRA-HARMONICAL*.

COUNTER-INDICATION. See the article *CONTRA-INDICATION*.

COUNTER-LIGHT, a window or light opposite to any thing, which makes it appear to a disadvantage.—A single *counter-light* is sufficient to take away all the beauty of a fine painting.

COUNTERMAND, in a general sense, a revocation of an order; or an excuse for setting aside, or deferring a thing ordered to be done.

By the French law, a *countermand* differs from an *esloin*, 1°. In that in the *countermand*, the confinement is proposed to be deferred to a day certain, which is not in the *esloin*. 2°. In the *esloin*, the cause of deferring the confinement is expressed and affirmed to be true, but in a *countermand* that affirmation is not required.

COUNTERMAND, in the English law, is where a thing formerly executed is afterward, by some act or ceremony, made void by the party that first did it.

As, if a man make his last will, and devise his land to T. S. and afterwards enfeoff another of the same land; this enfeoffment is a *countermand* of the will, and the will void as to the disposition of the land.

COUNTERMANDATE. See the article *CONTRAMANDATUM*.

COUNTER-MARCH, in war, a change of the face, or wings of a battalion; whereby the men who were in the front, come to be in the rear.

This is an expedient they have recourse to when the enemy attacks their rear; or when they change their march for a direction opposite to that wherein they had begun.

The *counter-march* is either made by files, or ranks; by files, when the men in the front of the battalion go into the rear; by ranks, when the wings or flanks of the battalion change ground with one another.

The term is also used at sea, for the like change or motion of a squadron of ships.

COUNTER-MARK, a second or third mark, put on any thing marked before.

The word is applied in commerce, to the several marks put on a bale of goods belonging to several merchants; that it may not be opened but in the presence of them all, or their agents.

In goldsmiths works, &c. the *counter-mark* is the mark or punchion of the hall, or company, to shew the metal is standard, added to that of the artificer who made it.

Counter-mark of a horse, is an artificial cavity, which the jockeys make in the teeth of horses that have out-grown the natural mark; to disguise their age, and make them appear as if they were not above eight years old.

Counter-mark of a medal, is a mark added to a medal, a long time after its being struck.

Counter-marks appear to be faults or flaws in medals, disfiguring the ground, sometimes on the side of the head, and sometimes on the reverse; particularly in the large and middle-sized brass: yet are they esteemed as beauties among the curious, who set a particular value on such medals, in regard they know the several changes in value they have undergone; which are expressed by those *counter-marks*.

Antiquaries, however, are not well agreed about the significance of the characters they find on them. On some, N. PROB. on others, N. CAPR. on others, CASR. RM. NT. AUG. SC. Some have for their *counter-mark*, an emperor's head; some several; some a cornucopia.

Care must be taken not to confound the monograms with the *counter-marks*: the method of distinguishing them is easy. The *counter-marks* being struck after the medal, are dented or sunk in; whereas the monograms being struck at the same time with the medals, have rather a little relief.

COUNTER-MINE, in war, a subterraneous vault, running the

whole length of a wall, three foot broad, and six deep, with several holes and apertures therein; contrived to prevent the effect of mines, in case the enemy should make any to blow up the wall.

This kind of *counter-mine* however is now little in use. The modern *counter-mine* is a well or pit, and a gallery, sunk on purpose till it meet the enemy's mine, and prevent its effect: it being first pretty well known whereabouts that is.

COUNTER-MURE, COUNTER-WALL, a little wall built close to another, to fortify and secure it, that it may not receive any damage from the buildings contiguous to it.

By the custom of Paris, if a stable be erected against a partition-wall, there must be a *counter-wall* added, eight inches thick. M. Bullet observes, that the *counter-wall* ought never to be bound, or connected with the proper wall.

COUNTER-MURE, in fortification. See *CONTRA-MURE*.

COUNTER-PALED, CONTRÉ-PALE, is when the escutcheon is divided into twelve pales parted per fesse, the two colours being counter-changed: so that the upper are of one colour, or metal, and the lower of another.

COUNTER-PART, a part of something opposite to another part.

Thus, in music, the bass and treble are two *counter-parts*, or opposite parts.

COUNTER-PART, in law, is the duplicate, or copy of any indenture, or deed.

COUNTER-PASSANT, is when two lions are in a coat of arms, and one appears to be passing or walking quite the contrary way from the other. See *PASSANT*.

COUNTER-PLEA, in law, a replication to a plea or prayer.

When a tenant by courtesy, in dower, or other real action, prays the view or aid of the king, or him in the reversion, for his better defence; or if a stranger to the action begun, desire to be admitted, to say what he can for the safeguard of his estate: that which the demandant alleges against this request, why it should not be admitted, is called a *counter-plea*.

COUNTER-PLOT, a plot, or intrigue contrived to thwart and overthrow another.

COUNTER-POINT, in music, the art of composing harmony; or of disposing and concerting several parts together, as that they make an agreeable whole.

Counter-point is divided into *simple*, and *figurative*; agreeably to the division of harmony, into the harmony of concords, and that of discords.

Counter-point took its name hence: when music in parts was first introduced, their harmony being so simple they used no notes of different time, and marked their consonances by points set against each other. Hence, in regard of the equality of the notes of time, the parts were made to concord in every note.

This afterwards became denominated *simple* and *plain counter-point*; to distinguish it from another kind, wherein notes of different value were used, and discords brought in betwixt the parts; which they call *figurative counter-point*.

Simple counter-point, or the harmony of concords, consists of the imperfect, as well as the perfect concords, and may therefore be denominated *perfect*, or *imperfect*, according as the concords are, whereof it is composed: thus, the harmony arising from a conjunction of any note with its fifth and octave, is perfect; but with its third and sixth, imperfect.

Now, to dispose the concords or the natural notes and their octaves in any key in *simple counter-point*, observe, with regard to the distinction into perfect and imperfect harmony, this general rule, *viz.* to the key *f*, to the fourth *f*, and to the fifth *f*, a perfect harmony must be joined; to the second *f*, the third *f*, and seventh *f*, an imperfect harmony is indispensable; to the sixth *f*, either an imperfect or perfect harmony.

In the composition of two parts, observe, that though a third appears only in the treble on the key *f*, the fourth *f*, and the fifth *f*; yet the perfect harmony of the fifth, is always supposed, and must be supplied in the accompaniments of the thorough bass to these fundamental notes.

More particularly, in the composition of two parts, the rules are, that the key *f* may either have its octave, its third, or its fifth; the fourth *f*, and fifth *f*, may have either their respective thirds or fifths; and the first may have its sixth; as, to favour a contrary motion, the last may have its octave.

The sixth *f* may have either its third, its fifth, or its sixth.—The second *f*, third *f*, and seventh *f*, may have either their respective thirds or sixths; and the last, on many occasions, its false fifth. Which rules hold the same both in flat and sharp keys. For the rules of *counter-point*, with regard to the succession of concords; it must be observed, That as much as can be in parts, may proceed by a contrary motion, *i. e.* the bass may ascend when the treble descends, and *vice versa*. The parts moving either upwards or downwards the same way; two octaves or two fifths never to follow one another immediately.

Two sixths *l*, never to succeed each other immediately. Whenever the octave or fifth is to be made use of, the parts must proceed by a contrary motion, except the treble move into such octave or fifth gradually. If in a sharp key, the bass descend gradually from the fifth *f* to the fourth *f*, the last, in

that case, must never have its proper harmony applied to it; but the notes that were harmony in the preceding fifth *f*, must be continued on the fourth *f*. Thirds and fifths may follow one another as often as one has a mind.

Figurative counter-point is of two kinds: in the one, discords are introduced occasionally; serving only as transitions from concord to concord: in the other, the discord bears a chief part in the harmony.

For the *first*, nothing but concords are ever to be used on the accented parts of the measure: in the unaccented parts, discords may pass transiently, without any offence to the ear. This the French call *supposition*; because the transient discord always supposes a concord immediately following it: which is of infinite service in music.

For the *second*, wherein the discords are used as a solid and substantial part of the harmony; the discords that have place are the fifth when joined with the sixth, to which it stands in the relation of a discord: the fourth when joined with a fifth; the ninth, which is in effect the second; the seventh; and the second and fourth.

These discords are introduced into the harmony with due preparation; and are to be succeeded by concords: which is commonly called the *resolution of a discord*.

The discord is prepared by first substituting in the harmony in quality of a concord; *i. e.* the same note which becomes the discord is first a concord to the bass note immediately preceding that to which it is a discord. The discord is resolved by being immediately succeeded by a concord descending from it by the distance only of second *g*, or second *f*.

As the discord makes a substantial part of the harmony, so it must always possess an accented part of the measure. Now to introduce the discords into harmony; it must be considered what concords may serve for their preparation and resolution: the fifth, then, may be prepared, either by being an octave, sixth, or third. It may be resolved either into the sixth or third. The fourth may be prepared in all the concords, and may be resolved into the sixth, third, or octave. The ninth may be prepared in all the concords except the octave; and may be resolved into the sixth, third, or octave. The seventh may be prepared in all the concords; and resolved into the third, sixth, or fifth. The second and fourth are used very differently from the rest; being prepared and resolved into the bass. See farther under HARMONY, CONCORD, DISCORD, KEY, CLEF, and MODULATION.

COUNTER-POINTED, by the French called *contre-pointé*, is when two chevrons in one clefcheon meet in the points; the one rising, as usual, from the base; and the other inverted, falling from the chief: so that they are *counter*, or opposite to one another in the points.

They may also be *counter pointed* the other way; that is, when they are founded on the sides of the shield, and the points meet that way; called *counter-pointed in fesse*.

COUNTER-POISE, any thing serving to weigh against another; particularly a piece of metal, ordinarily of brass or iron, making a part of the *platina romana*, or steelyard. See STEELYARD. It is contrived to slide along the beam; and from the division in which it keeps the balance in equilibrio, the weight of the body is determined.

It is also by some called the *pear*, on account of its figure; and *mala*, by reason of its weight.—Rope-dancers use a pole by way of *counter-poise*, to keep their bodies in equilibrio.

COUNTER-POISON, an antidote, or remedy, which prevents the effect of a poison.

Of this kind are Venice treacle, mithridate, orvietan, &c.

Counter-poisons are either *general*, or *specific*: to the general kind belong angelica, carduus benedictus, the vine-toxicum, dittany, scorzonera, citrons, bezoar, hartshorn, &c.

For specifics, citron-bark is supposed a *counter-poison* to nux vomica; Venice-treacle to the bite of a viper; oil of scorpion, to the bite of scorpions; oil of pine-apples, to orpiment; gentian, to the cicuta, &c.

Vander Linden, in his treatise *de venenis*, says, that in every putrid indisposition, whether arising from the bite of venomous beasts, or from an alcali formed by putrefaction, vinegar drunk is sovereign, either simple or distilled; either with honey in form of oxymel, or with squills.

COUNTER-POTENT, or *potent counter-potent*, by the French heralds called *contre-potence*, is reckoned a fur, as well as vair and ermine; but composed of such pieces as represent the tops of crutches, called in French *potences*, and in old English *potents*.

COUNTER-PROOF, in rolling-press printing, a print taken off from another fresh printed; which, by being passed through the press, gives the figure of the former, but inverted.

To *counter-prove*, is also to pass a design in black lead, or red chalk, through the press, after having moistened with a sponge, both that, and the paper on which the *counter-proof* is to be taken.

COUNTER-QUARTERED, by the French called *contrefaillié*, denotes the clefcheon, after being quartered, to have each quarter divided again into two: so that there are in it eight quarters, or divisions.

COUNTER-ROLL, a copy of the rolls relating to appeals, inquests, &c. See ROLL.

COUNTER-ROUND, a body of officers going to visit, and inspect the rounds.

COUNTER-SALIENT, is when two beasts are borne in a coat of arms in a posture of leaping from each other, directly the contrary way.

COUNTER-SCARP, in fortification, the exterior slope, or acclivity of the ditch, looking towards the campagne.—See Tab. Fortification, fig. 21. lit. cc.

COUNTER-SCARP is also used for the covert-way and the glacis. *Counter-Scarps* are sometimes made of stone, and without any slope.

To be lodged on the *counter-scarp*, is to be lodged on the covert-way, or the glacis. See COVERT-WAY.

Angle of the COUNTER-SCARP. See ANGLE.

COUNTER-SIGNING, the signing an order, or patent of a superior, in quality of secretary; to render the thing more authentic.

Charters, &c. are signed by the king, and *counter-signed* by a secretary of state, or lord-chancellor.

COUNTER-SWALLOW-TAIL, an outwork, in form of a single tenaille, wider at the gorge, or next the gorge, than at the head, or next the campaign.

COUNTER-TALLY, one of the two tallies whereon any thing is scored.

COUNTER-TENOR, is one of the mean or middle parts of music; so called, as being opposite to the *tenor*.

COUNTER-TRENCH, in fortification, a trench made against the besiegers, and which, of consequence, has its parapet turned towards them.

There are usually a great many communications between this and the place, to prevent the enemy from making any use of it, in case they render themselves masters thereof.

COUNTER-TRIPPING, is when two beasts are borne in a coat of arms tripping, *i. e.* in a walking posture, and the head of the one to the tail of the other.

COUNTER-VALLATION, a *counter-line*, or ditch, made around a place besieged; to prevent the sallies and excursions of the garrison, when it is strong.—Along its edge, on the side of the place, runs a parapet; and it is flanked from space to space.

COUNTER-VENTION. See the article CONTRAVENTION.

COUNTER-WORKING, in the military art, the raising of works, in order to oppose those of the enemy.

COUNTING, or **COMPTING-HOUSE**. See COMPTING-HOUSE.

COUNTRY wakes. See the article WAKES.

COUNTY, originally signifies the territory of a *count*, or earl.

But now it is used in the same sense with *shire*; the one word coming from the French, the other from the Saxon. See SHIRE.

In this view, a *county* is a circuit, or portion of the realm, into 52 of which, the whole land, England and Wales, is divided, for the better government thereof, and more easy administration of justice therein.

These *counties* are subdivided into rapes, lathes, wapentakes, hundreds; and these again into tithings.

For the execution of the laws in the several *counties*, excepting Cumberland, Westmorland, and Durham, every Michaelmas term, officers are appointed, under the denomination of *sheriffs*.

This officer has a double function: first, *ministerial*, to execute all processes and precepts of the courts of law directed to him; and secondly, *judicial*; whereby he has authority to hold two courts, the one called the *sheriff's turn*, the other the *county-court*.

Other officers of the several *counties*, are, a *lord- lieutenant*, who has the command of the militia of the *county*; *custodes rotulorum*, *justices of peace*, *bailiffs*, *high constable*, and *coroner*. See farther under LORD-LIEUTENANT, MILITIA, CUSTOS ROTULORUM, JUSTICE OF THE PEACE, HIGH CONSTABLE, BAILIFF, and CORONER.

Of the 52 *counties*, there are four of special note, which are therefore termed *counties palatine*, as, Lancaster, Chester, Durham, and Ely: Pembroke also, and Hexham, were antiently *counties palatine*; which last belonged to the archbishop of York, and was stripped of its privilege in the reign of queen Elizabeth, and reduced to be a part of the *county* of Northumberland.

The chief governors of these *counties palatine*, heretofore, by a special charter from the king, sent out all writs in their own names; and, touching justice, did all things as absolutely as the king himself in other *counties*; only acknowledging him their superior and governor. But in Henry VIII's time, the said power was much abridged.

COUNTY-CORPORATE, is a title given to several cities, or antient boroughs, on which the English monarchs have thought fit to bestow extraordinary privileges; annexing to them a particular territory, land, or jurisdiction.

The chief of these is the famous city of London; with York, Canterbury, Bristol, Chester, Norwich; the town of Kingston upon Hull, Newcastle upon Tyne, and Haverford West in Wales, &c. See CITY.

COUNTY.

COUNTY-COURT, is a court of justice held in each *county* by the sheriff thereof, or his deputy, every month. See **SHERIFF**.

This *county-court* had antiently the cognizance of matters of great moment; but it was much abridged by *magna charta*, and more i Edward IV. but it has still the determination of debts and trespasses under forty shillings.

In effect, till the courts at Westminster were erected, the *county-courts* were the chief courts of the kingdom. See **COURT**.

Among the laws of king Edgar is this, *viz.* Let there be two *county-courts* in a year, and let there be present a bishop and an alderman or earl; one whereof shall judge according to the common law, the other according to the ecclesiastical law.—The conjunction of these two powers to assist each other, is as antient as the English government itself.

They were first separated by William the conqueror, who brought all the ecclesiastical business into a consistory, erected for that purpose; and the law-business into the king's-bench.

Rier **COUNTY**. See the article **RIER**.

COUPED, **COUPE**, in heraldry, expresses a head, limb, or other thing in an escutcheon which is borne as if cut clear and even off, from the trunk; in opposition to its being forcibly torn off, which they call *erased*.

Thus, the arms of Ulster, which all baronets carry, is a dexter-hand *couped*, or cut off at the wrist.

COUPED, *coupée*, is also used to denote such crosses, bars, bends, chevrons, &c. as do not touch the sides of the escutcheon, but are, as it were, cut off from them.

COUPEE*, a motion in dancing, wherein one leg is a little bent, and suspended from the ground; and with the other a motion is made forwards.

* The word, in the original French, signifies a *cut*.

COUPLE *chefs*, in heraldry, the fourth part of a chevron: never borne but in pairs, except a chevron be between, saith Guillim; though Bloom gives an instance to the contrary. See **CHEVRON**.

COUPLED columns. See the article **COLUMN**.

COUPLET*, a division of an hymn, ode, song, or the like, wherein an equal number, or equal measure of verses is found in each part.

* The word is French, formed from the Latin *copula*.

In odes, these divisions are more ordinarily called *strophes*. See **STROPHE**.

By an abuse, *couplet* is sometimes used to signify a *couple* of verses.

COURANT*, or **CURRENT**, a term used to express the present time: thus, the year 1749 is the *current* year; the fifteenth *current*, the fifteenth day of the month now running.

* The term is French, and properly signifies *running*.

With regard to commerce, the *price current* of any merchandize, is the known, and ordinary price accustomed to be given for it.

COURANT is also used for any thing that has course, or is received in commerce: in which sense, we say, *current* or *current coin*, &c.

COURANT is also a term in musick and dancing; being used to express both the tune or air, and the dance.

With regard to the first, *current* or *current* is a piece of musick in triple time: the air of the *current* is ordinarily noted in triples of minims; the parts to be repeated twice.

It begins and ends, when he who beats the measure falls his hand; in contradistinction from the faraband, which ordinarily ends when the hand is raised.

With regard to dancing, the *current* was long the most common of all the dances practised in England: it consists, essentially, of a time, a step, a balance, and a couple; though it also admits of other motions.

Formerly they leaped their steps; in which point, the *current* differed from the low dances and pavades. There are *simple currents*, and *figured currents*, all danced by two persons.

COURIER, or **CURRIER**, a messenger sent post, or express, to carry dispatches.

Antiquity, too, had its *couriers*; we meet with two kinds, *viz.* those who ran on foot, called by the Greeks *hemerodromi*, q. d. *couriers of a day*. Pliny, Corn. Nepos, and Cæsar, mention some of these, who would run 20, 30, 36, and in the circus, even forty leagues per day.—And *riding couriers*, *cursores equestris*, who changed horses, as the modern *couriers* do.

Xenophon attributes the first *couriers* to Cyrus. Herodotus says, they were very ordinary among the Persians, and that there was nothing in the world more swift than these kind of messengers.

* That prince, says Xenophon, examined how far a horse would go in a day; and built stables, at such distances from each other, where he lodged horses, and persons to take care of them; and at each place kept a person always ready to take the pack, mount a fresh horse, and forward it to the next stage: and this quite through his empire.

But it does not appear, that either the Greeks or Romans had any regular fixed *couriers*, till the time of Augustus: under that prince they travelled in cars; though it appears from Socrates, they afterwards went on horseback.

Under the western empire, they were called *viatores*; and under that of Constantinople, *cursores*: whence the modern name.

COURIERS extraordinary. See the articles **EXTRAORDINARY**. **VAN-COURIERS**.

COURSE, in navigation, the point of the compass, or horizon, on which a ship steers.

When a vessel begins its *course*, the wind wherewith it is driven makes a certain angle with the meridian of the place; and, as it is here supposed, the vessel follows exactly the direction of the wind; it makes the same angle with the meridian which the wind makes.

The wind is further supposed always the same; and because each point, or instant of a *course*, may be regarded as the first; every moment of the *course* it makes the same angle with the wind.

Now a wind that is north-east, *v. gr.* here, (and by consequence makes an angle of 45 degrees with our meridian) is north-east where-ever it blows, and makes the same angle of 45 degrees with all the meridians it meets.

The *course* of a vessel, therefore, driven by the same wind, makes the same angle with all the meridians on the surface of the globe. If the vessel run north and south, it makes an angle infinitely small with the meridian, *i. e.* is parallel to it, or never goes from it: if it run east and west, it cuts all the meridians at right angles.

In the first case it describes a great circle; in the second, either a great circle, which is the equator, or a parallel. But if the *course* be between the two, it does not then describe a circle; because a circle drawn in such a manner, would cut all the meridians at unequal angles. It describes, therefore, a spiral, or curve, the essential condition whereof, is to cut all the meridians under the same angle; called the *loxodromic curve*, or *loxodromy*, popularly *rhumb*.

The ship's *course*, therefore, except in the two first cases, is always a loxodromic curve; and the hypotenuse of a right-angled triangle, the two other sides whereof, are the ship's way in latitude and longitude.

The latitude is usually had by observation.

The *rhumb*, or angle of the *course*, is had by the compass, together with the one or other of the two sides; and what remains to be calculated in sailing, is the quantity of the longitude, and of the *rhumb*, or *course*.

Complement of the COURSE. See **COMPLEMENT**.

COURSE of a river. See the article **RIVER**.

COURSE, in architecture, denotes a continued range of stones, level, or of the same height, throughout the whole length of the building; and not interrupted by any aperture.—See *Tab. Architecture*, fig. 16. see also **BUILDING**, **WALL**, and **MASONRY**.

COURSE of plinths, is the continuity of a plinth of stone, or plaster, in the face of a building; to mark the separation of the stories. See **PLINTH**.

COURSE, is also used for a collection, or body of laws, canons, or the like. See **CORPUS**.

The *civil course*, is the collection of Roman laws, compiled by order of Justinian. See **CIVIL law**.—*Canonical course*, is the collection of the canon law, made by Gratian.

COURSE, again, is used for the time ordinarily spent in learning the principles of a science, or the usual points and questions therein.—Thus, a student is said to have finished his *course* in the humanities, in philosophy, &c.

COURSE is also used for the elements of an art exhibited and explained, either in writing, or by actual experiment.

Hence our *courses* of philosophy, anatomy, chymistry, mathematics, &c. probably so called, as going throughout, or running the whole length or *course* of the art, &c.

COURSE of the moon. See the articles **MOON**.

Paddock COURSE. See the articles **PADDOCK**.

COURT*, an appendage to a house, or habitation; consisting of a piece of ground inclosed with walls, but open upwards. See **HOUSE**.

* The word is formed from the French *cour*, and that from the Latin *cohort*; whence also *cortis*, and *curtis* is sometimes used for the same. In the laws of the Germans, there is one article, *de eo qui in curte regis furum commiserit*; and another, *de eo qui in curte ducis hominem occiderit*. Others derive *court* from the Gaulish *Cors*, formed of *cohort*, and *cohort* from *cohort*. See **COHORT**.

The *court* before a house is properly called the *fore-court*; that behind, the *back-court*: that where country-affairs, &c. are managed, *i. e.* where cattle, &c. come, the *baile-court*.

COURT is also used for the palace, or place where a king, or sovereign prince resides.

COURT, *curia*, in a law sense, is the place where the judges distribute justice, or exercise their jurisdiction.—Also the assembly of judges, jury, &c. in that place.

In this sense, *courts* are divided into *sovereign*, or *superior*, and *subaltern*, or *inferior*: and, again, into *courts of record*, and *baile courts*.—Crompton describes 32 *courts* in England, most of them *courts of record*.

Again, *courts* are either such as are held in the king's name; as all the ordinary *courts*: or those held by his authority, where the precepts are issued in the judge's name, *virtute magistratus sui*; as the admiral's *court*.

In England, we have four principal *courts* subsisting; all established by antient custom of the realm, rather than by any statute; tho' their establishments have been from time to time since confirmed by acts of parliament. These are, the *courts of king's bench*, the *common-bench* or *pleas*, the *exchequer*, and the *court*

of *chancery*. See each in its place, KING'S-BENCH, COMMON-PLEAS, EXCHEQUER, and CHANCERY.

COURT of admiralty, is a court for the decision of maritime controversies. See ADMIRALTY COURT, and ADMIRAL.

COURT of arches. See the article ARCHES COURT.

COURT of attachment. } See ATTACHMENT.

COURT of augmentation. } See AUGMENTATION.

COURT of chivalry, or the *marshal's court*; a court whereof the judges are the lord high constable, and the earl marshal of England.

This court is the fountain of marshal law; and the earl marshal is not only one of the judges, but also to see execution done. See CHIVALRY.

COURT of delegates, is a court where delegates or commissioners are appointed by the king's commission, under the great seal upon an appeal to him.

It is granted in three cases; first, when a sentence is given in an ecclesiastical cause, by the archbishop, or his official; secondly, when a sentence is given in an ecclesiastical cause, in places exempt; thirdly, when sentence is given in the admiralty court, in suits civil or marine, by order of the civil law.

COURT of faculties. See the article FACULTY.

COURT of the legate, was a court obtained by cardinal Wolsey of pope Leo X. in the ninth year of Henry VIII. wherein he, as legate of the pope, had power to prove wills, and dispense with offences against the spiritual laws, &c. It was but of short continuance.

COURT of peculiars, is a spiritual court, held in such parishes as are exempt from the jurisdiction of the bishops, and are peculiarly belonging to the archbishop of Canterbury.

COURT of pie-powders. See PIE-POWDERS.

COURT of requests, was a court of equity, of the same nature with the court of chancery, but inferior to it; being principally instituted for the help of such petitioners, as in conſcionable cases, dealt by supplication to his majesty.

Of this court the lord privy-seal was chief judge; assisted by the masters of requests. It had its beginning about 9 Hen. VII. according to Sir Julius's Caesar's tract on this subject—Mich. 40 and 41 Eliz. in a court of common-pleas, it was adjudged, upon solemn argument, that this court of requests, or the *white-hall*, was no court that had the power of judicature, &c. Coke *Inft.* fol. 97. It had assumed so great power to itself, that it grew burdensome and grievous, and was therefore taken away, with some others, by a statute made 16 and 17 Car. I. cap. 10.

COURT of verge. See the article VERGE.

COURT of wards and liveries. See WARDS and MASTER.

Bouche of COURT.

Despight of the COURT.

Forejudged the COURT.

Inns of COURT.

Perquisites of COURT.

Suit of COURT.

Ambulatory COURT.

Base COURT.

Bishop's COURT.

Christian COURT.

County COURT.

Duchy COURT.

Honour COURT.

Lawless COURT.

MAYOR'S COURTS.—To the lord-mayor and city of London, belong several courts of judicature. The highest and most ancient is that called the *hustings*, destined to secure the laws, rights, franchises, and customs of the city. The second is a COURT of requests, or of *conscience*; so called, as meddling with nothing above forty shillings value; or rather, because here the oath of the creditor himself is accepted.—The third is the COURT of the lord-mayor and aldermen, where also the sheriffs sit; to which may be added, two courts of sheriffs; and the court of the city orphans, whereof the lord-mayor and aldermen have the custody.—Also, the COURT of common council, consisting of two houses; the one for the lord-mayor and aldermen, and the other for the commons: in which court are made all by-laws, which bind the citizens.—Also, the *chamberlain's COURT*, where every thing relating to the rents and revenues of the city, as also the affairs of servants, &c. are transacted. Lastly, to the lord-mayor belong the courts of coroner, and of *escheator*; another court for the conservation of the river of Thames; another of *goal-delivery*, held usually eight times a year, at the Old-Bailey, for the trial of criminals, whereof the lord-mayor is himself the chief judge.

There are other courts called *wardmotes*, or meetings of the wards; and courts of *balymote*, or assemblies of the several guilds and fraternities.

Prerogative COURT. See the article PREROGATIVE.

Sedentary COURTS. } See the articles } SEDENTARY.

Wood-pla COURT. } See the articles } WOOD.

COURTS-BARON are courts that all lords of manors, who were antiently called *barons*, have within their respective precincts. This court is two-fold; 1^o. by custom: as, if a man having a manor in a town, grant the inheritance of the copyholds thereto

belonging to another; this grantee may keep a court for the customary tenants, and accept surrenders to the use of others, and make both admittances and grants.

2^o. By common law. This is of freeholders, which is properly called a court-baron, wherein the freeholders are judges: whereas of the other, the lord or his steward is judge.

COURT-DAYS, are days when the courts of judicature are open, and pleas held.

COURT-LANDS, such as the lord of the manor keeps in his own hands, for the use of his family, and for hospitality. See MANOR.

COURT-LEET, a court belonging to a lord of a manor in which all offences under high-treason are inquired into.

COURT-ROLL, a roll which contains an account of the number, &c. of lands, depending on the lord of the manor; with the names of the tenants, &c.

Tenants holding by copy of this roll, are denominated *copy-holders*. See COPY-HOLDER, and TENANT.

COURTAIN. See the article CURTIN.

COURTESY, or CURTESY of England, a tenure, whereby a man marrying an inheritrix, or a woman seized of lands in fee-simple, or fee-tail general, or seized as heir of tail-special, and getting a child by her which cometh alive into the world, tho' both wife and child die forthwith; yet, if the were in possession, he shall keep the land during his life, and be called *tenant by the courtesy of England*; this privilege being not allowed in any other country, except Scotland, where it is called *curialitas Scotiae*. This tenure was introduc'd by the conqueror, and borrowed by him from his own country, Normandy, where it obtained before, under the name of *curiavit*.

Arms of COURTESY. See the article ARMS.

COURTIN, or COURTAIN, in fortification. See CURTIN.

COURTISAN, a term of infamy, applied to women who expose their persons, and make a trade of prostitution.

Lais, the famous Theban *courtisjan*, stands on record for requiring no less than ten thousand crowns for a single night. Of all places in the world, Venice is that where *courtisjans* abound the most: It is now 250 years since the senate, which had expelled them, was obliged to recall them; to provide for the security of women of honour, and to keep the nobles employed, lest they should turn their heads to make innovations in the state.

COUSIN*, a term of relation and kinship, applied to those who are issued from two brothers, or two sisters.

* The word is ordinarily derived from *conanguineus*; though Menage brings it from *congenius*, or *congenius*, q. d. ex eodem genere.

In the first generation they are called *cousins germanus*, i. e. next *cousins*.—In the second, *second cousins*; in the third and fourth, *cousins in the third and fourth degrees*.

In the primitive times, it was allowed *cousin-germans* to marry, to prevent their making alliances in heathen families; but Theodosius the great prohibited it under pain of death; on pretence that they were, in some sort, brothers and sisters, with regard to each other.

Paternal *cousins*, are those sprung from relations on the father's side.—Maternal, those on the mother's.

Quarter Cousins. See the article QUATER.

COUSIN is also a title of honour, which kings bestow on peers, or nobles, foreign princes of the blood, cardinals, and the principal persons of their state.

COUSSINET, *cushion*, in architecture, the stone that crowns a pier-droit, or peer; or that lies immediately over the capital of the impost.

Its underſide is level, and its upper curved; receiving the first rife or spring of the arch, or vault.

COUSSINET is also used for an ornament in the Ionic capital, between the abacus, and echinus or quarter-round; and which serves to form the volutes.

It is thus denominated from its representing a pillow or cushion, pressed by the weight over it, and bound with the strap or girdle, called by Vitruvius, *baltheus*.

COUSU, in heraldry, is used in the same sense as *remply*; viz. for a piece of another colour or metal, placed on an ordinary as if it were sewed on; which the word in the French language naturally implies.—By reason the additional piece is not properly on the field, but in the nature of a thing sewed on; *adjustus*. This is generally of colour on colour, or metal on metal, contrary to the general rule of heraldry.

COUTHUTLAUCH, (from the Saxon *couth*, knowing; and *utlaugh*, out-law;) he that wittingly receives a man outlawed, and cherishes or conceals him: for which offence he was, in antient time, subject to the same punishment with the outlaw himself. Bracton.

COUVERT, in heraldry, denotes something like a piece of hanging, or a pavilion falling over the top of a chief, or other ordinary; as if not to hide, but only be a shading thereon.

COWARD, in heraldry, a lion borne in an escutcheon, with his tail doubled or turned in between his legs, is called a *lion coward*.

COWL, or COVL, *cuculla*, a sort of hood, wore by certain monks. See COUL.

COWRING,

COWRING, in falconry, the quivering of young hawks, who shake their wings, in sign of obedience to the old ones.

COXÆ OI. See the article *Coccygis*.

COXÆ, COXENDICIS, ossa, and in English the *hip-bones*, called also *ossa innominata*, are two large bones, situate on either side of the os sacrum.—See *Tab. Anatomy*, (Osteol.) fig. 3. n. 16, 17, 18, 19.

In infants, each of these consists of three distinct bones, separated by cartilages; which, in adults, grow up, and constitute one firm, solid bone; whose parts, however, retain three distinct names, according to their former division, viz. the *os ilium*, or *ischium*, by some peculiarly called *coxendicis*, and the *os pubis*.

COXÆ MUSCULUS, according to Dr. Drake, is a pair of muscles arising fleshy from the os ischium, between the muscoli marfupialis, and pyriformis, and which descending obliquely, terminate on each side the os coccygis, and adjoining part of the os sacrum; serving to draw the os coccygis upwards and inwards, as antagonists to two ligaments springing from the back part of the os sacrum, and terminating in the external surface of the os coccygis.

CRABS-EYES, Oculi cancerum, or lapides cancerum, in natural history and medicine, are little, white, round stones, ordinarily flat; so called, tho' really taken out of the craw-fish, or river lobster: and bearing no great resemblance to eyes, though resembling them more than any other part.—They are much used in medicine, as a powerful alkali, or absorbent.

The most able naturalists long imagined them formed in the brain of the animal. Van Helmont first found them in the region of the stomach: M. Geoffroy the younger has observed the manner of their formation much more accurately.

According to him, we may lay down one class of animals, which have their bones without-side; whereas the rest have them within-side: of the first kind are the fishes we are speaking of. Those of the rivers divest themselves every year in June of the bones wherewith they are covered and armed: a membrane wherewith the inside of those scales is lined, takes their place, and hardens, by degrees, into a new shell.

Indeed, it is much less wonder an animal should cast its skin, or covering; than that it should discharge itself of its stomach, as the craw-fish does; and even, as M. Geoffroy thinks, of its intestines too: the exterior membranes of those viscera taking the place thereof.

There is room to believe, that as they putrify and dissolve, they serve for food to the animal; during the time of the re-formation, the old stomach seems to be the first food the new one digests.

It is only in this time that the stones are found, called *crabs-eyes*: they begin to be formed when the antient stomach is destroyed; and are afterwards wrapped up in the new one, where they decrease by degrees till they disappear entirely.

CRAFT, a sea term, signifying all manner of lines, nets, hooks, and the like, which serve for fishing. See *FISHING*.

Hence, as those who use the fishing trade, use small vessels, such as ketches, hoyes, smacks, &c. they call such little vessels *small craft*.

CRAMP*, a kind of numbness, or convulsion, occasioned by a thick viscid vapour entering the membranes of the muscles, which contracts or extends the neck, arms, legs, &c. with a violent, but transitory pain; being usually driven off with friction alone.

* The word comes from the German *krampe*, which signifies the same.

CRAMP-IRON*, a piece of iron, bent at each extreme, serving to bind together pieces of wood, stones, or other things.

* Some derive the word, by corruption, from the French *agra-pen*, or the Italian *rampone*, which signify the same thing.

CRAMPONEE, in heraldry. A *croix cramponée*, is that which at each end has a *cramp*, or square piece coming from it.—As presented in *Tab. Heraldry*, fig. 52.

CRAMPOONS, CRAMPONS, pieces of iron, hooked at the ends; for the drawing or pulling up of timber, stones, &c.

CRANAGE*, a liberty to use a *crane*, for drawing up wares out of a ship, or hoy, &c. at a wharf; and to make profit thereof.

* The word also signifies the money taken, or paid for the same.

CRANE, a machine used in building and commerce, for the raising large stones and other weights.

M. Perrault, in his notes on Vitruvius, makes the *crane* the same with the *corvus*, or raven of the ancients.

The modern *crane* consists of several members, or pieces, the principal whereof is a strong perpendicular beam, or arbor, firmly fixed in the ground, and sustained by eight arms, coming from the extremities of four pieces of wood laid across, through the middle whereof the foot of the beam passes. About the middle of the arbor the arms meet, and are mortised into it: its top ends in an iron pivot, whereon is bore a transverse piece, advancing out to a good distance in manner of a *crane's* neck; whence the name.

The middle and extremity of this is again sustained by arms from the middle of the arbor; and over it comes a rope, or cable, to one end whereof the weight is fixed; the other is

wound round the spindle of a wheel, which turned, draws the rope, and that heaves up the weight; to be afterwards applied to any side or quarter, by the mobility of the transverse piece on the pivot.

CRANE is also a popular name for a siphon.

CRANE-LINES, in a ship, are lines going from the upper end of the sprit-fail-top-mast, to the middle of the foretays; serving to keep the sprit-fail-top-mast upright and steady.—See *Tab. Ship*, fig. r. n. 137.

CRANIUM*, in anatomy, an assemblage of several bones, which cover and enclose the brain and cerebellum; popularly called the *skull*.—See *Tab. Anatomy*, (Osteol.) fig. 1. and 2.

* The word comes from the Greek *κρανιον*, of *κραν*, helmet; in regard it serves to defend the brain, like a head-piece. Pezron again, derives *κρανιον* from the celtic *cren*, by reason of its roundness.

The *cranium* is divided into two tables, or laminae, laid or applied over each other; between which is a thin spongy substance, made of bony fibres detached from each lamina, and full of little cells of different bignesses, called *diploe*, or *medullullum*.

The tables are hard and solid, the fibres being close to one another; the *diploe* is soft, in regard the bony fibres are here at a greater distance: a contrivance whereby the skull is not only made lighter, but less liable to fractures.

The external lamina is smooth, and covered with the *pericranium*; the internal is likewise smooth, abating the furrows made by the pulsation of the arteries of the dura mater, ere the *cranium* be arrived at its confistence.

It has several holes, through which it gives passage to the spinal marrow, nerves, arteries, and veins, for the conveyance and re-conveyance of the blood, &c. between the heart and the brain.

Its figure is round, which is an advantage to its capacity; but a little depressed, and length; advancing out behind, and flattened on the two sides, which form the temples; which contributes to the enlargement of the sight and hearing.

It is composed of eight bones, six whereof are *proper*, and two *common*.—the *proper* are, the bone of the forehead, or *frontis*, that of the back of the head, or *occipitis*, the two *offa parietalia*, and the two of the temples, or *offa temporum*. See each in its place, *FRONTIS, OCCIPITIS, TEMPORIS, &c.*

Within the eminences of the bones of the temples, is contained the organ of hearing, with the four little bones belonging thereto, viz. the malleolus, incus, stapes, and os orbiculare. See *EAR*.

The *common* bones of the *cranium* are the os sphenoides, and ethmoides.

The *cranium* has three *common* sutures, which divide it from the jaw: it has others *proper*, whereof there are three genuine, the coronalis, sagittalis, and lambdoides; the rest spurious, called *squamosae*, or *temporales*.

This division of the *cranium* into pieces by sutures, is of good use, as it makes it less liable to break, gives passage to the membranes which sustain the *pericranium*, and affords vent to the matter of insensible perspiration. See *FRACTURE*.

CRANK, a contrivance in machines, in manner of an elbow, only of a square form; projecting out from an axis, or spindle; and serving by its rotation, to raise, and fall the pistons of engines for raising water, or the like.

CRANK, in the sea language.—A ship is said to be *crank-sided*, when she cannot bear her sails, or can bear but small sail for fear of oversetting.

She is said to be *crank by the ground*, when her floor is so narrow, that she cannot be brought on ground without danger.

CRAPE, a light transparent stuff, in manner of gauze; made of raw silk, gummed and twisted on the mill; wove without crossing, and much used in mourning.

Crapes are either *craped*, i.e. *crippled*, or *smooth*: the first *double*, expressing a closer mourning; the latter *single*, used for that less deep.—Note, white is reserved for young people, or those devoted to virginity.

The silk destined for the first is more twisted than that for the second; it being the greater or less degree of twisting, especially of the warp, which produces the crisping given it when taken out of the loom, steeped in clear water, and rubbed with a piece of wax for the purpose.

Crapes are all dyed raw.—The invention of this stuff came originally from Bologna: but the chief manufacture hereof is said to be at Lyons.

History tells us, that S. Bathilda, queen of France, made a fine *crappe*, *crepa*, of gold and silver, to lay over the body of S. Eloy. The Bollandists own they cannot find what this *crepa* was. Binet says, it was a frame to cover the body of the faint withal: but others, with reason, take it to be a transparent stuff, through which the body might be seen; and that this was the *crepa*, whence our word *crappe* was formed.

CRAPULA, a surfeit by over-eating and drinking. See *SURFEIT*.

CRASIS * of the blood, denotes a due temperament or constitution of that humour; wherein the several principles, viz. salt and oil, whereof it is composed, are found in their just proportion and purity:—in contradistinction to *dycrasis*, which consists in an improper mixture of the principles, or an unnatural state of some of the ingredients thereof.

* The word is Greek, *κρᾶσις*, signifying mixture, temperament. The chief dycrasies the blood is susceptible of, whence flow most of the diseases of the body, are coagulation, dissolution, oiliness, sizzyness, and faltness.

CRASIS, in grammar, is a figure, whereby two different letters are either contracted into one long letter, or a diphthong.—Such, e. g. is *οἶος* for *οἶος*; *ἀλῆδι* for *ἀλῆδινα*, &c. *τῆς* for *τῆς*, &c. where *i* and *a* are contracted into *i*; *e* and *a* into *e*; and *e* and *o* into *o*.

CRASSAMENTUM, a term used by some anatomists, for the cruror of the blood; or that part which, upon standing to cool, and separate, forms the coagulum:—in opposition to the *serum*, or whey, wherein it swims. Some authors have supposed the *crassamentum* to be specifically lighter than the serum; but Dr. Jurin shews the contrary from repeated experiments.

CRATER, *cup*, in astronomy, a constellation of the southern hemisphere; whose stars in Ptolemy's catalogue are 7; in Tycho's 8; in the Britannic catalogue 11. The order, names, longitudes, latitudes, &c. whereof are as follow.

Names and Situations of the Stars.	Sign.	Longitude.	Latitude. South.	Magn.
That in the foot	♊	19 26 3	22 42 47	4 3
Preced. of 3 in the middle of the cup		22 23 50	17 35 20	4
South. in the middle of the cup		25 5 50	20 47 43	4
Preced. in the north part of the circumference of the mouth		21 55 59	13 28 28	4
Middle of 3 in the middle of the cup		24 56 16	19 39 22	4
Subst. in north. circumf. of the mouth		23 9 20	14 35 16	6
In the north. handle		24 16 26	11 18 33	4
In the middle of the mouth		26 8 52	14 13 32	5
In the fourth. circumf. of the mouth		29 45 50	18 17 29	4
In the fourth. handle	♊	1 47 42	16 4 46	4
10	♊	3 58 41	17 52 59	5 6

CRATER, in falconry, denotes a line on which hawks are fastened when reclaimed.

CRAVEN, or **CRAVENT**, in our ancient customs, a term of reproach used in trials by battle.

The law was that the victory should be proclaimed, and the vanquished acknowledge his fault in the presence of the people; or pronounce the word *cravent* in the name of recreance, or cowardice, &c. and, presently, judgment to be given; and the recreant, *amittere legem terræ*, i. e. become infamous.

Coke observes, that if the appellant join battle, and cry *craven*, he is to lose, *liberam legem*. If the appelled cry *craven*, he is to be hanged.

CRAYON, a general name for all coloured stones, earths, or other minerals, used in designing, or painting in pastel; whether they have been beaten and reduced to a paste, or are used in their primitive consistence of a stone, after sawing or cutting them into long narrow slips.

In this last manner are red *crayons* made, of blood-stone, or red chalk; black ones, of charcoal and black lead. *Crayons* of all other colours are compositions of earths reduced to paste.

CREAM *, the thickest and fattest part of milk; being that whereof butter is made.

* The word is derived from the Latin *cremur*, which signifies the same thing; though in the lower Latin we find *crema lactis*.

CREAM of tartar, **CREMOR tartari**, in pharmacy, a preparation of tartar, otherwise called *crystal of tartar*.

It is made by boiling tartar in water till it be dissolved, and passing the dissolution through a straining-bag: half the liquor being evaporated, the remainder is set in a cool place; where it shoots into crystals, part of it swimming a-top, in form of *cream*.

—This latter is properly the *cream of tartar*, the rest *crystal of tartar*, both are of the same nature and use.

Cream of tartar is reputed a great sweetner of the blood; for which some take it in whey or water-gruel in the spring-time, to the quantity of half an ounce every morning, for three or four weeks.

Its operation is by stool; and, by its saline particles, pretty much also by urine.—It is generally mixed with lenitive electuaries, and other gentle catharticks, in nephritic and antivenereal cases, where it often proves serviceable.

CREASE-TYLES. See the article **TYLE**.

CREATION. } See the articles **GENESIS**.

Epocha of the CREATION. } **EPOCHA**.

CREDENTIALS, letters of credit and recommendation; especially such as are given to ambassadors, plenipotentiaries, &c. sent to foreign courts.

CREDIBILITY, a quality in objects whereby they become fit to be believed. See **FAITH**.

A thing is said to be *credible*, which is not apparent of itself, nor is certainly to be inferred either from the cause or effect; and yet has the attestation of a truth.—Things which appear immediately true, as the whiteness of snow, or that the whole is equal to its parts, are not said to be *credible* but evident.—Those to which we only give our assent in virtue of some competent authority, or testimony of others, are, by the schoolmen said to be *credible*; as Christ was incarnate, crucified, &c. In the *Philosophical Transactions*, we have a mathematical computation of the *credibility* of human testimony.

CREDIT, in commerce, a mutual trust or loan of merchandize or money, on the reputation of the probity and solvability of a dealer.

Letters of CREDIT, are those given to persons in whom a merchant, &c. can trust, to take money of his correspondent abroad, in case he happens to need it.

CREDIT is also used for the currency which papers, or bills, have in the publick, and among dealers.

In this sense, *credit* is said to *rise*, when in negotiating the shares of a company, they are received and sold at prices above *par*, or the standard of their first creation.

Discredit is opposed to *credit*, and is used where money, bills, &c. fall below *par*.

CREDIT was also antiently a right which lords had over their vassals; consisting in this, that during a certain time they might oblige them to lend them money.

In this sense, the duke of Brittany had *credit* during fifteen days on his own subjects, and those of the bishop of Nantes; and the bishop had the same *credit* or right among his subjects, and those of that prince.

CREDITOR, a person to whom any sum of money is due, either by obligation, promise, or otherwise.

The laws of the twelve tables, which were the foundation of the Roman jurisprudence, allowed the *creditor* to tear or cut his debtor to pieces, in case he proved insolvent.

CREDITOR, in book-keeping. See **BOOK-KEEPING**.

CREED, **CREDO**, a short, or summary account of the chief articles of the christian faith; thus called from the first word thereof in Latin, *credo*, I believe. See **SYMBOL**.

CREEK, part of a haven, where any thing is landed from the sea. See **HARBOUR**.

So many landing-places as there are in a harbour or port, so many *creeks* there are. Crompt.

CREMASTERS *, in anatomy, an epithet given two muscles, otherwise called *suspensores*; serving to raise, or draw up the testicles. See *Tab. Anat. (Myol.) fig. 2. n. 32*.

* The word comes from the Greek *κρεμασαν* (*suspender*) to suspend, to hang.

CRENATED leaves, a term used by botanists, for such leaves of plants as are jagged, or notched round their edges. The more accurate writers, indeed, distinguish between crenated and deritated; the former denoting such leaves as are divided into obtuse or rounded segments; the latter, such as are divided into pointed ones of the number of dentated *leaves*, are those of mint; of the number of the crenated, are those of wood betony.

CRENELLE *, *imbattled*, in heraldry, is when any honourable ordinary is dentated, after the manner of battlements of a wall.

* The French word comes from *cren*, a notch, or interval; the English from its being a place of fighting, or battle. Upton, in Latin, calls this *imbattellatum*, a word forged from the English; but most others term it *pinnatum*, from *pinnæ*, a battlement.

The origin hereof is, doubtless, from the figures of such walls being given to warriors, either for having been the first at mounting, or the chief in defending them.

CREPITATION, that noise of which some salts make over the fire in calcination; called also *detonation*.

CREPITUS lupi, in natural history, a kind of fungus, popularly called *puff-ball*.

Mr. Derham observes, that upon examining the powder thereof with a microscope, he found the seeds to be so many exceeding small puff-balls, with round-heads, and long, sharp-pointed stalks; as if made on purpose to prick into the ground.

The seeds become hurtful to the eyes, probably by their sharp stalks pricking and wounding them.

CREPUSCULUM *, in astronomy, twilight; the time from the first dawn or appearance of the morning, to the rising of the sun; and again, between the setting of the sun, and the last remains of day.

* Papias derives the word from *creperus*; which, he says, antiently signified uncertain, doubtful, q. d. a dubious light.

The *crepusculum* is usually computed to begin and end when the sun is about 18 degrees below the horizon.—It is of longer duration in the solstices than in the equinoxes, longer in an oblique than in a right sphere.

The *crepuscula* are occasioned by the sun's rays refracted in our atmosphere, and reflected from the particles thereof, to the eye.

—For suppose an observer in O, (*Tab. Astronomy, fig. 41.*) the sensible horizon A B, and the sun under the horizon in H K; and let the ray S E fall in the atmosphere below the horizon. Since it passes out of a rarer into a thicker medium, it will be refracted,

refracted, and that towards the perpendicular, *i. e.* towards the semidiameter CE. It will not, therefore, proceed to T, but touching the earth in D, it will fall upon A, the eastern part of the sensible horizon; nor can any other ray besides AD, of all those refracted in E, arrive at A. But now, since the particles of the atmosphere reflect the sun's rays, (see REFLECTION;) and since the angle DAC is equal to CAO; the rays reflected in A will be carried to O, the place of the spectator; who will therefore see the particle A shining in the sensible horizon, and consequently the beginning of the morning *crepusculum*. And in the same manner might be shewn the refraction and reflection of the sun's rays in the atmosphere, in the evening *crepusculum*.

Kepler, indeed, assigns another cause of the *crepusculum*, *viz.* the luminous matter around the sun; which arising near the horizon, in a circular figure, exhibits the *crepusculum*; in no wise, as he would shew, owing to the refraction of the atmosphere. The depth of the sun below the horizon, at the beginning of the morning *crepusculum*, or end of the evening one, is determined in the same manner as the arch of vision, *viz.* by observing the moment wherein the air first begins to shine in the morning *crepusculum*, and that wherein it ceases in the evening; and finding the sun's place for that moment.

Alhazen found it 10 degrees; Tycho 17°; Rothmannus 24°; Stevinius 18°; Cassini 15°; Riccioli, in the equinox in the morning, 16°, in the evening 20° 30'; in the summer solstice in the morning, 21° 25'; in the winter solstice in the morning, 17° 25'.

Nor need we wonder at this difference among astronomers; the cause of the *crepusculum* being inconstant: for, if the exhalations in the atmosphere be either more copious, or higher than ordinary; the morning *crepusculum* will begin sooner, and the evening hold longer than ordinary: for the more copious the exhalations are, the more rays will they reflect, consequently they will be illumined by the sun. To this it may be added, that in a denser air, the refraction is greater; and that not only the brightness of the atmosphere is variable, but also its height from the earth.

Hence, when the difference between the sun's declination and the depth of the equator is less than 18°, and does not, in effect, exceed 15°, the *crepusculum* will continue the whole night.

The elevation of the pole PR, (fig. 42.) and the sun's declination OS, being given, to find the beginning of the morning *crepusculum*, or end of the evening. PZ the complement of the elevation of the pole PR, and PS the complement of the declination OS, and SZ the aggregate of the quadrant ZD, and the sun's depth DS, find the angle ZPS, whose measure is the arch AO. See TRIANGLE.

Convert AO into solar times: thus have you the time elapsed from the beginning of the morning *crepusculum*, to noon. See TIME.

To find the *crepusculum* by the artificial globe. See GLOBE.

CRESCENT*, the new-moon, which, as it begins to recede from the sun, shews a little rim of light, terminating in points, or horns, which are still increasing, till it become full, and round in the opposition.

* The word is Latin, *crescens*, formed from *creresco*, I grow, or increase.

The term is also used for the same figure of the moon in its wane, or decrease; but improperly: in regard the points or horns are then turned towards the west, whereas they look to the east in the just *crefcent*.

CRESCENT, in heraldry, is a bearing in form of a half moon.—The Ottomans bear sinople, a *crefcent* montant, argent.

The *crefcent* is frequently used as a difference in coat-armour, to distinguish it for that of a second brother, or junior family.

The figure of the *crefcent* is the Turkish symbol; or rather, it is that of the city *Byzantium*, which bore this device from all antiquity; as appears from medals struck in honour of Augustus, Trajan, &c.

The *crefcent* is sometimes *montant*, *i. e.* its points look towards the top of the chief, which is its most ordinary representation: whence some contend, that the *crefcent*, absolutely so called, implies that situation; though other authors blazon it *montant*, when the horns are towards the dexter-side of the escutcheon, when others call it *incroissant*.

Crefcents are said to be *addorsed*, when their backs or thickest parts are turned towards each other; their points looking to the sides of the shield.

Crefcent inverted, is that whose points look towards the bottom:—turned *crefcents* are placed like those *addorsed*; the difference is, that all their points look to the dexter-side of the shield:—*conturned crefcents* on the contrary, look to the sinister-side:—*affronted* or *appointed crefcents*, are contrary to the *addorsed*, the points looking towards each other.

CRESCENT is also the name of a military order, instituted by Renatus of Anjou, king of Sicily, &c. in 1448; so called from the badge, or symbol thereof, a *crefcent* of gold enamelled. What gave occasion to this establishment, was, that Renatus took for his device a *crefcent*, with the words *leo, pax*; which,

in the file of Rebus, makes *leo in crefcent*, *q. d.* by advancing in virtue, one merits praise.

CREST, in armoury, the uppermost part of the defensive armour of the head; rising over the rest, in manner of the comb or tuft of a cock; to sustain the effort of very keen scimitars, &c.—It has its name from *crista*, cock's comb.—Hence, also,

CREST, in heraldry, denotes the uppermost part of an armoury; or that part rising over the cask, or helmet. See CASK.

Next to the mantle, says Guillim, the *crest* or *cognizance* claims the highest place, being seated on the most eminent part of the helmet; yet so, as to admit an interposition of some escrol, wreath, chapeau, crown, &c.

The *crest* of the arms of England, is a lion passant gardant, crowned with an imperial crown; that of France, a flower-de-lys.

In the ancient tournaments, the cavaliers had plumes of feathers, especially those of ostriches and herons, for their *crests*; these tufts they called *plumarts*; and were placed in tubes, on the tops of high caps, or bonnets.—Some had their *crests* of leather; others of parchment, pasteboard, &c. painted or varnished, to keep out the weather; others of steel, wood, &c. on which were sometimes represented a member or ordinary of the coat; as, an eagle, flower-de-lys, &c. but never any of those called honourable ordinaries, as pale, fesse, &c.—The *crests* were changeable at pleasure; being reputed no other than as an arbitrary devise, or ornament.

Herodotus attributes the rise of *crests* to the Carians, who first bore feathers on their casks, and painted figures on their bucklers; whence the Persians called them *caks*.

The oldest of the heathen gods are said to have wore *crests*, even before arms were made of iron and steel.—Jupiter Ammon bore a ram's head for his *crest*; Mars that of a lion, or a tyger casting out fire at his mouth and nostrils. Alexander the great wore for his *crest* a ram's head, to insinuate that he was the son of Jupiter Ammon. Julius Cæsar sometimes bore a star, to denote that he was descended from Venus; and sometimes the head of a bull, or an elephant with his trunk; and sometimes the wolf that suckled Romulus and Remus.

The Christians, in their first religious wars, were wont to wear a cross darting forth rays, for their *crests*, as well as on their shields and banners, as Prudentius informs us;

—*Clypeum insignia Christus*

Scriserat, ardebat summis crux addita cristis.

The ancient warriors bore *crests* to strike terror in their enemies, as the sight of the spoils of animals they had killed; or to give them the more formidable mien, by making them appear taller, &c.—Plutarch observes, that the *crest* of Pyrrhus was a bunch of feathers, with a stag's horns; and Diodorus Siculus, that of the kings of Egypt, a lion's head, or bulls or dragons. The *crests* have given rise to several fables: the antients, *v. gr.* give Serapis the head of a spar-hawk; this being the *crest* of that cavalier. Geryon they made a monster with three heads, because he bore a triple *crest*; they feigned, that Proteus changed his form every moment, because, being king of Egypt, he frequently changed his *crest*; sometimes bearing that of a lion, sometimes of a dragon, &c.

The *crest* is esteemed a greater mark of nobility, than the armoury, as being bore at tournaments; to which none were admitted, till they had given proof of their nobility. Sometimes it serves to distinguish the several branches of a family. It has also served, on occasion, as the distinguishing badge of factions. Sometimes the *crest* is taken from the device; but more usually it is formed of some piece of the arms: thus, the emperor's *crest* is an eagle; that of Castile a castle, &c.—Families that exchange arms, as have done the houses of Brunswick and Cologne, do not change their *crests*; the first still retain the horse, and the latter the mermaid.

CREST, among carvers, an imagery, or carved work, to adorn the head, or top of any thing; like our modern corniche.

CREST-FALLEN, is spoken of a horse, when the upper part of the neck, on which the main grows, does not stand upright, but hangs either to one side or the other.

CRESTED stalk. See the article STALK.

CREUX, a term in sculpture, much used by the French; though not yet, that we know of, naturalized among us: but the want of a word of equal import in English, as it has frequently put us under a necessity of using this in the course of the present work; so it pleads strongly for its admission into our language.

Creux originally signifies a hollow, cavity, or pit, out of which something has been scooped, or dug: hence it is used to denote that kind of sculpture, and gravure, where the lines and figures are cut, and formed within the face, or plane of the plate, or matter engraven on.

In which sense, it stands opposed to *relievo*; where the lines and figures are imbued, and the prominent above the face of the matter.

CREW, the company of sailors belonging to a ship, boat, or other vessel.

The sailors that are to work and manage a ship, are regulated by the number of lasts it may carry; each last making two ton. The crew of a Dutch ship, from 40 to 50 lasts, is seven sailors and a swabber; from 50 to 60 lasts, the crew consists of eight men

men and a swabber; and thus increases at the rate of one man for every 10 lasts; so that a ship of 100 lasts has 12 men, &c. —English and French *crews*, are usually stronger than Dutch; but always in about the same proportion. In a ship of war, there are several particular *crews*, or gangs; as the boatwain's *crew*, the carpenter's *crew*, the gunner's *crew*, &c.

CRIBRATION, in pharmacy, *sifting*; the act of separating the finer parts of a medicine, whether dry, or humid, from the grosser; the latter by means of a pulping-sieve, the former by a fine sieve.

CRIBROSUM *os*, or *os CRIBRIFORME*, in anatomy, a little bone at the top of the nose, pierced like a sieve, to let pass several little fibres, arising from the mamillary productions, and terminating in the membrane that lines the cavity of the nostrils: called also *os ethmoides*.

CRICOARYTÆNOIDEUS, in anatomy, a name given to two pair of muscles, serving to open the larynx. The *cricoarytænoidæ* are either *posterior*, or *lateral*: the former are the first pair of openers of the larynx; the latter, the second pair.

The *lateral* have their origin in the edge of the lateral and superior part of the cartilage cricoides, and are inserted into the lateral and superior part of the arytenoides.

The *posterior* have their origin in the posterior and lower part of the cricoides: and hence, the reason and etymology of the name is evident.

CRICOIDES *, in anatomy, a cartilage of the larynx; so called, as being round, like a ring, and encompassing the whole larynx.]

* The word is formed from *κρίκω*, used by transposition for *κρίνω*, circle, and *ειδος*, form.

The *cricoides* is the second cartilage of the larynx: it is narrow before, thick behind; and serves as a base to all the other cartilages; being, as it were, let into the thyroids. It is by means of this, that the other cartilages are joined to the trachea; on which account it is immovable.

CRICOTHYROIDEUS, in anatomy, a name given to the first pair of muscles proper to the larynx.

Their name is derived hence, that they have their origin in the lateral and anterior part of the *cricoides*; and are inserted into the inferior part of the thyroids.—Their use is to dilate the scutiform cartilage.

CRIME *, a breach or transgression of a law, or an action contrary to the purport of a law, either natural or divine, civil, or ecclesiastical; to which a penalty is annexed.

* The term *crime* includes in it the idea of a determination, and design formed to do an injury: it is derived from the Latin *crimen*, of the Greek *κρίνω*, *judico*, I judge.

The Romans distinguished two kinds of *crimes*, viz. *private*, which only affected particular persons; the prosecution whereof was not allowed by the laws to any but those interested therein; as *adultery*, &c. and *public crimes*; the prosecution whereof was permitted to all persons, though in no wise immediately interested.

With us, *crimes* are distinguished into *capital*; as *treason*, *murder*, *robberies*, &c. and *common*, as *perjuries*, &c.

They are again divided into *crimes* cognizable by the king's judges; as those abovementioned; and such as are only cognizable in the spiritual courts, as *simple fornication*, &c.

Quæstio CRIME. See the articles *QUASI crime*.

CRIMEN falsi. See the articles *FALSI*.

CRIMSON *, one of the seven red colours of the dyers.

* The word comes from the Arabic *kermis*, of *kermes*, red.—The Bollandists insinuate, that *crimson* comes from *Cremena*, and is used for *cremonesi*.

The stuffs to be dyed in *crimson*, after they have been cleared of their soap, and strongly allumed, are put in a decoction of cochineal, each according to its colour.

CRINONES, in medicine, a sort of worms, sometimes found under the skin, in children; resembling short thick hairs, or bristles.

They are also called *dracunculi*, and *comedones*, from the Latin *comedere*, to eat; by reason they prey on the substance of the child, or consume its nourishment. See *DRACUNCULI*.

CRISIS, in medicine, a change, or turn in acute diseases; wherein the morbid matter is so altered, as determines the patient either for recovery or death.

The cause of such change is owing to the remaining vital force's being irritated by the matter of the disease so or so conditioned; i. e. fit either to be evacuated, or translated, or to kill.

If the matter be disposed for evacuation or translation, but is not salubrious, it produces a change called a *critical perturbation*, or *imperfect crisis*.

If the change become sensible, they are called *critical symptoms*, or *signs of a crisis*, either future or present. See *SIGN*.

The symptoms of the *crisis* are frequently confounded with those arising from the cause of the disease, and the disease itself, or the matter of the disease; whence the most unhappy consequences.

The differences between *critical symptoms* and morbid ones, are, that the first proceed from the vital power's prevailing over the force of the disease; but the latter from the disease's

prevailing over the vital faculty: that the first are preceded by a manifest concoction, but the latter are formed even in crudities: that the former happen about the critical times, but the latter at all times of the disease, chiefly during its increase.

The principal symptoms of an approaching *crisis*, are, after digestion, and about the critical time, a sudden stupor, drowsiness, waking, delirium, anxiety, dyspnoea, grief, redness, titillation, pricking, heaviness, darkness, light, spontaneous tears, nausea, heat, thirst, trembling of the lower lip, &c.

The symptoms and effects of a present *crisis*, are, after the preceding ones, a vomiting, salivation, looseness, thick sediment in the urine, bleeding at the nose, hæmorrhoids, sweat, abscesses, pustules, tumors, buboes, parules, aphthæ, &c.

CRISTA galli, in anatomy, an eminence in the middle of the os ethmoides, advancing within the cavity of the cranium; and to which is fastened that part of the dura mater which divides the brain, called *falx*.

It has its name from its figure, which resembles that of a cock's comb.—In adults, this process appears of a piece with the septum narium.

CRISTÆ is also a term used by surgeons for certain præternatural excrescences arising about the fundament, resembling cock's combs.

These, M. Dionis says, are taken off either by ligature, cauterization, or amputation. When they have other figures, they have other names, as *ficus*, &c.

CRISTA is also used for a crooked, twisted, spiral eminence, in the middle of the spine of the omoplate.

CRITERIUM, or **CRITERION**, a rule or standard, whereby to compare propositions and opinions, in order to discover their truth or falshood.

The doctrine of *criteria*, and the characters and rules thereof, make the first part of the Epicurean philosophy.

CRITHOMANCY *, a kind of divination, performed by considering the dough, or matter of the cakes offered in sacrifice; and the meal strewn over the victims to be killed.

* Hence, in regard they ordinarily used barley-meal in these ceremonies, this kind of divination was called *crithomancy*; from *κριθή*, barley, and *μαντεία*, divination.

CRITICAL days *, symptoms, &c. are certain days, and symptoms, usually arising in the course of acute diseases, as fevers, small-pox, &c. which indicate the patient's state, and determine him either to recover or grow worse.

* The word comes from the Greek *κρίνω*, *judico*, I judge.

The *crises* have been frequently observed to happen on the seventh, fourteenth, or twentieth day; whence those are denominated *critical days*.

For the theory of *critical days*, it may be observed, that the concoction of any morbid matter, and the humour to be secreted, is nothing else but a change thereof into such a due magnitude, or smallness, as it may be carried by the circulating blood along the canals, and excreted by vessels destined for that purpose. But if the morbid matter cannot be reduced to such a magnitude or smallness as may correspond to the orifices of the secretory vessels; then either an abscess or a hemorrhage will follow, if a crisis be begun; for which reason, abscesses, &c. are accounted less perfect *crises*. But, that the morbid matter may be reduced to a due magnitude, or smallness, and its wished-for discharge take place, there is required a considerable time, if the quantity of matter be large; that is, if the distemper be great and severe: and since there are a great many causes, and those very constant, which may occasion the blood, and offending humours therein, to be of a different fluidity in the inhabitants of different climates; it is impossible but that different spaces of time should be required for the finishing concoction: which makes it impossible to determine the *critical days* in one climate, from what they are found to be in another.

The causes of real *critical days*, that is, such on which happens the last concoction of the morbid matter, which is always attended with its expulsion, are all those things which occasion the humours to become of such a certain magnitude or minuteness, and of a greater or lesser cohesion; but with any given power, bodies unequally large, or unequally cohering, cannot be concocted in an equal time: wherefore, it is to be found by the observations made by all nations among themselves, which are the usual causes and conditions of those diseases, which require a certain number of days to finish such a concoction in.

CRITICISM, the art of judging concerning discourse and writings. See *JUDGMENT*.

Some define *criticism* more amply, the art of judging of a history, or a work of genius, with the various incidents there met with, their style, and authors.

On which footing M. le Clerc seems to have given a defective idea of *criticism*, when he defines it simply the art of entering into the meaning of ancient authors, and of making a just discernment of their genuine works.

Philosophical CRITICISM, or the art of judging of opinions and hypotheses in philosophy.

We may distinguish divers sorts, or branches of this art: as,

Theola-

Theological Criticism, the art of judging of explications of doctrines of faith, &c.

Political Criticism, the art of judging of the means of governing, acquiring, and preserving states.

But the ordinary use of the word is restrained to

Literary Criticism, which, however, is of great extent, as it takes in the art of judging of facts: a branch of *criticism*, which regards not only history, but also the discernment of the real works of an author, the real author of a work, the genuine reading of a text, and the art of discovering supposititious monuments, charters, interpolated passages, &c.

The other parts of *literary criticism*, are, the art of judging of works of genius, their excellencies and defects. We have also **Grammatical Criticism**, or the art of interpreting and discovering the words and meanings of an author.

Criticism of antiques, which consists in distinguishing genuine medals, and the different taste and spirit found among them, according to the different people, the different country, and the different times wherein they were struck; the distinguishing between what is cast and what struck; what has been retouched, and repaired or added, from what is really antique; the genuine from the spurious, &c. and to decypher and explain them, &c.

Sacred Criticism, in general, is that employed in ecclesiastical matters, the history of the church, the works of the fathers, councils, lives of the saints, &c. but more particularly what concerns the books of the holy scriptures, and the canon thereof.

Aristotle, if we believe Halicarnassus, is the first inventor of the art of *criticism*. Aristarchus, Dionysius Halicarnassus himself, Varro and Longinus, distinguished themselves therein in their days. Among the Christians, Dionysius Alexandrinus, Eusebius, Eusebius, S. Jerom, and Theodoret, were the greatest masters in this art. The decree of pope Gelasius about the apocryphal books, required a good share of *criticism*.

But the critical art fell with the other arts; and lay unknown till the time of Charlemaign, when it was re-established under him and his sons.—The care which the religious Cistercians took to correct the manuscripts of the bible, shew that the rules of *criticism* were not entirely unknown in the eleventh century.—The works of Johannes Sarisburiensis, Eustathius, and Tzetzes, make it evident, it was cultivated in the twelfth.—The manuscripts of the bible corrected by the Dominicans of Paris, and the doctors of the Sorbonne in the thirteenth, shew it was subsisting then.—In the following ages it was still cultivated with more earnestness; especially in the sixteenth and seventeenth centuries, when all the world made it their study.

From the whole, it follows, that *criticism* does, indeed, suppose an uncommon stock of knowledge of the subject whereon it is employed: but that *criticism*, itself, is nothing else but good sense perfected by grammar and logic.

CROCHES, among hunters, the little buds about the top of a deer's horns.

CROCI, among botanists, the apices, or small knobs on the tops of flowers.

CROCIA, a bishop's or abbot's crozier, or pastoral staff. See **CROSIER**.

CROCODILE, **CROCODILUS**, in rhetoric, a captious and sophistical kind of argumentation; contrived to seduce the unwary, and draw them speciously into a snare.

It has its name, *crocodile*, from the following occasion, invented by the poets.—A poor woman begging a *crocodile* that had caught her son walking by the river-side, to spare and restore him; was answered, that he would restore him, provided she should give a true answer to a question he should propose: the question was, *Will I restore thy son, or not?* to this the poor woman, suspecting a deceit, sorrowfully answered, *Thou wilt not*: and demanded to have him restored, because she had answered truly. Thou liest, says the *crocodile*, for if I restore him thou hast not answered truly: I cannot therefore restore him, without making thy answer false. Under this head may be reduced the propositions called *mentientes*, or *insolubiles*; which destroy themselves. Such is that of the Cretan poet; *omnes ad unum Cretenses semper mentiuntur*: all the Cretans, to a man, always lie. Either, then, the poet lies, when he asserts that the Cretans all lie; or the Cretans do not all lie.

CROCOMAGMA, in pharmacy, a name given by some to troches compoed of saffron, myrrh, red roses, starch, and gum arabic: thus called from the Greek *κροκος*, saffron, and *μαζα*, a mass of any thing.

CROCUS, a term used for saffron. See **SAFFRON**.

Crocus, in chymistry, is a name given to several different preparations; from their red, or saffron colour.—As

Crocus martis, a preparation of iron; which is of two kinds, viz. *crocus martis aperientis*, and *crocus martis astrigentis*.

Crocus martis aperientis, opening saffron of mars, is a preparation of iron plates, made by first washing them, then exposing them to the dew, till they have contracted a rust; which rust is scraped off, and the plates exposed for more.

Others prepare it by calcining iron filings, with an equal weight of sulphur.—Others, by clapping a bar of iron, red, or rather white hot, between two rolls of brimstone; in which case, the iron melts, and runs down into a vessel of water below: which

some call *maris cum sulphure preparatus*. Others have other preparations.

M. Lemery endeavours to shew, that iron taken in substance; is much more salutary and efficacious than when thus prepared; the process tending to strip it of its oily part, wherein its chief virtue resides; leaving nothing behind but the mere ferruginous earthy part.

Crocus martis astrigentis, binding saffron of iron, is a preparation of iron filings; wherein they are deprived of their more saline parts by washing them five or six times in strong vinegar, and calcining them five or six hours.

Crocus metallorum, a kind of impure, opaque, glass of antimony, of a liver colour; hence frequently called *liver of antimony*; it is made by firing equal parts of powder of antimony and salt-petre, well mixed in an iron mortar, covered with a tile. See **ANTIMONY**. This is kindled by dropping in a coal of fire; upon which a great detonation ensues; and the mortar is struck, to make the matter fall to the bottom.—The shining part is the *crocus*, or liver, which is to be separated from the dross, and reserved for use. Its chief use is in making the vinum emeticum, or benedictum, by infusing an ounce or two of the *crocus* powdered, in a quart of wine for 24 hours.

CROFT, **CROFTUM**, a little close adjoining to a dwelling-house, either for pasture or tillage.

* *Possunt etiam dicti monachi de eisdem mariscis versus occidentem jacentibus pro se & hominibus suis, includere croftos, sive pratam juxta pontem specialiter quantum illis placuerit.* Ingulf.

In some antient deeds, *crofta* occurs as the Latin word for a *croft*; but *cum toftis* & *croftis* is more frequent. *Croft* is translated in Abbo floriacensis, by *pradium*, a farm.

CROISADE, **CRUZADE**, or **CRUZADO**, a holy war; or an expedition against infidels and heretics; particularly against the Turks, for the Recovery of Palestine.

People antiently flocked on these *croisades* out of devotion; the pope's bulls, and the preaching of the priests of those days, making it appear a point of conscience. Hence several orders of knighthood took their rise.

Those who meant to go on this errand, distinguished themselves by crosses of different colours, wore on their clothes; and were thence called *croises*: the English wore them white; the French, red; the Flemish, green; the Germans, black; and the Italians, yellow.

They reckon eight *croisades* for the conquest of the holy land: the first undertaken in 1095, at the council of Clermont; the second in 1144, under Louis VII. the third in 1188, by Henry II. of England, and Philip Augustus of France; the fourth in 1195, by pope Celestin III. and the emperor Henry VI. the fifth published in 1198, by order of Innocent III. wherein the French, Germans, and Venetians engaged; the sixth under the same pope, began tumultuously, in 1213 and ended in the rout of the Christians; the seventh resolved at the council of Lyons in 1245, undertaken by S. Louis; the eighth, which was the second of S. Louis, and the last of all, in 1268.

It is said, it was the Cistercian monks who first projected the *croisades*; Philip Augustus solicited the execution thereof with the holy see; and Innocent III. raised the first standard of the cross. It was the council of Clermont who ordered that they who embarked herein should bear the cross in their banner; and that those who entered themselves into the service, should also wear it on their clothes.

The abbot Justiniani makes an order of knighthood of the *croises*, who served in the *croisades*.

Towards the middle of the twelfth century, there was also a *croisade* of the Saxons, against the pagans of the north; wherein the archbishop of Magdeburg, the bishops of Halberstadt, Munster, Mersburgh, Brandenburg, &c. with several lay-lords embarked.—And towards the beginning of the same century, under the pontificate of Innocent, there was also a *croisade* undertaken against the Albigenes; who were become powerful in Languedoc, &c.

CROISES, or **CROIZES**, in our antient customs, pilgrims bound for the holy land, or had already been there; so called from a badge which they wore on their garments, representing a cross. The word *croises* is also extended to the knights of S. John of Jerusalem, created for the defence and protection of pilgrims; and all those of the nobility, gentry, &c. who in the reigns of king Henry II. Richard I. Henry III. and Edward I. were *cruce signati*, i. e. dedicated themselves to the wars, for the recovery of the holy land.

CROISIERS, **CRUCIGERS**, or **croisibourers**; a religious order, or congregation of regular canons, so called.

There are three orders which have, or do still bear this name: one in Italy; another in the Low-countries; and a third in Bohemia.

The first pretend to be derived from S. Clet; and add, that S. Quiriacus the Jew, who shewed S. Helena the place of the true cross, and was afterwards converted, reformed them. All we know for certain, is, that they subsisted in Italy before Alexander III. mounted the throne; for that pontiff, flying from Frederick Barbarossa, found an asylum in the monasteries of the *croisiers*.

fiery, which he afterwards, in 1169, took under his protection, giving them the rule of S. Augustine, &c.

They were confirmed by Pius V. but the discipline being much relaxed, they were suppressed in 1656, by Alexander VII. Matt. Paris says, that the *croisiers*, bearing staves with crosses at the end, came into England in 1244, and presented themselves before a synod held by the bishop of Rochester, demanding to be admitted.

Dodsworth and Dugdale mention two monasteries of this order in England, the one at London, the other at Ryegate; the first founded in 1245, the latter in 1298: some add a third at Oxford, where they were received in 1349. M. Allemand says, there were fourteen monasteries of *crois-bearers* in England; adding, that they came from Italy; those of the Low-countries disowning them.

The *croisiers* of the Low-countries and France, were founded in 1211, by Theodore de Celles son of Bofon, who having served in a crusade in Palestine, in 1188, and there found some of the *croisiers* instituted by S. Clet, conceived a design of instituting another congregation in his own country. This is certain, that Theodore, in his return from Palestine, engaged himself in the ecclesiastical state; and went in quality of missionary to the crusade against the Albigenses: and that at his return in 1211, the bishop of Liege gave him the church of S. Thibault near Huy; where, with four companions, he laid the foundation of his order; which was confirmed by Innocent III. and Honorius III. Theodore sent his religious to Tholouse, to join those of S. Dominic, and combat the Albigenses; and the congregation multiplied in France.—The popes have endeavoured to bring the *croisiers* of Italy under those of Flanders.

The *croisiers*, or *port-croix* with a star, in Bohemia, derive their origin from S. Quiriacus, and say they came from Palestine into Europe, where they embraced the rule of S. Augustine, and built monasteries. They add, that S. Agnes of Bohemia, to distinguish them from other *croisiers*, obtained of Innocent IV. to add a star to their habit. But the story of S. Quiriacus has no foundation; and it was Agnes herself, daughter of Premislas king of Bohemia, who instituted the order at Prague, in 1234.—They are very numerous; and have, now, two generals.

CROISSANTE, in heraldry. *Croix croissanté* is a cross crescentated; that is, having a crescent, or half-moon, fixed on each end thereof.

CROOKED *styles*. See the article *TYLE*.

CROSETTES, in architecture, the returns in the corners of chambranes, or door-cases, or window-frames; called also *ears*, *elbows*, *ancones*, *protubyridet*, &c.

CROSIER, or **CROZIER**, *shepherd's crook*; a symbol of pastoral authority, consisting of a gold or silver staff, crooked a-top, carried occasionally before bishops and abbots, and held in the hand when they give solemn benedictions. See *BISHOP*, and *ABBOT*. At one end it is crooked, at the other pointed; expressed in the verse:—*Curva trahit mites, pars pungit acuta rebelles*.

The custom of bearing a pastoral staff before bishops is very ancient, as appears from the life of S. Casarea of Arles, who lived about the year 500. Among the Greeks, none but the patriarchs had a right to the *crozier*.

The *croisiers* were at first no more than simple wooden staves, in form of a T, used to rest and lean upon: by degrees they were made longer; and at length arrived at the form we now see them of.

Regular abbots are allowed to officiate with a mitre and a *crozier*. See *ABBOT*, and *MITRE*.

CROSIER, in astronomy, four stars, in form of a cross; by help whereof, those who sail in the southern hemisphere find the antardtick pole.

CROSS*, **CRUX**, a sort of instrument, composed of two pieces of wood, traversing and cutting each other, ordinarily at right angles.

* Pezron derives the word *crux*, from the Celtic *croug*, and *croas*; though, perhaps, *croug* and *croas* might with as much justice be derived from *crux*.

The *crux* was used among the antients, as a punishment for malefactors and slaves; and was planted at several places, in *terrorem*, as our gallows, &c.

Sozomen observes, that it was Constantine who by law first abolished the punishment of the *crux*; which had obtained among the Romans till his time.

As to *crucifixion*, or the manner wherein the punishment of the *crux* was effected, the critics, both antient and modern, are exceedingly divided: the points in dispute are, Whether the criminal was fastened with three nails, or with four; whether the feet were immediately fastened to the *crux*; or whether they rested on a little piece of wood, in manner of a step or rest, called *suppellex*; whether the *crux* was planted in the earth before the person was nailed on, fastening him afterwards by means of a scaffold raised of the height of the place where the feet were to be nailed; or whether he was nailed ere the *crux* was raised or planted, as the painters represent it; or lastly, whether the patient was fastened quite naked, or covered: questions that have all been occasioned by the *crucifixion* of Jesus Christ!

Invention of the Cross, *Inventio Crucis*, an antient feast, solemnized on the third of May, in memory of S. Helena's (the mother of Constantine) finding the true *crux* of Christ deep in the ground,

on mount Calvary; where she erected a church for the preservation of part of it: the rest being brought to Rome, and deposited in the church of the *holy crux* of Jerusalem. See *FEAST*.

Theodoret mentions the finding of three *croisiers*, that of Jesus Christ, and those of the two thieves; and that they distinguished between them by means of a sick woman, who was immediately healed by touching the true *crux*.

The place is said to have been pointed out to her by S. Quiriacus, then a Jew, afterwards converted and canonized.

Exaltation of the Cross, an antient feast, held on the fourteenth of September, in memory of this, that Heraclius restored to mount Calvary the true *crux*, which had been carried off fourteen years before, by Cosroes king of Persia, upon his taking Jerusalem from the emperor Phocas.

CROSS-BEARER, *port-croix*, *cruciger*, in the Romish church, the chaplain of an archbishop, or a primate, who bears a *crux* before him on solemn occasions.

The pope has the *crux* borne before him every where; a patriarch any where out of Rome; and primates, metropolitans, and those who have a right to the pallium, throughout their respective jurisdictions.

Gregory XI. forbade all patriarchs and prelates to have it borne in presence of cardinals.—A prelate bears a *single crux*, a patriarch a *double crux*, and the pope a *triple* one on their arms.

Order of the Cross, or **CRUSADE**, an order of ladies, instituted in 1668, by the empress Eleonora de Gonzagua, wife of the emperor Leopold; on occasion of the miraculous recovery of a little golden *crux*, wherein were inclosed two pieces of the true *crux*; out of the ashes of part of the palace.—It seems, the fire had burnt the case wherein it was inclosed, and melted the crystal; yet the wood remained untouched.

Cross, in botany, is used to express the arrangement of the petala of certain flowers; called *plantæ flore cruciformi*. See *PLANT*, and *FLOWER*.

The flowers are not to have either more or less than four petals; and their calyx only to consist of four pieces. The pistil generally becomes a fruit called *siliqua*. See *Supplement*, article, *CRUCIFORM FLOWERS*.

Cross, in heraldry, is defined by Guillim, an ordinary composed of four-fold lines; whereof two are perpendicular, and the other two transverse; for so we must conceive of them, though they be not drawn throughout, but meet by couples, in four right angles, near the feet-point of the escutcheon. See *ORDINARY*.

The content of a *crux* is not always the same: for when it is not charged, cantoned, nor accompanied, it has only the fifth part of the field; but if it be charged, it must contain the third part thereof.

This bearing was first bestowed on such as had performed, or at least undertaken, some service for Christ, and the christian profession; and is held, by divers, the most honourable charge in all heraldry. What brought it into such frequent use, was the antient expeditions into the holy land; and the holy war pilgrims, after their pilgrimage, taking the *crux* for their cognizance; and the ensign of that war being the *crux*.

In those wars, says Mackenzy, the Scots carried St. Andrew's *crux*. The French a *crux* argent; the English a *crux* or; the Germans sable; the Italians azure; the Spaniards gold.

St. George's *crux*, or the *red crux*, in a field argent, is now the standard of England; that faint being the reputed patron of this nation.

Guillim enumerates thirty nine different sorts of *croisettes* used in heraldry, the several names whereof here follow; the descriptions are to be looked for under their proper articles.—A *crux* voided, a *crux* wavy-voided, a *crux* patee fimbriated, a *crux* patee fished on the foot, a *crux* patee on three parts and fished on the fourth, a *crux* engrailed, a *crux* patonce, a *crux* flory, a *crux* patonce voided, a *crux* avelane, a *crux* patee lambeaux, a *crux* furtchee, a *crux* croillet, a *crux* croillet fished at the point, a *crux* bottonee, a *crux* pommee, a *crux* urdee, a *crux* degraded fitchee, a *crux* potent, a *crux* potent fished, a *crux* calvary, a *crux* croillet set in degrees, a *crux* patriarchal, a *crux* anchored, a *crux* molinee, a *crux* clechee, a *crux* flory, or fleurdelisee, a *crux* double fitchee, a *crux* a-seize points, a *crux* milrinee, a *crux* raguled, a *crux* pointed voided, a *crux* pall, a tau or S. Anthony's *crux*, a *crux* voided and couped, a *crux* couped pierced, a *crux* molinee pierced lozenge-ways, a *crux* molinee quarter-pierced, a saltier, or S. Andrew's *crux*, which will be distinctly spoken of under that denomination; and so all the others may be found more particularly described under the names of their several differences.

Colombiere makes seventy-two distinct sorts of *croisettes*, of which we shall only mention those that differ from such as have been mentioned above; as, a *Croix-remply*, which is only one *crux* charged with another: a *crux* party, that is, one half of one colour, and the other of another: a *crux* quartered, that is, the opposite quarters of several colours: a *crux* of five pieces, that is, of so many colours: a *crux* mouflée, and abaissée; a *crux* urdee; a *crux* croissantee, or crescentated, that is, having a crescent at each end: a *crux* forked of three points; a *crux* pomette of three pieces; a *crux* relievecelee; a *crux* pointed; a *crux* ankered, and sur-anker; a *crux* ankered with snakes heads; a *crux* orled; a high *crux*; a *crux* rayonnant, or casting out rays of glory; a *crux* of Malta; a *crux* of the Holy Ghost; a *crux* forked like the antient

tient rests for muskets; a *crofs* with eight points; a *crofs* bodr-donnee; a *crofs* cramponnee and tournee; a *crofs* cable; a *crofs* inclining; a *crofs* pater noster, that is, made of beads; a *crofs* trefle; a *crofs* fleu-onnee; a *crofs* vuidee, clechee, and pommetee; a *crofs* crenellee and bafille; a *crofs* with four steps to every arm; a *crofs* rounded; a *crofs* and an half; a *crofs* estoilee, or starways; a *crofs* corded; a *crofs* doubled of six pieces set together; a double *crofs* split in pale; a long *crofs* cut in pieces and dismembered; a *crofs* coupé, or cut through in felle, of the two contrary colours to the field; a chevron furlmounted by an half *crofs*: four tails of ermine in a *crofs*, the tops of the ermines opposite to each other in the middle: four pieces of vair placed *crofs*-ways, and counter-pointing in the centre: the *crofs* or sword of S. James: *crofs* potence cramponnee on the dexter upper arm, and a potence about the middle of the shaft.

These are the various *croffes* we find in the aforefaid authors; which some may think too many, as not being all used in England: but heraldry extends to all countries; and all terms used require to be explained.

Nor is it only in *croffes* that the variety is so great; the like is found in many other bearings, and particularly in lions, and the parts of them; whereof the fame Colombiere gives us no less than ninety-six varieties.—Leigh mentions but forty-six several *croffes*; Sylvanus Morgan, twenty-six; Upton, thirty; Johannes de Bado Aureo, twelve; and so others, whom it is needless to mention.

Upton owns he dares not presume to ascertain all the various *croffes* used in arms, for that they are at present almost innumerable: and therefore he only takes notice of such as he had seen used in his own time.

Cross, in surveying, or, the *surveying Cross*, is an instrument consisting of a brass circle, divided into four equal parts, by two lines cutting each other in the centre: at each extremity of either line is fixed a sight, perpendicular over the lines; with holes below each fit, for the better discovery of distant objects. The *crofs* is mounted on a staff, or stand, for use. Sometimes, instead of four sights there are eight.—The *surveying crofs* is but little known or used among us; abroad it is of more account: the manner of applying it is as follows.

Suppose the field ABCDE, (Tab. *Surveying*, fig. 24.) required to be surveyed: plant poles at all the angles; measure the line A C, and the perpendiculars let fall from the angles to the line: take down the dimensions of each. Now, to find the point F, plant poles at pleasure in the line A C, and the foot of the instrument in the same line, in such manner, as that through two of the opposite sights you may observe two of the staffs; and through the other two, the staff E. If in this station E be not visible, remove the instrument backwards or forwards, till the lines A F, E F make a right angle in F; by which means, the plot of the triangle A F E will be had. After the same manner is the point H found, where the perpendicular D H falls; whose length, together with that of H F, is measured, to have the plot of the trapezium E F H D. Again, measure H C, making a right angle with H D, and the plot of the triangle D H C will be had. All that now remains, is to find the point G, where the perpendicular B G falls: which being found after the same manner as the rest, we have the plot of the whole field A, B, C, D, E. The area whereof, is had by adding the triangles and trapeziums together.

Cross multiplication, a method of multiplying feet and inches, by feet and inches, or the like; so called, because the members are multiplied *crofs*-wise. See the method under **MULTIPLICATION**.

Cross, in dialling. See the article **DIAL**.

Cross batteries, in war. See **BATTERY**.

Cross-grained stuff, in joinery.—Wood is said to be *crofs-grained*, when a bough or branch has shot out of it: for, the grain of the branch shooting forward, runs athwart that of the trunk.

In wood well grown this defect is scarce perceivable, except in working; but in deal-boards these boughs make knots.—If the bough grew up with the young trunk, instead of a knot is found a *curling in the stuff*; very sensible under the plane.

Cross-staff, a mathematical instrument, otherwise called the *fore-staff*. See its description and use under **FORESTAFF**.

CROSSELET, little *crofs*, a diminutive of *crofs*, used in heraldry, where we frequently see the shield covered with *croffiletes*; also fesses, or other honourable ordinaries, charged or accompanied with *croffiletes*.

Croffes themselves frequently terminate in *croffiletes*: as in Tab. *Heraldry*, fig. 54.

CROTALUM, an ancient kind of castagnetta, or musical instrument found on medals, in the hands of the priests of Cybele.

The *crotalum* differed from the *systrum*; though authors frequently confound the two. It consisted of two little brass plates, or rods, which were shook in the hand, and in striking against each other made a noise.

It was sometimes also made of a reed split lengthwise; one part whereof they struck against the other: and as this made

a noise somewhat like that of a crane's bill, they called that bird *crotalis*, *player on crotala*.

An ancient, in Pausanias, says, that Hercules did not kill the birds of the lake Stympalus, but that he drove them away by playing on *crotala*. On this footing, the *crotalum* must be exceedingly ancient.

Clemens Alexandrinus attributes the invention to the Sicilians; and forbids the use thereof to the Christians, because of the indecent motions and gestures that accompany it.

CROTAPHITES, a muscle of the lower jaw, serving to draw it downwards.—Its fibres spring severally from the bones of the forehead, the finciput, sphenoides, and temporale; which meeting, and as it were centering under the os jugale, whence also this muscle receives some fibres, proceed to the processus corone, into which they are inserted.

CROTCHET, in music, one of the notes, or characters of

time marked thus ♪ equal to half a minim, and double a quaver.

It is not easy to conceive how this character comes by the name *crotchet*: the word is apparently borrowed from the French *crochet*, of *croce*, a crook or hook, used by them for what we call the *quaver*, or *half crotchet*; by reason of the additional stroke at bottom, which gives it an appearance of a crook.

A dot added to the *crotchet*, thus ♪ increases its time by half;

that is, makes it equal to a *crotchet* and an half, or to three quavers.

CROTCHET, in printing, denotes a sort of line, sometimes strait, sometimes waved, but always turned up at each extreme; serving to bind or link together several articles, that are to be read together, ere you proceed to the subdivisions, placed aside of them with similar or smaller *crotchets*; much used in genealogies, analytical tables, &c. for facilitating the division and subdivision of any subject.

CROTCHETS are also used for two opposite characters, serving to inclose what we call a *parentesis*, or any other part of a discourse, to be distinguished from the rest of the work; sometimes in this form () and sometimes in this { }.

CROW, in the sea language, a machine with an iron hook, for fastening hold, and grappling with the enemies vessel, in an engagement.

The name *crow*, or *raven*, *corvus*, was antiently given to several machines of war, used in the defence of places: one invented by Diades; another by the Tyrians, mentioned by Q. Curtius; another by Cn. Octilius.

Vitruvius calls the first the *demolishing crow*, *corvus demolitor*, and also *depredator*: others called it the *crane*, *grus*.—Polybius describes another invented by C. Duillius used against the Carthaginian fleet.

They were all a kind of grappling-hooks; serving to drag things towards the engineer.—That described by Q. Curtius was thrown out of a ballista.

Crow's-BILL, an instrument used by chirurgeons, in their operations; especially for the drawing bullets and other foreign bodies out of wounds.—It has its name from its figure.

Crow's-Feet, in the military art, are irons with four points, each three or four inches long; so that which way soever they fall, one point will be uppermost.

Crow's-Feet, in a ship, are small ropes, or lines, sometimes six, eight, or ten, reeved through the dead man's eye: of little use further than to make a shew of small rigging.

CROWN, *corona*, a mark of regal dignity; being an ornament worn on the head by kings and sovereigns, as a symbol of their authority.

In the remotest antiquity, the *crown* was only given to Gods: Pliny says, that Bacchus was the first who used it: Pherecydes, cited by Tertullian de *Corona*, says Saturn: Diodorus ascribes it to Jupiter, after his victory over the Titans. Q. Fabius Pictor attributes the invention to Janus; adding, that it was an ornament he used in sacrificing: Leo the Egyptian says, it was Isis who first wore a *crown*; and that it consisted of ears of corn, the use whereof the first taught men.

In this, most authors agree, that the *crown*, originally, was rather a religious than a civil ornament; rather one of the pontificalia, than the regalia: that it only became common to kings, as the ancient kings were priests as well as princes; and that the modern princes are entitled to it, in their ecclesiastical capacity rather than their temporal. See **KING**, &c. The first *crowns* were no more than a bandelet, or headband, drawn round the head, and tied behind; as we still see it represented on medals, around the heads of Jupiter, the Ptolemies, and the kings of Syria.

Afterwards they consisted of two bandelets; by degrees they took branches of trees of divers kinds: at length they added flowers; inasmuch that Tertullian de *corona*, assures us, (from Claudius Saturaipus, who had wrote expressly on the subject) there was not any plant whereof *crowns* had not been made.

The woods and groves were searched, to find different *crowns* for the several deities: thus, on medals, we find Jupiter's *crown* of flowers, more frequently of laurel; Juno's of the vine; that

that of Bacchus, the vine with grapes, vine-leaves, and branches of ivy, with flowers and berries: those of Castor, Pollux, and the river-gods, of bulrushes: that of Apollo, sometimes of laurel, sometimes of rushes; that of Saturn, new figs: that of Hercules, poplar; that of Pan, pine or alder; that of Lucina, dittany; that of the Horse, the fruits proper to each season; that of the Graces, olive-branches, as well as that of Minerva; that of Venus, roses: of Ceres, ears of corn, as well as that of Isis: that of the Lares, myrtle or rosemary, &c.

Crowns were not only used on the statues and images of the Gods, by the priests in sacrificing, and by kings and emperors; but also on altars, temples, doors of houses, sacred vessels, victims, ships, &c.

The agonothetæ *crowned* those who were victors in the solemn games, warriors, &c.

From some passages in Eusebius Cæsariensis, some authors conclude, that bishops had likewise antiently their *crowns*.

The Roman emperors had four kinds of *crowns*, still seen on medals; viz. a *crown* of lawrel, a radiating *crown*, a *crown* adorned with pearls and precious stones; and the fourth a kind of bonnet, or cap, something like the mortar.

The first was that ordinarily used from the time of Julius Cæsar: the right of bearing it was granted him by the senate; some say, on account of his baldness: and afterwards continued to his successors. Justinian was the first who took that of the bonnet-kind.

The *papal crown*, is composed of a cap or tiara, and a triple *crown* encompassing it; having two pendants, like the bishop's mitres: these three *crowns* represent the pretended triple capacity of the pope, viz. as high priest, supreme judge, and sole legislator of the christians.

The *imperial crown* is a bonnet or tiara, with a semi-circle of gold, supporting a globe, with a cross a-top.

The *English crown* is adorned with four crosses, in the manner of those of Malta; between which are flower-de-luces. It is covered with four diadems, which meet at a little globe supporting a cross.

The *French crown* is a circle of eight flower-de-luces, encompassed with six diadems; bearing a-top a double flower-de-luce, which is the crest of France.

The *Spanish crown* is adorned with large indented leaves, covered with diadems, bordering on a globe, surmounted with a cross.

Among the Romans, there were various kinds of *crowns*, distributed as rewards of military achievements.—The *oval crown* was the first, made of myrtle; and was bestowed on generals who had been victorious over slaves or enemies unworthy of the Roman valour, and who were entitled to the honours of the lesser triumph, called *ovatio*.

The second was the *naval* or *rostral crown*, consisting of a circle of gold, raised with prows and poops of ships; given to the captain who first grappled, or the soldier who first jumped aboard, an enemy's ship.

The third called *vallaris*, or *castrensis*, was also a circle of gold, raised with piles or palisades; given him who first leaped into the enemy's camp, or forced the palisades.

The fourth, called *mural crown*, was a circle of gold, indented or embattled; given him who first mounted the wall of a place besieged, and there lodged a standard: this *crown* we also find given, on medals, to the particular geni and guardians of provinces and places.

The fifth, the *civic crown*; made of a branch of green oak: given to him who had saved the life of a citizen in a battle or assault.

The sixth was the *triumphal crown*, made of branches of laurel, given to a general who had gained a battle, or conquered a province. This was afterwards made of gold.

The seventh the *corona obsidionalis*, or *graminea*, made of grass or herbs found on the ground; given to generals who had delivered a Roman army besieged by the enemy, and obliged him to decamp.

The eighth was also a *crown* of laurel, given by the Greeks to their athlete; and by the Romans, to those who had negotiated, or confirmed a peace with an enemy: this was the least esteemed. Besides these, in antiquity, we meet with *radial crowns*, given to princes at their translation among the gods; whether before or after their death.—Cæsaubon says, this sort of *crown* was peculiar to deities; yet, it is certain Nero took it in his life-time.

Athletic crowns, were destined to crown victors at the publick games.

Father Daniel says, that S. Louis ransomed the *crown* of thorns of our Saviour, which had been pawned by Baldwin, emperor of Constantinople, for an immense sum of money; and transported it with great ceremony to France: where it is still kept in the holy chapel. The author of the history of S. Louis, adds, that the thorns were still green in his days. Some writers from Clemens Alexandrinus, hold that it was made of bramble, *ex rubo*; others of buckthorn, *ex rhamno*; others of white thorn.

Those who fee it in the chapel, take it to be the juncus marinus. Galiot derives the word *corona*, whence *crown*, from the Latin *cornu*, horn; because the antient *crowns* were pointed in manner of horns; which were antiently, both by Jews and Gentiles, esteemed as marks of power, strength, authority,

and empire.—Hence, in the holy scripture, horns are used for the regal dignity: and accordingly, *horn* and *crown*, in the Hebrew, are expressed by the same word.

Ch. Pafchal has wrote expressly *de coronis*: Baudelot in his history of Ptolemy Auletes has a good number of curious observations on the same subject, that had escaped Pafchal. Du Cange gives us a curious dissertation on *crowns*; and Schmeizell, a German, a treatise of *royal crowns*, both antient and modern.

Royal CROWN.

Electoral CROWN.

See the articles

ROYAL.

ELECTORAL.

CROWN, in an ecclesiastical sense, is used for the clerical tonsure;

which is the mark, or character of the Romish ecclesiastics.

This is a little circle of hair, shaved off from the crown of the head;

more or less broad, according to the quality of the orders received.—That of a mere clerk is the smallest; that of priests and monks the largest.

The clerical crown, was antiently a round list of hair, shaved off around the head, representing a real crown: this is easily observable in several antient statues, &c. The religious of S. Dominic and S. Francis still retain it.

CROWN, in commerce, is a general name for coins both foreign and domestic, of or near the value of five shillings sterling.

In its limited sense, *crown* is only applicable to that popular English coin which bears the name, and which is equivalent to sixty English pence, or five shillings; or to five livres 16 sols French money.—But, in its extensive sense, it takes in several others; as the French *ecu*, which we call the French *crown*, struck in 1641 for sixty sols, or three livres, also the patagon, dollar, ducat, rix-dollar, and piastra or piece of eight.

CROWN, in architecture, denotes the uppermost member of the cornice; called also *corona* and *larmier*. See CORONA, and LARMIER.

CROWN, in astronomy, is a name given to two constellations; the one called *septentrionalis*, the other *meridionalis*.

CROWN, or CORONET, in heraldry, is used for the representation of that ornament, in the mantling of an armoury; to express the dignity of the person who bears it.

The crown here is of more antiquity even than the helmet; and was used as a symbol of victory and triumph.

Radiated, or pointed CROWNS, are those of the antient emperors, which had twelve points; representing, as some will have it, the twelve months of the year.

Pearled, or flowered CROWNS, those with pearls, or leaves of smallage, parsley, &c. Such were antiently almost all crowns, even those of sovereign princes: though they were not used in their armouries, till about 200 years ago.

CROWN, in geometry, a plane ring included between two parallel or concentric peripheries, of unequal circles; generated by the motion of some part of a right line round a centre, the moving part not being contiguous to the centre.

The area of this is had, by multiplying its breadth by the length of the middle periphery: for a series of terms in arithmetick progression being $n \times \frac{a+o}{2}$; that is, the sum of the first and last multiplied by half the number of terms, the middle element must be $\frac{a+o}{2}$; wherefore, that multiplied by the breadth or sum of the two terms will give the *crown*.

CROWN-OFFICE, a court or office under the king's-bench, so called, because the *crown* is more immediately concerned in what is therein transacted.

Though none of the officers under the lord chief justice of the the king's-bench, are employed in summoning a parliament; yet, many of them have business in other matters, during the sitting of the parliament: as, in cases of error, &c. but more especially on trials of peers; wherein the clerk of the *crown* is chief manager. He has likewise, out of parliament, all indictments in the *crown*, informations, recognizances; and a multitude of other business runs through his hands, as the writings of all pleadings, declarations, and other proceedings upon records: but the executive part is left to his secondary or deputy.

Clerk of the CROWN.

Pleas of the CROWN.

Officers of the CROWN.

See the articles

CLERK.

PLEA.

OFFICER.

CROWN-GLASS, denotes the finest sort of window-glass. See GLASS.

CROWN-GRAFTING. See the article ENGRAFTING.

CROWN-POST, in architecture, a post which in some buildings stands upright in the middle, between two principal rafters; and from which there go struts or braces to the middle of each rafter.

It is otherwise called a *king's piece*, or *joggle-piece*. See POST.

CROWN-WHEEL of a watch, is the upper wheel next the balance, or that which drives the balance. See WATCH.

CROWN-WORK, in fortification, an outwork running into the field; designed to keep off the enemy, gain some hill, or advantageous post, and cover the other works of the place.—See Tab: Fortif. fig. 21. lt. 11.

The *crown work* consists of two demi-bastions at the extremes, and an entire bastion in the middle, with curtains.

CROWNED horn-work, is a horn-work with a *cruson-work* before it. See **HORN-WORK**.

CROWNING, in architecture, is understood, in the general, of any thing that terminates, or finishes a member or decoration.

Thus, a cornice, a pediment, a crociera, &c. are called *crownings*. Thus, also, the abacus is said to *crown* the capital; and thus any member or moulding is said to be *crowned*, when it has a fillet over it; and a niche is *crowned*, when it is covered with a capital.

CROUPADE, in the manege, a leap, higher than the corvet, wherein the fore and hind parts of the horse keep an equal height; his legs being trusted under his belly, without stretching them out, or shewing his shoes.

CROUPER, or **CRUPPER**. See **CRUPPER**.

CROZIERED abbots. See the article **ABBOT**.

CRUCIAL incision, in chirurgery, an incision, or cut into some fleshy parts, in form of a cross.

CRUCIBLE, a little vessel, ordinarily of earth, sometimes of iron, without any handle; wherein chymists, coiners, goldsmiths, glaziers, and other artificers, use to melt and calcine gold, silver, or other metals whereon they work.

* The word is formed from the French *crusit*, which signifies the same: Du Cange derives this further from *crusellum*; which in the lower latin, signifies a little drinking vessel.

Earthen crucibles are made of potters-clay, with stone potherds pounded and sifted: they are of various sizes, but generally of the same form, which resembles that of an inverted cone, or pyramid. It is these are chiefly used in coining, as being the only ones in which gold will melt kindly. Iron crucibles are in form of little buckets without handles, made of iron well forged and hammered: in these they melt silver, copper, &c. There are earthen crucibles that hold from 800 to 24 or 2500 ounces; but those ordinarily used are but of 800. The iron ones are larger; some holding ten thousand ounces: these are not taken off the furnaces when the plates are to be run, but the metal is laden out with an iron ladle. It is a rule never to put as much metal in the crucible as it will hold. See **COINING**. The crucibles used by goldsmiths and founders, are like those used in coining: those of chymists, &c. are of all sizes, according to the quantity and quality of the metal to be put in them. See **Supplement**, article **CRUCIBLE**.

CRUCIFIX, a cross, wherein the body of Jesus Christ is fastened in effigy; much used by the Romanists in their churches, and other places, to recognize the passion of Jesus Christ, and direct their prayers to.

There are some chapters wherein Jesus Christ is the first canon, and the income of the canonry goes to the subsistence of the crucifix.

CRUCIFIXION, an ancient form of execution; by fastening the criminal to an erected cross. See **CROSS**.

CRUCIFORM flowers. See the article **FLOWER**.

CRUCIS experimentum. See the article **EXPERIMENTUM**.

CRUDE, something that has not passed the fire, or has not had the degree of coction, i. e. of heat, requisite to prepare it for eating, or some other use.

Crude, or raw silk, is that which has not been put in boiling water, to unwind it from off the cod; nor boiled in water and soap, to fit it for dyeing.

CRUDE sugar. See the article **SUGAR**.

CRUDE antimony, is that which comes immediately from the mines, without any preparation, except once melting.

In medicine, **CRUDE humours** are those which want of that preparation and elaboration which they ordinarily receive from a thorough digestion.

The retainers to the doctrine of trituration, hold that the crudity of the humours only consists in this; that they are not broke and comminuted so much as they should be by the ordinary action of the stomach.

CRUDITY, sometimes denotes that state of a disease, wherein the moribund matter is of such bulk, figure, cohesion, mobility, or inactivity, as creates or increases the disease. See **DISEASE**.

The crudity is discovered, 1. From the disease's continuing its degree of strength, or increasing. 2. From a continual increase of symptoms. 3. From a disorderly exercise of the functions. 4. But chiefly from a fault in the quantity or quality of the humours; both those still circulating, and those secreted; as of sweat, tears, mucus of the nose, saliva, sputum, the bile, urine, ichor, pus, blood, menfes, lochia, milk, apthae, &c. That state of the disease, wherein the crude matter is changed, and rendered less peccant, and laudable, is called *digestion*, *concoction*, or *maturation*.

CRUISE, from the German *kruis*, a-cross, signifies to cross to and fro, to sail up and down for guard of the seas, &c.

CRUOR, a term used by anatomists for the red globules of the blood; in contradistinction to the limpid or ferous part. Some authors, Dr. Keill and Dr. Woodward for instance, suppose these globules replete with an elastic aura, or air; and on this principle account for some of the phenomena of the animal economy; particularly muscular motion, &c. But Dr. Vanhelmont has overturned that supposition.

Vanhelmont uses the word *crusor* for the blood in the veins;

Vol. I.

in contradistinction to the blood in the arteries, which he calls *sanguis*.

CRUPPER *, is used by some for the hind part of a horse, comprehended between the place of the saddle and the tail.

* The word is formed from the French *croupe*, which signifies the same.

CRURA clitoridis, in anatomy. Between the corpora nervosa of the clitoris, runs a septum, or membranous partition, from the glans to its divarication at the os pubis; dividing the clitoris into two parts, called the *crura of the clitoris*.—See **Tab. Anatomy**, (Splanx) fig. 12. lit. b.b.

These are three times as long as the ordinary trunk of the clitoris itself.

CRURA of the medulla oblongata, are two of the four roots whence the medulla oblongata springs, in the brain.

The *crura* are the larger roots; the two smaller are called *pedunculi*.

CRURAL, in anatomy, an epithet given to the large artery and vein of the thigh.

The *crural* artery arises from the iliac artery; or rather, it is the iliac itself, under another name; being called *crural*, from the place of its entrance into the thigh. See **Tab. Anatomy**, (Angiol) fig. 1. n. 69.

It conveys blood through all the part, by means of a great number of branches disseminated through its substance.

The *crural* vein is formed of six other veins, viz. the *great* and *little sciatica*, the *musculo*, the *poplitea*, the *fural*, and the *saphena*.

CRURAL nerves. See the article **NERVE**.

CRURÆUS *, in anatomy, a muscle arising from the fore part of the thigh-bone, between the lesser and great trochanter, and lying close upon the bone, joins its tendon with three others, which all together make one broad tendon, that passes over the patella, and is inserted into the little tuberosity on the upper and fore part of the tibia. Its use is to extend the leg. See **Tab. Anatomy**, (Myol.) fig. 2. n. 40.

* It is called *cruræus*, as being fastened to the thigh-bone in the same manner as the brachius to the arm.

CRUS, among anatomists, denotes all that part of the body which reaches from the buttocks to the toes; and is divided into thigh, leg, and foot. See each in its place, **THIGH**, &c.

CRUSCA, an Italian term, signifying *bran*, or what remains of meal after the flower has been sifted out.—It is only in use among us to denote that celebrated academy called *della crusca*, established at Florence, for purifying and perfecting the Tuscan language.

The academy took its name from its office, and the end proposed by it; which is, to refine the language, and as it were to separate it from the bran. Accordingly, its device is a sieve, and its motto, *Il più bel fior ne coglie*; that is, *It gathers the finest flower thereof*. In the hall or apartment where the academy meets, M. Monconis informs us, every thing bears allusion to the name and device: the seats are in form of a baker's basket; their backs like a shovel for moving of corn: the cushions of grey satin in form of sacks, or wallets; and the branches where the lights are placed, likewise resemble sacks.

The vocabulary *della crusca* is an excellent Italian dictionary, composed by this academy.

CRUSTA villosa, in anatomy, the fourth tunic, or coat of the stomach.

On the inner surface of this coat, are seen innumerable villi or fibrillae, rising every where perpendicularly from it; which some will have to serve for nothing but a defensive to the stomach, to preserve it from acrimonious humours: but Dr. Drake rather takes them to be excretory ducts to the subjacent glands; which some authors would have to be that now exploded thing a parenchyma; but which are, indeed, the organs by which most of that humour which is discharged into the stomach, is separated; and these villi the immediate channels through which it is conveyed.

CRUSTACEOUS fishes, in natural history, are those covered with shells consisting of several pieces, or scales; as those of crabs, lobsters, &c.

These are usually softer than the shells of the testaceous kind, which consist of a single piece, and usually much thicker and stronger than the former; such as those of the oyster, scallop, cockle, &c. See **Supplement**, articles **CRUSTACEOUS**, and **TESTACEOUS**.

Dr. Woodward observes, in his natural history, that of all the shells found in beds of all the different matters dug out of the earth, there are scarce any of the *crustaceous* kind: the reason he gives for it is, that these being much lighter than the rest, must have floated on the surface at the time of the deluge, when all the strata were formed; and there have corrupted and perished.

CRUX herringi. See the article **HERRING**.

CRUZADO, or **CRUISADE**, an expedition to the holy land. See **CRUISADE**.

CRUZADO, in commerce, is a Portuguese coin, struck under Alphonus V. about the year 1457, at the time when pope Calixtus sent thither the bull for a crusade, against the infidels. See **COIN**. It had its name from a cross, which it bears on one side; the arms of Portugal being on the other. A *crusade* is of the value

lue of 40 French sols, or upwards of 2 s. 10 d. sterl. See SOL.

CRY. See the article HUE, CLAMOR, HARO, &c.
CRYPTA *, a subterraneous cell, or vault; especially under a church, for the interment of particular families, or persons.
 S. Ciampini, describing the outside of the Vatican, speaks of the *crypta* of St. Andrew, St. Paul, &c.

* The word is formed of the Greek κρυπτο, *abscendo*, I hide; whence κρυπτον, *crypta*.

Vitruvius uses the word *crypta* for a part of a building, answering nearly to our cellar; Juvenal, for a *chaca*.

Hence, **CRYPTO-PORTICUS**, a subterraneous place, arched, or vaulted; used as an underwork, or passage in old walls.—The same is also used for the decoration at the entry of a grotto.

CRYPTA, is also used by some of our ancient writers, for a chapel, or oratory under ground.

CRYPTOGRAPHY *, the art of secret writing, or writing in cipher. See CIPHER, and DECIPHERING.

* The word is compounded of κρυπτο, I hide; and γραφο, I describe.

CRYSTAL *, in natural history, a kind of fossil, transparent stone, colourless, like a diamond, but much inferior thereto in lustre and hardness; used for vases, urns, mirrors, &c.

* The word comes from the Greek κρυσταλλος, *glacies*; formed of κρυος, *frigus*, and σκληρος, *concreto*, because of its resembling ice.

The ancients were but little acquainted with the nature of *crystal*: Pliny speaks of it as hardened, petrified water, which was the popular opinion of those days; but experience has shewn us the contrary: for by a chymical analysis, instead of resolving into water, it yields nothing but a calx, earth, and salts. For the places where it is found, Pliny adds, that he has seen it dug from off the highest and roughest rocks of the Alps; whence, doubtless, its name of *rock-crystal*. It is sometimes also found in brooks and rivers, but not formed there; only washed down thither from off the mountains by the violent rains. Several mountains of Europe, and some of Asia, produce *rock-crystal*. If we may believe the French relation of Madagascar, that island yields more than all the world beside.

Its texture consists in its lustre and transparency; that with straws, dust, clouds, &c. is little valued. It is frequently found hexagonal; the edges inimitably fine and accurate. It is cut or engraved in the same manner, with the same instruments, and by the same workmen as diamonds.

Crystal is of some use in medicine, being reputed an astringent; and as such used in diarrheas and dysenteries: it is also used to increase the milk of nurses; and, further, is esteemed a good antidote against arsenic.

The formation of **CRYSTAL**, is delivered by F. Francisco Lana in the philosophical transactions, to this effect: 'In the Val Sabbia I observed a spacious round of a meadow, some parts whereof were bare of all herbs; wherein, and no where else thereabout, *crystals* are generated: all hexangular; both points terminating in a pyramidal figure, likewise hexangular. The country-people told me, they were produced from the dews; because, forsooth, being gathered over-night, there would others arise, only in a serene and dewy sky. But having observed that there was no mark of any mine thereabout, I concluded them produced by the plenty of nitrous steams, which at the same time might hinder the vegetation in those places, and coagulate the dew falling thereon: for nitre is not only the natural coagulum of water, as is manifest in artificial glaciations, but ever retains the above-said hexangular figure; which, by the way, may be the cause of the hexagonal figure of snow.'

'Since *crystals* are only found in certain narrow places, it is probable, thence are raised the exhalations that concrete the dew; after the same manner as the vapour or exhalation of lead coagulates quicksilver.'

Rohault argues, that *crystal*, diamond, &c. must have been originally liquid, from their figure, which is such as drops of water of the same size must necessarily assume; and such as globules of meal or sower, heaped up and compressed by their own weight, might have: for as each *crystal* is encompassed and closed round with six others; so it becomes modelled into a hexagonal body, consisting of equal and square sides.

Boerhaave takes *crystal* to be the proper matter, or basis of all gems or precious stones, which assume this or that colour, &c. from the different admixture of mineral and metalline fumes, with the primitive crystalline matter. See Supplement, article CRYSTALL.

CRYSTAL is also used for a factitious body, cast in the glass-houses; called also *crystal glass*.

It is, in effect, glass; but carried, in the melting, and in the matter whereof it is composed, to a degree of perfection beyond the common glass: though it come far short of the whiteness and vivacity of the natural *crystal*.

The best artificial *crystals* are said to be those made at Moran near Venice; called *Venice crystals*.

CRYSTALS, in chymistry, express salts, or other matters, shot, or congealed in manner of *crystal*. See CRYSTALLIZATION.—Thus,

CRYSTAL of allum, is allum purified, and reduced into *crystals*, in the same manner as tartar. In like manner are vitriol, nitre, and other salts crystallized.

Crystals of allum are quadrangular, and brilliant like diamonds; those of nitre, white, and oblong; those of vitriol, green, angular, and shining. See SALT.

CRYSTAL, or *cream of tartar*, is tartar purified and dissolved, and again coagulated in form of *crystals*.

To prepare it, they boil tartar in water, skim it, and strain it; when cool, there are formed little white, shining *crystals* at the edges, as also a pellicle, or cream swimming a-top.

The cream and *crystals* were antiently supposed to be different; but are now found the same thing.

Crystal of tartar is esteemed purgative, and aperitive; proper in hydropical and affthmatical cafes, and in intermitting fevers.

CRYSTAL of tartar calcheated, is when it is impregnated with the most diffusible parts of iron.

CRYSTAL of tartar emtic, is when it is charged with the sulphureous parts of antimony, to render it vomitive.

CRYSTAL mineral, called also *mineral anodyne*, and *sal prunella*, is salt-petre prepared with sulphur; thus: put half a pound of salt-petre in a crucible, and set that in a furnace; and when the salt-petre is in fusion, add, at several times, two drachms of flower of sulphur. After the flame is over, invert the crucible into a bras or copper bafon: and it is then *sal prunella*, which being dissolved again in water, and shot into *crystals*, becomes *crystal mineral*.

This is esteemed good against the squinancy, whence its name of *sal prunella*; *pruna*, or *prunella*, expressing that disease.

CRYSTALS of silver, or *luna*, denote silver, penetrated and reduced into the form of salts, by the pointed acids of spirit of nitre.

It is used for making elchairs, by applying it to any part: it is also of use internally, in dropsies, and diseases of the brain.

CRYSTALS of mars, called also *sal*, or *vitriol of mars*; is iron reduced into a salt by an acid liquor; used in dicates arising from obstructions.

CRYSTALS of Venus, called also *vitriol of Venus*; is copper reduced into the form of vitriol by spirit of nitre, very caustick, and used to eat off proud flesh. See VITRIOL.

Island CRYSTAL, is a transparent fissile stone, brought from Iceland; soft, as talc; clear, as rock-crystal, and without colour; famous among optic writers for its unusual refractions.

It bears a red heat without losing its transparency; and, in a very intense heat, calcines without fusion: steeped a day or two in water, it loses its natural polish; rubbed on cloth it attracts straws, &c. like amber. In effect, it appears a kind of talc; and is found in form of oblique parallelepipeds with six parallelogramatic sides, and eight solid angles.

The phenomena of this stone are very remarkable, and have been examined with great accuracy by M. Huygens and Sir Isaac Newton: 1°. whereas in other pellucid bodies there is only one refraction, in these there are two; so that objects viewed through it appear double.

2°. Whereas in other transparent bodies, a ray falling perpendicularly on the surface, passes straight through, without suffering any refraction; and an oblique ray is always divided: in *island crystal*, every ray, whether perpendicular or oblique, becomes divided into two, by means of the double refraction. One of these refractions is, according to the ordinary rule, the sine of incidence out of air into *crystal*, being to the sine of refraction as five to three; but the other is perfectly new. The like double refraction is also observed in *crystal of the rock*, though much less sensibly.

When an incident ray is thus divided, and each moiety arrives at the further surface; that, refracted in the first surface after the usual manner, is refracted entirely after the usual manner at the second; and that refracted in the unusual manner in the first, is entirely refracted after the like manner in the second: so that each emerges out of the second surface, parallel to the first incident ray. Again, if two pieces of this *crystal* be placed over each other, so as the surfaces of the one be parallel to the corresponding ones of the other; the rays refracted in the usual manner in the first surface of the first, are refracted after the usual manner in all the other surfaces: and the same uniformity appears in the rays refracted after the unusual manner; and this in any inclination of the surfaces; provided their planes of perpendicular refraction be parallel.

From these phenomena, Sir Isaac Newton gathers, that there is an original difference in the rays of light; by means whereof some are, here, constantly refracted after the usual manner; and others in the unusual manner.

Were not the difference original, and did it arise from any new modifications impressed on the rays at their first refraction, it would be altered by new modifications in the three following ones; whereas, in fact, it suffers no alteration at all.

Again, he hence takes occasion to suspect, that the rays of light have several sides, endued with several original properties: for, it appears from the circumstances, that there are not two sorts of rays differing in their nature from each other, one constantly, and in all positions, refracted in the usual, and the other in the unusual manner; the difference in the experiment mentioned, being only in the position of the sides of the rays, to the plane of perpendicular refraction. For one and the same ray is refracted sometimes after the usual, and sometimes after the unusual manner,

ner, according to the position of its sides to the crystal: the refraction being alike in both, when the sides of the rays are positioned the same way to both, but different when different.

Every ray, therefore, may be considered as having four sides, or quarters; two of which, opposite to each other, dispose the ray to be refracted after the unusual manner; and the other two in the usual. These dispositions, being in the rays before their incidence on the second, third, and fourth surfaces; and suffering no alterations, for what appears, in their passage through them; must be original and connate. See *Supplement, article ISLAND CRYSTAL, and PARALLELOPIPEDUM.*

CRYSTALLI, among physicians, denote pustules dispersed all over the body, white and transparent, and of the bigness of a lupine: much the same with what are otherwise called *phlyænae*.

CRYSTALLINE humour, is a thick, compact humour of the eye, in form of a flatish, convex lens, situate in the middle of the eye; serving to make that refraction of the rays of light, necessary to have them meet in the retina, and form an image thereon, whereby vision may be performed.

The *crystalline* is set in the anterior part of the vitreous humour, like a diamond in its collet; and is retained there by a membrane which surrounds it, and which for that reason is called the *capsula of the crystalline*.—This membrane is sometimes also called *crystalloides*; and by others, on account of its fineness, which resembles that of a spider's web, *arachnoides*.

It is the configuration of the *crystalline* that occasions persons to be either *myopes*, or *presbytes*, i. e. to be either long, or short-sighted.

The *crystalline* being of two consistences; outwardly, like a jelly; but toward the center as hard as salt: hence, some authors think that its figure may be varied; which variation they suppose to be effected by the ligamentum ciliare. Hence, Dr. Crew, and others, ascribe to the ciliary ligament a power of making the *crystalline* more convex, as well as of moving it to or from the retina: accordingly, by the laws of optics, something of this kind is absolutely necessary to distinct vision: for, as the rays from distant objects diverge less than those from nigh ones; either the *crystalline humour* must be capable of being made more convex, or more flat; or else there must be an elongation of the eye, or of the distance between that and the retina.

The *crystalline humour*, when dried, appears to consist of a vast number of thin, spherical laminae, or scales, lying over one another: Leewenhoeck reckons there may 2000 of them in one *crystalline*; each of these, he says, he has discovered to consist of a single fibre, or fine thread wound up in a stupendous manner, this way and that; so as to run several courses, and meet in as many centers; and yet not interfere nor cross in any place. *Philos. Transf.* N° 165, and 293.

The *crystalline* is the subject of the disease called a *cataract*, as well as of the operation of *couching*. See *EYE*.

CRYSTALLINE heavens, in the old astronomy, two orbs imagined between the prime mobile and the firmament, in the Ptolemaic system, where the heavens were supposed solid, and only susceptible of a single motion.

King Alfonso of Arragon is said to have introduced the *crystallines*, to explain what they called the *motion of tripudiation*, or *tibulation*.

The first *crystalline*, according to Regiomontanus, &c. serves to account for the slow motion of the fixed stars; which makes them advance a degree in 70 years, according to the order of the signs, *viz.* from west to east; which occasions the precession of the equinox.

The second serves to account for the motion of libration, or tripudiation; whereby the celestial sphere librates from one pole towards another, occasioning a difference in the sun's greatest declination.

But the moderns account for these motions, in a much more natural and easy manner.

CRYSTALLINE arsenic. See the article *ARSENIC*.

CRYSTALLIZATION, in chymistry, a kind of congelation befalling salts, both essential, fixed, and volatile; when, being set free from the greatest part of their humidity, they are left to harden, dry, and shoot into crystals.

The ordinary method of *crystallization*, is performed by dissolving the saline body in water, filtering it, and letting it evaporate, till a film appears at the top; and lastly, letting it stand to shoot.

This shooting is accounted for, on Sir Isaac Newton's principles, from that attractive force which is in all bodies, and particularly in salt, by reason of its solidity; whereby, when the menstruum or fluid in which such particles float, is fated enough, or evaporated, (which brings it to the same) so that the saline particles are within each other's attractive powers, and can draw one another more than they are drawn by the fluid, they will run into crystals.

This is peculiar to salts, that let them be ever so much divided, and reduced into minute particles; yet, when they are formed into crystals, they each of them re-assume their proper fi-

gures: so that one might as easily divest and deprive them of their saltiness, as of their figure. See *SALT*.

This being an immutable and perpetual law, by knowing the figure of the crystals, we may understand what the texture of the particles ought to be, which can form those crystals: and, on the other hand, by knowing the texture of the particles, may be determined the figures of the crystals.

For, since the figures of the most simple parts remain always the same, it is evident that the figures they run into, when compounded and united, must be uniform, and constant: and since the force of attraction may be stronger on one side of a particle than on another; there will constantly be a greater accretion of salts upon those sides which attract more strongly: from which it may easily be demonstrated, that the figure of the least particles, is entirely different from that which appears in the crystal. See *Supplement, article CRYSTAL*.

CRYSTALLOIDES, the crystalline coat of the eye; a fine membrane, immediately encompassing, and containing the crystalline humour; and supposed to serve, by constringing or dilating that humour, to vary the place of its focus.

Anatomists are divided about the reality of such tunic, which is also, from its fine texture, called *aranea tunica*, or *arachnoides*.

CRYSTALLOMANCY, the art of divining, or foretelling future events, by means of a mirror; wherein the things required are represented.

* It is also called *catoptronomy*.—The first from *καταλάω*, *congealed water*, or *crystal*; and the second from *κατοπτρον*, *mirror*, and *μαντεία*, *divination*.

CUBATURE, or **CUBATION**, of a solid; the measuring of the space comprehended in a solid; as a cone, pyramid, cylinder, &c. or finding the solid content thereof.

The *cubature* regards the content of a solid, as the quadrature does the superficies of a figure; so that the *cubature* of the sphere turns on the same thing as the quadrature of the circle.

CUBE, in geometry, a regular or solid body, consisting of six square and equal faces, or sides; and its angles all right, and therefore equal.

* The word comes from the Greek *κῦβος*, *teffara*, die.

The *cube* is also called *hexaedron*, because of its six sides.

The *cube* is supposed to be generated by the motion of a square plane, along a line equal to one of its sides, and at right angles thereto: whence it follows, that the planes of all sections parallel to the base, are squares equal thereto, and consequently to one another.

To describe a rete, or net, whence any given cube may be constructed, or wherewith it may be covered. On the right line A B, (Tab. Geometry, fig. 49.) set off the side of the cube, four times; on A erect a perpendicular, A C, equal to the side of the cube A I, and complete the parallelogram A C B D. With the interval of the side of the cube, in the line C D, determine the points K, M and O: lastly, draw the right lines I K, L M, N O, and B D; produce I K and L M, each way to E and F, and to G and H; till E I = I K = K F, and G L = L M = M H, and draw the right lines E G, F H.

To determine the surface and solidity of a cube: as the surface of a cube consists of six equal squares, a side multiplied by itself, and the product by six, will give the superficies; and the same product, again, multiplied by the side, the solidity.

Hence, if the side of a cube be 10, the solidity will be 1000; if that be 12, this will be 1728: wherefore, the geometrical perch being 10 foot, and the geometrical foot 10 digits, &c. the cubic perch is 1000 cubic feet, and a cubic foot 1000 cubic digits, &c.

Hence, also, cubes are in the triplicate ratio of their sides; and are equal, if their sides be so.

Duplication of a CUBE. } See the articles } DUPLICATION.
Scenography of a CUBE. } SCENOGRAPHY.

CUBE, or **CUBIC number**, in arithmetic, is a number arising from the multiplication of a square number by its root.

Thus, if the square number four, be multiplied by its root, two, the factum eight is a *cube*, or *cubic number*; and the number two, with respect thereto, a *cube-root*.

Hence, since, as unity is to the root, so is the root to the square; and as unity is to the root, so is the square to the cube; the root will, also, be to the square as the square to the cube: that is, unity, the root, the square, and the cube, are in continual proportion; and the *cube-root* is the first of two numbers that are mean proportionals between unity and the cube.

For the composition of CUBIC numbers. Every cubic number of a binomial root, is composed of the cubic numbers of the two parts, of the factum of thrice the square of the first part into the second, and of the factum of thrice the square of the second part into the first.

Demonst. For a cubic number is produced by multiplying the square by the root: but the square of a binomial root, is composed of the squares of the parts, and double the factum of one part into the other.

Wherefore, the cubic number is composed of the cube of the first part, of the triple factum of the square of the first part into the second,

CUB

second, and of the triple factum of the square of the second part into the first.

An ocular demonstration of this we have in the following example, where multiplication alone is used. Suppose, *v. gr.* the root 24, or 20 + 4. Here,

$$\begin{array}{r} 24^2 = 576 \\ 20^2 + 2 \cdot 20 \cdot 4 + 4^2 = 576 \\ 20^2 = 400 \\ 2 \cdot 20 \cdot 4 = 160 \\ 4^2 = 16 \\ 400 + 160 + 16 = 576 \end{array}$$

Hence, as the part on the right hand is placed among units, and that on the left among tens; the cubic number of the right hand part must be put in the right hand place; the factum of its triple square into the left, in the second place; and the factum of the triple square of the left into the right, in the third: lastly, the cube of the left-hand part falls in the fourth place.

If the root be a multinomial, two or more characters on the right must be esteemed as one; that it may have the form of a binomial. It is obvious, that any cube is composed of the cubes of the several parts of the root, and of the factums of the triple square of any of the left-hand characters into the next on the right; and also of the factums of the triple square of the right-hand characters into all the left. Suppose, *v. gr.* the root 243: take 240 for one part of the root, three will be the other part; consequently,

$$\begin{array}{r} 240^3 = 13824000 \\ 3 \cdot 240^2 \cdot 3 = 518400 \\ 3 \cdot 240 \cdot 3^2 = 6480 \\ 3^3 = 27 \\ 243^3 = 14348907 \end{array}$$

The places of the several factums, are determined from what was observed above: for regard must here, too, be had to the ciphers to be added to the numbers multiplied by each other, if they be placed alone.

This composition of cubic numbers once well conceived, the extraction of cubic roots will be easy. See EXTRACTION.

CUBE root, or **CUBIC root**, the origin of a cubic number; or a number by whose multiplication into itself, and again into the product, any given number is formed.

The extraction of the cube root, is the same thing as the finding any number, *v. gr.* 2; by whose multiplication into itself twice continually, a given number, *v. gr.* 8, is produced: the process whereof, see under the article EXTRACTION.

CUBEBS, in pharmacy, a fruit brought from the island of Java, in grains or seeds resembling pepper, both in form and size; whence some call it *wild pepper*.

It is said, the natives of the place boil it ere they allow it to be exported, to prevent its being sown in other countries.—

Cubebs fortify the stomach, brain, and other viscera; and enter as an ingredient in several official compositions.

CUBIC equation, is an equation wherein the unknown quantity is of three dimensions, as $x^3 = a^3 - b^3$, &c. See EQUATION.

For the construction of cubic equations, see CONSTRUCTION.—For their resolution, see RESOLUTION.—For their roots, see ROOT.

CUBIC foot. See the article FOOT.

CUBICAL parabola, a term used by some writers for a parabola of the higher kind, *v. gr.* where $a^2 x^2 y$, &c. See CURVE; see also PARABOLA.

CUBING of a solid. See the articles CUBATURE, and SOLID.

CUBIT, a long measure, used by the antients, especially the Hebrews; taken from the ordinary extent of a man's arm, between the elbow and the tip of the hand.

In the scripture, we find cubits of two lengths, the one equal, according to Dr. Arbuthnot, to 1 foot, 9 inches, $\frac{33}{128}$ of an inch, our measure; being the fourth part of the fathom, double the span, and six times the palm:—the other equal to 1. $\frac{33}{128}$ foot, or the four hundredth part of a stadium.—The Romans, too, had a cubit, equal to 1 English foot, five inches, $\frac{1}{16}$ of an inch. F. Merfenne makes the Hebrew cubit 1 foot, 4 digits, and 5 lines, with regard to the foot of the capitol. According to Hero, the geometrical cubit is 24 digits; and, according to Vitruvius, the foot is $\frac{2}{3}$ of the Roman cubit, i. e. 16 digits or finger's-breadths. See FOOT, FINGER's-breadth, &c.

CUBITAEUS externus, or **ulnaris**, in anatomy, the first of the extensor muscles of the fingers, thus called, as being placed along the cubitus, externally.—It rises from the external protuberance of the humerus, and passing its tendon under the ligamentum annulare, is inserted into the fourth bone of the metacarpus, that sustains the little finger.

CUBITAEUS internus, the first of the flexors, placed along the cubitus, within the arm. It rises from the internal protuberance of the humerus, and part of the ulna; upon which it runs all along till it passes under the ligamentum annulare, and is inserted by a strong and short tendon into the fourth bone of the first order of the carpus.

CUBITUS, in anatomy, a bone of the arm, reaching from the

CUE

elbow to the wrist; otherwise called *ulna*, or the *greater foie*. Some use the word for all that part of the arm between the elbow and the wrist; including the *ulna*, or *cubitus*, properly so called, and the radius.

CUBITI biceps. } See the articles { **BICEPS**.
CUBITI brevis. } **BREVIS**.
CUBITI longus. } **LONGUS**.

CUBO-CUBO-CUBUS. See **CUBUS-CUBI**.

CUBO-CUBUS, the term whereby Diophantus, Vieta, &c. distinguish the sixth power; which the Arabs call *quadratum-cubi*.

CUBOIDES, or **O**; **CUBIFORME**, in anatomy, the seventh bone of the foot; so called, from its being in form of a cube, or die.—See Tab. *Anatomy*, (Osteol.) fig. 7. lit. b. b. see also FOOT.

Some also call it *multiforme*: it is situate in the forepart of the calcaneum, in the same rank with the ossa cuneiformia.

Behind, it is articulated to the os cili; before, to the two outer bones of the metatarsus; and within, it is joined to the third os cuneiforme.

CUBUS-CUBI, a name whereby the Arab writers, and those who follow them, to denominate the ninth power, or a number multiplied eight times by itself continually; which Diophantus, and after him Vieta, Oughtred, &c. call *Cubo-cubo-cubus*. See POWER.

CUCKING-STOOL, or **COKESTOOL**, antiently called *tumbrel*, and *trebuchet*; an engine for the punishment of scolds and unquiet women, by ducking them in the water.

Kitchen says, 'Every one having view of frank-pledge, ought to have a pillory and a tumbrel.' This machine was much in use, even among our Saxon ancestors, who called it *scalding-stole*.

The punishment was antiently inflicted on brewers, and bakers transgressing the law; who were thereupon, in such a stool or chair, to be ducked in *stercore*, some muddy or stinking pond. This was antiently written *gaging stole*: in Domesday it is called *cathedra stercoris*.

CUCULLARIS, in anatomy, a muscle of the scapula, so called from the resemblance it is supposed to bear to a monk's cowl; and trapezius, from its resemblance to a geometrical figure called a trapezium.—See Tab. *Anatomy*, (Myol.) fig. 6. n. 9. fig. 2. n. 4. fig. 1. n. 18.

The fibres of this muscle have various originations and actions: whence Dr. Drake thinks it may be more properly called *three*, than one muscle.—The upper order of fibres or muscles, springs from the os occipitis; the second from the spine of the vertebrae of the neck; and the third from the spines of the eight upper vertebrae of the thorax, or back: and are inserted into the spine, acromion, and basis of the scapula, and part of the clavicle.

From the different dispositions of these fibres, the scapula is drawn different ways; the first pulling obliquely upwards, the last obliquely downwards, and the middle backwards: when they act all three together, they are said to draw backwards only; i. e. the two extremes antagonizing, the middle one alone is at liberty to act.

CUCULLATE flowers, among botanists, are such as resemble a cucullus, or monk's hood, or cowl. See FLOWER.

CUCULLUS, was antiently a traveller's cap; called also *cowl*, *gaul*, or *gula*: whence the name passed to the monks, among whom it signified their frock and cap, which were of one piece.

CUCUPHA, an antient form of medicine; being a cap, or cover for the head, with cephalic powders quilted therein; wore in many nervous distempers, and particularly such as more immediately affect the head: as against catarrhs, defluxions, &c.—It is now much out of use.

CUCURBITACEOUS plants, a class of plants, so called from their resemblance to the gourd, called by the Latins *cucurbita*, which is the head of this family.

Plants of the *cucurbitaceus* kind, send out their branches every way; which are soft, and generally be-set with tendrils, by means whereof they cling to the bodies that are near them.

Their flowers are either sterile, or fertile: the last knit, and yield fleshy fruits of various figures; containing within them several flat seeds placed in three or four lodges, or even a greater number.

These seeds have usually a white sweetish kernel; the greatest part of them being of those called *frigida majores*, or the greater cold seeds.

The pumpkin, melon, &c. are of the *cucurbitaceus* kind.

CUCURBIT, **CUCURBITA**, in chymistry, an earthen, or glass vessel, called also *body*; of the figure of a gourd, or a pear: wherein are put the matters to be distilled.

It is sometimes also made of tin, and sometimes of brass, tinned.

When a distillation is to be made, they fit on to it a glass head, with an aperture, and a neck proportional.

CUCURBITULA, in chirurgery, a cupping-glass, or instrument used in the operation of cupping. See CUPPING-GLASS.

CUDDY, in a first rate man of war, is a place lying between the captain-lieutenant's cabin, and the quarter-deck; and divided into partitions, for the master and other officers.—See Tab. *Ship*, fig. 2. lit. R.

CUE, an item, or inuendo, given to the actors on the stage, what, or when to speak. See PROMPTER.

CUERPO. To walk in CUERPO, is a Spanish phrase, for going without a cloke; or without all the formalities of a full dress.

CUI

CUL ante divortium, a writ, which a woman divorced from her husband, hath, to recover lands or tenements from him to whom her husband alienated them during marriage; because, during the marriage, she could not gainst him.

CUL in vita, is a writ of entry, which a widow hath against him to whom her husband alienated her lands or tenements in his life-time; specifying, that, during his life, she could not withstand it.

CUIRASSE *, a piece of defensive armour, made of an iron plate well hammered; serving to cover the body, from the neck to the girdle, both before and behind.

* Some derive the word, by corruption, from the Italian *cuors* heart; because it covers that part: others from the French *cuir*, or the Latin *corium*, leather; whence *coriaceous*: by reason defensive arms were originally made of leather.

The *cuirasse* was not brought into use till about the year 1300. Hence, *cuirassiers*, the cavalry armed with *cuirasses*.

The French have still a regiment of *cuirassiers*; and a good part of the German cavalry, are *cuirassed*.

In the Roman calendar, we find the name of S. Dominic the *cuirassed*; a title given a saint of the eleventh century, from his constant wearing of an iron *cuirasse*, by way of penance.

CULINARY *, an epithet frequently added to fire; determining it to be a common fire, excited in wood, coals, or other ordinary fuel: in contradistinction to solar fire, or that raised by the action of a burning-glass; also to central fire, to animal fire, &c.

* The word is formed from the Latin *culina*, kitchen; this being the chief place of such fires.

Culinary fire, according to Boerhaave, consists of a portion of pure elementary, or solar fire, attracted by the oily, or sulphurous parts of the fuel, with such velocity, as that it moves the flame, agitates and whirls them violently about, and by degrees breaks and attenuates them; renders them volatile, and disperses them in air.

The effect of air upon this fire, is to make, as it were, a vault around it, and by that means, refrain and keep it in, determine it upon the sulphur, and thus prevent its too hasty dissipation.

CUL de lamp, a French term, properly signifying the bottom of a lamp. It is applied in architecture to several decorations, both of masonry and joinery, used in vaults and ceilings, to finish the bottom of works, and wreathed somewhat in manner of a testudo; particularly a kind of pendentive in Gothic vaults.

CUL de four, a sort of low, spherical vault, oven-like. See VAULT. *Cul de four of a niche*, denotes the arched roof of a niche on a circular plan.

CULLAGE *, or **CULLAGE**, a right usurped by the ancient lords, and established by a shameful custom, which gave them the first night with their vassal brides.

* The word is formed from the French *cui poëx*, the breach.

It is said this right was established by Euenus III. king of Scotland, and finally abolished by Malcolm III. a compensation being settled in its stead; as occasioning frequent revolts of the vassals against their lords.

CULMIFEROUS, in botany, a term 'applied to such plants as have a smooth-jointed stalk, usually hollow; the stalk wrapped about, at each joint, with single, narrow, sharp-pointed leaves; and the seeds contained in chaffy husks.

Culmiferous plants are divided by Ray, into two kinds; those with a greater, and those with a smaller seed.

Those with a larger seed are called *frumentaceous*, or *cereales*; and are again divided into *spicatus*, as wheat, rye, spelt, barley, rice, peas, &c. and *paniculatus* or *jubatus*, as oats, scordium, milium, and maize.

CULMINATION, in astronomy, the transit of a star, or planet over the meridian, or that point of its orbit wherein it is at its greatest altitude.

Hence, a star is said to *culminate*, when it passes the meridian.

To find the culmination of a star, or the time wherein it passes the meridian: on a meridian-line AB, (Tab. *Astronomy*, fig. 48.) stretch a thread, DC, perpendicularly; and from D to E another, DE, cutting the meridian obliquely, at any angle: the triangular thread, DCE, will cut the plane of the horizon in the meridian line, or at right-angles; and consequently will be in the plane of the meridian.

The eye, therefore, being so placed as that the thread DE may cover the thread DC; wait till the star be bisected by the triangle DCE; for then the eye and the star will, together with the triangle DCE, be in the same plane: consequently the star is in the meridian. To find the culmination of a star by the globe. See GLOBE.

To find the time of a star's culminating; its right ascension, and the sun's place in the ecliptic being given.—From the sun's place find his right ascension: and from this subtract the right ascension of the star: the difference being converted into solar time, gives the time elapsed from mid-day to the time of the star's culmination.

CULMUS, properly denotes the stem or stalk of corn, or grass; which in other plants is called *caulis*.

Hence the appellation, *culmiferous plants*.

VOL. I.

CULPABILE. See the article *Non est culpabilis*.

CULPRIT, a term used by the clerk of the arraignments, when a person is indicted for a criminal matter.

After the indictment is read in court (which is the crown's charge against the prisoner at the bar) he is asked if guilty, or not guilty? If he answers, *not guilty*, there is next a replication from the crown, by continuing the charge of guilt upon him; which is expressed by pronouncing the word *cul-prit*; *cul* being an abbreviation of the Latin word *culpa*, guilt, or *culpabilis*, guilty, and *prit* (now *pret*) the old French word for *ready*; or, as others rather think, the Latin *apparet*, appears.

From this formula, therefore, of the clerk of the arraignments, the prisoner is deemed guilty of the crime charged on him; and that the crown is ready to prove it upon him.

That this is the true explanation of the term, seems evident from the form of the entry of the record of the trial, when drawn at large.

CULTELLATION, a term which some authors use for the measuring of heights, and distances, by piecemeal; that is, by instruments which give us such heights and distances by parts, and not all at one operation.

CULTRARIUS. See the article *POPA*.

CULTURE. See *AGRICULTURE*, and *HORTICULTURE*.

CULTURE of hops. See the article *HOPS*.

CULVERIN *, a long slender piece of ordnance or artillery, serving to carry a ball to a great distance.

* Menage derives the word from the Latin *culubrina*; others from *culuber*, snake; either on account of the length and slenderness of the piece, or of the ravages it makes.

Of these there are three kinds, viz. the *culverin extraordinary*, the *ordinary*, and the *leaf fixed*.

The *culverin extraordinary* has 5½ inches bore; its length 32 calibers, or 13 foot; it weighs 4800 pound; its load is above 12 pound; carries a shot 5 inches ¼ diameter, weighing 20 pound weight.

The *ordinary culverin* is 12 foot long; carries a ball of 17 pound 5 ounces; caliber 5½ inches; its weight 4500 pound.

The *culverin of the leaf fixed*, has its diameter 5 inches; is 12 foot long; weighing about 4000 pounds; carries a shot 3 inches ½ diameter, weighing 14 pounds 9 ounces. See *DEMI-CULVERIN*.

CUMMIN *, the seed of a plant of the fennel name, much like that of fennel; growing abundantly in the isle of Malta, where it is sown and cultivated after the manner of corn.

* The French frequently call it *anis aigre*, sharp or sour anise.

It is used with success in vertigo's, wind-colics, tympanies, &c. It is esteemed excellent to retrieve the natural heat in stallions, bulls, &c. Pigeons are exceedingly fond of it; whence some make use of it to people their dove-houses, incorporating it with an earth naturally saline, or some other earth that has imbibed urine.

This seed, as well as the common anise, yields, by expression, a kind of oil, esteemed sovereign in rheumatisms; provided it be used with precaution, and in small quantities.

CUNEIFORME *os*, in anatomy. See *SPHENOIDES*.

CUNEIFORMIA ossa, denote the fourth, fifth, and sixth bones of the foot; thus called from their wedge-like shape, being large above, and narrow below.—See Tab. *Anat.* (Ofteol.) fig. 7. lit. c. c. fig. 3. n. 27. 27.

They lie all three a-side of one another, and are of different sizes; their upper side convex, and their under hollow by which means, the muscles and tendons in the bottom of the foot are not hurt in walking.

At one end they have each a sinus, which receives the os naviculare; and at the other end they are joined each to one of the three inner bones of the metatarsus.

CUNETTE, or **CUVETTE**, in fortification, a deep trench, about three or four fathom wide, sunk along the middle of a dry moat, to lade out the water; or to make the passage more difficult to the enemy.

CUNEUS, one of the mechanical powers; more usually, by English writers, called the *wedge*. See *WEDGE*.

Parabolic CUNEUS. See the article *PARABOLIC*.

CUNNUS *, the pudendum muliebri; or the anterior parts of the genitals of a woman, including the labia, pudendi, and mons veneris. See *PUDENDUM*.

* The word is formed from the Greek *κυνος*, to kiss, or to be with-child.

CUP, *calyx*, a vessel so called, of various forms and uses.

In the Ephem. German. we have a description of a *cup* made of a common pepper-corn, by Oswald Nerlinger; which holds 1200 other ivory cups, each having its several handle; all gilt on the edges: with room for 400 more.

CUPS, among herbalists, are those short green husks in which flowers grow; some being divided into two, three, four, five, or six leaves. See *Supplement*, article *CALYX*.

CUP fountain. See the article *FOUNTAIN*.

CUPOLA *, in architecture, the same with dome. See *DOMUS*. * The word is Italian, formed of the barbarous Latin *cuppala*, otherwise called *tholia*, and *fornix*.

CUPPEL, **CUPEL**, or **COFFEL**, among chymists, a vessel or utensil, used in the trying and purifying of gold and silver; called also *teff*. See *Supplement*, article *COFFEL*.

CUR

CUPPING, an operation in chirurgery, for the discharge of blood, and other humours by the skin.

It is performed by collecting the humours into a tumour under the cutis; and letting them out thence, by scarification; *i. e.* by several incisions made with a scarificator.

The instruments used herein, are the *cucurbitula*, or *cupping-glasses*, and *scarificator*: the description of each whereof see under their proper head.

Cupping is performed either *with*, or *without fire*.

Cupping with fire, is the more usual process; and is commonly, among us, thus effected: the air in the cavity of the *cucurbitula* is heated, and so rarefied, by the application of the flame of a lamp, or the like; and the vessel immediately applied to the part to be *cupped*.

Others, especially the French, proceed thus: a piece of card is cut round, and a lamp, or four little wax candles affixed to it: this is placed after the manner of a candlestick on the part whereon the operation is to be performed, and covered with a *cucurbitula* or *cupping-glass*.

After the included air has been well heated and rarefied with the flames of the candles, the glass is clapped close to the skin; which it has no sooner touched but the candles are extinguished, and the tumour is raised.

In *cupping without fire*, instead of rarefying the air included in the *cupping-glass* by heat, it is done by a syringe applied to the neck of the *cupping glass*, fitted with a brass collar, cap, and valve: the *cupping-glass* being applied to the skin, and the syringe wrought, part of the air is pumped out of the *cucurbitula*; and thus the tumour rises, as in the former case. See **SYRINGE**. The reason of the phenomenon is this: the air included in the *cupping-glass* being rarefied, a great part of the load which before pressed the part and kept it down, and which still continues to press the rest of the body, is taken off; upon which the air, known to be contained in the vessels of the body, and mixed with the blood and juices, expands itself; and raises a tumour, carrying with it the fluids wherewith it is mingled.

The operation is performed on the back, and on the breasts and thighs, to stop or promote the menses; on the navel for the colic.—*Cupping* is also used for defluxions on the eyes, for venomous wounds, and buboes; on the head, for apoplexies, &c.

CUPPING-GLASS, *cucurbitula*, in chirurgery, a glass vessel, applied to certain parts of the body, to draw the blood and other humours from within outwards; to be afterwards discharged, through several incisions made with a scarificator.

The vessel is of various dimensions: sometimes, instead of glass, it is made of wood, horn, brass, silver, &c.

When the *cupping* is to be performed with fire, the vessel is heated with candles, tow, a torch, lamp, or the like; and in this state applied close to the part: the air in its cavity being by this means rarefied, and brought near to the condition of a vacuum; that part of the body covered by it becoming less pressed by the air than the rest, its juices are forced up with the cutis, and raise a bunch in the cavity of the vessel: to which the scarificator being applied, and ten or twelve incisions made at the same time, a plentiful evacuation is effected.

To cup without fire, the vessel is fitted with a brass neck; to which a syringe being applied, a rarefaction is produced, by working it to and fro: the rest is done as in the former case.

CURATE, is properly a parson, or vicar of a parish, who hath the charge or cure, of the parishioners souls. See **CURE**, and **PARSON**.

CURATE is now more generally used for a deputy, or substitute of the parson; or one who officiates in the place of the incumbent, or beneficiary.

CURATIVE indication, among physicians, that which directs what is to be done for the cure of a disease. See **SYMPTOM**, and **INDICATION**.

CURATOR, in the civil law, a trustee, or person nominated to take care of the affairs, and interests of a person emancipated, or interdicted.

In countries where the Roman law prevails, between the age of 14 and 24 years, minors have *curators* assigned them: till 14, they have tutors.

CURATOR of an university, in the united provinces, is an elective office, to which belongs the direction of the affairs of the university; as, the administration of the revenues, the inspection of the professors, &c.

The *curators* are chose by the states of each province: the university of Leyden has three; the burghermasters of the city have a fourth.

CURDLING, the coagulating, or fixing of any fluid body; particularly milk.

Pausanias says, Aristæus son of Apollo, and Cyrene daughter of the river Peneus, were the first who found the secret of *curdling* milk.

At Florence, they *curdle* their milk for the making of cheese with artichoke flowers; in lieu of the rennet used for the same purpose among us.

The Bisaltæ a people of Macedonia, Rochfort observes, live wholly upon *curdled* milk, *i. e.* of curds. He adds, that curds is the whole food of the people of the upper Auvergne in France, and whey their only drink.

Women newly delivered are subject to have their milk *curdled*,

CUR

converted into little grumæ in their breasts, which occasions violent pains, with a shivering in the back.

It is owing to the want of being sucked, whence the method of remedying, and preventing it, is apparent.

CURE, in medicine. See **PALLIATIVE cure**.

CURE of souls, a benefice, the incumbent whereof has the charge, and guidance of the souls of the people within a certain extent of ground, called a *parish*.

Such is a vicar, a rector, &c. in contradistinction to a prebend, a dean, a chanctor, &c.

Sine CURES. See the article **SINE**.

CURE, in falconry, the fame with casting. See **CASTING**.

CURETES*, in antiquity, a sort of priests, or people of the isle of Crete; called also *corybantes*.

* The name *curetes*, according to Strabo, was giving them by reason of their cutting off the hair before, to prevent the enemy's taking hold thereof: the word being Greek, κούρης, of κούω, *tonsure*, from κείω, *tundo*. Others derive it from κρηστραία, the feeding or educating of a child; by reason they are said to have educated Jupiter.

The *curetes* are said to have been originally of mount Ida, in Phrygia; for which reason they were also called *idaei dactyli*. Ovid says, they had their origin from a huge shower of rain: Lucian and Diodorus Siculus represent them as very expert in casting of darts; though other authors give them no weapons but bucklers and pikes: but all agree in furnishing them with tabors, and castanets; and relate that they used to dance much to the noise and clashing thereof.

Some authors, however, give a different account of the *curetes*: according to Pezron, and others, the *curetes* were, in the times of Saturn, &c. and in the countries of Crete and Phrygia, what the druids and bards were afterwards among the Gauls, &c. *i. e.* they were priests who had the care of what related to religion, and the worship of the Gods.

Hence, as in those days it was supposed there was no communication with the Gods but by divinations, auguries, and the operations of magic; the *curetes* passed for magicians and enchanters: to these they added the study of the fairs, of nature, and poetry; and so were philosophers, astronomers, &c.

Such were the *curetes*, and after them the druids; with this difference, that the *curetes*, in the time of the Titans, went to the wars; for which reason they were armed, and were wonderfully dextrous in dancing, cap-a-pe, shaking their bucklers and javelins: from which action, Pezron conjectures, they took their name, *curetes*; *cure*, in the Celtic, being the same with κρη, in the Greek: *q. d.* I strike or beat.

According to Kircher, the *curetes* were what the *spirits* are among the Cabbalists, the *powers* in Dionysius, the *demons* among the Platonists, and the *genii* among the Egyptians.

Vossius, *de Idolat.* distinguishes three kinds of *curetes*; those of Ætolia, those of Phrygia, and those of Crete, who were originally derived from the Phrygians.

The first, he says, took their name from κρη, *tonsure*; in regard, from the time of a combat wherein the enemy seized their long hair, they always kept it cut: those of Phrygia and Crete, he supposes were so called from κρη, *young man*; in regard they were young; or because they nursed Jupiter when he was young.

CURFEW, *q. d.* *couvre-feu*, a signal of retreat, given in cities taken in war, &c. to advertise the inhabitants to go to bed, and not to stir out any more.

The *curfew-bell*, wherewith the signal was antiently given, was sometimes hung up as a punishment of sedition. Pasquier says, it was called *curfew*, and *garefou*; as being intended to advertise the people to secure themselves from the robbers and debauchees of the night.

The most antient *curfew*, was that established in England, by William the conqueror; who appointed, under severe penalties, that at the ringing of a bell, at eight a-clock in the evening, every one should put out their lights, cover, or rake up their fires, and go to bed.—Whence, to this day, where a bell is accustomed to be rung about bed-time, it is called *curfew-bell*.

CURIA, in our antient customs.—It was usual for the kings of England to summons the bishops, peers, and great men of the kingdom, to some particular place, at the chief festivals in the year; and this assembly is called, by our historians, *curia*; because there they consulted about the weighty affairs of the nation: whence it was sometimes also called, *plenitudo curia*, *generalis curia*, *angustis curia*, and *curia publica*, &c.

CURIA adjuvare vult, in law, is a deliberation, which the court sometimes take, before they give judgment in a cause wherein there seems to be any point of difficulty.

Accedas ad CURIAM. } See the articles } *ACCEDAS.*
Auxilium CURIAE. } } *AUXILIUM.*

CURIA baronum. See **COURT-BARON**.

CURIA claudenda, is a writ that lies against him who should fence and enclose the ground, but refuses or defers to do it.

CURIA militum*, a court so called; antiently held at Carisbrook-castle, in the isle of Wight.

* Et idem Dominus Willelmus de Insula facere debet festam ad curiam armis castri de Carisbroc, de tribus septimanis in tres septimanas, in curia quæ vocatur curia militum.

Relius

Refus in CURIA. See the article RECTUS.

CURIA, among the Romans, denoted a portion, or division of a tribe.

In the time of Romulus, a tribe consisted of ten *curiae*, or a thousand men; each *curia* being one hundred: that legislator made the first division of his people into thirty *curiae*.

Afterwards, *curia*, or *domus curialis*, became used for the place where each *curia* held its assemblies.

Hence, also, *curia* passed to the senate-house; and it is from hence the moderns come to use the word *curia*, court, for a place of justice, and for the judges, &c. there assembled*. See COURT.

- Varro derives the word from *cura*, care, *q. d.* an assembly of people charged with the care of public affairs: others deduce it from the Greeks; maintaining, that at Athens they called *kuria* the place where the magistrate held his sittings, and the people used to assemble: *kuria*, again, may come from *kurō*, authority, power; in regard, it was here the laws were made.

CURIALITAS anglia. See COURTESY of England.

CURIO, the chief, and priest of a *curia*. See CURIA.

Romulus, upon dividing the people into *curiae*, gave each division a chief, who was to be priest of that *curia*, under the title of *curio*, and *flamen curialis*.

His business was to provide and officiate at the sacrifices of the *curia*, which were called *curiales*; the *curia* furnishing him with a sum of money on that consideration: which pension or appointment was called *curionum*.

Each division had the election of its *curio*; but all these particular *curios*, were under the direction of a superior, or general, called *curio maximus*; who was the head of the body; and elected by all the *curios*, assembled in the *comitia curiata*.

All these institutions were set a-foot by Romulus, and confirmed by Numa, as Halicarnassus relates it. Godwyn will have two *curios* in each *curia*.

CURIOSUS, an officer of the Roman empire, during the middle age, appointed to take care that no frauds and irregularities were committed; particularly no abuses in what related to the posts, the roads, &c. and to give intelligence to the court of what passed in the provinces.

This made the *curiosi* people of importance; and put them in a condition of doing more harm than they prevented: on which account, Honorius cashiered them, at least in some parts of the empire, anno 415.

The *curiosi* came pretty near to what we call controllers: they had their name from *cura*, care; *quod curis agendis & evellendis curis publicis inspicendis operam darent*.

Academy of the CURIOSI natura. See ACADEMY.

CURLING stuff, in joinery. See CROSS-GRAINED stuff.

CURNOCK, a measure of corn, containing four bushels, or half a quarter.

CURRENTS, or **CURRANS**, a kind of little raisins, or dried grapes of different colours, black, white, or red; brought from several places of the Archipelago, and among others, from the isthmus of Corinth; whence their name, *currants*, *q. d. corinthi*.

They must be chosen new, small, and in large masses; and care be taken that the little Spanish *currants* be not soiled in their room.—When made up in bales, they may keep two or three years, without stirring, or giving them air.—Their use is in seasoning several viands, and in some medicinal compositions; where they serve in lieu of raisins. Sir George Wheeler's account of these fruits, and the manner of preparing them is very curious.—The island of Zant, he observes, is the chief place whence *currants* are brought: the Morea, or the isthmus of Corinth, which was antiently the principal plantation, and whence the Latins denominated them *uvae Corinthiacae*, now produces no more; as having been much neglected: the jealousy of the Turks not allowing large vessels to enter the gulph to take them off their hands.

They do not grow on bushes, like our gooseberries, though that be the common opinion; but on vines, like other grapes; except that the leaves are somewhat thicker, and the grapes somewhat smaller: they have no stone, and, in this country, are all red, or rather black.

They gather them in August, dispose them in couches on the ground till they be dry, clean them, and lay them up in magazines, which the natives call *seraglio's*; pouring them in at a hole, till the magazine be full. They cling so fast together by their own weight, that they are forced to be dug out with iron instruments.

To barrel them for sending abroad, they have people who grease their feet and legs, and tread them close, that they may keep the better. They are sold for about twelve crowns the thousand weight; and pay as much custom to the state of Venice.

Zant produces enough yearly to load five or six vessels; Cephalonia three or four; and the other islands one. The English have a factory at Zant; the Dutch two or three merchants, and the French one: the English consuming more than six times the quantity that both France and Holland do together.

Those of Zant know but little of the use we make of them; being persuaded they only serve in dyeing of cloth; and being entirely ignorant of the luxury of Christmas pyes, and English puddings.

CURRENT, or **COURANT money**, good money, or that which

passes in commerce from one to another. See COURANT.

CURRENT accounts.

CURRENT coin.

CURRENT price.

See the articles BOOK.

COIN.

PRICE.

CURRENT, **CURRENTO**, also denotes a sort of running French dance—sometimes, a musical air in triple time. See COURANT.

CURRENT, in hydrography, a stream, or flux of water in any direction.

Currents, in the sea, are either *natural* and *general*, as arising from the diurnal rotation of the earth on its axis; or *accidental* and *particular*, caused by the waters being driven against promontories, or into gulphs and straits; where, wanting room to spread, they are driven back, and thus disturb the ordinary flux of the sea.

The *currents* are so violent under the equator, where the motion of the earth is the greatest, that they carry vessels very speedily from Africa to America; but absolutely prevent their return the same way: so that ships are forced to run as far as the fortieth degree of latitude, to find a passage into Europe.

In the Straights of Gibraltar, the *currents* almost constantly drive to the eastward, and carry ships into the Mediterranean: they are usually, too, found to drive the same way in St. George's channel. The great violence and dangerousness of the sea in the straits of Magellan, is attributed to two contrary *currents* setting in, one from the south, and the other from the north sea.

CURRENTS, with respect to navigation, may be defined, certain progressive motions of the water of the sea, in several places, either quite down to the bottom, or to a certain determinate depth; by which a ship may happen to be carried forward more swiftly, or retarded in her course, according to the direction or setting of the *current*, in, with, or against the course or way of the ship.

The business of *currents* making a considerable article in navigation; the way they set, together with their strength, is to be carefully observed: this some do by the ripples of the water, and by the driving of the froth along the shore, when in sight of it: but the more usual, as well as more accurate way, is thus:

They first fix their boat, by throwing out a triangular piece of wood, with a piece of lead fastened to it and tied to the stem of the boat with a cord; and letting it sink sixty fathom, or more; or, sometimes, by a kettle tied by the bowl, and sunk as the other. By either of these means, the boat is brought to ride as at anchor; which done, the log is cast over, the glass turned, and as the log-line veers out, the drift of the log is set with the compass.

This shews whether there be any *current*, or none; and if any, which way it sets, and at what rate it drives: observing, however, to add something to the drift, for the boat's drift; for tho' she appear to stand still, yet, in reality, she is found to move. This addition experience has thus determined; if the line she ride by be sixty fathom, a third part of the drift to be added; if eighty fathom, a fourth; if an hundred, a fifth.

If a ship sail along the direction of a *current*, it is evident the velocity of the *current* must be added to that of the vessel: if her course be directly against the *current*, it must be subtracted; if she sail athwart the *current*, her motion will be compounded with that of the *current*; and her velocity augmented or retarded, according to the angle of her direction, with that of the direction of the *current*; i. e. she will proceed in the diagonal of the two lines of direction, and will describe or pass through that diagonal in the same time wherein she would have described either of the sides, by the separate forces.

To determine a ship's course and distance, sailing obliquely with, or against a *current*. Suppose, *v. gr.* she sails N. E. 110 miles, in a *current* which sets S. W. 30 miles in the same time: to solve the problem geometrically; set off four points from N towards E, (Tab. Navigation, fig. 15.) and draw AC equal to 110 miles; from C draw CB, parallel to the line NNE, and equal to 30 miles: lastly, draw AB, which will be the ship's true course and distance.

To find which trigonometrically. In the triangle ABC, there are given AC 110, BC 30, and the angle C, $22^{\circ} 30'$; then, $A + CBC$: AC — BC :: t , $\frac{1}{2} A + B$: t , $\frac{1}{2} B - A$. That is, as the sum of AC and B C, *viz.* 140, is to their difference 80:: so is the tangent of $78^{\circ} 45'$ to the tangent $10^{\circ} 49'$. Hence her true course appears to be N. E. $7^{\frac{1}{2}} 56'$ easterly. For her distance; as the sine of the angle A, $7^{\circ} 56'$, is to the drift of the *current* B C, 30, so is the sine of the angle at C $22^{\circ} 30'$, to the distance run, 83, two miles.

Under-CURRENTS.—Dr. Halley makes it highly probable, that in the Downs, in the Straights of Gibraltar, &c. there is an *under-current* whereby as much water is carried out, as is brought in by the *upper-current*. See UNDER-CURRENTS.

This he argues from the offing between the north and south Foreland, where it runs tide and half-tide, i. e. it is either ebb or flood in that part of the Downs three hours ere it is so off at sea: a certain sign, that though the tide of flood runs aloft, yet the tide of ebb runs under-foot, i. e. close by the ground; and so at the tide of ebb it will flow under-foot. This he confirms by an experiment in the Baltic Sound, communicated to him by an able seaman present at the making it: being there, then, with one of the king's frigates, they went with

with their pinnace into the mid-stream, and were carried violently by the *current*. Soon after that, they sunk a basket with a large cannon-bullet, to a certain depth of water, which gave check to the boat's motion; and sinking it still lower and lower, the boat was driven a-head to the windward, against the *upper-current*: the *current* aloft, not being above four or five fathom deep. He added, that the lower the basket was let down, the stronger the *under-current* was found. From this principle, it is easy to account for that vast draught of water continually pouring in with the *current* out of the Atlantic into the Mediterranean, through the Straights of Gibraltar; a passage about twenty miles broad: yet, without any sensible rising of the water along the coasts of Barbary, &c. or any overflowing of the lands, which there lie very low.

CURRICULUS*, in our ancient writers, denotes the year, or course of a year.

* *Annus est hoc annorum dominicæ incarnationis quater quinquagenis & quingenis, quinis lustis & tribus curriculis, i. e.* In the year 1028; for four times fifty makes two hundred, and five times two hundred makes one thousand; five *lustra* are twenty-five years, and three *curriculi* are three years.

CURRIED hide. See the article **HIDE**.

CURRYING, a method of preparing leather, with oil or tallow; which raises on the hair, or wool-side, a kind of grain, not unlike that of morocco.—Though there is also a kind of *curried* leather without grain.

Currying is the last preparation, and puts the leather in a condition to be used for shoes, saddles, harness, &c. It is equally practised on sheep, calf, and bullocks-skins.

The colours given in *currying* are, black, white, red, yellow, and green: the other colours are given by the skimmers; who differ from the *curriers* in this, that they apply their colours on the flesh-side; the *curriers* on the hair-side.

Manner of currying in black, with the grain.—Of blacks there are four cases: either the skins are put in tallow on both sides; or oil is used, in lieu of tallow, on the flesh-side; or tallow is used alone on the hair-side, and nothing on the other; or tallow is used on both sides, but no grain raised.

The two first are used for cows and calves leather; the second is the only way used for sheep; and the two last are used occasionally for cow and bullock: for calf and sheep, they use *sumac* on the flesh-side, which gives an orange-cast.

For *neats-skin* in black; the skin, coming from the tanner, is wet several times with a broom, rolled and trod under-foot to make it tractable, drained, and as much of the remaining flesh as possible taken off with the knife; hung in the air till half dry, then wet and trampled again, and again.

This done, it is rubbed over with a pummel, or call having niches in manner of teeth, to render it still more pliant; and singed with straw, to prepare it to receive the tallow; which is applied, boiling hot, on both sides.

The skin is then singed a second time, laid four hours in a vessel of fresh water, trampled, and worked a second time with the pummel on each side, and stoutly drained; smeared over with its first black made of galls and ferailles, boiled in beer-agre, or four beer; half dried, stretched on a table, and the grain beat down with a flat iron instrument drawn over it from place to place.

It now receives its second black, made of galls, copperas, and gum arabic; when dry, and stretched on a table, it is smeared over with beer-agre; then folded from corner to corner, and the pummel drawn over it to cut the grain, first on the hair-side, then on the flesh-side; the last with a pummel of cork: the beer hanging in it is taken out with a hair rubber, boiled in hatter's lye; and the skin fastened to the table, and cleaned with the iron instrument abovementioned, and again wiped with a piece of worsted stocking. The skin is now brightened, on the hair-side with a lustre made of barberries, to prepare it to receive its last grain. The grain, we already observed, is begun, by folding the skin, the hair-side inwards, several ways: to finish it, it is again folded, after its first lustre, two ways; first from corner to corner, a little slanting; then a-cross, *i. e.* first directly, or from eye to eye, then from head to tail.

The grain thus formed, the last lustre, which makes its last preparation, is given; composed of gum arabic, garlic, beer vinegar, and Flanders size, boiled together, and applied cold.

Calf-skin, in black, is prepared much after the same manner; though begun differently. After wetting, taking off as much of the flesh remaining as possible, and drying; they pounce the flesh-side with a hard, rough, pumice-stone, which makes it more smooth and gentle; then give the grain with the pummel, put in the tallow: the rest as before.

Sheep-skins, in black. What these have peculiar in their preparation, is, that they are first stretched on a table to get off the bourre, or tan wherewith they are laden; then wet, trod under-foot, and tallow added on the hair-side: they are again wet, again trod, stretched on the table, and the water squeezed out with the pummel; then blacked, repassed under the pummel on each side, dried, and all the roughness and inequality pared off with a flat, round, cutting instrument: the rest as before.

Sheep-leather, or that without any grain, made of cows or bul-

locks skins, differs a little in its preparation from the former. The skins being wet, trod, and passed under the pummel, the flesh is taken off; the rest as in the first article: observing, that the tallow be applied on both sides as thick as possible: being now steeped in water, trod, frized, and blacked the first time; the second black is next laid on, till the hair-side be quite smooth. Lastly, after receiving the two lustres, they are pressed between two tables; without plating or folding them in any manner during the whole preparation.

CURSED. See the articles **ACCURSED** and **CORNNED**.

CURSITOR, an officer or clerk belonging to the court of chancery, who maketh out original writs.

These are also called *clerks of the curse*; and are twenty four in number: making a corporation of themselves. To each of them are allotted several shires; in which shires they make out such original writs as are by the subject required.

CURSOR, a little ruler, or label of brass, divided like a line of fines, and sliding in a groove, or notch, along the middle of another label, or ruler, representing the horizon, and always at right angles to it.—It is used in the analemma.

CURSOR is also used for a point screwed on the beam-compass; and which may be moved, or slid along the beam thereof, for the striking of greater or less circles. See **Beam-Compass**.

CURTAILING, in the manage, the docking, or cutting off a horse's tail.

The practice of *curtailing* is no where in vogue so much as in England; it being a popular opinion, that the cutting off the tail renders the horse's chine or back the stronger, and more able to bear burdens: which seems warranted by experience.

The amputation is usually made between the fourth and fifth joints of the tail; a ligature being first tied tight about the place, to prevent the flux of blood; and the raw stump afterwards seared up with a hot iron, till the extremities of the vessels be all stopped.

CURTAIN, in fortification. See the article **CURTIN**.

CURTATE distance, in astronomy, the distance of a planet's place from the sun, reduced to the ecliptic; or, the interval between the sun, and that point where a perpendicular let fall from the planet, meets with the ecliptic.

CURTATION, the interval between a planet's distance from the sun, and the *curtate* distance.

From the preceding article, it is easy to find the *curtate distance*; whence the manner of constructing tables of *curtations* is obvious.

The quantity of inclination, reduction, and *curtation* of a planet, depending on the argument of the latitude; Kepler, in his *Rudolphin tables*, reduces the tables of them all into one, under the title of *tabula latitudinaria*.

CURTESY. See the article **COURTESY**.

CURTICONE, in geometry, a cone whose top is cut off by a plane parallel to its basis; called also *truncated cone*. See **TRUNCATED**.

CURTIN*, **CURTAIN**, or **COURTINE**, in fortification, that part of a wall, or rampart, which is between two bastions; or which joins the flanks thereof.—See *Tab. Fortif. fig. 21. lit. q. q.*

* Du Cange derives the word from the Latin *curtina*, *quasi minor curtis*, a little country court, inclosed with walls: he says, it was in imitation hereof, that they gave this name to the walls and parapets of cities, which inclose them like courts; he adds, that the *curtains* of beds take their name from the same origin; that *curtis* was the name of the general's, or prince's tent; and that those who guarded it were called *curtinarii* and *curtisarii*.

The *curtin* is usually bordered with a parapet five foot high; behind which the soldiers stand to fire upon the covert way, and into the moat.

Besiegers seldom carry on their attacks against the *curtin*; because it is the best flanked of any part. See **FLANK**.

Angle of the CURTIN.

See the articles **ANGLE**, **COMPLEMENT of the CURTIN**, and **COMPLEMENT**.

CURVATURE of a line, is its bending, or flexure; whereby it becomes a curve, of such peculiar form and properties.

Thus, the *curvature* of the circle is such, as that all points of the periphery are equally distant from one point within, called the *center*.

The *curvatures* of different circles, are to each other reciprocally as their radii.

CURVE, in geometry, a line whose several points tend several ways, or are posited towards different quarters. See **LINE**.

In this sense, the word is used in opposition to a *straight line*; whose several points are posited towards the same quarter.

Hence, figures terminated with lines of the first sort are called *curvilinear* figures; in opposition to those terminated with the latter, called *rectilinear* figures.

The doctrine of *curves*, and of the figures and solids generated from them, constitute what we call the *higher geometry*.

In a *curve*, the line A D, (Tab. *Geometry*, fig. 51.) bisecting the parallel lines M M, is called the *diameter*: if the lines be equidistant, and it cut them at right angles, it is called the *axis*; and the point A, whence the diameter is drawn, is called the *vertex*.

The equidistant lines M M are called *ordinates*, or *applicates*; and

and their halves, *P M*, *femioordinates*.

The portion of the diameter *A P*, between the vertex, or other fixed point, and an ordinate, is called the *abscissa*. And the concourse of all the diameters, the center.

Curves are distinguished into *algebraic*, frequently with Des Cartes called *geometrical*; and *transcendental*, called by the same Cartes, &c. *mechanical curves*.

Algebraical CURVES, are those wherein the relation of the abscisses *A P*, *A P*, *A P*, fig. 52. to the femioordinates *M P*, *M P*, *M P*, may be expressed by an algebraical equation.

Suppose, *v. gr.* in a circle, $AB = a$, $AP = x$, $PM = y$; then will $PB = a - x$; consequently, as $PM = AP \cdot PB$, $y = ax - x^2$. Or, suppose $PC = x$, $AC = a$, $PM = y$; then will $MC = PC^2 = PM^2$; that is, $a^2 - x^2 = y^2$.

Note, Those are also called *algebraical curves*, which are of a determinate order; so, as that the equation always continues the same in the several points of the curve.

Moff authors, after Des Cartes, call algebraic curves, *geometrical* ones; as admitting none else into the construction of problems; nor, consequently, into geometry. But Sir Isaac Newton, and after him Messr. Leibnitz and Wolfius are of another opinion; and think, that in the construction of a problem, one curve is not to be preferred to another, for its being defined by a more simple equation, but for its being more easily described.

Transcendental CURVE, is that which cannot be defined by an algebraic equation.

These curves, Des Cartes, &c. call *mechanical* ones (see *MECHANICAL*) and under that notion exclude them out of geometry: but Newton and Leibnitz, for the reason abovementioned, are of another opinion. Indeed, Leibnitz has found a new kind of equations, which he calls *transcendental equations*; whereby even *transcendental curves*, and those which are not of any determinate order, *i. e.* which do not continue the same in all the points of the curve, may be defined. *Act. erudit. Lips.* an. 1684. p. 234.

Algebraical CURVES of the same kind or order, are those whose equations rise to the same dimension.

Geometrical lines being defined by the relation between the ordinates and abscisses, or (which is the same, by the number of points wherein they may be cut by a right line) are well distinguished into two kinds or orders: in which view, lines of the first order will be right lines; and those of the second, or quadratic order, will be curves, *viz.* the conic sections.

Now, a curve of the first kind is the same with a line of the second, (a right line not being numbered among curves) and a curve of the second kind, is the same with a line of the third. Thus, curves of the first kind, are those whose equations rise to two dimensions; if they rise to three, the curves are of the second kind; if to four, of the third, &c.

Thus, *e. gr.* the equation for a circle is, $y^2 = ax - x^2$, or $a^2 - x^2 = y^2$. A circle, therefore, is a curve of the first kind.

Again, a curve of the first kind, is that defined by the equation $ax = y^2$; and a curve of the second kind, that defined by the equation $a^2 = x^2 + y^2$.

For the various curves of the first kind, and their properties, see *CONIC SECTIONS*.

For curves of the second kind, Sir Isaac Newton has a distinct treatise, under the title of *enumeratio linearum tertii ordinis*.

Curves of the second and other higher kinds, he observes, have parts, and properties similar to those of the first: thus, as the conic sections have diameters and axes; the lines cut or bisected by these, are called *ordinates*; and the intersection of the curve and diameter, the *vertex*: so, in curves of the second kind, any two parallel right lines being drawn so as to meet the curve in three points; a right line cutting these parallels so, as that the sum of the two parts between the secant and the curve on one side, is equal to the third part terminated by the curve on the other side, will cut, in the same manner, all other right lines parallel to these, and that meet the curve in three points, *i. e.* so, as that the sum of the two parts on one side, will be still equal to the third part on the other side.

These three parts, therefore, thus equal, may be called *ordinates*, or *applicates*; the secant the *diameter*; and where it cuts the ordinates at right angles, the *axis*: the intersection of the diameter and the curve, the *vertex*; and the concourse of the two diameters, the center; and the concourse of all the diameters, the common or general center.

Again, as a hyperbola of the first kind has two asymptotes; that of the second has three, that of the third four, &c. and as the parts of any right line between the conic hyperbola and its two asymptotes are equal on either side; so, in hyperbolas of the second kind, any right line cutting the curve and its three asymptotes in three points; the sum of the two parts of that right line, extended from any two asymptotes, the same way, to two points of the curve, is equal to the third part, extended from the third asymptote, the contrary way, to the third point of the curve. See *ASYMPTOTE*, *HYPERBOLA*, &c.

Again, as in other conic sections, not parabolic, the square of an ordinate, *i. e.* the rectangle of the ordinates drawn to contrary parts of the diameter, is to the rectangle of the parts of the diameter terminated at the vertices of an ellipsis or hyper-

bola, as a given line, called the *latus rectum*, is to that part of the diameter which lies between the vertices, and called the *latus transversum*: so, in curves of the second kind, not parabolic, the parallelepiped under three ordinates, is to the parallelepiped under the parts of the diameter cut off at the ordinates and the three vertices of the figure, in a given ratio: wherein, if there be three right lines situate at the three parts of the diameter between the vertices of the figure, each to each; then those three right lines may be called the *latera recta* of the figure, and the parts of the diameter between the vertices, the *latera transversa*.

And, as in a conic parabola which has only one vertex to one and the same diameter, the rectangle under the ordinates, is equal to the rectangle under the part of the diameter cut off at the ordinates and vertex, and a given right line called the *latus rectum*: so, in curves of the second kind, which have only two vertices to the same diameter, the parallelepiped under three ordinates, is equal to the parallelepiped under two parts of the diameter cut off at the ordinates and the two vertices, and a given right line, which may therefore be called the *latus transversum*.

Further, as in the conic sections, where two parallels terminated on each side by a curve, are cut by two parallels terminated on each side by a curve; the first by the third, and the second by the fourth: the rectangle of the parts of the first, is to the rectangle of the parts of the second, as that of the second is to that of the fourth: so, when four such right lines occur in a curve of the second kind, each in three points; the parallelepiped of the parts of the first, will be to that of the parts of the second, as that of the second to the parts of the fourth.

Lastly, the legs of curves, both of the first, second, and higher kinds, are either of the parabolic or hyperbolic kind: an hyperbolic leg, being that which approaches infinitely towards some asymptote; a parabolic, that which has no asymptote.

These legs are best distinguished by their tangents; for, if the point of contact go off to an infinite distance, the tangent of the hyperbolic leg, will coincide with the asymptote; and that of the parabolic leg, recede infinitely, and vanish. The asymptote, therefore, of any leg, is found by seeking the tangent of that leg to a point infinitely distant; and the bearing of an infinite leg, is found by seeking the position of a right line parallel to the tangent, when the point of contact is infinitely remote: for this line tends the same way towards which the infinite leg is directed.

Reduction of CURVES of the second kind.—Sir Isaac Newton reduces all curves of the second kind to four cases of equations: in the first, the relation between the ordinate and abscissa, making the abscissa x , and the ordinate y , assumes this form $xy + ey = ax^2 + bx + cx + d$. In the second case, the equation assumes this form $xy = ax^2 + bx^2 + cx + d$. In the third case, the equation is $y = ax^2 + bx^2 + cx + d$. In the fourth, the equation is of this form, $y = ax^2 + bx^2 + cx + d$.

Enumeration of the CURVES of the second kind.—Under these four cases, the same author brings a vast number of different forms of curves, to which he gives different names.

A hyperbola lying wholly within the angle of the asymptotes, like a conic hyperbola, he calls an *inscribed hyperbola*; that which cuts the asymptotes, and contains the parts cut off within its own periphery, a *circumscribed hyperbola*; that, one of whose infinite legs is inscribed, the other circumscribed, he calls *ambigenal*; that whose legs look towards each other, and are directed the same way, *converging*; that where they look contrary ways, *diverging*; that where they are convex different ways, *cross-legged*; that applied to its asymptote with a concave vertex and diverging legs, *conchoidal*; that which cuts its asymptote with contrary flexures, and is produced each way into contrary legs, *anguineous*, or *snake-like*; that which cuts its conjugate a-crofs, *cruciform*; that which returning around cuts itself, *nodated*; that whose two parts concur in the angle of contact, and there terminate, *cuspidated*; that whose conjugate is oval, and infinitely small, *i. e.* a point, *pointed*; that which from the impossibility of its two roots, is without either oval, node, cusp, or point, *pure*: and in the same manner he denominates a parabola, to be *converging*, *diverging*, *cruciform*, &c. Where the number of hyperbolic legs, exceeds that of the conic hyperbola; he denominates the *hyperbola redundant*.

Now, the various curves which he enumerates under these four cases, are in number 72; whereof nine are *redundant* hyperbolas, without diameters, having three asymptotes including a triangle, the first consisting of three hyperbolas, one *inscribed*, another *circumscribed*, another *ambigenal*, with an oval; the second *nodated*; the third *cuspidated*; the fourth *pointed*; the fifth and sixth *pure*; the seventh and eighth *cruciform*; the last *anguineal*. There are twelve *redundant* hyperbolas, having only one diameter: the first oval, the second *nodated*, the third *cuspidated*, the fourth *pointed*; the fifth, sixth, seventh, and eighth, *pure*; the ninth and tenth *cruciform*; the eleventh and twelfth *conchoidal*.

Two are *redundant* hyperbolas, with three diameters. Nine are *redundant* hyperbolas, with three asymptotes converging to a common point; the first formed of the fifth and sixth *redundant* parabolas, whose asymptotes include a triangle; the second, of the seventh and eighth; the third and fourth, of the

ninth; the fifth is formed of the fifth and seventh of the redundant hyperbolas, with one diameter; the sixth, of the sixth and seventh; the seventh, of the eighth and ninth; the eighth, of the tenth and eleventh; the ninth, of the twelfth and thirteenth: all which conversions are effected, by distinguishing the triangle comprehended between the asymptotes, till it vanish into a point. Six are defective parabolas, having no diameters: the first *oval*, the second *nodated*, the third *cuspidated*, the fourth *pointed*, the fifth *pure*.

Seven are defective hyperbolas, having diameters: the first and second *conchoidal*, with an *oval*; the third *nodated*, the fourth *cuspidated*, which is the cissoid of the antients; the fifth and sixth *pointed*, the seventh *pure*.

Seven are parabolic hyperbolas, having diameters: the first *oval*, the second *nodated*, the third *cuspidated*, the fourth *pointed*, the fifth *pure*, the sixth *cruciform*, the seventh *angineus*.

Four are parabolic hyperbolas. Four are hyperbolisms of the hyperbola. Three hyperbolas of the ellipsis. Two hyperbolisms of the parabola.

Five are diverging parabolas: one, a *trident*, the second *oval*, the third *nodated*, the fourth *pointed*, the fifth *cuspidated*; (this is Neil's parabola, usually called the *semicubic parabola*;) the sixth, *pure*.

Lastly, one commonly called the *cubic parabola*.

Organical description of CURVES.—10. If two angles given in magnitude, P A D, P B D, (Tab. Geometry, fig. 53.) revolve round poles given in position, A and B; and their legs, A P, B P, with their point of concurrence, P, pass over another right line: the other two legs A D, B D, with their point of concurrence D, will describe a conic section passing through the poles A, B: unless that line happen to pass through either of the poles A or B; or unless the angles B A D and A B D vanish together: in which cases, the point will describe a right line.

2^a. Now, if the legs, A P, B P, by their point of concurrence, P, thus describe a conic section passing through one of the poles, A; the other two, A D, B D, with their point of concurrence D, will describe a curve of the second kind, passing through the other pole B, and having a double point in the first pole A: unless the angles B A D, A B D, vanish together; in which case, the point D will describe another conic section, passing through the pole A.

3^a. If the conic section described by the point P, pass through neither of the poles A, B; the point D will describe a curve of the second or third kind, having a double point: which double point will be found in the concurrence of the describing legs A D, B D, when the two angles B A P, A B P, vanish together. The curve described will be of the second kind, when the angles B A D, A B D, vanish together; otherwise of the third kind, having two other double points in the poles A and B.

With regard to double points of curves: we have observed that curves of the second kind may be cut by a right line in those points: now two of these sometimes coincide, v. gr. when the right line passes through an infinitely small oval; or through the concurrence of two parts of a curve, mutually cutting each other, and uniting in a cusp. Sometimes all the right lines only cut the curve in one point; as in ordinates of the cartesian and cubic parabola, &c. In which case, we must conceive the right lines passing through two other points of the curve, placed, as it were, at an infinite distance: two of these coincident intersections, whether at a finite or infinite distance, make what we call a double point.

Genesis of CURVES of the second order by shadows.—If the shadows of figures be projected on an infinite plane, illumined by a lucid point; the shadows of conic sections will still be conic sections; those of curves of the second kind, will be curves of the second kind; those of the third kind, curves of the third kind, &c. And as a circle, in projecting a shadow, generates all the conic sections; so, the five diverging parabolas, with their shadows, generate and exhibit all other curves of the second kind.

And in this manner may a train of simple curves of other kinds be found, which shall form all the other curves of the same kind, by their shadows projected from a lucid point, upon a plane.

Description of CURVES of the second order, having double points.—

These are all described from seven given points, whereof one is the double point itself: thus, let there be given any seven points of the curve to be described; as, v. gr. A, B, C, D, E, F, G, (Tab. Geometry, fig. 54.) whereof A is the double point: join the point A, and any other two points, v. gr. B and C; and let the angle C A B of the triangle A B C, revolve about its vertex A; and another of the angles A B C, about its vertex B. And when the point of concurrence C, of the legs A C, B C, is successively applied to the four other points, D, E, F, G, let the concurrence of the remaining legs A B and B A, fall on the four points P, Q, R, S.

Through those four points, and the fifth A, describe a conic section; and let the forementioned angles C A B, C B A, so revolve, as that the point of concurrence of the legs A B, B A, may pass over that conic section; and the concurrence of the other legs A C, B C, will describe the proposed curve.

Use of these CURVES in the construction of equations.—The use of curves in geometry is, by means of the intersections thereof, to solve problems. See CONSTRUCTION.

Suppose, v. gr. an equation to be constructed of nine dimensions, as $x^9 + b x^8 + c x^7 + d x^6 + e x^5 + f x^4 + g x^3 + h x^2 + k x + l = 0$; where $b, c, d, \&c.$ signify any given quantities affected with the signs + and —: assume the equation to a cubic parabola $x^3 = y$; and the first equation, writing y for x^3 will come out $y^3 + b y^2 + c y + d y^2 + e y + f y + g y^2 + h y + k y + l = 0$; an equation to another curve of the second kind, where m or f may be assumed or annulled at pleasure. And by the descriptions and intersections of these curves will be given the roots of the equation to be constructed. It is sufficient to describe the cubical parabola once. If the equation to be constructed, by omitting the two last terms $h x$ and k , be reduced to seven dimensions; the other curve, by expunging m , will have the double point in the beginning of the abscissa, and may be easily described as above: if it be reduced to six dimensions, by omitting the three last terms, taking $g x^2 + h x + k$; the other curve, by expunging f , will become a conic section: and if, by omitting the three last terms, the equation be reduced to three dimensions, we shall fall on Dr. Wallis's construction by the cubic parabola and right line.

Rectification of a CURVE, denotes the finding a right line equal to a curve. For the praxis hereof, see RECTIFICATION of curves.

Inflexion of a CURVE. See the article INFLECTION.

Quadrature of a CURVE, the finding the area, or space included by a curve; or the assigning a square equal to a curvilinear space.

Family of CURVES, is an assemblage of several curves of different kinds, all defined by the same equation of an indeterminate degree; but differently, according to the diversity of their kind.

E. gr. Suppose an equation of an indeterminate degree, $a^m - 1 x^m = y^n$. If $m = 2$, then will $a x = y^n$; if $m = 3$, then will $a^2 x = y^n$; if $m = 4$, then $a^3 x = y^n$, &c. All which curves are said to be of the same family, or tribe.

The equations whereby the families of curves are defined, are not to be confounded with the transcendental ones: for though, with regard to the whole family, they be of an indeterminate degree, yet, with respect to each several curve of the family, they are determinate; whereas transcendental equations are of an indefinite degree, with respect to the same curve.

All algebraic curves, therefore, compose a certain family, consisting of innumerable others; each whereof comprehends infinite kinds. For since the equations whereby the curves are defined enter the facta, either of the powers of the abscissas and semiordinates into the given coefficients, or of the powers of the abscissas into the powers of the semiordinates, or of the mere given quantities; and all equations may be equal to nothing, (v. gr. if $a x = y^n$, then $a x - y^n = 0$); the equation for all algebraic curves will be $a y^m + b x^n + c y^p x^q + d f = 0$.

Causitic CURVE. See the articles CAUSTIC.

Diacaustic CURVE. See the article DIACAUSTIC.

Exponential CURVE, is that defined by an exponential equation; that is, by an equation wherein is an exponential quantity, v. gr. $x^x, a^x, \&c.$

The symptoms, properties, genesis, &c. of particular curves, v. gr. the cycloid, logarithmic curve, conchoid, &c. see under their proper heads, CYCLOID, LOGARITHMIC, CONCHOID, &c.

Radial CURVES.

Regular CURVES. See the article REGULAR.

Characteristic triangle of a CURVE. See the article CHARACTERISTIC.

CURVET, in the manage. See COURVET.

CURVILINEAR, or **CURVILINEAL figures**, in geometry, are spaces bounded by crooked lines; as the circle, ellipsis, spherical triangle, &c.

CURVILINEAR angle. See the articles ANGLE.

CURVILINEAR superficies. See the articles SUPERFICIES.

CURULE chair, *sella CURULIS*, in antiquity, a high ivory chair, wherein certain of the Roman magistrates had a right to sit.

The curule magistrates were the aediles, pretors, censors, and consuls.

The senators who had born these charges, were carried to the senate on curule chairs; as also those who triumphed: the chair being fitted into a kind of chariot, *currus*; whence the origin of the word curulis.

The curule chair is used on medals, to express a curule magistracy: when traversed by a hasta, it is the symbol of Juno, and serves to express the conservation of princepses.

CURULE statues. See the article STATUE.

CUSP, *cusps*, properly denotes the point or a spear, or sword; but is used in astronomy, to express the points of horns of the moon, or other luminary.

In astrology, Cusp is used for the first point of each of the twelve houses, in a figure, or scheme of the heavens. See HOUSE.

CUSPIDATED, in botany, is when the leaves of a flower end in a cusp, or point, resembling that of a spear.

CUSPIDATED hyperbola, &c. See CURVE.

CUSTODE admittendo, and **CUSTODE anovendo**, are writs for the admitting, or removing of guardians.

CUSTODES libertatis anglie, autoritate parlamenti, was the style or title in which writs, and other judicial proceedings, did run in the time from the death of king Charles I. till Oliver was declared protector, &c.

CUSTODIA. See RECTO de custodia terre & hereditatis.

Hic.

Herede deliberando illi qui habet CUSTODIAM terræ. See *HæREDE*.

CUSTOM is used to denote the manners, ceremonies, or ways of living of a people, which in time have turned into habit, and by usage obtained the force of laws.

In this sense, *custom* implies things that were at first voluntary, but are become necessary by use: thus, the presents made by officers at their admission into posts, are only due because they have passed into *custom*.

CUSTOM also signifies the doing, or not doing, certain things, introduced by the greatest part of the people of a country, or province.

If there be nothing evil in such *custom*, it obliges, till it be either abrogated by a contrary *custom*, or a law.

For a *custom* thus established to have the force of a law, it is necessary, ordinarily, that it be founded on some natural equity, or some considerable good; and that it have subsisted *ultra trituncum*: but, as this is hard to prove, it is sufficient if two or more witnesses depose they heard their fathers say the same of their time. If it be matter of record, the continuance of 100 years is sufficient.

The effect of a *custom* thus circumstantiated, is, that it has the same force and authority as a law; making what we call *lex non scripta*; and that in popular states and limited monarchies, it serves to interpret the written laws: for in absolute monarchies, it is the king alone has the power of interpreting laws. Hence, the word *custom* is still retained, and serves to express the particular rights and municipal laws established by usage in particular provinces, &c. after they are reduced into written laws.

In this sense, most of the common law of England is *lex non scripta*; being originally no more than the *customs* of our forefathers.

Lex non scripta, in this sense, is used in opposition to *statutes* or *acts of parliament*; which commence laws at once.

Cowel distinguishes *custom* from *prescription*, in that the former is more general, and relates to several persons; whereas the latter is usually confined to this or that man. Five years time, too, are ordinarily sufficient for prescription, whereas for *custom* there are required 100.

Customs are real things, and are included within their limits or territories: they are either *local*, i. e. restrained to this or that place, or *general*.

The *custom* of Paris, serves as a rule for all the other places of France; where they have no provisions contrary thereto.

The Romans were governed by *customs*, or unwritten laws, after the expulsion of their kings.

Cæsar observes, that the Gauls had their *customs*, which they constantly retained; and that it was impossible for the Romans to govern them by any other laws: so that it was only the provinces bordering on Italy that received the Roman laws.

Dower by CUSTOM. See the articles *DOWER*.

Suit CUSTOM. See the articles *SUIT*.

CUSTOMS, in commerce, the dues, duties, or tolls, paid by merchants to the king, for carrying out, and bringing in of merchandizes.

The *customs* of goods exported and imported, throughout England, amount yearly to 1300000 pounds; whereof those of the port of London make a third part.

The *customs* in England are very numerous, and very high; perhaps beyond what any other trading nation knows: the principal are duties of *turnage* and *ponnage*, which are very ancient, being the only ones in use before the time of king Charles II. But that prince, and his successors, have introduced divers others: at present, the *customs* on liquors are, *turnage*, the additional duty, the duty of *excise*, *coinnage*, duty of the *old imposition*, duty of the *additional imposition*, duty of *orphans money*, duty on French wines, *new subsidy*, $\frac{1}{2}$ and $\frac{2}{3}$ of *subsidies*.

For other merchandizes, the duties are, *ponnage*, the *additional* duty on silks and linens, *new imposition* of *ponnage*, another of $\frac{1}{2}$; a duty of 25 per cent. on French commodities; the *new subsidy* of *ponnage*, in 1697; an *additional subsidy* of $\frac{1}{2}$ of *ponnage* in 1703; a third in 1704; a duty on *fib* and *oils*, another on *leathers*, another on *paper*, *soap*, &c. See *these described more at large under the article DUTY*; see also *TUNNAGE*, *POUNNAGE*, &c.

CUSTOM-HOUSE, an office established on the frontiers of a state, or in some chief city, or port, for the receipt of the *customs* and duties of importation and exportation, imposed on merchandizes, by the authority of the sovereign, and regulated by tariffs, or books of rates.

There are several *custom-houses* in the several ports of England: the most considerable is that of London.—It is under the direction of seven commissioners appointed by patent; who have the charge and management of all the *customs* (the petty-farms alone excepted) in all the ports of England.

Other officers are, a *secretary*, *solicitor*, *receiver-general*, *comptroller* of the issues and payments of the receiver-general, *comptroller-general*, *inspector* of the out-port collectors accounts, *inspector-general* of the exports and imports, *register-general* of all ships of Great-Britain, *surveyor-general*, *surveyor* of the out-

ports, *register* of the seizures, &c. all holding their places by patents: with other inferior officers, appointed by warrant from the board of treasury.

CUSTOMARY tenants, *CUSTOMARII*, or *tenetarii per consuetudinem*, are such tenants as hold by the custom of the manor as their special evidence.

These were antiently bondmen, or those that held *tenura bondagii*.—*Et omnes illi qui tenuerint in bondagii tenura, solvant vocari customarii.*—*MS. de consuetud. man. de Sutton Colfield, de anno 3 Edw. II.*

CUSTOS brevium, a clerk, belonging to the court of common pleas; whose office is to receive, and keep all the writs, and put them upon files; every return by itself; and at the end of each term to receive of the prothonotaries all the records of the nisi prius, called the *posse*.

The writs are first brought in by the clerks of assize of every county to the prothonotary who entered the issue in that matter, to enter judgment. Four days after the return, the prothonotary enters the verdict, and judgment thereupon, into the rolls of the court; and then delivers them over to the *custos brevium*.

The *custos brevium* also makes entry of writs of covenant, and concords on fines; and makes copies and exemplifications of all writs and records in his office, and of all fines levied: the fines, when engrossed, are divided between the *custos brevium* and chirographer; the former keeping the writ of covenant and the note, the latter the concord, and foot of the fine.

In the court of the king's-bench, there is likewise a *custos brevium & rotulorum*, who files such writs as are there used to be filed, and all warrants of attorney; and transcribes or makes out records of nisi prius, &c.

CUSTOS rotulorum, he who has the custody of the rolls, or records of the sessions of peace; and some say, of the commissions of peace itself.

He is always a justice of peace, and quorum, in the county where he hath his office; and by his office appears to be rather a minister than a judge: for that the commission of the peace, by express words, lays this special charge upon him, *Quod ad dies & loca prædicta, brevia, præcepta, processus, & indilamentum prædicta coram te & dictis sociis tuis venire facias.*

CUSTOS spiritualium, he who exercises spiritual or ecclesiastical jurisdiction in any diocese, during the vacancy of the see.

This, by the canon law, belongs to the dean and chapter; but in England, to the archbishop of the province, by prescription: though, divers deans and chapters do challenge it by antient charters, from kings of this land.

CUSTOS temporalium, the person to whose custody a vacant see was committed by the king, as supreme lord; who, as a steward of the goods and profits, was to give an account to the excheator, and he into the exchequer.

His trust continued till the vacancy was supplied by a successor, who obtained the king's writ of *restitutione temporalium*; which was commonly after consecration, but sometimes before.

CUT a feather, in the sea language, is when a well-bowed ship so swiftly presses the water, that it foams or froths.

To *cut the sail*, is to unfurl it, and let it fall down.

CUT bastion. See the articles *BASTION*.

CUT roof. See the articles *ROOF*.

CUT-Water, the sharpness of the head of a ship under the beak.

See *SHIP*.

CUTANEOUS, something that concerns the cutis or skin; whether in the way of distemper or remedy.

Thus, we say, *cutaneous* eruptions; the itch is a *cutaneous* disease.

CUTICULA, *CUTICLE*, in anatomy, a thin, pellucid membrane, void of sense; serving as a cover to the cutis or skin.—See *Tab. Anatomy*, (Myol.) fig. 9.

The *cuticle* is that first, and outermost covering of the body, called also *epidermis*, but more commonly the *scarf-skin*; or that soft tegument which rises in a blister upon a burn, or the application of a cautery.

It sticks close to the surface of the cutis, or true skin, to which it is also tied by the vessels that feed it; though these are so small as not to be seen.

When examined by a microscope, it appears to consist of several layers of exceeding small scales, which cover one another, more or less, according to its different thickness, in the several parts of the body; and in the lips, where the scales appear plainest because the skin is thinnest, they do little more than barely touch.

These scales are either the excretory ducts of the glands of the cutis; as is the case apparently in fishes: or else the glands have their tubes, opening between the scales. See *MILIARY gland*.

Leeuwenhoek reckons, that in one *cuticular* scale there may be 500 excretory ducts; and that a grain of sand will cover 250 scales: so that one grain of sand will cover 1250000 pores or orifices, through which we daily perspire.

Yet, notwithstanding the exceeding porosity of the *cuticle*, it obstructs a great part of the serous humours which would otherwise be evacuated by the glands of the cutis; as is evident from that plentiful discharge consequent on the application of a blister

blister, or other accident, whereby the *cuticula* is removed, and the cutis bared.

The scales are often glued together by the grosser parts of our insensible transpiration hardening upon them by the heat of the body, which carries off the more volatile particles; and in this is supposed to consist that indisposition we popularly call a cold.

The humour which is thenceforward separated by the glands of the skin, being pent in between the scales, causes frequent itching; and where the matter has been long pent up, small pimples, and other foulnesses: for removing of which, nature directs to those wholesome remedies of frequent rubbing, washing, or bathing.

Some imagine the *cuticle* to be form'd from the grosser parts of the excrementitious ferous humour, eliminated through the pores of the cutis, and condensed on the surface; like the pellicle which appears, upon evaporation, on the surface of the serum of the blood: but Leewenhoeck, with more probability, takes it to be from an expansion of the excretory ducts of the glands of the skin.

Its use is to defend the nerves of the cutis, which are the origin of the sense of feeling, from the injuries of rough and hard bodies, as well as the air: for either of those would make too exquisite and painful an impression on the naked nerves; or the air would dry them, so as that they would be less susceptible of the nicer touches of pleasure.

Riolanus, and several others, maintain that the *cuticula* of women has no pores: Molinette argues the contrary from their sweating; but maintains, withal, that this is true of dogs and cats, which never sweat, how much soever fatigued.

CUTICULARES *carunculae*. See **CARUNCULÆ** *cuticulares*.

CUTIS, in anatomy, the skin; a reticular plexus, or body of vessels, immediately under the cuticle, or scarf-skin. See **Tab. Anat. (Myol.)** fig. 8.

The vessels of the *cutis* contain a mucous liquor; from the tincture of which, Malpighi, and others, take the colour of the skin to be derived; founded on this, that the *cutis*, as well as cuticle of blacks is white, and the blood red, &c. and that the only thing they have peculiar in this part, is the colour of this liquor.

The *cutis* consists of fibres of its own; or, according to Steno, is formed out of the productions of the tendons of the subjacent parts: which terminate in an infinite number of pyramidal papillæ, interwoven with innumerable nervous fibres, and other vesicles, forming what we call a *parenchyma*. See **PARENCHYMA**.—It is by means of these papillæ that the *cutis* becomes the organ of feeling.

The *cutis* is generally connected to the subjacent parts by the *membrana adiposa*, and its proper vessels, the veins, arteries, nerves, &c. Its use, is to wrap up and cover the whole body; to be a general emunctory for the matter of perspiration; and to be the organ of feeling.

The diseases of the *cuticula* and *cutis*, are the itch, *leprosy*, *small-pox*, *measles*, *scarlet fever*, and *erysipelatos inflammations*.

CUTTER of the tallies, an officer of the exchequer, who provides wood for the tallies, and cuts the sum paid upon them. See **TALLY**.

CUTTING, a term used in various senses, and various arts; in the general, it implies a division or separation.

CUTTING, is particularly used in heraldry, where the shield is divided into two equal parts, from right to left, parallel to the horizon, or in the fesse-way.

The word is also applied to the honourable ordinaries, and even to animals, and moveables, when they are divided equally the same way; so, however, as that one moiety is colour, the other metal.—The ordinaries are said to be *cut*, *couped*, when they do not come full to the extremities of the field.

CUTTING, *lithotomy*, in chirurgery, denotes the operation of extracting the stone out of the bladder by section. See **STONE**.

It appears, that cutting was in use for the stone, even in the time of Hippocrates; though we are perfectly in the dark as to the manner in which they performed it: it was, however, wholly disused in the after-ages; inasmuch, that in the beginning of the sixteenth century, there was no body durst practise it. The faculty of medicine at Paris were obliged to petition the parliament, to obtain leave to make a trial on a criminal condemned to death, who had the stone in the bladder: the operation succeeding, the practice became popular.

There are three principal ways of performing the operation; the *apparatus minor*, *apparatus major*, and *apparatus altus*; or the *low*, *lateral*, and *high operations*. The method of performing each, see under the article **LITHOTOMY**.

CUTTING-GLASS, in chirurgery. See **CUPPING-GLASS**.

CUTTING, in coinage. When the laminæ, or plates of the metal, be it gold, silver, or copper, are brought to the thickness of the species to be coined, pieces are cut out, of the thickness, and nearly of the weight of the intended coin; which are now called *planchets*, till the king's image have been stamped on them.

The instrument wherewith they cut, consists of two pieces of steel, very sharp, and placed over one another; the lower a

little hollow, representing a mortar; the other a pestle.—The metal put between the two, is cut out in the manner described under the article **COINAGE**.

Nate, Medallions, where the relievo is to be great, are not cut, but cast, or moulded.

CUTTING, in the manege, is when the horse's feet *interfere*; or when with the shoe of one foot he beats off the skin from the pattern joint of another foot.

This is more frequent in the hind feet than the fore: the causes are either weariness, weakness in the reins, not knowing how to go, or ill shoeing.

CUTTING, in painting, the laying one strong lively colour over another, without any shade or softening.—The cutting of colours has always a disagreeable effect.

CUTTING in wood, a particular kind of sculpture, or engraving; denominated from the matter wherein it is employed.

It is used for various purposes; as, for initial or figured letters, head and tail-pieces of books; and even for schemes and other figures, to save the expences of engraving on copper: and for prints, and stamps for paper, calicoes, linnens, &c.

The invention of cutting in wood, as well as that in copper, is ascribed to a goldsmith of Florence; but it is to Albert Durer, and Lucas, they are both indebted for their perfection.

One Hugo de Carpi invented a manner of cutting in wood, by means whereof, the prints appeared as if painted in chiaro-obscure: In order to this, he made three kinds of stamps for the same design; which were drawn, after one another, thro' the press for the same print: they were so conducted, as that one served for the grand lights, a second for the demi-teints, and a third for the outlines, and the deep shadows.

The art of cutting in wood, was certainly carried to a very great pitch about 150 years ago; and might, even vie, for beauty and justness, with that of engraving in copper: at present it is in a low condition, as having been long neglected, and the application of artists wholly employed on copper, as the more easy and promising province: not but that wooden cuts have the advantage of those in copper on many accounts; chiefly for figures and devices in books; as being printed at the same time, and in the same press as the letters: whereas, for the other, there is required a particular impression.

The cutters in wood begin with preparing a plank or block, of the size and thickness required, and very even, and smooth on the side to be cut: for this, they usually take pear-tree, or box; though the latter is the best, as being the closest, and least liable to be worm-eaten.

On this block they draw their design with a pen, or pencil, just as they would have it printed. Those who cannot draw their own design, as many there are cannot, make use of a design furnished them by another; fastening it upon the block with paste made of flower and water, with a little vinegar; the strokes or lines turned towards the wood.

When the paper is dry, they wash it gently over with a sponge dipped in water; which done, they take off the paper by little and little, still rubbing it a little first, with the tip of the finger; till at length there be nothing left on the block, but the strokes of ink that form the design, which mark out so much of the block as is to be spared, or left standing.

The rest they cut off, and take away very curiously with the points of very sharp knives, or little chisels, or gravers, according to the bigness or delicacy of the work; for they need no other instruments.

CUTTINGS, or *slips*, in gardening, the branches or sprigs of trees, or plants, cut or slipped off to set again; which is done in any moist, fine earth.

The best season is from August to April; but care is to be taken, when it is done, the sap be not too much in the top, lest the cut die ere that part in the earth have root enough to support it: nor yet must it be too dry, or scanty; the sap in the branches assisting it to take root.

In providing the cuttings, such branches as have joints, knots, or burrs, are to be cut off two or three inches beneath them, and the leaves to be stripped off so far as they are set in the earth. Small top-branches, of two or three years growth, are fittest for this operation. See **Supplement**, article **CUTTINGS**.

CUVETTE. See the article **CUNETTE**.

CYCLE, in chronology, a certain period, or series of numbers proceeding orderly from first to last, and repeating again from last to first; successively, and without interruption. See **PERIOD**.

The origin of *cycles* was thus: the apparent revolution of the sun round the earth, has been divided, arbitrarily, into 24 hours; the basis or foundation of all our mensuration of time. Civil use knows none but hours; or rather, multiples of hours, as days, and years. But neither the annual motion of the sun, nor that of the other heavenly bodies, can be measured exactly, and without any remainder, by hours, or their multiples. That of the sun, *v. gr.* is 365 days, five hours, forty-nine minutes, nearly; that of the moon twenty-nine days, twelve hours, forty-four minutes.

Hence, to swallow up these fractions, in whole numbers, and yet in numbers which only express days and years, *cycles* have been invented:

invented: which comprehending several revolutions of the same body, replace it, after a certain number of years, in the same points of the heaven, whence it first departed; or, which is the same thing, in the same place of the civil calendar.

Such is the famous *cycle* of 19 years, called also the

CYCLE of the moon, or lunar CYCLE, a period of 19 solar years; equivalent to 19 lunar years, and seven intercalary months: in which time, the new and full moons are supposed to return to the same day of the Julian year.

This is also called the *metonic period*, from its inventor Meton, the Athenian; and the *golden number*.—Though, in propriety, the golden number is rather the particular number which shews the year of the lunar cycle, which any given year is in.—This cycle of the moon only holds true for 312 years: for, though the new moons do return to the same day after 19 years; yet not to the same time of the day, but near an hour and a half sooner: which error, in 312 years, amounts to an entire day.

Yet, those employed in reforming the calendar, went on a supposition of the lunations returning precisely from 19 years to 19 years, for ever.

The use of this cycle in the ancient calendar, is to shew the new moon of each year, and the time of Easter.

In the new one, it only serves to find the epacts; which shew, in either calendar, that the new moons fall eleven days too late. As the orientals began the use of this cycle at the time of the council of Nice; they assumed, for the first year of the cycle, the paschal new moon to fall on the 13th of March: on which foot, the lunar cycle three, fell on the first of January, in the third year.

The occidentals, on the contrary, put the number one to the first of January, which occasioned a considerable difference in the time of Easter: hence, Dionysius Exiguus, upon framing a new calendar, persuaded the christians of the West to save the difference, and come into the practice of the church of Alexandria.—To find the year of the lunar CYCLE, is to find the golden number. See **GOLDEN number**.

CYCLE of indictions, is a series of 15 years, returning constantly around, like the other cycles; and commencing from the third year before Christ.

When this cycle of indictions was first set on foot among the Romans, and for what end; is much controverted among chronologists. Petavius leaves it as a thing not to be ascertained. The most probable opinion is, that it was received about the year 312, after the time of Constantine.

To find the cycle of indiction for any given year; add three to the given year, and divide the sum by 15; the remainder is the cycle of indiction.—If there be no remainder the indiction is 15.

CYCLE of the Sun, or solar CYCLE, a revolution of 28 years; beginning with one, and ending with 28; which elapsed, the dominical or Sunday-letters, and those that express the other feasts, &c. return into their former place, and proceed in the same order as before.

It is called *solar cycle*, not with regard to the sun's course, which has nothing to do herein; but from Sunday, anciently called *dies solis*, the day of the sun: in regard, it is the dominical letter is principally fought for from this revolution; the dominical letters, which are the first in the alphabet, having been substituted in lieu of the nundinal letters of the Romans.

The reformation of the calendar under pope Gregory, occasioned a considerable alteration of this cycle: in the Gregorian calendar, the solar cycle is not constant and perpetual; by reason every fourth secular year is common; whereas, in the Julian it is biffextile. The epocha, or beginning of the solar cycle, both Julian and Gregorian, is the ninth year before Christ.

To find the cycle of the sun for any given year; add nine to the number given, and divide the sum by 28; the number remaining will be the number of the cycle, and the quotient the number of revolutions since Christ.

If there be no remainder, it will be the twenty-eighth, or last year of the cycle.

CYCLE of the Sun in Julian Years.

1	G	F	5	B	A	9	D	C	13	F	E	17	A	G	21	C	B	25	E	D
2	E	6	G	10	B	14	D	18	F	22	A	26	C							
3	D	7	F	11	A	15	C	19	E	23	G	27	B							
4	C	8	E	12	G	16	B	20	D	24	F	28	A							

CYCLE of the Sun from the Gregorian Year 1700, to the Year 1800.

1	D	C	5	F	E	9	A	G	13	C	B	17	E	D	21	G	F	25	B	A
2	B	6	D	10	F	14	A	18	C	22	E	26	G							
3	A	7	C	11	E	15	G	19	B	23	D	27	F							
4	G	8	B	12	D	16	F	20	A	24	C	28	E							

CYCLE, it may be observed, is not only applied in general, to all the numbers that compose the series; but to each number in particular: thus, we compute, that the ordinary epocha from the birth of Jesus Christ, had the solar cycle 10; the lunar cycle, or the golden number 2; the dominical letter B, and the cycle of indiction 4.

CYCLISCUS, (from *κύκλος*, circular;) an instrument in form of an half-moon; used by the surgeons to scrape the skull, in fractures of that part.

CYCLOID, in geometry, one of the mechanical, or, as others term them, transcendental curves; called also the *trochoid*.

It is described by the motion of a point A, (Tab. Geometry, fig. 55.) in the periphery of a circle; while the circle makes a revolution along the right line A P.

Hence, the properties of this curve, viz. that the right line A E is equal to the periphery of the circle A B C D; and A c to the semi-periphery; and in any situation of the generating circle, the right line A d is equal to the arch D d.—Again, a d being parallel to A c; A d is equal to the arch of the generating circle d F.

—Further, the whole length of the cycloid is four times that of the diameter of the generating circle; and the cycloidal space comprehended between the curve and the subtense A E, is triple the area of the generating circle.—Lastly, any part estimated from the vertex, as F I, is every where double the chord of the circle F b; and the tangent thereof G I, perpetually parallel to the same chord F b.

The genesis of the CYCLOID, may be conceived by imagining a nail in the circumference of a wheel: the line which the nail describes in the air, while the wheel revolves on a right line, is the cycloid.

The cycloid is reputed a modern curve, and its invention ascribed by some to Merenne; by others to Galileo: but Dr. Wallis shews it of an older standing, and to have been known to Bo villus, about the year 1500; and even considered by cardinal Cusanus much earlier, viz. before the year 1451.

M. Huygens has demonstrated, that from whatever point, or height, a heavy body, oscillating on a fixed centre, (v. g. a pendulum) begins to descend; while it continues to move in a cycloid, the times of its falls, or oscillations, will be equal to each other. This property M. Fontenelle states thus: the nature of the cycloid is such, that, if a body which describes it, fall from a greater height, and by that means acquire a certain augmentation of velocity, as in Galileo's theory the greater cycloidal arch which it describes, takes up precisely that excess of velocity. So that the body does not describe it, either sooner for its being accelerated, or later for having a greater space to move: and hence arises an equality in time, notwithstanding the inequality of arches.

On this foundation it is, that the pendulum-clock is built: on the subject whereof, the same M. Huygens has wrote a large volume, under the title of *horologium oscillatorium*. See **PENDULUM**; see also **OSCILLATION**.

CYCLOIDAL space, the space contained between the cycloid, and the subtense thereof.

CYCLOMETRY, the art of measuring cycles, or circles.

CYCLOPEDIA, *κυκλωπαιδία*, the circle, or compass of arts and sciences: more ordinarily called *encyclopædia*.

- The word *cyclopædia* is not of classical authority, though frequent enough among modern writers, to have got into several of our dictionaries. Some make it a crime in us to have called the present work by this name; not considering, that names and titles of books, engines, instruments, &c. are in great measure arbitrary, and that authors make no scruple even of coining new words on such occasions, when there are no old ones to their mind. Thus it is Dr. Hook calls his fine book of microscopical observations, *Micrographia*, Wolfius his book on the air, *Aerometria*, Drake his book of anatomy, *Antropologia*, &c. all of them words of modern, if not their own fabric: and on no better authority stand the names of half our later inventions, as *Microscope*, *Telescope*, *Barometer*, *Thermometer*, *Micrometer*, &c.—But it is suggested, the word *cyclopædia* is ambiguous, and may denote the science of a circle, as well as the circle of sciences: we answer, that as custom, the only sovereign rule of language, has determined the word to the latter sense, it is no more chargeable with ambiguity than a thousand other words of received use; no more, for instance, than *micrometer*, which might either denote a little measure, or a measure of little things.

CYDER. See the article **CIDER**.

CYDER vinegar. See the article **VINEGAR**.

CYDONITES vinum. See the article **VINUM**.

CYGNUS, or **CYCNU**, the swan, in astronomy, a constellation of the northern hemisphere, between Lyra and Cepheus. See **CONSTELLATION**.

The stars in the constellation *cygnus*, in Ptolemy's catalogue are 17; in Tycho's 19; in the Britannic catalogue 107. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow.

CYLINDER, in geometry, a solid body, contained under three surfaces; supposed to be generated by the rotation of a parallelogram, as CBEF, (Tab. *Geometry*, fig. 56.) about one of its sides, CF.

If the generating parallelogram be rectangular, as CBEF, the cylinder it produces will be a *right cylinder*, i. e. a cylinder whose axis is perpendicular to its base.

If the parallelogram be a rhombus, or rhomboides, the cylinder will be *oblique*, or *scalene*.

The surface of a *right cylinder*, exclusive of its bases, is demonstrated to be equal to a rectangle contained under the periphery, and the altitude of the cylinder.

The periphery, therefore, of the base, and thence the base itself, being found, and multiplied by two, and the product added to the rectangle of the height, and periphery of the cylinder; the sum will be the area or superficies of the cylinder: multiply this by the area of the base; and the product will be the solidity of the cylinder.

For it is demonstrated, that a circle is equal to a triangle, whose base is equal to the periphery, and height, to the radius; and also, that a cylinder is equal to a triangular prism, having the same base and altitude with itself: its solidity, therefore, must be had by multiplying the superficies into the base.

Again, since a cone may be esteemed an infinite-angular pyramid; and a cylinder an infinite-angular prism: a cone is one third part of a cylinder, upon an equal base, and of the same height.

Further, a cylinder is to a sphere of the same base and altitude as 3 to 2.

Lastly, It being demonstrated in mechanics, that every figure, whether superficial or solid, generated, either by the motion of a line, or of a figure; is equal to the factum of the generative magnitude into the way of its centre of gravity, or the line its centre of gravity describes: hence, if the rectangle ABCD, (Tab. *Mechanics*, fig. 43.) revolve about its axis AD, it will describe a cylinder, and its side BC the surface of the cylinder. But the centre of gravity of the right line BC, is in the middle F; and the centre of gravity of the generating plane in the middle G, of the right line EF. The way of this, therefore, is the periphery of a circle described by the radius FG; and of that, the periphery of a circle described by EF. The superficies, therefore, of the cylinder, is the factum of the altitude BC, into the periphery of the circle described by the radius EF, i. e. into the base: but the solidity of the cylinder, is the factum of the generating rectangle ABCD, into the periphery of the circle described by the radius EG; which is sub-duple of EF, or the semidiameter of the cylinder.

Suppose, v. gr. the latitude of the describing plane, and therefore of the cylinder, BC = a, the semidiameter of the base DC = r; then will EG = $\frac{1}{2}r$; and supposing the ratio of the semidiameter to the periphery, = 1: m; the periphery described by the radius, $\frac{1}{2}r$ will be equal to $\frac{1}{2}mr$. Therefore, multiplying $\frac{1}{2}mr$ into the area of the rectangle A C = ar, the solidity of the cylinder = $\frac{1}{2}mar$: but $\frac{1}{2}mar = \frac{1}{2}r.mr.a$, and $\frac{1}{2}r.mr$, the area of the circle described by the radius DG. The solidity of the cylinder, therefore, is equal to the factum of the base, and the altitude.

For the ratio of CYLINDERS; as the radii of all cylinders, cones, &c. are in a ratio composed of their bases, and altitudes; hence, if their bases be equal, they will be in the ratio of their heights; if their altitudes be equal, in the ratio of their bases.

Hence, also, the bases of cylinders and cones being circles; and circles being in a duplicate ratio of their diameters; all cylinders and cones are in a ratio compounded of the direct ratio of the altitudes, and the duplicate one of their diameters; and, if they be equally high, as the squares of the diameters.

Hence, again, if in cylinders the altitude be equal to the diameter of the bases, they will be in a triplicate ratio of the diameters of the base. All cylinders, cones, &c. are in a triplicate ratio of their homologous sides; as also of their altitudes.

Again, equal cylinders, cones, &c. reciprocate their bases and altitudes. See CONE, &c.

Lastly, a cylinder whose altitude is equal to the diameter of the base, is to the cube of its diameter, as 785 to 1000.

To find a circle equal to the surface of a given CYLINDER, we have this theorem: the surface of a cylinder is equal to a circle, whose radius is a mean proportional between the diameter and height of the cylinder.

The diameter of a sphere, and altitude of a CYLINDER, equal thereto, being given; to find the diameter of the cylinder: the theorem is; the square of the diameter of the sphere, is to the square of the diameter of the cylinder equal to it, nearly, as triple the altitude of the cylinder, to double the diameter of the sphere. See SPHERE. To find a rete, or cage, where a cylinder may be formed, or where-with any cylinder may be covered. With the diameter of the base, describe two circles; find their peripheries: and upon a line equal to the altitude of the cylinder, form a rectangle, whose other dimension is equal to the found periphery. Thus may the cylinder required, be formed, or covered.

Resistance of a CYLINDER. } See the articles } RESISTANCE.
Scenography of a CYLINDER. } SCENOGRAPHY.

CYLINDER charged, in gunnery, is that part of a great gun, which is possessed by the powder and ball.

CYLINDER concave, in gunnery, is all the chase, or hollow length of a piece of ordnance.

CYLINDER vacant, in gunnery, is that part of the hollow that remains empty, after the gun is charged. See CANNON.

CYLINDRICAL column. } COLUMN:

CYLINDRICAL compasses. } COMPASSES.

CYLINDRICAL mirrors. } MIRRORS.

CYLINDRICAL wax-candles. } CANDLE.

CYLINDROID*, in geometry, a solid body, approaching the figure of a cylinder; but differing from it in some respect, e. g. as having its bases elliptical, but parallel, and equal.

* The word comes from the Greek κυλινδρῶς, cylinder; and εἶδος, form.

Hyperbolic CYLINDROID. See HYPERBOLIC.

CYMA, in botany, a term signifying the tender sprout of any plant, especially of the cabbage kind.

CYMA, in architecture. See CIMA, and CYMATIUM.

CYMATIUM, CIMATIUM, or CIMA, in architecture, a member, or moulding of the cornice, whose profile is waved, i. e. concave a-top, and convex at bottom; frequently also called denticus, gorge, or gula recta; especially by the French: by the Italians goletta, i. e. parva gula; but more usually, cymatium, among us; being the last, or uppermost member of the cornice. See Tab. Architecture, fig. 8.

Some write the word *simais*, from *simis*, *comus*, flat-nosed; but this etymology is unlucky: the beauty of the moulding consisting in its having its projection equal to its height. M. Felibien therefore rejects this origin; contending, that the moulding is not so denominated from its being the uppermost member of the cornice, but, according to the sentiment of Vitruvius, from its being waved, from the Greek κυμαίνω, undula, of *κύμα*, wave. This is certain, that Vitruvius sometimes uses the word *wida* for cymatium; and sometimes *lysis*, i. e. *sektion*, separation; in regard, cornices, where the *cymais* are found, separate one piece of architecture from another; as the pedestal from the column, and the frieze from the cornice.

But, withal, it must be observed, that he does not confine cymatium to the cornice; but uses it indifferently for any similar moulding, where-ever he meets with it: in which he differs from the more accurate among the moderns.

Fellicien makes two kinds of cymatiums; the one right, the other inverted: in the first, that part which projects the furthest is concave, and is otherwise called *gula recta*, and *denticus*. See DENTICUS. In the other, the part that projects furthest is convex, called *gula inversa*, or *talus*. See TALON.

Our architects do not use to give the name cymatium to these mouldings, except when found on the tops of corniches; but the workmen apply the name indifferently, where-ever they find them.—Palladio distinguishes the cymatium of the cornice by the name *intecolata*.

Tastan CYMATIUM, consists of an ovolo, or quarter-round. Philander makes two doric cymatiums, whereof this is one: Balæus calls this the *lesbian aetrogal*.

Doric CYMATIUM, is a cavetto; or a cavity less than a semicircle, having its projection subduple its height.—See Tab. Architecture, fig. 28. lit. L. and fig. 6.

Lesbian CYMATIUM, according to Vitruvius, is what we otherwise call *talus*, viz. a concavo-convex member, having its projection subduple its height.

CYMBAL*, a musical instrument, used among the antients; called by the Greeks κυμβαλον, and by the Latins, *cymbalum*.

* Syllburgius derives the word from three several Greek roots, viz. from κυβῶ, crooked; from κυμβαλον, cup; and from κυβω, voice. Isidore derives it from *cym*, and *balleumatica*, an immodest dance, used to accompany this instrument. The real etymology appears to be from κυβῶ, caviy.

The cymbal was of brass, like our kettle-drums; and some think in their form, but smaller, and its use different.

Cassiodorus, and Isidore, call it *acetabulum*, the name of a cup or cavity of a bone wherein another is articulated; and Xenophon compares it to a horse's hoof: whence it must have been hollow; which appears, too, from the figure of several other things, de-

nominated from it, as a basin, caldron, goblet, calque; and even a shoe, such as those of Empedocles, which were of brass. In effect, the antient cymbals appear to have been very different from our kettle-drums, and their use of another kind: to their exterior cavity was fastened a handle; whence Pliny takes occasion to compare them to the upper part of the thigh, *coxendicibus*; and Rabanus to phials.

They were struck against one another, in cadence, and made a very acute sound. Their invention was attributed to Cybele; whence their use in feasts and sacrifices: setting aside this occasion, they were seldom used but by dissolute and effeminate people. M. Lampe, who has wrote expressly on the subject, attributes the invention to the Curetes, or inhabitants of mount Ida in Crete: it is certain, these, as well as the Corybantes, or guards of the kings of Crete, and those of Rhodes, and Samothracia, were reputed to excel in the music of the cymbal. See CORYBANTES.

The Jews, too, had their cymbals, which they called צלצלים or צלצלים; or at least, instruments that the Greek, Latin, and English translators render cymbals; for as to their matter, form, &c. the critics are wholly in the dark.

The modern cymbal is a paltry instrument, chiefly in use among vagrants, gypsies, &c. It consists of steel wire, in a triangular form, whereon are passed five rings, which are touched and shifted along the triangle with an iron rod held in the left hand, while it is supported in the right by a ring, to give it the freer motion. Durandus says, that the monks used the word cymbal for the bell hung in the cloister, used to call them to the refectory. See BELL.

CYMBIFORME, in anatomy. See NAVICULARE.

CYNEGETICS, κυνηγετικά, books treating of the art of hunting.—Gratius Faliscus has wrote a *cyngetica* with applause.

CYNICS, a sect of antient philosophers, who valued themselves on their contempt of every thing, especially riches and state, arts, and sciences; all excepting morality.

The founder of this sect is said to have been Antisthenes, a disciple of Socrates; who, after his master's death, quitting the Pyreum, retired to Cynopolis, a kind of academy not far from the gates of Athens.

Hence, some will have it, came the name κυνικός, cynicus, viz. from *cynopolis*. But others, with more probability, derive it from *κύων*, dog, because of their severity and importunity in reprehending vice. Thus, Aristotle observes, as *de cynicis*, &c. the Cynicks were so called, from their free way of rebuking, &c. Hence, Diogenes the cynic said of himself, I bite the evil; and Antisthenes himself was called *κύων κυνικός*, an ingenious and sincere dog: it being the distinguishing character of the cynics, to attack and bark at the ill, and to defend and fawn on the good.

Arrian praises the cynic genius to the skies: * A cynic, says he, is a messenger sent from Jupiter, to overlook human affairs; — a public doctor, and tutor of mankind; who instructs, and chastises at the same time.—an Æsculapius; a lord and king, adorned with a scepter and diadem,—who governs the people; and this voluntarily, without trembling, without guards, &c. but by a good conscience.

The ground of this encomium, may be owing, in some measure, to that affinity between the *storks* and *cynics*: the chief difference between them consisted in this, that the former were more modest and reserved than the latter; who were said to have banished all shame; and were able to practise any obscenity without blushing.

Hence, Laertius observes of Diogenes, that he did every thing openly, whether it belonged to Ceres or to Venus: though, the same Laertius adds, that he did it in imitation of the choriadiscal, i. e. he only ran to an excess of impudence, to put others out of conceit with it.

CYNIC *spasmus*, *spasmus* CYNICUS, a sort of convulsion, whereby the patient is brought to imitate the gestures, inarings, howlings, &c. of a dog. See SPASMUS.

Dr. Friend, in the *Philosophical Transactions*, gives us an account of a very extraordinary *spasmus* of this kind, wherewith two families, at Blackthorn in Oxfordshire, were seized.

The novelty of the thing drew abundance of visitors to the village, and among the rest Dr. Willis; who, a good while ere he reached the place, heard a terrible noise of barking and howling: upon his entering the house, he was frail saluted with five girls, bawling, and answering each other by turns, with violent motions of the head. In their face there was no convulsion seen, beside cynic distortions, and oscillations of the mouth: their pulse was pretty regular; their noise was rather like that of the howling, than of the barking of dogs; only that its returns were more frequent, with deep sighings between.

The *spasmus* had seized them all equally; whereof the youngest was but six, and the eldest fifteen years of age: at intervals they had their reason and senses entire; but not long, ere one of them returning to her yelling, set on the rest: till at length, all fainting, they fell like epilepticks on a bed laid in the middle of the room to receive them.

A little while they would lie quietly and decently together; but upon a new organ of the spirits, they began to beat and bruise each other. Two of the youngest awaked while the doctor

layed,

stayed, and left their sisters on the bed: but the *spasm* soon had hold on them again.

In July, 1700, Dr. Freind himself visited another family, in the same village; where one boy and three girls had been seized ten weeks, without any apparent preceding cause. A girl had had it first; and the rest, as the mother informed him, were so struck with their sister's disorder, that they too were seized. At his arrival, they were all at play, very briskly, and unconcernedly before the doors; at length the eldest girl, about fourteen years of age, was seized as usual.

The only symptom of its approach, was a swelling of the stomach; which rising gradually up the throat, set the muscles of the larynx and the head upon their usual convulsions: this rising was a certain symptom of an approaching paroxysm in them all; and if they endeavoured to stop it, it burst out with the greater violence, and held the longer.

The noise they made was incessant, and disagreeable; yet not so much like the barking or howling of dogs, as had been given out, as a quaint kind of a song, consisting of three notes, or tones, repeated twice over; and closed by deep sighs, &c. accompanied with extraordinary gestures and nutations of the head.

This disease the doctor takes to be natural; and to rise from the common cause of all convulsions, *viz.* from the animal spirits growing unruly in the nerves, and driving the muscles into various contractions, according to the circumstances of the indisposition.

CYNOCOTONON. See ACONITE.

CYNODESMUS, or CYNODESMION, among anatomists, the band, or ligament, which ties the prepuce of the yard to the nut, or glans.

CYNOREXY, an immoderate appetite, to the degree of a disease; called also *fames canina*, and *bulimy*. See BULIMY.

CYNOSURA *, in astronomy, a denomination given by the Greeks to Ursa minor, or the little bear. See Ursa.

* The word is formed of *κυνος*, q. d. the dog's-tail.

This is the constellation next our pole, consisting of seven stars; four whereof are disposed like the four wheels of a chariot; and three lengthwise, representing the beam: whence some give it the name of the *chariot*, or Charles's wain.

From these seven stars it is the pole takes its name, *septentrionalis*; and the rest of the hemisphere, as far as the line, *septentriones*.

CYON, or CION, a graft, sprig, or sucker. See CION, GRAFT, &c.

CYPHER. See the article CIPHER.

CYPHI, a term in the Arabian pharmacy, signifying a kind of cordial perfume.

Mithridates gave the appellation *cypbi* to the troches wherewith the Egyptian priests used to sweeten their gods, to make them grant what they requested. He used the same in the composition of mithridate, on account of their efficacy against poisons, defluxions, &c.

The *cypbi* are composed of raisins, or dried grapes, turpentine, myrrh, bdellium, spica nardi, cassia lignea, alpalathum, saffron, &c. tempered into a mass with honey and a little wine.

CYPHONISM, CYPHONISMUS, a kind of torture, or punishment, in use among the antients.

The learned are at a loss to determine what it was: some will have it to be that mentioned by S. Jerom, in his life of Paul the hermit, chap. 2. which consisted in smearing the body over with honey, and thus exposing the party, with his hands tied, to the warm sun, to invite the flies and other vermin to persecute him.

CYPRESS, CUPRESSUS, in natural history, a precious sort of wood, the produce of a tree of the same name; frequent in the island of Cyprus.

It is very compact, and heavy; and its smell as agreeable as that of sanders. It scarce ever rots, decays, or is worm-eaten, no more than cedar, or ebony: for which reason, the antients used it to make the statues of their gods.

In Candia, and particularly about mount Ida, the tree is said to rise spontaneously, where-ever the earth is a little dug; but is somewhat difficult to raise by art.

The fruits of this tree, called *cones*, are used in astringent decoctions, against hernia's, hemorrhages, &c.

CYPRUS, an order of knights, called also knights of *silence*, and knights of the *sword*; instituted by Guy de Lusignan, king of Cyprus, in 1192.

The design of the institution was, to oppose the inroads and irruptions of the infidels in that island: accordingly, their motto was *securitas regni*.

CYPRUS *virtil*. See the article VITRIOL.

CYRENAICI, a sect of ancient philosophers; so called from their chief, Ariftippus of Cyrene, a disciple of Socrates. See SOCRATIC.

Their leading tenet was, that man is born for pleasure; and that virtue is only so far laudable, as it conduces thereto.

By pleasure, they meant, not only a privation of pain, and a tranquillity of mind like what Epicurus preached up; but an assemblage of all the positive pleasures both of the mind and the senses; especially the last. See EPICUREAN.

Cicero makes frequent mention of Ariftippus's school; and speaks of it as yielding debauches.

Three disciples of Ariftippus, after his death, divided the sect into three branches; under which division it languished and sunk: the first called the *Hegesiac* school; the second the *Amicerian*, and the third the *Theodoran*; from the names of their authors.

CYRTOMA, a bunch or curvity of the back. See GIBBOUS.

CYST-HEPATIC *duct*, a canal, by which the porus biliary discharges part of its bile into the gall-bladder.

It was first described by Dr. Glisson, and long afterwards pretended to be discovered by M. Perrault. See Tab. *Anatomy*, (Splanchn.) fig. 5. lit. c. c.

Verheyen, from the course of the bile, inverts the name, and more properly calls it *hepaticus*.

CYSTIC, an epithet given to two arteries, and two veins opening into the gall-bladder. See Tab. *Anatomy*, (Angioli) fig. 1. n. 34.

The *cystic arteries*, *cystica gemellæ*, are two branches from the cœliac, bestowed on the gall-bladder, and bringing blood to the same. The *cystic veins* return the remains of this blood into the vena porta.

CYSTICS, denote medicines against distempers of the bladder. See STONE, LITHONTRITIC, &c.

CYSTICUS *ductus*, or *meatus*, a biliary duct, about the bigness of a goose's quill; joined to the meatus hepaticus, at about two inches distance from the gall-bladder, the two together forming the ductus communis. See Tab. *Anatomy*, (Splanchn.) fig. 1. lit. d. fig. 5. lit. g. g.

CYSTIS *, the same with vesica, or bladder.

* The word is Greek, *κυστις*, which signifies the same.

CYSTIS *choledocha*, the same with *felliculus*, or *vesicula fellis*. See VESICULA *fellis*.

CYTHARA. See the article CITHARA.

CYZICENS, CYZICENA, among the antient Greeks, were a sort of magnificent banqueting-houses, always looking towards the north, and usually opening upon gardens.

They had their name from Cyzicus, a city very considerable for the grandeur of its buildings; situate in an island of Myia, bearing the same name. These *cyzicenes* were among the Greeks, what the triclinia and cenacula were among the Romans.

CZAR, a title of honour, assumed by the grand-dukes, or, as they are now stiled, emperors, of Russia.

The natives pronounce it *tzar*, or *zaar*; and this, by corruption, from *cæsar*, emperor; on account of I know not what relation to the Roman emperors; by reason of which, they also bear the eagle as a symbol of their empire.

The first who bore the title of *czar*, was Basil, son of Basilides, who freed his country from its subjection to the Tartars, and first set it on its present footing, about the year 1470.

M. Sperlingius, in his dissertation on the majesty of the name *koming*, observes, that the Russian princes never bore the name *czar*, till their people had embraced the Greek faith: before that time, he says, they were called *konger*, king. See KING.

D.

D A C

D, The fourth letter of the alphabet, and the third consonant.

Grammarians generally rank *D* among the lingual letters, as supposing the tongue to have the principal share in the pronunciation thereof; tho' the Abbot de Dangeau seems to have reason in making it a palatal letter. The letter *D* is the fourth in the Hebrew, Chaldee, Samaritan, Syriac, Greek, and Latin alphabets; in the five first of which languages it has the same name, though somewhat differently spoke, *e. gr.* in Hebrew, Samaritan, and Chaldee *Daleth*, in Syriac *Dolath*, and in Greek *Delta*.

The Arabians have three *D*'s in their language, the first called *Dal*, which is the eighth of their 28 letters; the second called *Dhhal*, is only distinguished from the former by having a point added over it; though its sound is much the same with that of the *Z*: the third, which is their seventeenth letter, is called *Da*, and pronounced like our *D*, tho' in form it resembles the Arabic *Ta*, all it differs in, being a point added a-top. The form of our *D*, is the same with that of the Latins; as appears from all the ancient medals and inscriptions. And the Latin *D*, is no other than the Greek Δ , rounded a little, by making it quicker, and at two strokes. The Δ of the Greeks, again, is borrowed from the ancient character of the Hebrew *Daleth*; which form it still retains on the Samaritan Coins, as is shewn by the Jesuit Souciet in his dissertation on the Samaritan medals. All the alteration the Greeks have made in it, is the making it stoop a little, and taking away a little Line. Nor would it be difficult to shew, that the Syriac *Dolath*, and the Arabic *Dal*, are both borrowed from the ancient Hebrew, as well as the Δ *Daleth* of the modern, or Chaldee Hebrew.

Some indeed will have it, that the Greek, Δ , *Delta*, is borrowed from the Egyptians, who made their *D* of three stars disposed in a triangle; which was a hieroglyphic that among them denoted God, the sovereign Being, as if they had had some notion of a Trinity: but this surmise is but weakly supported.

D is also a numeral letter, signifying five hundred, which arises hence, that in the Gothic characters the *D* is half the *M*, which signifies a thousand. Hence the verse.

Litera D velut A Quingentos significabit.

A dash added at the top of *D*, denotes it to stand for five thousand.

DACRYODES*, in medicine, a term applied to ulcers, which are continually yielding a putrid matter.

* The word is formed from *dacry*, tear, and *odes*, form; denoting the ulcers to weep, or shed somewhat like tears.

DACTYL, **DACTYLUS**, a foot in the Latin and Greek poetry, consisting of a long syllable, followed by two short ones: as *Carmine*.

The *Dactyl* is said to have been the invention of Dionysius or Bacchus, who delivered oracles in this measure at Delphos, before Apollo.—The Greeks call it *παιωνικός*. *Dion.* iii. p. 474. The *Dactyl* and spondee are the most considerable of the poetical feet; as being the measures used in heroic verse, by Homer, Virgil, &c. These two are of equal time, but not equal motion. The spondee has an even, strong and steady pace like a trot: the *Dactyl* resembles the nimble strokes of a gallop.

DACTYLOS was also a sort of dance among the ancient Greeks, chiefly performed, as Hesychius observes, by the *Athletæ*.

DACTYLs also denote the fruits of the palm-tree; more usually called *Dates*.

DACTYLI, in antiquity, a name attributed to the first priests of the Goddess Cybele; who were particularly called *Dactyli Idæi*, on account of the Goddess herself, who was styled *Cybele Idæa*, because principally honoured on mount Ida in Phrygia. The name *Dactyli* is supposed to have been given them on this occasion; that to prevent Saturn from hearing the cries of Jupiter, whom Cybele had committed to their custody, they used to sing I know not what verses of their own invention, which by their unequal measures seemed to resemble the foot called *Dactylus*.—This is the account of the grammarian Diomedes.

One Sophocles, quoted by Strabo, Lib. X. speaks differently. According to him they were called *Dactyli*, from the Greek word *δακτυλος*, finger, by reason their number was at first equal to that of the fingers of the hand, *viz.* ten; five of them boys, and as many girls.—He adds, that it is to them we owe the invention of iron, and the manner of working it, with diverse other useful things. Others make their numbers more, and others less than ten. Some, again, make them

Vol. I.

D A D

natives of Phrygia near the foot of mount Ida; and others bring them from elsewhere.

However, all the Authors Strabo had seen, he says, agreed, that they were the first who wrought in iron; that they had been ministers of the mother of the gods, or Cybele; and that they dwelt at the foot of mount Ida.

It is also conjectured by some authors, not that the Curetes and Corybantes were the same with the *Dactyli Idæi*, but that the Curetes and Corybantes were their posterity; that a hundred men, born in Crete, were first called *Dactyli Idæi*; that each of these had nine children, who were the Curetes; and that each of the Curetes had ten children, who were also called *Dactyli Idæi*.

Strabo only gives us the names of four of the *Dactyli Idæi*, which are Salaminus, Damnanæus, Hercules, and Aemon.

DACTYLIC, something that has a relation to *Dactyls*.

Anciently, there were *Dactylicæ*, as well as spondaic flutes, *Tibia Dactylicæ*.—The *Dactylicæ* flutes consisted of unequal intervals; as the *Dactylic* foot does of unequal measures.

DACTYLIC Versus are hexameter verses, ending in a *Dactyl* instead of a spondee; as spondaic verses are those, which have a spondee in the 4th foot instead of a *Dactyl*.

An instance of a *Dactylic* verse we have in *Virg. Æ. L. VII. 33.*

Bis patria cecidere manus: quin protinus omnia

Perlegerint oculis.

DACTYLIOMANCY*, **DACTYLIOMANTIA**, a sort of divination performed by means of a ring.

* The word is composed of the Greek *δακτυλος*, ring; of *δακτυλος*, finger, and *μαντεία*, divination.

Dactyliomancy consisted principally in holding a ring, suspended by a fine thread, over a round table, on the edge whereof were made diverse marks with the 24 letters of the alphabet. The ring in shaking, or vibrating over the table, stopped over certain of the letters, which being joined together, composed the answer required.

But the operation was preceded and accompanied by several superstitious ceremonies: for first the ring was to be consecrated with a great deal of mystery; the person who held it was to be clad in linen garments, to the very shoes; his head was to be shaved all round; and in his hand he was to hold vervain. And ere he proceeded on any thing, the gods were first to be appeased by a formulæ of prayers, &c. Ammianus Marcellinus gives the process at large in his XXIXth book.

DACTYLONOMY, **DACTYLOΝΟΜΙΑ**, the art of accounting, or numbering by the fingers.

The rule is this: The left thumb is reckoned 1, the index 2, and so on to the right thumb, which is the tenth, and of consequence is denoted by the cypher 0.

DADO, in architecture, is by some writers used for that part in the middle of the pedestal of a column between its base and cornice—it is of a cubic form, whence it is also denominated, *dyz*.

DADUCHI, in antiquity, priests of Ceres.

That goddess having lost her daughter Proserpine, say mythologists, began to make search for her at the beginning of the night. In order to do this in the dark, she lighted a torch, and thus set forth on her travels throughout the world: for which reason it is; that she is always seen represented with a lighted torch in her hand.

On this account, and in commemoration of this pretended exploit, it became a custom for the priests, at the feasts and sacrifices of this goddess, to run about, in the temple, with torches after this manner: one of them took a lighted torch from off the altar, and holding it in his hand, run with it to a certain part of the temple; where he gave it to another, saying to him, *Tibi trado*: this second run after the like manner, to another place of the temple, and gave it to the third; and so of the rest*.

* From this ceremony, the priests became denominated *Daduchi*, *δαδύχοι*. q. d. torch-bearers; from *das*, an uncultured and resinous wood, as pine, fir, &c. whereof the ancients made torches; and *εχω*, I have, I hold.

DÆMON, **ΔΑΙΜΩΝ**, a name the ancients gave to certain spirits, or genii, which they say appeared to men, either to do them service, or to hurt them.

The first notion of *Dæmons* was brought from Chaldaea; whence it spread it self among the Persians, Egyptians, and Greeks. Pythagoras and Thales were the first, who introduced *Dæmons* into Greece. Plato fell in with the notion, and explained it more distinctly, and fully, than any of the former philosophers had done. By *Dæmons*, he understood

spirits inferior to gods, and yet superior to men; which inhabiting the middle region of the air, kept up the communication between gods and men, carrying the offerings and prayers of men to the gods, and bringing down the will of the gods to men. But he allowed of none but good and beneficent ones. Though his disciples afterwards, finding themselves unable to account for the origin of evil, adopted another sort of *Demons*, who were enemies to men.

There is nothing more common in the heathen theology, than these good, and evil genii. And the same superstitious notion we find got footing among the Israelites, by their commerce with the Chaldeans. But by *Demons*, they did not mean the devil or a wicked spirit: they never took the word *Demon* in that sense, nor was it ever used in such a signification, till by the evangelists and some modern Jews. The word is Greek, *δαίμων*.

Gale endeavours to shew, that the origin, and institution of *Demons*, was an imitation of the Messiah. The Phœnicians called them *בעלים* *Baalim*. For they had one supreme being, whom they called *Baal*, and *Moloch*, and various inferior deities, called *Baalim*, whereof we find frequent mention in the Old Testament. The first *Demon* of the Egyptians was Mercury, or Thuet. The same author finds some resemblance between the several offices ascribed to the *Demons*, and those of the Messiah.

DEMONIAC, is applied to a person possessed with a spirit, or *Demon*.

In the Romish church, there is a particular office for the exorcism of *Demoniacs*.

DEMONIACS, are also a party, or branch of the Anabaptists, whose distinguishing tenet it is, that the devils shall be saved at the end of the world.

DAILY, in astronomy, &c. See **DIURNAL**.

DAMAGE, is generally taken for any hurt, or hindrance, that a man receives in his estate; but more particularly for a part of what the jurors are to inquire of, in passing verdict for the plaintiff, or defendant in a civil action, be it personal or real.—After verdict given of the principal cause, they are asked their consciences touching costs and *Damages*, which contain the hindrances that the plaintiff or demandant hath suffered by means of the wrong done him by the defendant or tenant.

DAMAGE has two significations; the one proper and general, the other strict and relative:—*Proper*, as it is in cases, where *Damages* are founded on the statute of 2 H. IV. cap. 1. and 8 H. VI. cap. 9. where costs are included within the word *Damages*. *Damage*, then in its proper signification, is said a *demendo*, when, by diminution, a thing becomes worse; and in this sense costs of suit are *Damages* to the plaintiff, as by them his substance is diminished.

Relative is when the plaintiff declares the wrong done him to the *Damage* of such a sum—this is to be taken relatively, for the wrong which passed before the writ brought; and is assessed by reason of the trespass aforesaid; and cannot extend to the costs of suit, which are future, and of another nature.

DAMAGE Fesant, or Faisant, is when a stranger's beasts are doing hurt, or spoiling the grass, corn, woods, &c. of another man, without his leave or licence.

In this case, the party whom they *damage* may disfranchise, and impound them both by night and by day; though in other cases, as for rent, services, &c. none may disfranchise in the night.

DAMASK, a sort of silken stuff, having some parts raised above the ground, representing flowers, or other figures.

Damask is properly a sort of mohair and fawn intermixed, in such manner as that what is not fawn on one side, is on the other. The elevation which the fawn makes on one side, is the ground on the other. The flowers have a fawn grain; and the ground, a grain of taffetas. It has its name from its being originally brought from *Damascus*, in Syria.

DAMASK EENING, the art, or act of adorning iron, steel, &c. by making incisions therein, and filling them up with gold or silver wire: chiefly used in enriching sword-blades, guards, and gripes, locks of pistols, &c.

Its name shews the place of its origin; or at least, the place where it has been practised in the greatest perfection, viz. the city of *Damascus* in Syria. Though M. Felibien attributes the perfection of the art to his countryman Curlienet, who wrought under the reign of king Henry IV.

Damaskening, is partly mosaic work, partly engraving, and partly carving: as mosaic work, it consists of pieces inlaid; as engraving, the metal is indented, or cut in *creux*; and as carving, gold and silver are wrought therein in *relievo*.

There are two manners of *Damaskening*: in the first, which is the most beautiful, the artist cuts into the metal with a graver, and other tools proper for engraving on steel; and afterwards fills up the incisions, or notches with a pretty thick silver, or gold wire.—In the other, which is only superficial, they content themselves to make hatches, or strokes across the iron, &c. with a cutting knife, such as is used in making of small files. For the first, it is necessary the gravings, or incisions be made in the dovetail form; that the gold or silver wire, which is thrust forcibly into them, may adhere the more strongly.

For the second, which is the more usual, the method is thus: Having heated the steel till it changes to a violet, or blue colour; they hatch it over, and across with the knife; then draw the delign, or ornament intended, on this hatching, with a fine brass point or bodkin. This done, they take fine gold wire, and conducting or chasing it according to the figures already designed, they sink it carefully into the hatches of the metal with a copper tool.

DAMASCUS-Steel, a very fine kind of steel, made in some parts of the Levant, and particularly at *Damascus*, remarkable for its excellent temper; and used chiefly in the making of sword-blades.

Some authors assure us it comes from the kingdom of Golconda, in the East-Indies; where the method of tempering with allom, which the Europeans have never been able to imitate, was first invented.

DAMIANISTS*, a branch of the ancient Acephalous Severites; who agreed with the Catholics in admitting the IVth council; but disowned any distinction of persons in the godhead, and professed one single nature incapable of any difference. And yet they called God, the Father, Son, and Holy Ghost. On which account the Severite Petritæ, another branch of Acephali, used to call them Sabellianists, and sometimes Tetradites. Thus much we learn from Nicephorus Callistus, L. XVIII. c. 49.

* They took their name from *Damianus* a bishop, who was originally their leader.

DAMNATA Terra, in chymistry, the same with *Caput Mortuum*; that is, the earthy part, or mass remaining at the bottom of the retort, &c. after all the other principles have been drawn out of the body by fire.

DAMPS, in natural history, are noxious steams, or exhalations, frequently found in close, subterraneous places, particularly mines, pits, and Wells.

The *Damps* in mines are of four kinds: the first, which withal is the most ordinary, the workmen apprehend in its approach, by the flame of the candle's becoming orbicular, and lessening by degrees, till it goes quite out; as also by their shortness or difficulty of breathing; those who escape swooning, seldom suffer any great harm by this kind; but such as swoon away, though they are not downright suffocated, yet on their first recovery are tormented with very violent convulsions: the way of cure is to lay the person down on the earth in a prone posture, with a hole dug in the ground under his mouth; if this fail, they fill him with good ale; and if that will not do, they conclude him desperate. These are the miners remedies.

The second is the *Pease-Bloom Damp*, which is called so from its smell. This *Damp* always comes in the summer-time, and hath never been known to be mortal: the miners in the peak of Derby fancy it arises there from the multitude of red trefoil flowers, called by them honey-suckles, with which the lime-stone meadows of the peak much abound; the smell of this gives timely notice to get out of the way.

The third is the most pestilential, and most strange of all, if what is said of it be true: they, who pretend to have seen it, (for they say it is visible) describe it thus: In the highest part of the roof of those passages in a mine which branch out from the main grove, they see a round thing hanging, about as big as a foot-ball, covered with a skin of the thickness and colour of a cob-web: if this bag, by a splinter, or any other accident, become broken, the *Damp* immediately flies out, and suffocates all the company: the workmen, by help of a stick, and long rope, have a way of breaking this at a distance; and when they have done it, they purify the place well with fire: and they will have it, that it gathers from the steam of their bodies, and candles, ascends up into the highest part of the vault, and there condenses, and in time has a film grown over it, and then corrupts, and becomes pestilential.

The fourth, is the *fulminating, or Fire-Damp*, whose vapour being touched by the flame of the candle, presently takes fire, and has all the effects of lightning, or fired gun-powder. These are found frequently in the coal-mines, and sometimes, tho' rarely, in lead ones.—How mineral steams may prove poisonous, may be understood from Doctor Mead's essay on poisons. See **MEPHITICS**, and **POISON**.

Naturalists furnish us with very surprising instances of the effects of *Damps*. In the *Hist. de l'Academie des Sciences An. 1701*; we read of a well in the city of Rennes, into which a mason, at work near its brink, letting fall his hammer, a labourer, who was sent down to recover it, ere he reached the water, was strangled. A second fell to fetch up the corps, met with the same fate, and so a third: at last a fourth, half drunk was let down, with charge to call out as soon as he felt any thing incommode him. He called accordingly, as soon as he came near the water; and was instantly drawn out: yet he died three days afterwards. The information he brought them was, that he felt a heat, which scorched up his entrails. A dog being let down, cried about the same place; and died as soon as he came to air; but throwing water on him, he recovered; as happens to those thrown into

the Grotto del Cane near Naples. The three carcases being drawn up with hooks, and opened; there appeared not any cause of their death.—What renders the relation the more remarkable, is, that the water of this Well had been drawn, and drank several years, without the least ill Consequence.

In the same history, *An. 1710*, we are told of a Baker of Chartres, who having carried 7 or 8 bushels of brands out of his oven into a cellar 36 fairs deep; his son, a robust young fellow, going with more, his candle went out on the middle of the fairs. Having lighted it a-fresh, he was no sooner got into the cellar, than he cried out for help; and they heard no more of him: his brother, an able youth, run immediately after him; cried out, he was dead; and was heard no more. He was followed by his wife; and she by a maid, and still it was the same. Such an accident struck the whole neighbourhood with a panic; and no body was forward to venture any further: till a fellow, more hardy and zealous than the rest, persuaded that the four people were not dead, would go down to give them help: he cried too, and was seen no more. Upon this a sixth man requiring a hook to draw some of them forth without going to the bottom; drew up the maid: who, having taken the air, fetch'd a sigh and died. Next day, the baker's friend, undertaking to get up all the carcases with a hook, was let down with ropes on a wooden horse, to be drawn up whenever he should call. He soon called, but the rope breaking, he fell back again; and tho' the rope was soon pieced again, he was drawn forth dead. Upon opening him, his meninges were found extravagantly stretched; his lungs spotted with black, his intestines swelled as big as one's arm, inflamed and red as blood; and what was most extraordinary, all the muscles of his arms, thighs and legs, torn and separated from their parts. The magistrate, at length taking cognizance of the case, and the physicians, being consulted; they gave their opinion, that the brands had been but ill extinguished: the consequence of which must be, that as all the cellars in Chartres abound with saltpetre, the unusual heat in this had raised a malignant vapour which had done the mischief: and that a good quantity of water must be thrown in to put out the fire, and lay the vapour. This performed, a dog, and a lighted candle were let down without injury to either: an infallible sign the danger was over.

A third history we shall add from Doctor Connor, in his *Disfert. Med. Phys.* Some people digging in a cellar at Paris, for supposed hidden treasure; after a few hours working, the maid going down to call her master, found them all in their digging postures: but stark dead. The person who managed the spade, and his attendant who shoveled off the earth, were both on foot, and seemingly intent on their several offices: the wife of one of them, as if a-weary, was sat down on the side of a hopper, very thoughtful, and leaning her head on her arm: and a boy, with breeches down, was evacuating on the edge of the pit; his eyes fixed on the ground: all of them, in fine, in their natural postures and actions, with open eyes, and mouths that seemed yet to breathe; but stiff as statues, and cold as clay.

DAMSEL, DAMOISEL, or DAMOISEAU, an appellation anciently given to all young people of genteel, or noble extraction of either sex, *e. gr.* to the sons, and daughters of knights, barons, and even of kings.

Thus in history, we read of the *Damfel Pepin*, *Damfel Louis le Gros*, *Damfel Richard*, prince of Wales.

Paquier will have the word a diminutive of *Dam*, an ancient name for Lord; as in some authors we read *Dam Dieu* for Lord God; *Dam Chevalier*, &c. Tho' in its feminine sense he takes it to come from *Dame*.—Others derive the word from *Domicellus*, or *Domnicellus*, a diminutive of *Dominus*, *quasi parvus Dominus*: accordingly, du Cange observes, that it has been sometimes wrote *Damenger*.

They who hold the signory of Commerce, M. de la Roque tells us, anciently held it in the title of *Damoiseau*: and M. de Marca assures us, that the noblesse of Bearn is still divided into three bodies or classes: the barons, the cavers, and the *Damfeli*, Domicellos, called in that country *Damengers*.

The Kings of Denmark and Sweden have here the same title, as appears from Pontanus's *hist. of Denmark*, L. VII. and VIII. and Henry of Upsal's *hist. of Suec.* L. III.

From the sons of kings, the appellation passed to those of great lords and barons; and at length, to those of gentlemen who were not yet knights.—

DAMSEL at present is applied to all maids, or girls not yet married; provided they be not of the lowest class of people.

DAMSEL is sometimes also applied to a kind of utensil put in beds, to warm old men's feet withal.

It consists of a hot iron inclosed in a hollow cylinder, which is wrapped round with linnen cloth, and keeps its warmth a long time. Some call it a *Nun*.

DANAIDES, in the ancient Mythology, the daughters of *Danaus*, or *Danaus*, eleventh king of Argos, and brother of *Egyptus*.

They were 50 in Number, and were espoused to the 50 sons of their uncle *Egyptus*.

Danaus fearing the accomplishment of an oracle, which had foretold that he should be expelled his kingdom by a son-in-law, persuaded his daughters to murder, each of them, her husband, the first night; which they performed, all but *Hypermnestra*, who spared her husband *Lynceus*.

In vengeance for this crime of the 49 *Danaides*, the poets have condemned them to hell, to be continually employed in filling a cask perforated at bottom.

The *Danaides* are sometimes also called *Belides*, from their father, who was the son of the Egyptian *Belius*. *Hyginus* has preserved the names of 47 of them.

DANCE*, an agreeable motion of the body, adjusted by art to the measures or tune of a violin, or other Instrument, or voice.

* The Word is French, *Dance*, formed of the German *Dance*, or *Tanze*, which signifies the same thing: Bochart derives it from the Arabic *Tanza*, and *Guichart* from the Hebrew דאנצ, *dantz*, which have all the same signification. *Salmasius* derives the French *Danser* to *dance*, from the Latin *dansare* to thicken; as holding it a practice among the ancient fullers, to leap and *dance* as they fulled their clothes.

Some distinguish the *high Dance*, consisting of capers, gambades, &c. from the *low Dance*, which is the *Terra a Terra*, or close to the ground.

In the Carroual of king Louis XIII. there were *Dances* of horses. The invention of such *Dances* is attributed to the Sybarites.

Dancing has always been in use among all nations, both civilized and barbarous: though held in esteem among some, and in contempt among others. Of it self, no doubt, *Dancing* is harmless. There is a time, says the preacher, to *dance*: and sometimes it is even made an act of religion. Thus *David danced* before the ark, to honour God, and express his excess of joy for its return into the city of Sion. *Socrates* learnt to *dance* of *Alpalia*. And the people of Crete and Sparta went to the attack, *dancing*. On the other hand, *Cicero* reproaches *Gabinus*, a consular man, with having *danced*. *Tiberius* expelled the *Dancers* out of *Rome*. And *Domitian* excluded several members from the senate, for having *danced*. *Caesar* and *Pollux* are said to be the first who taught the art of *Dancing*; and that to the *Lacedæmonians*: though others attribute the invention to *Minerva*; who they say *danced* for joy after the defeat of the giants.

The ancients had three kinds of *Dances*: the first grave, called *Emmelia*, answering to our *low Dances* and pavanes. The second gay, called *Cordax*; answering to our *Courants*, *Galliards*, *Gavots* and *Vaults*. The third, called *Siccinis*, was a mixture of gravity and gaiety. *Neoptolemus*, son of *Achilles*, taught the *Cretans* a new sort of *Dance*, called *Pyrricha*, or the *armed Dance*, to be used in going to war: tho' according to mythologists, the *Curetes* first invented this *Dance*, to amuse and divert the infant *Jupiter*, and to drown his cries with the noise, and clash of their swords, beating against their bucklers.

Diodorus Siculus in the IVth of his *Bibliotheca* assures us, that *Cybele*, daughter of *Meneos*, king of *Phrygia*, and *Dindymenis* his wife, invented divers things, and among others the *Flageolet* of several pipes, *Dancing*, the *Tabor* and the *Cymbal*. *Numa*, 'tis certain, instituted a sort of *Dance* for the *Salii*, priests of *Mars*, who made use of weapons therein. From these *Dances* were composed another sort, called *Salutatio Mimicrum*, or the *Buffoon's Dance*; wherein the *Dancers* were dressed in little corsets, with gilt morions, and had bells on their legs, and swords and bucklers in their hands. *Lucian* has an express treatise, and *Julius Pollux*, a chapter on this head; *Athenæus*, *Cælius Rhodiginus*, and *Scaliger*, also make mention of this *Dance*.

It is not many years ago, since *Thoinot Arbeau*, a *dancing* master of Paris, gave an *orchefography*, wherein all the steps and motions of a *Dance* are writ, or noted down; as the sounds of a song are scored in music. Tho' the famous *Beauchamp* had some pretensions to be the inventor of this secret, and accordingly procured an *arret* in his favour.

Dancing is usually an effect, and indication of joy among most nations: tho' *Mr. Palleprat* assures us, that there are people in South America, who *dance* to show their sorrow.

ROPE-DANCER, *Schoenobates*. *Grodeck*, professor of philosophy at *Dantzic*, has published a dissertation on *Rope-Dancers*, *de Funambulis*; full of learning, and an uncommon knowledge of antiquity. He defines a *Rope-Dancer*, a person who walks on a thick rope fastened to two opposite posts; which is precisely, what is expressed by the Latin word *Funambulus*. But our *Rope-Dancers* do more, for they not only walk, but *dance*, and leap upon the rope.

The ancients, 'tis certain, had their *Rope-Dancers* as well as we: witness the Greek words *Neurobates*, and *Schoenobates*, as well as the Latin *Funambulus*, which every where occur. They had likewise the *Cremnobates* and *Oribates*, that is, people who walked on the brinks of precipices. Nay more, *Suetonius* in *Galba*, c. 6. *Seneca* in his 85th epistle, and *Pliny*, Lib. VIII. cap. 2. make mention of elephants that were taught to walk on the rope.

Acron, an ancient grammarian and commentator on *Horace*, takes occasion to observe on the Xth satire of the first book,

DAR

book, that Meffala Corvinus was the first, who used the word *Punambulus*; and that Terence had it from him. But Mr. Groddeck shews that he is mistaken, and that Meffala lived after Terence. The business is, Acron confounds Valerius Meffala, who got the surname Corvinus in the war against the Gauls about 200 years before Terence, with one of his descendants, who was a famous orator in the time of Horace. Mr. Groddeck coming from the historical to the moral consideration, maintains that the profession of a *Rope-Dancer* is not lawful; that the professors are infamous, and their art of no use to society; that they expose their bodies to very great dangers; and that they ought not to be tolerated in a well regulated state.—But coming afterwards to temper the severity of his morals, he allows that there are sometimes reasons for admitting them: that the people must have shews; that one of the secrets of government is to furnish them therewith, &c. The ancient *Rope-Dancers* had four several ways of exercising their art; the first vaulted or turned round the rope, like a wheel round its axis, and there hung by the heels, or the neck. The second flew or slid from above, downwards, resting on their stomachs with the arms and legs extended. The third run along a rope stretched in a right line, or up and down. Lastly, the fourth not only walked on a rope, but made surprising leaps and turns thereon.

DANCETTE, in heraldry, is when the out-line of any bordure, or ordinary, is indented very largely; the largeness of the indentures being the only thing that distinguishes it from indented.

There is also a bearing of a bend, called *double Dancetté*; thus, he beareth azure, a bend double *Dancetté* argent.

DANCHE, or *Denché* in heraldry, the same with indented; or, as others will have it, with *Dancetté*.

DANEGLT, an annual tax laid on our ancestors, first of 1s. afterwards 2s. for every hide of land through the realm, for maintaining such a number of forces as were thought sufficient to clear the *British* seas of *Danish* pyrates, which heretofore greatly annoyed our coasts.

DANEGLT was first imposed as a standing yearly tax on the whole nation, under king Ethelred, A. D. 991. That prince, says Cambden, *Britan.* 142. much distressed by the continual invasions of the Danes; to procure his peace, was compelled to charge his people with heavy taxes, called *Danegelt*.—At first they paid 10000 *lib.* then 16000 *l.* then 24000 *l.* after that 36000 *lib.* and lastly 48000 *lib. per annum*.—At Edward the confessor remitted this tax: William I. and II. re-assum'd it occasionally. In the reign of Henry I. it was accounted among the king's standing revenues; but king Stephen, on his coronation day, abrogated it for ever.

No church, or church land pay'd a penny to the *danegelt*; because, as is set forth in an ancient *Saxon* law, the people of England placed more confidence in the prayers of the church, than in any military defence they could make. *Camb. ap. Magn. Brit. p. 68.*

DANTELE, in heraldry, the same with *Danché*, or rather with *Dancetté*, viz. a large, open indenture. See *DANCETTE*.

DAPIFER *, the dignity, or office of grand master, or grand feeder of a king's, or prince's household.

* The word is pure Latin, compounded of *daps*, *dapis*, a dish of meat served on the table, and *fero*, I bear: so that *Dapifer* literally signifies a dish-carrier, or an officer who serves the meats upon the table.

The title of *Dapifer* was given by the emperor of Constantinople to the Czar of Russia, as a testimony of favour. In France, the like office was instituted by Charlemagne, under the title of *Dapiferus*, and *Seneschallus*; to which was affixed the superintendence over all the officers of the household. In England, the office of *Dapifer* was less eminent; being found in several of our ancient charters named one of the last of the officers of the household.

The dignity of *Dapifer* is still subsisting in Germany. Till the year 1623. the elector palatine was *Dapifer*, or grand feeder of the empire: since that time the elector of Bavaria has assumed the title of *Arch-Dapifer* of the empire. His office is, at the coronation of an emperor, to carry the first dish of meat to table on horseback.

The several functions of a *Dapifer* occasioned the ancients to give him divers names: as, *Æxualis**, and *Eleator*, *Dipnator*, *Convocator*, *Trapezopæus*, *Architriclinus*, *Proguſta*, *Præguſtator*, *Domesticus*, *Megadomesticus*, *Oeconomus*, *Majordomus*, *Seneschallus*, *Schalvus*, *Gastaldus*, *Aſſiſſor*, *Præſeſtus*, or *Præpoſitus Menſæ*, *Princeps Coquorum* & *Magiſtus*.

DARAPTI, in logic, a mode of syllogism in the third figure, wherein the major and minor are universal affirmative propositions, and the conclusion a particular affirmative. *E. gr.*

d. A. Every truly religious man is virtuous.

r. A. Every truly religious man is hated by the world.

pt. I. Therefore, some virtuous men are hated by the world.

DARDANARIUS, *Uſurer*, *Monopolist*; a name anciently attributed to such as caused a scarcity, and dearth of provisions, particularly corn, by buying and hoarding it up, to raise its value, and sell it again at an extravagant rate.

DAT

The name *Dardanarius* was given from one *Dardanus*, who is said to have made a practice of spoiling and destroying the fruits of the earth by a sort of sorcery.

The same people are also called *Ærufatores*, *Direſtarii*, *Sitocæpeli*, *Annonæ Flagellatores*, and *Siploſarii*.

DARE, see *FISHING*.

DARII, in logic, a mode of syllogisms in the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives. *E. gr.*

d. A. They who speak well of every body have many friends.

r. A. Some speak well of every one.

I. Therefore some have many friends.

DARK-Chamber. See the article *CAMERA Obscura*.

DARK-Tent, a portable Camera Obscura, made not unlike a desk, and fitted with optic glasses; to take prospects of landscapes, buildings, fortifications, &c. See *CAMERA Obscura*.

DARREIN, in law, a corruption of the French *Dernier* last, and used in the like sense: as—*Darrein* continuance. (See *CONTINUANCE*.)—*Darrein* presentment. See *ASSISE Darrein* presentment.

DART, in geometry, astronomy, &c. See *SAGITTA*.

DARTOS *, or *DARTUS*, in anatomy, the inner coat of the scrotum, composed of a great number of muscular, or fleshy fibres; whence some consider it as a cutaneous muscle.

* The word is pure Greek, *ἄστρον*, *Excortatus*, *pelle Nudatus* of *Jæqu*, *excoris*, probably by reason it lies close under the skin. See *SCROTUM*.

'Tis by means hereof that the scrotum is contracted, or corrugated, which is esteemed a sign of health.

The *Dartos* was anciently taken to be a continuation of the panniculus carnosus; but mistakenly. It has several veins and arteries. It invests the testicles, and extending itself between them, separates them from each other.

DATA, in mathematics, certain things, or quantities supposed to be given, or known, in order, from them, to find out other things or quantities, which are unknown, or sought for. A problem or question generally consists of two parts; *Data* and *Quæſita*.

Euclid has an express treatise of *Data*; wherein he uses the word for such spaces, lines and angles as are given in magnitude; or to which we can assign other equal.

From the primary use of the word *Data* in mathematics, it has been transplanted into other arts; as philosophy, medicine, &c. where it expresses any quantity, which, for the sake of a present calculation, is taken for granted to be such, without requiring an immediate proof for its certainty; called also the *given* quantity, number, or power—and hence also such things as are known, from whence either in natural philosophy, the animal mechanism, or the operation of medicines, we come to the knowledge of others unknown, are now frequently in physical writers called *Data*.

DATE *, an addition, or appendage in writings, acts, instruments, letters, &c. expressing the day, and month of the year when the act, or letter, was passed or signed; together with the place where the same was done.

* The word is formed from the Latin *Datum* given, of the participle *do*, I give. The Latins usually say *dabam*, I gave.

In writings of importance the *Date* should be written in words at length, *dated* or given at London this twenty sixth day of March in the year of our Lord one thousand seven hundred and fifty. In letters, the *Date* is usually in figures. London; March the 26th, 1750.

An *Anti-date* is a false *Date*, prior to the real time when the instrument was passed, or signed.

A *Post-date* is that posterior to the real time, &c.

Our ancient deeds had no dates, but only the month and year, to signify that they were not made in haste, or in the space of a day, but upon longer and more mature deliberation. The king's grants began with these words, *Præſentibus* & *futuris*, &c. but the grants of private persons with, *Omnibus præſentibus Literis inſcripturis*—

DATE *, *Dactylus*, the fruit of the palm-tree.

* The word is formed of *Dactr*, and that of *Dactylus*, finger; as being round and oblong, resembling a finger's end.

This fruit is gathered in autumn, before it is ripe; and bears a near resemblance to our bullace; being of a green colour, and very sharp and astringent. When ripe, it becomes ruddy, having a hard, longish stone, cloven at bottom, and encompassed with a thin white pellicle or skin.

The husk or covering of the *Date*, called by the ancients *Elate*, or *Spatha*, when the fruit is in its growth, is variable; having as many changes of colour as the fig has.

Some *Dates* are black, some white, some brown, some again are round like apples, and very big. Ordinarily they are oblong, fleshy, yellow, somewhat bigger than the thumb's end, and some are very agreeable to the taste. Some are no bigger than a chick-pea, and others as big as a pomegranate. The best are those called *Royal-Dates*. There is also another sort called *Caryotæ*, which are very good. Some of them have stones, and others none.

Dates are principally used in medicine: their qualities are, to soften the aperities of the gut, to strengthen the *Fætus* in the womb, to assuage all immoderate fluxes of the belly, and

to ease disorders of the reins and bladder. Their bad property is, that they digest difficultly, cause pains in the head, and produce a thick melancholic blood.—These effects arise from the principles they contain, which are a moderate share of oil, and a deal of phlegm, and essential salt. The oil and phlegm render them moistening and nutritious, good against acrimonies of the breast, to assuage coughs, &c. And the phlegm and salt render them detergent and astringent, and good against diseases of the throat. For the rest; they are an heavy food, full of earthy juice, and occasion obstructions in the viscera; for which reason, people who eat great quantities of *Dates* become scorbutic and lose their teeth betimes. Our *Dates* are brought us from Egypt, Syria, Africa, and the Indies. They never come to full maturity in Italy, or the most southern parts of Spain. And yet there are tolerable *Dates* in Provence; but they do not keep, but breed worms. Those from Persia exceed all others in largeness, colour, and Taste.

DATISI, in logic, a mode of syllogisms in the third figure, wherein the major is an universal affirmative, and the minor, and conclusion are particular affirmative propositions. *E. gr.*

d. A. All God's friends are kings.

1. I. Some of God's friends are poor.

S. I. Therefore, some poor, are kings.

DATIVE, in grammar, the third case in the declension of nouns; expressing the state, or relation of a thing to whole profit or loss some other thing is referred.

It is called *Dative*, because usually governed by a verb implying something to be given to some person. As, *commodare Socrati*, to lend to Socrates; *utilis reipublice*, useful to the commonwealth; *perniciosus ecclesie*, pernicious to the church; *visum est Platoni*, it seemed to Plato, &c.

In English, where we have properly no cases, this relation is expressed by the sign *to*, or *for*.

DAUGHTER. See the article SON.

The *Sons and Daughters* of the king of England are called the *Sons and Daughters* of England; because all the subjects of England have a special interest in them. See *PRINCES of the Blood*.

DAVIDISTS, DAVIDICI, a sect of heretics, the adherents of David George, a glazier, or, as others say, painter of Ghant; who in 1525, began to preach a new doctrine: publishing himself to be the true messiah, and that he was sent thither to fill heaven, which was quite empty for want of people to deserve it.

He rejected marriage, with the Adamites; held with Manes, that the soul was not defiled by sin; and laughed at the self-denial so much recommended by Jesus Christ.—Such were his principal errors.

He made his escape from Ghant, and retired first into Friseland, and then to Basil, where he changed his name, assuming that of John Bruck, and died in 1566.

He left some disciples behind him, to whom he promised that he would rise again at the end of three years. Nor was he altogether a false prophet herein, for the magistrates of that city, being informed at the three years end of what he had taught, ordered him to be dug up, and burnt, together with his writings, by the common hangman.

There are still some remains of this ridiculous sect in Holstein, particularly about Frederickstadt, where they are intermixed with the Arminians.

DAVIS'S Quadrant. See the article. BACK-STAFF.

DAUPHIN, DOLPHIN, in astronomy. See *DELPHINUS*.

DAUPHIN, is a title given the eldest son of France, and presumptive heir of the crown; on account of the province of *Dauphiné*, which in 1343, was given to Philip de Valois on this condition, by Humbert *Dauphin* of the Viennois.

The *Dauphin*, in his letters patents, styles himself, "By the grace of God, eldest son of France, and *Dauphin* of Viennois."

DAUPHIN was anciently the title or appellation of the prince of Viennois in France.

* Most authors, who have sought the origine of the name *Dauphin*, and *Dauphine*, seem to have given too much loose to conjecture. Some will have it derived from the Ausinates, an ancient people mentioned by Ptolemy and Pliny; but those authors place the Ausinates on the other side of the Alps in the Gallia Cisalpina. Others write that the Allobroges brought the name from Delphos; others, that king Bofon's shield was distinguished by the figure of a Dolphin, which he bore thereon. Others, that the princes who reigned in the Viennois after Bofon, pitched on the *Dolphin* for their arms as a symbol of their mildness and humanity. Others, that it was first given by an emperor who made war in Italy, but whom they do not name, to a governor of this province, who sent him a powerful supply with such expedition, that it deserved to be compared with the swiftness of a *Dolphin*. Thaboet fancies the word to be Gothic; as well as the names Brest, Savoy, Beaujeu, &c. Claud de Grange takes it to have been formed from the word *Viennois*, the ancient name of this province. A person of this province, says he, being asked what countryman he was, answered, *de Vienne*, and the prince of the pro-

vince called himself the prince *de Vienne*; and afterwards changing the V, according to custom, into F, *de Vienne*; and at length retrenching the two e's, *Defin*; lastly, the common opinion that the word was formed from *Delphinus*, occasioned them to write *Dauphin*: but this appears to Chorier no better than a ridiculous subtilty. Others will have it that Guy the Fat, having a daughter he was very fond of, used to call her *Dauphin*; and to immortalize her when dead, gave her name to his country. Others are of opinion, that the last count d'Albon, whose estate being incorporated with that of the count de Grestevaudan, by the marriage of his only daughter with the first Guy, was actually named *Dauphin*; and that his eldest grandson, being obliged to take his name, was called *Dauphin*; and bore the figure of a *Dolphin* for his arms. Du Chelne is likewise of opinion, that it was the grandson of Guy the Fat, who first bore the name of *Dauphin*; though not for the reason just alledged, but that it was given him at his baptism, and added to that of Guy. Chorier will not allow any thing probable in any of these opinions: he observes that William canon of Notre Dame at Grenoble, who has wrote the life of Margaret daughter of Stephen earl of Burgundy married with Guy son of Guy the Fat, calls the latter simply *Guy the Old*, and the former always count *Dauphin*; and adds, that no record, no monument, ever attributes the title of *Dauphin* to Guy the Fat, or any of his predecessors; so that it must necessarily have taken its rise in his son, all whose successors so constantly assumed it, that it became the proper name of the family. He died in 1142, in the flower of his youth; so that it must be about the year 1120, that the title commenced; and without doubt, adds he, on some illustrious occasion. He observes farther, that this prince was of a military disposition, and delighted in nothing but war; and again, that it was the custom of the Cavaliers to deck their casks, coats of arms, and the housing of their horses, with some figure or device peculiar to themselves, whereby they were distinguished from all others engaged in the same combat or tournament. From all these circumstances he conjectures that this Guy chose the *Dolphin* for his signature; that this was the crest of his helmet; and that he bore it on his coat in some notable tournament or battle wherein he distinguished himself. And this, Chorier makes no doubt, is the real origin of the appellation. The President de Valbonnet speaks more fully on the subject: Guignes, or Guy the Fat, son of Guy the old, married Mathilda, who has been supposed to be of the same royal family, as being called *Regina* in several ancient charters. This couple had a son, who, in a deed passed between him and Hugh bishop of Grenoble in 1140, is called *Delphinus*; *Guigo Comes, qui vocatur Delphinus*. This has occasioned some historians to think, that to discover the origin of the name *Dauphin*, there was no necessity for having recourse to voyages beyond the sea, where the counts de Grestevaudan might take the *Dolphin* for their arms, or badge of distinction. In effect, that conjecture does not stand on any proof; nor is it true that the first and second race of those princes bore the *Dolphin* for their arms; there being scarce any signs thereof before Humbert I. who first wore it on his shield. It is more probable that the surname *Dauphin*, which Guy first assumed, pleased his successors so much, that they added it to their own name, and erected it into a title, which has been retained ever since. Nothing was more common in those times, than to make proper names become the names of families, or dignities. Witness the Ademars, Arthauds, Aynards, Ademans, Berengiers, and infinite others, who all owe their names to some one of their ancestors, from whom it has been transmitted throughout the family.

The seigneurs or lords of Auvergne have likewise bore the appellation of *Dauphin*; but the *Dauphins* of Auvergne had it not till a good while after those of the Viennois, and even received it from them. The manner was this: Guy the VIIIth, *Dauphin* of Viennois, had by his wife Margaret, daughter of Stephen, earl of Burgundy, a son and two daughters. The son was Guy the IXth his successor. Beatrix, one of the daughters, was married to the count d'Auvergne, who, according to Blondel, was William the Vth, or rather, as Chorier and others hold, Robert the VIth, father of William the Vth. This prince lost the greatest part of the county Auvergne, which was taken from him by his uncle William, assisted by Louis the young; and was only left master of the little canton whereof Vodable is the capital. He had a son whom he called *Dauphin*, on account of Guy, or Guignes, his uncle by the mother's side. From his time his successors holding the same petty canton of Auvergne, styled themselves *Dauphins* of Auvergne, and bore a *Dolphin* for their arms.

DAY, a division of time, drawn from the appearance, and disappearance of the sun.

The *Day* is of two kinds, *Artificial*, and *Natural*.

Artificial DAY, which seems to be that primarily meant by the word *Day*, is the time of light; determined by the sun's rising and setting.

This is properly defined the stay of the sun above the horizon: In opposition to which, the time of darkness, or, the sun's stay below the horizon from setting to rising again, is called *Night*.

Natural DAY, called also *Civil Day*, is the space of time wherein the sun performs one revolution round the earth: or, more justly, the time wherein the earth makes a rotation on its

axis; which the Greeks more properly express by *πύξινος*, *Nychthemeron*, q. d. night-day.

The *Epocha*, or *Beginning of the Civil Day*, is the term from which one *Day* begins, and in which the preceding *Day* concludes. The fixing of this term is of some importance. It is certain, that for the more commodious distinguishing of *Days*, it ought to be fixed in some moment of time wherein the sun is in some distinguishable part of the heavens. The most eligible therefore should be the moments wherein the sun passes either the horizon, or the meridian. In effect, as there is no moment can be more accurately determined by observation than that in which the sun passes through the upper meridian: if regard be had to the exactness of the measure, the noon-tide has the best pretensions; the rising and setting of the sun being disturbed by the refraction; beside that, the horizon is seldom clear of clouds. But yet, as the *Artificial Day* does begin with the sun's rise, and ends with the setting; and besides, the sun's passing the horizon is a thing easily observed, the rising or setting of the sun should appear the most commodious, tho' not most accurate *Epoch* or beginning of the *Civil Day*.

As then there are not wanting reasons for beginning the *Natural Day*, both from the sun's passing the meridian, and the eastern, and western side of the horizon; it is no wonder that different nations should begin their *Day* differently. Accordingly, 1st, The ancient Babylonians, Persians, Syrians, and most other eastern nations, with the present inhabitants of the Balearic islands, the Greeks, &c. begin their *Day* with the sun's rising. 2^{dly}, The ancient Athenians and Jews, with the Austrians, Bohemians, Marcomanni, Silesians, modern Italians, and Chinese, reckon it from the sun's setting. 3^{dly}, The ancient Umbri and Arabians, with the modern astronomers, at noon. And, 4^{thly}, The Egyptians and Romans, with the modern English, French, Dutch, Germans, Spaniards, and Portuguese, at midnight.

The *Day* is divided into hours; and the week, month, &c. into *Days*.

For the different lengths of the *Day* in different climates. It has been a matter of some controversy among astronomers, whether or no the *Natural Days* be all equally long throughout the year; and if not, what is their difference? A professor of mathematics at Sevil, in a memoir in the *Philosophical Transactions*, asserts, from a continued series of observations for three years, that they are all equal. Mr. Flamsteed, in the same transactions, refutes the opinion; and shews, that one *Day*, when the sun is in the equinoctial, is shorter than when he is in the tropics, by 40 seconds; and that 14 tropical *Days* are longer than 10 many equinoctial ones, by $\frac{1}{2}$ of an hour, or 10 minutes. This inequality of the *Days* flows from two several principles: the one, the eccentricity of the earth's orbit; the other, the obliquity of the ecliptic with regard to the equator, which is the measure of time. As these two causes happen to be combined, the length of the *Day* is varied.

DAY, in law, is frequently used for the *Day* of appearance in court, either originally, or upon assignation.

We say, He had a *Day* by the rolls, i. e. he had a *Day* of appearance assigned him.

DAYS in Bank, are *Days* set down by statute, or order of the court, when writs shall be returned, or when the party shall appear on the writ served.

To be dismissed without *Day*, *sine Die*, is to be finally discharged the court.

DAYS of Prolation, in the Exchequer. See REMEMBRANCE.

DAYS of Grace, in commerce, are a number of *Days* allowed by custom for the payment of a bill of exchange, after the same becomes due, i. e. after the time it was accepted for is expired.

In England three *Days of Grace* are allowed; so that a bill accepted in order to be paid, e. gr. ten *Days* after sight, is not to be paid till thirteen *Days*. Throughout France, they allow ten *Days of Grace*; as many at Dantzic; eight at Naples; six at Venice, Amsterdam, Rotterdam, and Antwerp; four at Francfort; five at Leipfic; 12 at Hamburg; 6 in Portugal; 14 in Spain; 30 in Genoa, &c.—Note, fundays, and holidays are included in the number of *Days of Grace*.

Fifth DAYS, See the article ABSTINENCE.

Dog-DAYS, *Dies Caniculares*. See CANICULAR.

Critical DAYS, *Dies Critici*. See CRITICAL DAYS.

Intercalary, or Additional DAYS. See INTERCALARY DAYS.

DEACON, *DIACONUS*, a person in the lowest degree of holy orders, whose business is to baptize, read in the church, and assist at the celebration of the eucharist.

* The word is formed from the Latin *Diaconus*, of the Greek *διακονέω*, minister, servant.

Deacons were first instituted, seven in number, by the apostles, *Acts*, chap. vi. which number was retained a long time in several churches. Their office was to serve in the Agape, and to distribute the bread and wine to the communicants, and dispense the alms.

By the ancient canons, marriage was not incompatible with the state and ministry of a *Deacon*. But it is now a long

time that the Romish church has prohibited their marrying; and the pope only grants them dispensations for very important causes; and after this dispensation, they lose the rank and functions of their order, and return to a lay state.

The *Deacons* were formerly prohibited fitting with the priests: the canons forbid *Deacons* to consecrate; that being a sacerdotal office. They also prohibit a *Deacon* being ordained, unless he have a title, or call, and be at least twenty five years of age. The emperor Justinian, in *Novel* 123, assigns the same age of twenty-five years for a *Deacon*. But this was the custom when priests were not ordained at less than thirty years of age. At present twenty-three years of age suffices for a *Deacon*. At Rome, under pope Sylvester, they had only one *Deacon*; then seven were appointed; then fourteen, and at last eighteen, who were called *Cardinal Deacons*; to distinguish them from those of other Churches.

Their office was to take care of the temporalities of the church, to look to the rents and charities, and provide for the necessities of the ecclesiastics, and even of the pope. The collecting of the rents, alms, &c. belonged to the *Sub-Deacons*; the *Deacons* were the depositaries and distributors. Having thus the management of the revenues of the church in their hands; their authority grew apace, as the riches of the church increased. Those of Rome, as being ministers of the first church, preceded all others, and even at length took place of the priests themselves. Doubtless, it was the avarice of the priests that made them give place to the *Deacons*, who had the disposal of the money. St. Jerom exclaims against this attempt, and proves that a *Deacon* is properly inferior to a priest.

The Council in Trullo, which is the II^d of Constantinople, Aristenus in his Synopsis of the canons of that council, Zonaras on the same council, Simeon Logotheta, and Oecumenius, distinguish *Deacons* destined for service at the altar, from those who had the care of the distribution of the alms of the faithful. Thus, the custom of constituting *Deacons*, without any other office but to attend the priest at the altar, being once introduced, those simple *Deacons* durst no longer pretend to a superiority over the priests. As to the other *Deacons*, who had got the administration of the revenues, they would still retain the superiority; and for distinction sake, where there were several, the first took the appellation of *Arch-Deacon*.

The *Deacons* rehearsed certain prayers at the holy office, which were thence denominated *Diaconical*.

They took care that the people at church behaved themselves with due modesty and respect. They were not allowed to teach publicly; at least not in the presence of a bishop or priest. They only instructed the Catechumens, and prepared them for baptism. The doors of the church were likewise in their custody: though, in after times, that charge was committed to the *Sub-Deacons*.

Among the Maronites of mount Lebanon, there are two *Deacons*, who are mere administrators of the temporalities. Dandini, who calls them *li Signori Diaconi*, assures us, they are secular lords, who govern the people, sit in judgment on all their differences, and treat with the Turks as to what concerns the taxes and other affairs. In this, the patriarch of the Maronites seems to have aimed to imitate the apostles, who discharged all the temporal concerns of the church on the *Deacons*; it is not well done, say they, to leave the word of God, and serve at tables. And, in effect, it was this that gave occasion to the first establishment of the *Diaconate*.

DEACONESS, *DIACONISSA*, an office in use in the primitive church, though now laid aside. St. Paul makes mention thereof in his epistle to the Romans: and the younger Pliny, in a letter to Trajan, tells that prince, that he had ordered two *Deaconesses*, whom he calls *Ministræ*, to be tortured. *Deaconess* was a title given to certain devout women, who consecrated themselves to the service of the church, and rendered those offices to the women, which men could not decently do; as, in baptism, for instance, which was conferred by immersion, on women as well as men.

They were likewise to look to the doors on the side the women were on, who were separated from the men, according to the custom of those times. They had the care and inspection of the poor, sick, &c. And in times of persecution, when a *Deacon* could not be sent to the women, to exhort and fortify them, a *Deaconess* was sent. See Balsamon on the eleventh canon of the council of Laodicea; and the *Ap-
stolical Constitutions*, L. II. c. 57. To say nothing of the epistle of Ignatius to the people of Antioch; where, what is said of *Deaconesses*, is supposed to be an interpolation.

In Lupus's commentaries on the councils it is said that they were ordained by the imposition of hands: and the council in Trullo uses the term *χειροτονέω*, to impose hands, to express the consecration of *Deaconesses*. Baronius, however, denies that hands were laid on the *Deaconesses*; or that there was any ceremony of consecration: founding his opinion on the nineteenth canon of the council of Nice, which places them in the rank of the laity, and says expressly, they have had no imposition of hands. And yet the council of Chalcedon decrees they should not be ordained till forty years of age; whereas till then they had not been ordained before sixty;

as is prescribed in the first epistle to *Timothy*, chap. v. g. And as is seen in the *Nomocanon* of John of Antioch, in Balamon, the *Nomocanon* of Photius, the *Theodorian Code*, *Tertullian de Veland. Virgin.* &c.

Tertullian, ad uxorem, L. i. c. 7. speaks of women who had received ordination in the church, and who, on that account, were deprived of the liberty of marrying. For the *Deaconesses* were widows and might not re-marry. Nor were they capable of being admitted to that order, if they had been married more than once. Though in after-times virgins were also made *Deaconesses*, if we may credit St. Epiphanius, Zonaras, Balamon and Ignatius.

The council of Nice ranks *Deaconesses* among the clergy: though some hold that their ordination was not sacramental, but a mere ecclesiastical ceremony. However, it gave them a preeminence above the rest of their sex; for which reason the council of Laodicea forbade the ordaining of any more for the future. The first council of Orange, held in 441 likewise forbids the ordaining of *Deaconesses*, and enjoins such as had been ordained to receive the benediction with the mere laity. It is hard to say when the order of *Deaconesses* expired; by reason they did not all cease together. The eleventh canon of the council of Laodicea, it is true, seems to abrogate them; but it is certain they subsisted in diverse places long afterwards. For tho' the twenty sixth canon of the first council of Orange, and the twenty first of that Epauona, held in 515, forbid the ordination of *Deaconesses*; yet there were some at the time of the council in Trullo.

Atto of Verecil in his VIIIth letter gives the reason of their being abolished: he observes that in the first ages the ministry of women was necessary, in order to the more easy instructing of other women, and recovering them from paganism; and that they likewise served for the more decent administration of baptism to the same: but that it was not then necessary, by reason none but children were baptized; and it might now be added, by reason baptism is only conferred by sprinkling. The number of *Deaconesses* does not seem to have been fixed: the emperor Heraclius, in his letter to Sergius patriarch of Constantinople, orders that, in the great church of Constantinople there be forty *Deaconesses*, whereas there were only six in that of the mother of God, in the quarter of the Blachernæ.

DEACONRY, DIACONATE, the order, or ministry of a *Deacon*, or *Deaconess*. See **DEACON** and **DEACONESS**.

DEACONRY, DIACONIA, is also a name still reserved to the chapels and oratories in Rome, under the direction of the several deacons, in their respective regions or quarters.

To the *Deaconries* were annexed a sort of hospitals, or boards for the distribution of alms, governed by the regionary deacons, called cardinal deacons, of whom there were seven, answering to the seven regions, their chief being called the arch-deacon.

The hospital adjoining to the church of the *Deaconry*, had an administrator for the temporal concerns, called the *Father of the Deaconry*, who was sometimes a priest, and sometimes a lay-man. At present there are fourteen of these *Deaconries* or hospitals at Rome, which are reserved to the cardinals. Du Cange gives us their names: as the *Deaconry* of St. Maria in the broad way; the *Deaconry* of St. Eustachio near the Pantheon, &c.

DEADLY FEUD*, in our law-books, a profession of irreconcilable enmity till a person is revenged by the death of his enemy.

* The word *Feud*, is derived from the German *Feld*, which, as Hotoman observes, signifies, *modo bellum, modo capitales iniurias*. See **FEUD**.

Such enmity and revenge was allowed by our ancient laws in the time of the Saxons, viz. If any man was killed, and a pecuniary satisfaction were not made to the kindred, it was lawful for them to take up arms, and revenge themselves on the murderer: which was called *Deadly Feud*. And this, probably, was the original of an appeal.

DEAD-PLIDGE. See the article **MORTGAGE**.

DEAD-Reckoning, at sea, is that estimation, judgment or conjecture, which the sea-men make of the place where a ship is, by keeping an account of her way by the log, by knowing the course they have steered by the compass, and by rectifying all, with allowance for drift lee-way, &c. according to the ship's trim: so that this *Reckoning* is without any observation of the sun, moon and stars, and is to be rectified as often as any good observation can be had. See **LOG**.

DEAD-WATER, is the eddy-water just behind the stern of a ship: It is so called, because it does not pass away so swiftly, as the water running by her sides doth.

If a ship have a great eddy following her stern, they say, she makes much *Dead-Water*.

DEAFFORESTED, in our law-books, the being discharged from being forest; or freed and exempted from forest-laws*. See **FOREST**.

* *Johannes Dei Gratia, &c. Archiepiscopus, Episcopus, &c. scilicet nos omnino Deafforellasse For. cum de Brewood de omnibus que ad Forestam & Forasterios pertinent. Quare volumus & firmiter precipimus, quod predicta Foresta & homines in illa manentes, & heredes eorum sint Deafforellati perpetuum.*

DEAFNESS, the state of a person who wants the sense of hearing: or a disease of the ear, which prevents its due reception of sounds.

Deafness generally arises either from an obstruction, or a compression, of the auditory nerve; or from some collection of matter in the cavities of the inner ear; or else from the auditory passage being stopped up by some hardened excrement; or, lastly, from some excrecence, as a swelling of the glands, or some foreign body introduced within it.

Those born *deaf* are also dumb, as not being able to learn any language; at least in the common way. However, as the eyes, in some measure, serve them for ears, they may understand what is said by observing the motion of the lips, tongue, &c. of the speaker; and even accustom themselves to move their own, as they see other people do; and by this means learn to speak.

Thus it was that Dr. Wallis taught two young gentlemen born *deaf*, to know what was said to them, and to return pertinent answers. Digby gives us another instance of the same, within his own knowledge. And there was a Swiss physician lately living at Amsterdam, one Joh. Conrad Amman, who effected the same in several children born *deaf*, with surprising success. He has reduced the thing to a fixed art or method, which he has published in his *Surdus Loquens*, Amstelod. 1692. and *de Loquela*, ibid. 1700.

In the *Phil. Transact.* No. 312, we have an account by Mr. Waller, R. S. Secr. of a man and his sister, each about fifty years old, born in the same town with Mr. Waller, who had neither of them the least sense of hearing; yet both of them knew, by the motion of the lips only, whatever was said to them, and would answer pertinently to the question proposed. It seems they could both hear and speak when children; but lost their sense afterwards; whence they retained their speech, which, though uncouth, was yet intelligible.

Such another instance is that of Mr. Goddy's daughter, minister of St. Gervais in Geneva, related by bishop Burnet. At two years old they perceived she had in great part lost her hearing; and ever after, though she heard great noises, yet she could hear nothing of what was said to her. But by observing the motions of the mouth and lips of others, she had acquired so many words, that out of these she had formed a sort of jargon, in which she could hold conversation whole days with those that could speak her language. She knew nothing that was said to her, unless she saw the motion of their mouths that spoke to her; so that in the night, they were obliged to light candles to speak to her. One thing will appear the strangest part of the whole narration: she had a sister, with whom she had practised her language more than with any body else; and in the night, by laying her hand on her sister's mouth, she could perceive by that what she said, and so could discourse with her in the dark. Burn. *Let. IV.* p. 248.

It is observable that *deaf* persons and several others thick of hearing, hear better and more easily if a loud noise be raised at the time when you speak to them: which is owing, no doubt to the greater tension of the ear-drum, on that occasion. Dr. Willis mentions a *deaf* woman, who, if a drum were beat in the room, could hear any thing very clearly; so that her husband hired a drummer for a servant, that by his means he might hold conversation with his wife. The same Author mentions another, who, living near a steeple, could always hear very well, if there was a ringing of three or four bells: but never else. See **Supplement. Article DEAF**.

DEAN*, a prime dignitary in most cathedral and collegiate churches; being usually the president of the chapter.

* He is called *Dean, Decanus*, of the Greek *Ἐξάρχης*, ten, as being supposed to preside over ten canons or prebendaries, at least.

Canonists distinguish between *Deans* of cathedral, and those of collegiate churches. The first, with their chapter, are regularly subject to the jurisdiction of the bishop. As to *Deans* of collegiate churches, they have usually the contentious jurisdiction in themselves, that is, they exercise jurisdiction over their canons in all civil, or criminal matters; though sometimes this belongs to them in common with the chapter.

In England, as there are two foundations of cathedral and collegiate churches, the old and the new, (the latter being those founded by Henry the VIIIth on the suppression of the Abbots and Priors, when their convents were turned into *Dean* and chapter;) so there are two ways of creating the *Deans*. Those of the old foundation, are brought to their dignity much like a bishop; the prince first sending out his *Conge d'Esire* to the chapter; the chapter then choosing, the king yielding his royal assent, and the bishop confirming him, and giving his mandate to install him. Those of the new foundation are installed by a shorter course; only by the king's letters patent, without either election or confirmation.

Constantine we are told, erected an office of nine hundred and fifty persons at Constantinople, taken out of diverse trades and professions, whom he exempted from all impositions, and bestowed them on the cathedral church, to render the offices

lices of burial gratis to the defunct, particularly to the poor. These he called *Decani* and *Leſſicarii*, probably by reason they were divided by tens; each whereof had a bier or litter to carry the bodies in: it is ſuppoſed to be theſe, who under Conſtantius began to be called *Copiatæ*, i. e. clerks deſtined for labour. For they are uſually ranked among the clerks, and even before the chantors. By a law of the year 357, it appears that there were ſome of theſe *Copiatæ* at Rome.

DEAN is alſo a title applied among us to diſſerle Perſons that are the chief of ſome peculiar churches, or chapels: as, the *Dean* of the king's chapel, of the arches, of battel, of boking, &c.

Rural DEAN, or Urban DEAN, was formerly an eccleſiaſtical perſon, who had a diſtrict of ten churches or pariſhes, either in the country or city, within which he exerciſed juſdiction. Theſe Rural DEANS were ſometimes called *Archipreſbyteri*, and at firſt they were both in order and authority, above the archdeacons. They were at firſt elected by the clergy, and by their votes depoſed; but afterwards they were appointed, and removed, at the diſcretion of the biſhop: and hence they were called *Decani Temporarii*, to diſtinguiſh them from the cathedral DEANS, who were called *Decani Perpetui*.

We meet with Rural DEANS as early as the IXth century: Hincmar, in a capitular to his arch-deacons, reſerves the right of electing them to himſelf; and only allows it to the arch-deacons, in caſe he be abſent, and by proviſion only. Some take the Rural DEANS to hold the rank and place of the Chorepiſcopi. Be this as it will, it is certain they are very ancient in France, Germany, and England; though till the end of the XVIth century they were unknown in Italy, in regard the biſhopricks being there exceeding ſmall, they were not needed. S. Charles Borromeo is ſaid to have firſt introduced them there.

DEAN, in the ancient monaſteries, was a ſuperior eſtabliſhed under the abbot, to eaſe him in taking care of ten monks; whence he was called *Decanus*, in imitation of thoſe officers called by the ſame name among the Romans, who had ten ſoldiers under them.

Till the time of St. Benediſt, there were uſually in each monaſtery a provost, *Præpoſitus*, and ſeveral DEANS, *Decani*, under the abbot. In ſome abbies, there was but one DEAN, and he bleſſed by the biſhop, as well as the abbot himſelf. This privilege gave him occaſion to think himſelf in ſome meaſure the abbot's equal; and to ſcruple obedience to him. St. Benediſt was ſenſible of this inconvenience, and to prevent it in his order, he appointed that the monaſteries ſhould be governed under the abbot by ſeveral DEANS, whoſe authority being thus ſhared, they would be the leſs dangerous.

The office of the DEANS we have obſerved, was to have the inſpection each of ten monks, to look to their working, and all their exerciſes. They were not choſe by ſeniority, but merit; and might be depoſed after three admonitions. The monaſteries being now leſs populous than they were in ancient times, the abbot, or prior, do not ſtand in ſo much need of being eaſed; ſo that theſe DEANS are in general ſet aſide.

DEAN and Chapter.—Anciently, biſhops did not ordinarily tranſact matters of moment *ſine concilio preſbyterorum principalium*, who were then called *Senatores Eccleſiæ*, and colleagues of the biſhops; represented in ſome meaſure by our chapters of cathedrals, wherein the DEAN and ſome of the prebends are, upon the biſhop's ſummons, to aſſiſt him in ordinations, deprivations, condemnations, excommunications, and other weighty concerns of the church. See CHAPTER.

DEARTICULATION, in anatomy. See DIARTHROSIS.

DEATH, *Mors*, is generally conſidered as the ſeparation of the ſoul from the body; in which ſenſe it ſtands oppoſed to life, which conſiſts in the union thereof.

Physicians have uſually defined *Death* by a total ſtoppage of the circulation of the blood; and a ceſſation of the animal, and vital, functions conſequent thereon; as reſpiration, ſenſation, &c.

An animal body, by the actions inſeparable from life, undergoes a continual change. In time, its ſmalleſt fibres become rigid, its minute veſſels grow into ſolid fibres no longer previous to the fluids, its greater veſſels grow hard and narrow, and every thing becomes contracted, cloſed and bound up, whence the dryneſs, immobility, and extenuation obſerved in old age. By ſuch means the offices of the minuter veſſels are deſtroyed, and the humours ſtagnate, harden, and at length coaleſce with the ſolids. Thus are the ſubtleſt fluids in the body intercepted and loſt, the concoction weakened, and the reparation prevented; only the coarſer juices continue to run ſlowly through the greater veſſels, to the preſervation of life, after many of the animal functions are deſtroyed. At length, in the proceſs of theſe changes, *Death* it ſelf becomes inevitable, as the neceſſary conſequence of life.

But it is rare, that life is thus long protracted, or, that *Death* ſucceeds merely from the decays and impairments of old age. Diſeaſes, a long and horrid train, uſually cut the work ſhort.

DEATH-Watch, in natural hiſtory, a little inſect famous for a ticking noiſe, like the beat of a watch, which the populace

have long took for a preſage of *Death*, in the family where it is heard: whence it is alſo called *Pediculus Fatidicus*, *Mortifaga*, *Pulſatorius*, &c.

There are two kinds of *Death-Watches*: of the firſt we have a good account in the *Philoph. Tranſact.* by Mr. Allen. It is a ſmall beetle $\frac{1}{2}$ of an inch long, of a dark brown colour, ſpotted; having pellucid wings under the Vagina; a large cap or helmet on the head, and two Antennæ proceeding from beneath the eyes. The part it beats withal, he obſerved, was the extreme edge of the face, which he chuſes to call the upper lip, the mouth being protracted by this bony part, and lying underneath, out of view. Its figure, as it appears in a microſcope, ſee repreſented in *Tab. Nat. Hiſt.*

Fig. 2. This account is confirmed by Mr. Derham, with this difference, that inſtead of ticking with the upper lip, he obſerved the inſect to draw back its mouth, and beat with its forehead. That author had two *Death-Watches*, a male and a female, which he kept alive in a box, ſeveral months, and could bring one of them to beat whenever he pleaſed, by imitating its beating. And by this ticking noiſe he could frequently invite the male to get up upon the other in the way of coition. When the male found he got up in vain, he would get off again, beat very eagerly, and then up again. Whence the ingenious author concludes, thoſe pulſations to be the way whereby theſe inſects woo one another, and find out, and invite each other to copulation.

The ſecond kind of *Death-Watch* is an inſect in appearance quite different from the firſt. The former only beats ſeven or eight ſtrokes at a time, and quicker; the latter will beat ſome hours together, without intermiſſion, and his ſtrokes are more leiſurely, and like the beat of a *Watch*. This latter is a ſmall greyiſh inſect, much like a louse when viewed with the naked eye. Its figure, as magnified, is ſeen in *Tab. Nat. Hiſt.* Fig. 1.

It is very common in all parts of our houſes in the ſummer-months: is very nimble in running to ſhelter; and ſhy of beating when diſturbed. But will beat very freely before you, and alſo anſwer the beating, if you can view it without giving it diſturbance, or ſhaking the place where it lies. The author cannot ſay, whether they beat in any other thing, but he never heard their noiſe except in or near paper. As to their noiſe, he is in doubt, whether it be made by their heads, or rather ſnouts againſt the paper; or, whether it be not made after ſome ſuch manner, as grasshoppers and crickets make their noiſe. But he inclines to the former opinion: the reaſon of his doubt is, that he obſerved the animal's body to ſhake and give a jirk at every beat, but could ſcarce perceive any part of its body to touch the paper. But its body is ſo ſmall, and ſo near the paper, and its motion in ticking ſo quick, that he thinks it might be, yet he not perceive it. The ticking, as in the other, he judges to be a wooing-act; as having obſerved another, after much beating, come and make offers to the beating inſect, who after ſome offers, left off beating, and got upon the back of the other. When they had been a little while joined, he got off again, and they continued ſome hours joined tail to tail, like dog and bitch in coition. This inſect is at firſt a minute white egg, much ſmaller than the nits of lice; though the inſect is near as big as a louse. In March it is hatched, and creeps about with its ſhell on. When it firſt leaves its ſhell, it is even ſmaller than its egg; though that be ſcarce diſcernable without a microſcope. In this ſtate it is ſomewhat like the mites in cheeſe: from this ſmall ſtate they grow gradually to their mature or perfect ſize: when they become like the old ones, they at firſt run about much more ſwiftly than before.

DE BENE ESSE, a Latin phraſe uſed in our law-books—To take, or do a thing *De bene eſſe*, is to accept, or allow it as well done for the preſent; but when it comes to be more fully examined, or tried, to ſtand or fall, to be allowed or diſallowed, according to the merit, or well-being of the thing in its own nature: or as we ſay, *Valcat quantum valere poteſt*.

Thus, in chancery, upon motion to have one of the leſs principal defendants in a cauſe examined as a witneſs, the court (not then thoroughly examining the juſtice of it, or not hearing what may be objected on the other ſide) often orders ſuch a defendant to be examined *De bene eſſe*, i. e. that his depoſitions ſhall be allowed or ſuppreſſed at the hearing of the cauſe upon a full debate of the matter, as the court ſhall think fit; but for the preſent they have a well-being or conditional allowance.

DEBENTURE, a kind of writing in the nature of a bond, firſt given in 1649, to charge the commonwealth to ſecure the ſoldier-creditor, or his aſſigns, the ſum due, upon auditing the accounts of his arrears.

The word is now alſo uſed in the Exchequer, and in the king's houſhold, where *Debentures* are uſually given to the ſervants for the payment of their wages, board-wages, and the like.

Debenture is mentioned in the act of oblivion, 12 Car. II. cap. 2. and since the late revolution, has been used in many acts of parliament, especially in that which relates to the forfeited estates in Ireland, out of which the foldiers *Debentures* are appointed to be satisfied, 11 W. III.

DEBILITY (in a Medicinal sense) is a relaxation of the solids, which often induces weakness and fainting.

DEBILITY (in Astrology) See **DIGNITY**.

DEBRUIZED, or **DEBRUISED**, in heraldry, is when we would intimate the grievous restraint of any animal, which is debarr'd its natural freedom by any of the ordinaries being laid over it.

Thus when a pale, &c. is born upon a beast in an escutcheon, the beast is said to be *debruised* by the pale.

DEBT, a thing due to another, whether it consist of money, goods, or services.

By our law, *Debts* due to the king are to be satisfied in the first place in all Cases of executorship, and administratorship; and till the king's *Debt* be satisfied, he may protect the debtor from the arrest of any other creditor.

We meet with divers kinds of *Debts*: *Active Debts*, are those whereof a person is creditor: *Passive Debts*, those whereof he is debtor.—There are also *Real Debts*, *Personal Debts*, and *Mixed Debts*.

Chirographary DEBT; in the French law, is that due by virtue of a note, or writing under one's hand, and not proved in judicature.

Hypothecary DEBT, is that due in virtue of some contract, or judgment.

Prædatory DEBT, is that arising from an alienation of lands, &c. the whole purchase whereof has not been paid.

Privileged DEBT, is that which must be satisfied before all others; as, the king's tax, &c.

DEBTOR, a person who owes something to another: in opposition to creditor, which is he to whom it is owing.

DECAGON, a plain figure in geometry, having ten sides, and angles.

If all the sides and angles be equal, it is called a regular *Decagon*, and may be inscribed in a circle.

The sides of a regular *Decagon* are, in power and length, equal to the greatest segment of an hexagon, inscribed in the same circle, and cut according to extreme and mean proportion.

A fortification also consisting of ten bastions, is sometimes called a *Decagon*.

DECALOGUE*, the ten commandments of God, engraven on two tables of stone, and given to Moses.

* The word is Greek, composed of δέκα, ten, and λόγος, word, *g. d.* ten words. Accordingly, the Jews call them עשרת הדברות the ten words, which appellation is very ancient.

The Samaritans, both in their text and version, add after the 17th verse of the XXth chapter of Exodus, and after the 21st verse of the Vth chapter of Deuteronomy, an eleventh commandment, to build an altar on mount Gerizim, &c. But it is apparently an interpolation, to authorize their having a temple and an altar on that mountain, and to discredit, if possible, the temple at Jerusalem, and the worship there performed. It must be added, however, that, though all, both Jews and Christians, agree in the number of ten commandments; there is some difference as to the manner of dividing them.

The Falmudists, and Postellus after them, in his treatise *de Phenicum Litteris*, say, that the *Decalogue*, or ten commandments were engraven quite through the tables which God gave to Moses; but that nevertheless the middle of the D. Mem final, and of the D. Samech, remained miraculously suspended without adhering to any thing. See the *Dissertation on the Samaritan Medals*, printed at Paris in 1715. They add, that the *Decalogue* was wrote in letters of light, *i. e.* in luminous shining letters.

DECAMERIS*, a term signifying a tenth part; used by Mr. Sauveur, and some other Authors, to mark and measure the intervals of sounds.

* The word is formed of δέκα, ten, and μερς, part.

DECAMERON, a work containing the actions, or conversations of ten days. Boccaccio's *Decameron* consists of one hundred novels related in ten days.

DECAMP. When an army raises its camp, or breaks up from the place where it lay before, they say it is *decamped*.

DECANUS, among the Romans, an officer who had ten other officers, or persons, under his charge; whence our English dean.

DECANTATION, in chymistry, the act of pouring off a liquor from off the feces, &c. by gently inclining the lip, or canthus of the vessel; whence the word is derived. See **CANTHUS**.

DECAPITE, in heraldry. See **DEFFAIT**.

DECAPROTI*, **DECEMPRIMI**, among the ancients, were officers who gathered the tributes, or taxes.

* The word comes from δέκα, ten, and πρῶτος, first; probably by reason the ten first, or principal persons of each community, were chose to make the levies.

The *Decaproti* were obliged to pay for the dead; or, to answer to the emperor for the quota parts of such as died, out of their own estates. Cicero in his oration for Roscius, calls them *Decemprimi*.

DECASTYLE*, in the ancient architecture; a building with an ordonnance of ten columns in front.—The temple of Jupiter Olympius was *Decastyle*.

* The word is formed of δέκα, ten, and στυλος, column.

DECEMBER, the last month of the year; wherein the sun enters the tropic of capricorn, and makes the winter solstice. In Romulus's year *December* was the 10th month, whence the name, *viz.* from *Decem*, ten: for the Romans began their year in *March*.

The month of *December* was under the protection of Vesta: Romulus assigned it 30 days; Numa reduced it to 29; which Julius Cæsar increased to 31.

Under the reign of Commodus, this month was called by way of flattery *Amazonius*, in honour of a Courtezian, whom that prince passionately loved, and had got painted like an *Amazon*; but it only kept the name during that emperor's life.

At the latter end of this month they had the *Juvenilis Iudi*, and the country people kept the feast of the goddess Vacuna in the fields, having then gotten in their fruits, and sown their corn; whence seems to be derived our popular festival called *Harvest-home*.

DECEMPEDA, ΔΕΚΑΠΕΔΟΣ, *Ten-foot-rod*; an instrument used by the ancients in measuring.

The *Decempeda* was a rule, or rod, divided into ten feet; whence its name, from *Decem*, ten, and *Pes pedis*, foot.—The foot was subdivided into 12 inches; and each inch into 10 digits.

The *Decempeda* was used both in measuring of land, like the chain among us; and by architects to give the proper dimensions and proportions to the parts of their buildings, which use it still retains. Horace, Lib. II. *Od.* 15. blaming the magnificence and delicacy of the buildings of his time, observes, that it was otherwise in the times of Romulus and Cato, that in the houses of private persons there were not then known any portico's measured out with the *Decempeda*, nor turned to the north to take the cool air.

DECEMVIRI, an order of magistrates among the Romans, created with a sovereign power to draw up and make laws for the people; thus called by reason their number was ten.

To the *Decemviri* was given all the legislative authority ever enjoyed by the kings, and after them by the consuls. One among them had all the ensigns and honours of the function; and the rest had the like in their turn, during the year of their *Decemvirate*.

It was the *Decemviri* who drew up the laws of the twelve tables, called thence *Leges Decemvirales*, which for a considerable time were the whole of the Roman law.

In the year 302, the consuls Appius Claudius Crassinus, and T. Genucius Augurinus, being obliged to abdicate; and the first *Decemviri* were created; the year following ten new ones were appointed to succeed them, and in the year 304 another set were to have been chosen, but that the people rose, made them lay down, and resumed the consuls. The excessive debauchery of Appius Claudius Crassinus, one of the consuls, who was first obliged to abdicate, and who had been chosen first *Decemvir* three times, was the principal cause of all this. Cicero de *Finib.* Lib. I. Livy, Lib. III. Halicarnassus, Lib. X. and Florus, Lib. c. 24. relate the history.

The *Decemviral* administration, however, it is to be observed, had not its first rise at the time when the authority of the consuls was devolved into the hands of the *Decemviri*: for, during the interregnum that ensued after the death of Romulus, the management of affairs, which the senate then took upon them, is called by Halicarnassus, Lib. II. *Decemviral*, by reason the senators, divided into tens, commanded each in their turn: that is, one of each ten, for five days successively, having the *Fasces*, *Lictors*, &c. like the kings.

There were also military *Decemviri*; and on divers emergencies *Decemviri* were created to manage and regulate certain affairs, after the same manner as boards of commissioners are appointed among us. Thus, we find *Decemviri* for conducting colonies; *Decemviri* to prepare and preside at feasts in honour of the gods; *Decemviri* to take care of the sacrifices; and *Decemviri* to keep the Sybil's books.

Sometimes in lieu of *Decemviri*, they only created *Septemviri*, or *Triumviri*, or *Duumviri*, &c.

DECENNALIA, in antiquity, feasts which the Roman emperors held every tenth year of their reign, with sacrifices, games, largesses to the people, &c.

Augustus was the author of this custom, which was afterwards imitated by his successors.

At the same time they likewise offered vows for the emperor, and the perpetuity of his empire, called *Vota Decennialia*. See **VOW**.

From the time of Antoninus Pius, we find these ceremonies marked on medals. **PRIMI DECENNALES. SECUNDI**

DECENNALES. VOTA SOL. DECEN. II. VOTA SVSCEP. DECEN. III.

These vows must have been made at the beginning of every tenth year; for on a medal of Pertinax, who scarce reigned four months, we find VOTA DECENN. & VOTIS DECENNALIBUS.

Struvius is of opinion, that these vows took place of those which the censor used to make in the times of the republic for the prosperity and preservation thereof. In effect, they were not only made in behalf of the prince, but also of the state, as may be observed from Dion. Lib. VIII. and Pliny the younger, Lib. X. ep. 101.

Augustus's aim in establishing the *Decennalia*, was to preserve the empire and the sovereign power, without offence or restraint to the people. For during the celebration of this feast, that prince used to surrender up all his authority into the hands of the people, who, filled with joy, and charmed with the goodness of Augustus, immediately delivered it him back again.

DECENNIERS, see the next column.

DECIDUOUS, in the general, expresses a thing apt and ready to fall.

In some plants, the perianthium or calyx is *deciduous* with the flower, that is, falls off from the plant with it; in others not. In some the leaves are *deciduous*, or fall off in autumn; in others they remain all the winter.

DECIES *Tantum*, a writ that lies against a juror, who hath taken money for giving his verdict. It is so called from its effect, which is to recover ten times as much as he took.

It also lies against embracers that procure such an inequity. See EMBRACER.

DECIL, DECILIS, in astronomy, an aspect or position of two planets, when they are distant from each other a tenth part of the zodiac.

DECIMAL *Arithmetic*, the art of computing by *Decimal Fractions*, first invented by Johannes Regiomontanus, and used by him in the construction of his Tables of Sines.

DECIMAL *Fractions* are those whose denominator is 1, with one or more cyphers; as, 10, 100, 1000, 10000, &c. Thus $\frac{1}{10}$, $\frac{6}{100}$, $\frac{7}{1000}$, &c. are *Decimal Fractions*.

In the writing of *Decimal Fractions* we usually omit the denominator, as only consisting of unity with cyphers annexed; and in lieu thereof, a point or comma, is prefixed to the numerator. Thus, $\frac{1}{10}$ is wrote .5; $\frac{6}{100}$.06. So .125 expresses an hundred twenty-five parts of any thing supposed to be divided into 1000 parts.

As cyphers on the right hand of integers, do increase their value *decimally*; as, 2, 20, 200, &c. so when set on the left hand of *Decimal Fractions*, they decrease the value *decimally*; as, .5, .05, .005, &c. when set on the left hand of integers, or on the right hand of *Decimals*, they signify nothing, but only to fill up places; thus, .5000, or .0005. is but five units.

To reduce any *Vulgar Fraction*, as suppose $\frac{1}{2}$ to a *DECIMAL Fraction* of the same value, whose denominator shall be 1000; say, by the Rule of three, as 8 the denominator of the vulgar fraction, is to 5 its numerator: so will 1000, the denominator assigned, be to a 4th term, which by working will be found to be .625, and therefore $\frac{1}{2}$ is a *Decimal* of the same value with the former fraction $\frac{1}{2}$.

The common operations in *Decimals* are performed as in the vulgar rules, regard being had only to the particular notation, to distinguish the integral from the fractional part of a sum.

In *Addition, and Subtraction of DECIMALS*; the points being all placed under each other, the figures are to be added, and subtracted as in common arithmetic: and when the operation is done, so many figures of the sum, or the remainder, are to be noted for *Decimals*, as there are places of *Decimals* in the greatest given numbers.—An example will make this clear.

Addition of Decimals. Subtraction.

43791	59	271	From 67	59
792	15	040	Take 29	38754
6124	3	791	Rem. 38	0246
053	12	009		
10	7	5	From 25	1402
2	97	002	Take 13	07
2,19531			Rem. 12	0762

For *Multiplication of DECIMALS*, observe to cut off just so many *Decimal* parts from the product as there are *Decimals* in both factors. The work is the same as in integers. Thus,

Multiplication of Decimals.

1472	365	3,650	Note, In the first and second examples the products only amount to six and five places; for which reason cyphers are prefixed, to make up the numbers of <i>Decimal</i> places in the two factors respectively.
175	122	621	
7300	730	3050	
10304	730	7300	
1472	365	21900	
0257600	044530	2266,650	

In *Division of DECIMALS*, proceed in all respects as in dividing of integers; and when the operation is done, mark as many place in the quotient for *Decimals*, as, with the number of *Decimals* in the divisor, are equal to the *Decimal* places of the dividend.

22)8,030(3,65	22)8,030(3,65
66	66
143	143
132	132
110	110
110	110
0	0
22)8,030(0,365	732)83,219(1,13
66	732
143	1001
132	732
110	2699
110	2196
0	503

But there are certain cases in division of *Decimals*, which require some further management: as, first, where the divisor is a *Decimal Fraction*, and the dividend is an integer; add, or annex as many or rather more cyphers to the dividend, than there are places in the divisor: thus, .365)22,000(60,2. For there being three places of *Decimals* in the divisor, and four in the dividend, there will be but one in the quotient. Secondly, Where the divisor is a mixt number, and the dividend a whole number, add at least as many cyphers to the dividend, as there are places in the divisor. Thus .365)22,000(60,2. Thirdly, Wherever the divisor is bigger than the dividend, annex cyphers to the latter. Thus, .365)22,000(60,2.

DECIMAL *Scales*, in the general, denote any *Scales* divided *decimally*; but, particularly certain *Scales* of money, weights, and measures, made from tables so called, to expedite *Decimal arithmetic*, by shewing by inspection the *Decimal Fraction* of any part of money, weight, or measure. See SCALE.

DECIMATION, a punishment which the Romans used to inflict on the soldiers who had quitted their post, raised a mutiny in the camp, behaved themselves cowardly in the fight, or otherwise failed in their duty; for which every tenth man was put to death as an example to the rest.

The manner of *decimating* was thus: The general assembled the whole camp, then the tribune brought to him those that were guilty, and impeached, and reproached them, with their cowardly actions, and baseness in the presence of the whole army: then putting their names into an urn, or an helmet, as many were drawn out as made the tenth part of the whole number: and these were put to the sword, and the others saved. This was called *Decimare*, a word of the ancient Roman militia, who, to punish whole legions, when they had failed in their duty, sometimes also made every tenth soldier draw lots, and put him to death for an example to the others.

As the Romans had their *decimatio*, they had also the *vicefimatio*, and even *centesimatio*, when only the twentieth or hundredth man suffered by lot.

DECENNIERS, DECINERS, or DOZINERS, in the ancient monuments of our law, are such as were wont to have the oversight, and check of the friburghs, for maintenance of the king's peace; the limits of whose jurisdiction was called *Decurione*, and *Dozein*.

They seem to have had very large authority in the Saxon times; taking cognizance of causes within their circuit, and redressing wrongs by way of judgment. Thus Briton, "We will that all those who are fourteen years old, shall make oath, that they will be sufficient and loyal to us; and neither be felons, nor assenting to felons; and we will, that all profess themselves of this or that *Dozein*, and make or offer surety of their behaviour by those or those *Doziners*, except religious persons, clerks, knights eldest sons, and women." A *Dozein* now seems to be no other than aleet: for in leets only this oath is administered by the steward, and taken by such as are twelve years old and upwards.

DECIPHERING, or DECRYPHERING, the art, or act of finding the alphabet of a *Cipher*, or of explaining a letter wrote in *Cipher*.

Every language has peculiar rules of *Deciphering*. *Jacques Gefury* has published the principles of *Deciphering the French*; wherein the rules peculiar to that language are laid down.—The principal, we shall here add as a specimen in this kind.—As, First, that when a character is found alone, it must either be an A, X, or an O, these being the only letters in the French Alphabet that make words singly.

Secondly, the character that occurs the ofteneft in a writing to be deciphered is ordinarily an E; this being the most common letter in that language.

Thirdly,

Thirdly, to know the *U*, you must take the character that is always preceded by one certain other, which will be the *Q*. Fourthly, the *I* is also known by means of the *Q*, for since *QUE*, and *QUI*, are the only syllables in the French tongue that begin with *Q*; whenever you find a word of three characters, whereof the first is a *Q*, and the last is not an *E*, it must be an *I*.

Fifthly, in all words of two letters, one of them is a vowel. Sixthly, of the three first characters of a word, one of them is a vowel.

Seventhly, the vowels being once deciphered; the consonants are readily found by the connexion which certain consonants usually have with certain vowels.

DECK of a Ship, a kind of planked floor, reaching from stern to stern, whereon the guns are laid, and the men walk to and fro; serving also as a ceiling to separate the stories of the ship, or other vessel.

A Ship is said to have two, or three Decks, when it contains two or three stories. The middling sort of vessels have two Decks; the biggest have three, distant from each other about five feet. The bottom Deck is called the first Deck: the second Deck, answering to the second story from the ground in houses, contains an equal number of guns with the first, abating that there is none over the stern, which is the captain's apartment. Before this Deck are the kitchen-offices, &c. In large vessels there is a third Deck, and a third battery.

Some vessels have likewise a half Deck, which reaches from the main-mast to the stern of the Ship: as also a quarter-Deck, which is from the steerage aloft to the master's round-house.

Sometimes also there is a spare-Deck, which is the uppermost of all, being between the main-mast and the misen, called also the Orlop.

A Repe-Deck, is that made of cordages interwove, and stretched over a vessel that has no Deck, through which it is easy to annoy the enemy who comes to board her, and has leaped thereon.—These are little used but in merchant-vessels, to defend them from the corsairs.

DECLAMATION, a discourse, or speech made in public, in the tone and manner of an oration.

Among the Greeks, Declamation was the art of speaking indifferently on all Subjects, and on all sides of a question; of making a thing appear just that was unjust, and of triumphing over the best, and soundest reasons.

Such sort of Declamations, M. de St. Evremont observes, were fit only to corrupt the mind by accustoming men to cultivate their imagination rather than to form their judgment, and to seek for verisimilitudes to impose upon, rather than solid reasons to convince, the understanding.

Among us, Declamation is restrained to certain exercises, which scholars perform, to teach them to speak in public. We say, a Declamation against Hannibal, against Pyrrhus, the Declamations of Quintilian, &c.

In the colleges of the Jesuits, Declamations are little theatrical or dramatic performances, consisting of a few scenes not divided into acts, rehearsed by the students by way of exercise, and to form them for speaking in public.

Such Declamations are the most useful exercises performed in the colleges.

DECLARATION, in law, the act of shewing in writing the grief and complaint of the demandant, or plaintiff, against the defendant, where he is supposed to have received some wrong. This ought to be plain and certain, both because it impeacheth the defendant, and also compels him to answer thereto.

DECLARATION is also used for a confession which the quakers, who scruple taking the oaths of supremacy, &c. are obliged to make and subscribe in lieu thereof.

Its tenor is a solemn promise before God and the world, to be true to king George, with a detestation and horror of that damnable position, that princes excommunicated by the pope, or any other power, may be deposed or murdered; and a Declaration, that no foreign prince, or power, has any right, jurisdiction, or authority in this kingdom.

DECLENSION, in grammar, the inflexion of a noun, according to its diverse cases. See CASE, NOMINATIVE, &c. The Declension of nouns is a different thing in the modern languages, which have not properly any cases; from what it is in the ancient Greek and Latin, which have.

Declension in languages wherein the nouns admit of changes, whether in the beginning, middle, or end, is properly the expressing, or reciting of all those changes in a certain order, and by certain degrees, called Cases.

In languages wherein the nouns do not admit of changes in the same number, Declension is the expressing of the different states, or habitus of a noun in, and the different relations it has: which difference of relations is marked by particles, called Articles; as *a, the, of, to, from, &c.*

DECLENSION of a Disease, is when it is past its height, and the symptoms abate.

DECLINATION, in astronomy, the distance of the sun, a star, planet, or other point of the sphere of the world, from the equator, either northward, or southward.

Declination is either real or apparent, according as the real or apparent place of the point is considered.

The Declination is an arch of a great circle, as GS, (Tab. Astron. fig. 4.) intercepted between a given point, as S, and the equator A Q, and perpendicular to the same. Consequently, the circle, by whose arch the Declination GS is measured, passes through the poles of the world.

The Declination of a star, &c. is found by first observing the altitude of the pole as PR, (fig. 5.) This subtracted from 90° gives the height of the equator A H. Then, the meridian altitude of the star, H D, being observed, if it be greater than the altitude of the equator, A H, the latter subtracted from the former; leaves the Declination northward A D: or, if the altitude of the star H T be less than that of the equator H A, the former subtracted from the latter leaves the Declination southward T A.

E. gr. Tycho at Uranibourg observed the meridian altitude of the Cauda Leonis:

	HD	50°	59'	0"
Altitude of Equat.	HA	34	5	20
Declinat. therefore,	AD	16	53	40

If the star be in the quadrant Z R, then the least altitude MR subtracted from the altitude of the pole P R, leaves the distance from the pole P M: which subtracted again from the quadrant P Q, leaves the Declination M Q.—E. gr. M. Couplet observed P M 2°. 18' 50" which subtracted from 90°, leaves M Q 87° 41' 10". And by this method are constructed the tables of Declination of the fixed stars given us by Ricciolus and Dechales.

By comparing the ancient observations with the modern, it appears, that the Declination of the fixed stars is variable; and that, differently, in different stars. For in some it increases, and in others decreases, and that in different quantities. But the greatest increase or decrease does not exceed three minutes and a half in ten years time.

It has been greatly disputed among the later mathematicians, whether or no the Declination and obliquity of the ecliptic be variable? but the point seems now decided in favour of the immutability.

Circle of DECLINATION, is a great circle of the sphere, passing through the poles of the world; and on which the Declination of a star is measured: such is PGDK, passing through the poles T and K. Fig. 4.

Parallax of DECLINATION, is an arch of the circle of Declination, whereby the parallax of the altitude increases or diminishes the Declination of the star.

Refraction of the DECLINATION, an arch of the circle of Declination, whereby the Declination of a star is increased, or diminished, by means of the refraction.

DECLINATION of the Needle, or Compass, is its variation from the true meridian.

DECLINATION of a Plane, or Wall, in dialling, is an arch of the horizon, comprehended either between the plane, and the prime vertical circle, if you account it from east to west; or between the meridian, and the plane, if you account it from north to south.

There are many ways given by authors for finding the Declination of planes: the most handy and practical way is by a Declinator.

DECLINATOR, or **DECLINATORY**, an instrument in dialling, whereby the declination, inclination, and reclination of planes is determined.

Its structure is as follows: on a square wooden board ABCD, (Tab. Dial. fig. 1.) describe semi-circle AED, and divide the two quadrants thereof A E and E D into 90 degrees each, beginning from E, as in the figure. Then, having fixed a pin in the center F, fit a wooden ruler H I upon the same, moveable thereon, with a box and needle K, as shewn under COMPASS.

Now, to apply this, in taking the Declination of a plane: apply the side AD of the instrument to the plane proposed, as M N (fig. 2.) and move the ruler F G, with the compass G this way and that, about the center F, till the needle rest upon the line of the magnetical meridian of the place. Now if the ruler in this situation cut the quadrant in E, the plane is either northern or southern: but if it cut between D and E, the plane declines to the west; or, if between A E, to the east by the quantity of the angle G F E.

The same instrument will also serve to take the inclinations and reclinations of planes. To this end, instead of the ruler and needle, a thread with a plummet is fitted on a pin in the center F: then the side BC of the Declinator ABCD, being applied to the proposed plane, as I L (fig. 3.) If the plumb-line F G cut the semi-circle AED in the point E, the plane is horizontal; or if it cut the quadrant E L in any point as G, then will E F G be the angle of inclination: lastly, if applying the side AB to the plane, the plummet cut E, the plane is vertical. Hence, if the quantity of the angle of inclination be compared with the elevation of the pole, and equator, it is easily known.

known, whether the plane be inclined, or reclined. See INCLINATION and RECLINATION.

DECLINERS, or DECLINING Dials, are those which cut either the plane of the prime vertical circle, or the plane of the horizon, obliquely.

If we conceive the plane of the prime vertical circle to revolve a little upon a right line drawn from Zenith to Nadir; the plane will become *declining*; nor will it be any long cut at right angles by the meridian; but by some vertical circle passing through the intermediate points. After the like manner a horizontal plane will be brought to *decline*, if revolving on the meridian line, one part of it be raised a little towards the Zenith, and the other depressed towards the Nadir.

The use of *declining* vertical Dials is very frequent, in regard the walls of houses whereon Dials are commonly drawn, do generally decline from the cardinal points. Incliners and decliners, and especially decliners, are very rare. See DIAL.

DECLINING, { *Breſt,*
 { *Inclining,* } Dials. See DIAL.
 { *Reclining,*

DECLIVIS, in anatomy, a muscle of the abdomen, called also *Obliquus Descendens*. See OBLIQUUS Descendens.

DECLIVITY. See the article ACCLIVITY.

DECOCTION, the act of boiling one, or more plants, or other drugs, to extract the virtues out of the same for some medicinal purpose.

Decoctions of guaiacum and sassaaparilla, are the common drink in venereal diseases.

M. Boulduc assures us from his own experience, that the infusions of vegetable purgatives act better, and produce better effects, than their *Decoctions*; which he attributes to this, that the purest and most active principles of those bodies are dissipated and evaporated by a boiling heat. *Mémoires de l'Académie Royale des Sciences*, an. 1710.

DECOLLATION, *beheading*, a term frequently used in the phrase, *Decollation* of St. John Baptist, which denotes a painting, wherein is represented the baptist's head, struck off from his trunk; or, the feast held in honour of that martyr.

A French ambassador at Constantinople, shewing the grand signor a *Decollation* of St. John admirably represented, except that the painter had not observed, that when a man is beheaded, the skin shrinks back a little; the emperor immediately spied the fault in that exquisite performance; and to convince the ambassador thereof, sent orders for a man to be immediately beheaded, and his head to be brought for a proof. *Catherinet Traité de la Peinture*.

DECOMPOSITION, in chemistry and pharmacy, the same with analysis, or resolution, viz. the reduction of a body into its principles, or component parts.

DECOMPOSITION, is sometimes taken for any sort of resolution, or separation of parts; but in propriety, *Decomposition* is a chemical process, in order to a separation of the heterogeneities, or impurities from any matter.

Tradition, founded on repeated experiments, is a much surer way of arriving at the knowledge of the properties of a plant, than any chemical analysis, or *Decomposition* of its principles. See MEDICINE.

DECORATION, in architecture, any thing that adorns, and enriches a building, church, triumphal arch, or the like, either without side, or within.

The orders of architecture contribute greatly to the *Decoration*; but then the several parts of those orders must have their just proportions, characters, and ornaments; otherwise the finest order will bring confusion rather than richness.

Decorations in churches, are paintings, vases, festoons, &c. occasionally applied to the walls; but that with so much conduct and discretion, as not to take off any thing from the form of the architecture: as is much practised in Italy, at the solemn feasts.

DECORATION is more properly applied to the scenes of theatres.

In operas, and other theatrical performances the *Decorations* must be frequently changed conformably to the subject.

The ancients had two kinds of *Decorations* for their theatres: the first, called *Versatiles*, having three sides, or faces which were turned successively to the spectators: the other called *Fixes*, shewing a new *Decoration* by drawing, or sliding another before it.

This latter sort is still used, and apparently with much greater success than among the ancients, who were obliged to draw a curtain whenever they made a change in the *Decoration*; whereas on our stage the change is made in a moment, and almost without being perceived.

DECORTICATION, the act of peeling, or unhusking roots, seeds, fruits, branches, &c. or of freeing them from their barks, rinds, husks, or shells.

DECORUM, DECOR, in architecture, denotes the suitability of a building, and of the several parts, and ornaments thereof, to the place and occasion.

Vitruvius is very severe in this point; and gives express rules for the appropriating, or suiting the several orders to their natural characters: so, e.g. as that a Corinthian column may not be set at the entrance of a prison, or gate-house; nor a Tuscan, in the portico of a temple; as some have done among us, in breach of *Decorum*. Even in the disposition of the offices of our ordinary houses, we find grievous offences against *Decorum*: the kitchen being often where the parlour should be; and that in the first and best story, which should have been condemned to the lowest, and worst.

DECOUPLE, in heraldry, the same as uncoupled, i. e. parted; or severed.

Thus, a chevron *Decouplé*, is a chevron wanting so much towards the point, that the two ends stand at a distance from each other.

DECOURS. } in heraldry. See DECREMENT.

DECREASANT, } in heraldry. See DECREMENT.

DECOY, a place made fit for catching of wild fowl:

Hence also a *Decoy-duck* is one that flies abroad, and lights into company of wild ones, and being become acquainted with them, by her allurements draws them into the *Decoy*-place, where they become a prey. See Supplement, article wild Fowl.

DECREE, DECRETUM, an order, or resolve made by a superior power, for the regulating of an inferior.

The commerce between soul and body, Fa. Malebranch observes, has no other vinculum, or connexion, but the efficacy of the divine *Decrees*. Second causes only execute the *Decrees* of Providence.

The doctrine of the Calvinists implies, that God concurs to sin by a positive *Decree*; in that if crimes were not ordained by an antecedent *Decree*, God could not foresee the events.

DECREES of councils, are the laws made by them, to regulate the doctrine and policy of the church.

DEGREE was originally used by the lawyers for any thing ordained by the prince, upon cognizance of a cause.

But the canonists now restrain the word *Decree* to the ordinances of popes; as the name canon is to what is ordained by council.

DECREES in chancery, are the determinations, or sentences of the lord chancellor, upon full hearing, and weighing the merits of the cause. See CHANCERY.

DECREMENT, or **DECRESSANT,** in heraldry, denotes the wane, or decrease of the moon, when she is receding from the full towards the new.

In this state she is called in blazon, a *moon-decressant*, or, *en decours*; since to call it a crescent, would be improper, as that term denotes an increase. The moon looking to the left side of the escutcheon, is always supposed to be *decressant*: when she faces the right, she is crescent, or in her growth.

DECREPITATION, in chymistry, the operation of drying, and calcining salts over the fire, continued till such time as they cease to crackle.

DECREPITATION is also applied to the noise, or crackling of the salts during the operation.

The design of this operation is to free the salt of its superfluous moisture: but the salt is hereby rendered so porous, and apt to imbibe moisture, that unless it be kept very close afterwards, it soon moistens again.

DECRETAL, a rescript, or letter of a pope, whereby some point, or question in the ecclesiastical law is solved, or determined.

The *Decretals*, *Literæ Decretales*, compose the second part of the canon-law.

Pope Gregory IX. in 1220, procured a compilation to be made of all the *Decretals* or pontifical constitutions of his predecessors, in five books, by Friar Raimond, a dominican, his chaplain. Which is the only collection authorized by the holy see to be read in schools. Boniface VIIIth, in 1297, made a new collection, under the name of *Sextus*, containing 5 books. Clement the IIIrd made a third, under the title of *Clementines*; and John the XXIIrd, another under that of *Extravagantes*.

All the *Decretals* attributed to the popes before Siricius, in 318, are evidently supposititious. The imposture is so glaring, that even such as are most favourable to the court of Rome, are obliged to abandon them: though they have been one great means of establishing the grandeur of Rome, and ruining the ancient discipline, particularly as to ecclesiastical judgments, and the rights of bishops. They are supposed by some, the spurious offspring of Isidore, archbishop of Seville, by reason the collection thereof bears the name of Isidore Pectorator, or Mercator. They were first published by Riculph bishop of Mentz, in the IXth century.

DECUPLE, in arithmetic, a term of relation, or proportion, implying a thing to be ten times as much as another.

DECURIO, the chief, or commander of a *Decury*, both in the Roman army, and in the college, or assembly of the people. See DECURY.

DECURIO Municipalis, was a name given to the senators of the Roman colonies.

They were called *Decuriones*, by reason their court, or company always consisted of ten persons. See **DECURY**. By means hereof the cities of Italy, at least such as had colonies, had a share, under Augustus, in the election of the Roman magistrates; the *Decuriones* or senators of those cities, having suffrages therein, which they sent, sent up, to Rome a little before the election.

DECURIO was also a name given to certain priests intended as it should seem, for some particular sacrifices, or other religious ceremonies; or for the sacrifices of private families and houses, as Struvius conjectures, who thence derives their name.

Be the origin of the name what it will, we have an inscription in Gruter, which confirms what we have said of their function. ANCHIALVS. CVB. AED. Q. TER. IN. AEDE. DECVRIO. ADLECTVS. EX. CONSENSV. DECVRIONVM. FAMILIAE. VOLVNTATE. Where we have a *Decurio* in the house of a private person, Q. Terentius.

DECURY, ten persons ranged under one chief, or leader, called the *Decuria*.

The Roman cavalry was divided into *Decuries*.

Romulus divided the whole Roman people into three tribes; over each of which he appointed a tribune: each tribe he subdivided into ten centuries, with centuries at their heads: and each century he subdivided further into ten *Decuries*, over each of which a *decurio* commanded.

DECUSSATION, in geometry, optics, and anatomy, the point wherein two lines, rays, or nerves, cross, or intersect each other: or the action it self, of crossing.

The optic nerves of both eyes are commonly supposed to *decussate* before they reach the brain; to which *Decussation* many authors attribute it, that we see single with two eyes: though others deny this *Decussation*.

The rays of light *decussate* in the crystalline, before they reach the retina.

There are diverse muscles, membranes, &c. that *decussate*; their fibres running over each other at greater or lesser angles, and by that means giving both strength and convenience of motion different ways.

DECUSSORIUM, a furgeon's instrument, wherewith the dura mater is pressed down in trepanning, to secure it from damage in the operation.

DEDI, in conveyances, imports a warranty given to the scoffee and his heirs. See **WARRANTY**.

DEDICATION, the act of consecrating a temple, altar, statue, place, &c. to the honour of some deity. See **TEMPLE**, **ALTAR**, **CHURCH**, &c.

The use of *Dedications* is very ancient both among the worshippers of the true God, and among the heathens: the Hebrews call it *חנכה* *hannachab*, initiation, which the Greek translators render *Εκκλεια*, and *Εκκασις*, renewing.

In the scripture we meet with *Dedications* of the tabernacle, of altars, of the first and second temple, and even of the houses of private persons. Numb. VII. 10, 11, 84, 88. Deut. XX. 5. 1st of Kings VIII. 63. 2d of Chronic. VII. 5, 9. Ezra VI. 16, 17. 1st of Esdr. VII. 7. Psalm XXX. 1. Hebr. IX. 18. There are also *Dedications* of vessels, and garments of the priests, and Levites, and even of the men themselves.

Under the Christian dispensation, we call the like ceremonies *Consecrations*, *Benedictions*, *Ordinations*, &c. and not *Dedications*, which is only applied to places.

The feast of the **DEDICATION**, or rather the feast-day of the saint and patron of a church, called in our law-books, &c. *dedicatio*, was celebrated not only by the inhabitants of the place, but by those of all the neighbouring villages, who usually resorted thither. And such assemblies were authorized by the king.—*Ad dedicationes, ad synodos, &c. venientes sit summa pax.*

The custom is still retained in diverse places, under the name of *Fasts*, *Wakes*, or *Vigils*.

The heathens had also *Dedications* of temples, altars, and images of their gods, &c. Nebuchadnezzar held a solemn *Dedication* of his statue, Daniel III. 2. Pilate dedicated gilt bucklers at Jerusalem to Tiberius, Philo de *Legat.* Petronius would have dedicated a statue to the emperor in the same city, *ibid.* p. 791. Tacitus, *Hist.* lib. IV. c. 53. mentions the *Dedication* of the capitol, upon rebuilding it by Vespasian, &c.

These *Dedications* were performed with sacrifices proper to the deity they were offered to; but they were never practised without public permission. Among the Greeks, it does not appear who gave that permission: but among the Romans, it was always the magistrate.

The Jews celebrated the anniversary of the *Dedication* of their temple every year for eight days. This was first enjoined by Judas Maccabeus, and the whole synagogue, in the year of the Syro-Macedonian, *Æra* 148, i. e. 164 years before Christ.

The heathens had the like anniversaries, as that of the *Dedication* of the temple of Parthenope, mentioned by Lycophron.

Under Christianity, *Dedication* is only applied to a church; and is properly the consecration thereof, performed by a bishop, with a number of ceremonies prescribed by the church.

The Christians finding themselves at liberty under Constantine, in lieu of their ruinous churches, built new ones in every place: and *dedicated* them with a great deal of solemnity. The *Dedication* was usually performed in a synod; at least they assembled a number of bishops, to assist at the service. We have the description of those of the churches at Jerusalem and Tyre, in Eusebius, and many others in later writers. In the sacramentary of Gelasius, the *Dedication* of the baptistery, is delivered separately from that of the church, which was performed with less ceremony than at present.

DEDIMUS *Potesatem*, in law, a writ whereby commission is given to one, or more private persons to assist for the expedition of some act belonging to a judge.

The civilians call it *delegatio*: it is granted most commonly upon suggestion, that the party, who is to do something before a judge, or in a court, is so weak he cannot travel.

Its use is various; as, to take a personal answer to a bill in chancery; to examine witnesses, or to levy a fine, &c.

DEDUCTION, in commerce, a subtracting, or retrenching a little sum paid, from a greater remaining to pay.

When you have made a deduction of 300 l. which I lent you, from the 500, which you lent me, there will only remain 200 due.

DEED, *Factum*, in law, an instrument written on paper or parchment, the validity of which consists in three things, viz. writing, sealing, and delivery; and which comprehends a contract, or bargain between party, and party.

Of these there are two sorts; *Deeds indented*, and *Deeds poll*; which denominations arise from the form and fashion thereof; the one being cut in, and out in the top, or side, called *indented*; and the other plain, or *polled*.

A *Deed indented*, or an indenture, consists of two parts or more, (for there are tripartite, quadripartite, septempartite, &c. *Deeds*) wherein it is expressed, that the parties thereto have to every part thereof interchangeably set their several seals. The cause of their indenting is, that whereas the several parties have each of them one, the indenture may make it appear, that they belong to one and the same contract by their tallying. See **INDENTURE**.

A *Deed poll*, or *polled*, anciently called *charta deima parte*, or *charta simplex*, is a plain *Deed* without indenting, used when the vendor, for example, only seals, and there is no need for the vendee's sealing a counter part, by reason the nature of the contract is such, that it requires no covenant from the vendee.

DEEMSTERS, or **DEEMSTERS**—All controversies in the issue of Man are decided, without process, writings, or any charges, by certain judges chose yearly from among themselves, called *Deemsters*—This institution they are supposed to owe to the ancient Druids.

* The word is formed from the Saxon *Dema*, judge or umpire.

There are two *Deemsters* for each division of the island; in ancient court rolls they are called *Justiciarii Domini Regis*. They set judges in all courts either for life or property; and with the advice of the twenty-four keys declare what is law in uncommon emergencies.

DEEP-Sea Line, or **DIP-Sea Line**, in the sea-language, a small line to found withal when a ship is in very deep water at sea. At the end of this line is a piece of lead, called the *deep-sea lead*, at the bottom of which is a coat of white tallow to bring up stones, gravel, shells, or the like, from the bottom, in order to learn the differences of the ground; which being entered from time to time in their books, by comparing of observations, they guess by their soundings, &c. what coasts they are on, though they cannot see land.

DE expensis militum, a writ commanding the sheriff to levy four shillings per day, to defray the expences of a knight of the shire attending in parliament. See **KNIGHT**.

There is a like writ *de expensis civium, & burgensium*, to levy a shilling per day for every citizen and burgher in parliament. See **REPRESENTATIVE**.

DE facto, something actually in fact, or existing: in contradistinction to *de jure*, where a thing is only so in justice, or equity, but not in fact.

After the revolution, the retainers to the abdicated king insisted much on the difference between a king *de jure*, and *de facto*, or a prince in actual but not legal possession of the crown, and another who had the right, but not the possession. The Nonjurors still hold the pretender for king *de jure*; and only allow king George for king *de facto*.

DEFAULT, in law, an omission of what a person ought to do, particularly before a court of justice, at a day assigned; for which judgment may be given against the *Defaulter*.

DEFFECATE, or **DEFFECATE**, a term applied to some body that is purged, and cleared of feces, or impurities. Distillations, and other chemical operations, are intended to separate the most pure, and subtle parts from the feces, or lece.

DEFLECTION *, the act of abandoning, or relinquishing of a party, or an interest a person had been engaged in.

* The word is formed of the Latin *deficio*, to fail of.

DEFECTIVE, or **DEFICIENT** *Nouns*, in grammar, are such as want either a whole number, or a particular case, or are totally indeclinable.

The term *defective* is also applied to a verb that has not all its moods and tenses.

DEFEISANCE, **DEFEASANCE**, or **DEFEIZANCE**, in law, a condition relating to a deed, which being performed, the deed is defeated, or annulled, as if it had never been done.

The difference between a proviso, or condition in a deed, and a *defeisance*, is this, that a *proviso*, or condition is annexed or inserted in the deed of grant, whereas a *defeisance* is usually a deed by itself. See **PROVISO**.

DEFENCE, in sieges, is used for any thing that serves to preserve or screen the foldiers, or the place. See **FORTIFICATION**.

The parapets, flanks, calemates, ravelins, and outworks that cover the place, are called the *Defences*, or covers of the place. And when the cannon has beat down, or ruined these works, so that the men cannot fight under covert, the *Defences* of the city are said to be demolished.

Line of DEFENCE, is that which flanks a bastion, being drawn from the flank opposite thereto.

The line of *Defence* should not exceed a musket shot, i. e. 120 fathoms, or 720 foot, or 60 Rhinland perches. Indeed Melder allows 65; Scheiter 70; the counts de Pagan and Vauhan 75.

Line of DEFENCE greater, or *sichant*, is a right line, as E C, (Tab. Fortif. Fig. 1.) drawn from the point, or vertex of the bastion C to the concourse E of the opposite flank L E, with the curtain E A.

Line of DEFENCE lesser, called also *rasant*, and *flanquant*, is the face of the bastion continued to the curtain; as C I.

DEFENCE *, in old law books, is sometimes used for prohibition.

* Thus, in Rot. Parl. 21. Edw. III. Cries and *Defence* were made throughout England, i. e. Proclamation and Prohibition. *Salmons poutur in Defenso* Stat. West. 2. c. 47. *Salmons* are by that act prohibited to be taken at certain times. *Ufa rarius defendit. Rex Eduardus ne remaneret in regno LL. Edu. Confess.* In the statutes of Edward I. we have one, entitled, *Statutum de Defensione portandi arma*, &c. and it is *defended* by law, to refrain on the high-way.

DEFENCE-Month is more usually called *Fence-Month*. See **FENCE-Month**.

DEFENCES, in heraldry, are the weapons of any beast: as, the horns of a stag, the tusks of a wild boar, &c.

DEFENDANT, a term in law, signifying him who is sued in an action personal; as *Tenant* is he who is sued in an action real.

DEFENDEMUS, in law, a term used in feoffments and donations, having this force, that it binds the donor and his heirs to defend the donee, if any man go about to lay any incumbrance on the thing given, other than is contained in the donation. See **WARRANTY**.

DEFENDERS *, were anciently notable dignitaries both in church, and state, whose business was to look to the preservation of the publick weal, and to protect the poor and helpless, and to maintain the interests and causes of churches, and religious houses.

* The council of Chalcedon, Can. 2. calls the *Defender* of a church, *Defensor*. Codin, *de officiis aulae const.* makes mention of *Defenders* of the palace. So does Bollandus, AG. S. Januar. T. 1. p. 501. There were also a *Defender* of the kingdom, *Defensor regni*, *Defenders* of cities, *Defensores civitatis*; *Defenders* of the people, *Defensores plebis*; of the poor, fatherless, widows, &c.

About the year 420 each patriarchal church began to have its *Defender*; which custom was afterwards introduced into other churches, and continued to later days under other names, as those of *Advocate*, and *Advouee*. See **ADVOCATE**, and **ADVOUEE**.

In the year 407, we find the council of Carthage asking the emperor for *Defenders*, of the number of *Scholastici*, i. e. advocates who were in office; and that it might be allowed them to enter, and search the cabinets, and papers of the judges, and other civil magistrates, whenever it should be found necessary for the interest of the church.

The emperor still retains the quality of advocate of the church; and the kings of Great Britain preserve the title of *Defender of the faith*, granted to king Henry VIII. by pope Leo X. in 1521, on occasion of that prince's writing against Luther, and afterwards confirmed by Clement VII. Tho. Chamberlayne says, the title belonged to the kings of England before that time; and for proof hereof appeals to several charters granted to the university of Oxford. So that pope Leo's bull was only a renovation of an ancient right. *Pres. stat. l. 1. c. 2.*

DEFENDING, in fortification, is ordinarily synonymous with flanking.

Thus we say, the flank *defends* the curtain, and the opposite face of the bastion; this demi-lune-flank, or *defends* the horn,

or crown-work: the ancient fortifications are easily taken, there being nothing to *defend*, that is, to flank them.

When they say, the flank *defends* the curtain, they mean, not only that it is a-side of the curtain, but also, that it prevents the approaches; that is, such as are posted on the flank of a bastion, can see any that come to attack the curtain, and can shoot them, or prevent their approaching it.

Inner DEFENDING-Angle, is the angle CIE, (Tab. Fortif. Fig. 1.) made by the lesser line of *Defence* with the curtain.

Outer DEFENDING-Angle, is the angle COF, formed by the two lesser lines of *Defence* CO, and FO.

The lines, or sides of the rampart, or wall are *defended* by muskets or carbines, as more easy, cheap, and commodious than canons.

DEFENSITIVE, in medicine, and chirurgery, denotes a bandage, plaister, or the like, used in the cure of a wound, to moderate the violence of the pain, the flux of blood, and the access or impression of the external air.

The cauterization performed, the wound is covered with lint and the eye with a *Defensive*, and a triangular compress. For the first dressing of the entorse, M. Dionis used a little *Defensive* made of the white of an egg, oleum rosatum, and allum powder.

DEFENSOR. See **ADVOCATE**.

DEFERENT, **DEFERENS**, in anatomy, is applied to certain vessels of the body, appointed for the conveyance of humours from one place to another.

Vasa DEFERENTIA, are the vessels that convey the seed as fast as it is secreted, and prepared in the testicles, &c. into the vesiculae seminales, there to be deposited till an emission is required.—See Tab. Anat. (Splanch) fig. 1. lit. t. t. fig. 8. lit. n. n. fig. 15. lit. a. a.

Some call them the *Ejaculatory Vessels*: they are white, nervous, and round, situate partly in the scrotum, and partly in the abdomen.

DEFERENT, or **DEFERENS**, in the ancient astronomy, a circle invented to account for the excentricity, perigee, and apogee of the planets.

A- the planets are found differently distant from the earth at different times, it was supposed that their proper motion was performed in a circle, or ellipsis which is not concentric with the earth; and this excentric circle, or ellipsis, they called the *Deferent*, because, passing through the center of the planet, it seemed to support, or sustain it in its orbit.

The *Deferents* are supposed differently inclined to the ecliptic, but none more than 8 degrees, excepting that of the sun, which is in the plane of the equator it fell, and is cut differently by the *Deferents* of the other planets in two places, called *Nodes*.

In the Ptolemaic system, the same *Deferent* is also called the *Deferent of the Epicycle*, because it traverses the centre of the epicycle, and seems to sustain it.

DEFFAIT, or **DECAPITE**, a term used by the French heralds, to denote a beast whose head is cut off smooth; in which it differs from *craquel*, where the head is, as it were, torn off, and the neck left ragged.

DEFICIENT Numbers, are such whole parts added together make less than the integer, whose parts they are. See **NUMBER**. Such, e. gr. is 8, whose quota parts are 1, 2, and 4, which together only make 7. See **ABUNDANT Number**.

DEFICIENT Hyperbola, is a curve of that denomination, having only one asymptote, and two hyperbolic legs running out infinitely towards the side of the asymptote, but contrary ways. See **CURVE**.

DEFILE *, in fortification, a narrow pass or way, through which a company of horse, or foot, can pass only in file, by making a small front, so that the enemy may take an opportunity to stop their march, and to charge them with so much the more advantage, in regard that the front and rear cannot reciprocally come to the relief of one another.

* The word is formed from the French *defile*, to unthread, or unstring.

To **DEFILE**, is to go off file by file. See **FILE**.

The army began to *defile* on the left, and was forced to *defile* at each end of the field, by reason of the morasses, and the woods.

DEFINITE, in grammar, is applied to an article that has a precise, determinate signification.

Such are, the article *the* in English, *le* and *la* in French, &c. which fix, and ascertain the noun they belong to, to some particular; as, *the* king, *le* roy; whereas, in the quality of king, *de* roy, the articles *of*, and *de*, mark nothing precise, and are therefore called *indefinite*.

DEFINITION, in logic, an enumeration of the chief simple ideas, whereof a compound idea consists; in order to ascertain, or explain its nature, and character.

The schoolmen give very imperfect notions of *Definition*. Some define it the first notion, or conception, that arises of a thing, whereby it is distinguished from every other, and from which, all the other things that we conceive of it, are deduced. But the usual *Definition* of it is, *eratio explicans quid res est*, a discourse explaining what a thing is; that is, as some further

further explain it, a discourse setting forth those attributes which circumscribe, and determine the nature of a thing. For to explain, is only to propose the parts separately, and expressly, which were before proposed conjunctly, and implicitly; so that every explication has regard to some whole. Hence, according to the diverse kinds of parts in any thing, viz. physical parts, metaphysical parts, &c. arise so many different kinds of Definitions of the same thing; thus, man is either *defined* an animal, consisting of soul and body; or, a reasonable animal, &c.

Definitions are of two kinds; the one *Nominal*, or, of the Name: the other *Real*, or, of the Thing.

DEFINITION of the Name, or *NOMINAL DEFINITION*, is that which explains the sense, or signification appropriated to a word: or, as Wolfius more accurately considers it, it is an enumeration of certain marks, or characters, sufficient to distinguish the thing *defined* from any other thing; so to leave it out of doubt, what the subject is that is intended or denoted by the name.

Such is the Definition of a square, when it is said to be a quadrilateral, equilateral, rectangular figure.

By Definition of the Name, is either meant a declaration of the ideas, and characters appropriated to the word in the common usage of the language; or the peculiar ideas, &c. which the speaker thinks fit to denote by that word; i. e. the special sense wherein he proposes to use it, in his future discourse. For it may be observed, that the signification of any word depends entirely on our will; and we may affix what idea we please to a sound, which it self signifies nothing at all.

The Definition of the name therefore, in the second sense, is merely arbitrary; and ought never to be called in question; only it is to be minded, that we keep inviolably to the same signification. Hence, a Definition comes to stand, or to be made use of, as an undoubted, or self-evident maxim; as it frequently does, and particularly among geometers, who, above all other people, make use of such Definitions.

Not that we mean, that after having *defined* a thing so and so, there is nothing in our idea affixed to the *defined* term, but must be granted to the thing itself: thus, if any one should *define* heat to be a quality in certain bodies, like that which we feel upon the application of fire, or hot bodies; no man could find fault with the Definition, as far as it expresses what he means by the word heat; but this does not hinder us from denying, that there is any thing in the body that warms us, like what we feel in ourselves.

DEFINITION of the Thing, or *REAL DEFINITION*, is properly an enumeration of the principal attributes of a thing, in order to convey, or explain its nature.

Thus, a circle is *defined* a figure, whose circumference is every where equidistant from its centre.

Wolfius defines a *Real Definition* to be a distinct notion explaining the genesis of a thing, that is, the manner wherein the thing is made, or done: such is that of a circle, whereby it is said to be formed by the motion of a right line round a fixed point. On which footing, what was before instanced as a *Real Definition* of a circle, amounts to no more than a nominal one.

This notion of a *Real Definition* is very strict and just; and affords a sufficient distinction between a *real* and a *nominal* one. But, though it has the advantages of analogy, distinctness, and convenience on its side; yet, being only it self a *Nominal Definition*, i. e. a Definition of the term *Real Definition*, we must consider it in that light, that is, as an idea fixed arbitrarily to that word, and which the author always denotes by that word in the course of his book. But, in effect, it is not the usual sense, or acceptation of the term; which is much less convenient and distinct. And it is to that usual acceptation we are here chiefly to have regard.

Definitions are usually divided into *accurate* and *inaccurate*; the first make what we strictly call a Definition; the second, we distinguish under the name of Description.

Of the parts enumerated in a Definition, some are common to other things beside the thing *defined*; others are peculiar thereto: the first are called the *Genus*, or *Kind*; and the second, the *Difference*.—Thus, in the former definition of a circle, by a figure whose circumference is every where equidistant from its centre: the word *Figure* is the *Kind*, as being a name common to all other figures, as well as the circle: the rest are the *Difference*, which specify, or distinguish the circle from every other figure.

And hence arises that recipe of Fa. de Colonia, for the making of a Definition. Take, says he, something that is common to the thing *defined* with other things, and add to it something that is proper, or peculiar to the thing; and you will have a Definition. Thus, e. g. rhetoric is *defined* the art of speaking well; for that it is an art, is common to it with several other things; but that it is the art of speaking well; is peculiar to it alone.

There are three common rules of a good Definition. 1st, That it be clear, and more easy and obvious than the thing *defined*. 2^{dly}, That it be universal, or adequate to the thing *defined*; that is, that it agree to all the things contained in the species *defined*.

And Thirdly, that it be proper or peculiar to the thing *defined*. The two ordinary defects of Definitions, are, not to agree either to the whole thing, or the sole thing *defined*: *neque omni, neque soli*; than which nothing is more common, even among the best and justest authors.

Lord Bacon observes of Aristotle's Definitions in the general, that they are very much like that, whereby man should be *defined* an animal that tills the ground. Nor was his master Plato less exceptionable. The joke put upon him on that account is famous; Plato, it seems, had *defined* man, *animal bipes & implume*, a two-footed animal without feathers. Upon which, Diogenes the cynic, a great derider of the academics, threw a cock stripped of his feathers, and quite naked, into the middle of Plato's school; crying, "Here is 'Plato's man.'"

Definition it must be observed, has not place every where: it has only to do with compound ideas; as being no more than an enumeration of the chief simple ideas they are compounded of. Simple ideas cannot be *defined*, or not allowing of an enumeration. He who knows not what it is one calls *heat*, will only learn it by experience, or some synonymous word, or some word of another language, or by circumlocution, whereby a thing is shewn, not *defined*; as if we should say, "it was a sensation which we find when we sit by the fire, or in the sunshine"; which shews nothing of the nature of the thing; nor would a person that had never felt the sensation, understand any more what is meant thereby, than a man born blind would know what a green colour was, by telling him it was the sensation we have when we behold the grass in the field.

Our Definitions of substances, it must be added, are very defective: and as for individuals, we have no Definitions at all.—The ideas of substances are compounded of the various simple ideas jointly impressed when they present themselves; and all we can do to *define* them, is only to enumerate those several sensible ideas, as colour, density, malleability, weight, &c. Thus, gold is *defined* by such a peculiar colour, gravity, &c.—Yet such Definitions may raise an idea clear enough of that substance in the mind of one who has separately received, by his senses, all the simple ideas that are in the composition of the complex idea *defined*; though the intimate nature and essence of substance is unknown, and consequently cannot be *defined*.

It follows, that it is only the modes, or attributes that can be explained by what we properly call a Definition.

DEFINITION, in rhetoric, is defined by Tully, a short comprehensive explanation of a thing.

The Definitions of the orator, it must be observed, differ, much from those of the logician, and philosopher: these latter *define* a thing closely and dryly by genus and difference, e. g. man is a reasonable animal, &c.

The orators take a larger compass, and *define* things more ornamentally from the places of rhetoric, thus: man is a curious work of an Almighty Creator, framed after his own image, endued with reason, and born to immortality. But this rhetorical Definition, in strictness, comes nearer to the nature of a description, than an accurate Definition.

There are diverse kinds thereof; as, 1st, That drawn from the parts whereof a thing consists: thus, oratory is an art consisting of invention, disposition, elocution, and pronunciation. 2^{dly}, From the effects; as, sin is the plague of the soul, the sting of conscience, the scandal of nature, the ruin of the world, the hatred of God, &c. 3^{dly}, From affirmation and negation, as when we first say what a thing is not, that it may be the better conceived what it is. Thus Cicero, by *defining* the consulate, and shewing that it does not consist in enigmas, lectures, &c. but in virtue, proves that Piso was not consul. 4^{thly}, From the adjuncts, as when alchemy is *defined*, an art without sense, whose beginning is deceit; its middle, labour; and its end, beggary. And lastly, from similes, and metaphors; as when death is *defined*, a leap in the dark, &c.

To this last class of metaphorical Definitions, are reducible those five not unpleasing Definitions of a man which we shall here subjoin. The poets feign, that the sciences were once called together by Minerva's command, to form a Definition of man: the first, viz. logic, *defined* him, a short enthymeme; his birth the antecedent, and his death the consequent. Astronomy *defined* him, a changeable moon; which never continues in the same state. Geometry *defined* him, a spherical figure; which ends in the same point where it begun. Lastly, rhetoric *defined* man, an oration; whose exordium was his birth; narration, trouble; and peroration, death; the figures of the oration being sighs, tears, or joy worse than tears.

DEFINITIVE, is applied to somewhat that terminates or decides a question, or process.

The house of lords have passed a *Definitive* sentence in such a cause: the church has given a *Definitive* judgment on such an article of faith.

The word stands in opposition to *provisional*, and *interlocutory*. See PROVISIONAL.

DEFINITOR, a term used in several religious orders, for an assessor, or counsellor of a general, or superior, in certain monasteries.

In most orders of religious, the *Definitor* takes place after the superior of the convent he lives in, when in the convent itself; but out of the convent, the *Definitor's* place is before his own superior.

Definitors are also subjects, in the convent they reside in, to the immediate superior of the convent, as to things relating to the monastic discipline; but in nothing else.

DEFLAGRATION *, in chemistry, the kindling, or setting fire to a salt, a mineral, or other matter, either alone or mixed for that purpose with a sulphureous one, in order to purify it.—As is done in the preparing of *Æthiops mineral* by fire, of sal, prunellæ, &c.

* The word is formed of the Latin *de*, and *flagrare*, to burn.

DEFLECTION, the turning any thing aside from its former course, by some adventitious or external cause.

The word is often applied to the tendency of a ship from her true course, by reason of currents, &c. which divert her, and turn her out of her right way.

DEFLECTION of the Rays of Light, is a property which Dr. Hook observed 1672, and read an account of before the Royal Society, March 18, the same year.—He says, he found it different both from reflection, and refraction; and that it was made towards the surface of the opacous body perpendicularly.

This is the same property which Sir Isaac Newton calls *Inflexion*. See **INFLECTION**.

DEFLORATION, or **DEFLOWERING**, the act of violating or taking away a woman's virginity.

Death, or marriage, are decreed by the civil law in case of *Defloration*. Many anatomists make the hymen a real proof of virginity, persuaded that where it is not found, the girl must have been *deflowered*. See **HYMEN**.

The ancients had so much respect for virgins, that they would not put them to death, till they had first procured them to be *deflowered*. It is said, the natives of the coast of Malabar pay strangers to come and *deflower* their brides.

Among the Scots, and in the northern parts of England, it was a privilege of the lords of the manor, granted them by king Ewen, that they should have the first night's lodging with their tenants wives. King Malcolm III. allowed the tenants to redeem this service at a certain rate, called *Marcheta*, consisting of a certain number of cows: Buchanan says, it was redeemed with half a mark of silver. The same custom had place also in Wales, Flanders, Friseland, and some parts of Germany.

By the custom of Anjou, and Maine, a maid after twenty-five years of age, may suffer herself to be *deflowered* without being dishonoured for it by her father.

Du Cange quotes an arrêt of the 19th of March 1409, obtained by the inhabitants of Abbeville against the bishop of Amiens, for taking money to dispense with an injunction he had made, not to suffer them to get their wives maidenheads the three first nights; the injunction being founded on a canon of the IVth council of Carthage, which decrees the same, out of reverence of the matrimonial benediction.

DEFLUXION *, or **FLUXION**, a falling, or flowing of some humour to any part of the body; as of rheum on the trachea, and oesophagus in a catarrh.

* The word is formed from the Latin, *defluo*, I flow down, the humours falling upon some part, where they are gathered together.

Defusions on the Lungs are of dangerous consequence. See **CATARRH** and **PHTHISIS**.

Defusions on the Eyes produce a weakness of sight, and frequently blindness. See **EYE**.

DEFORCEMENT, in law, a withholding lands, or tenements, by force, from the right owner.

DEFORCEOR, or **DEFORCIANT**, one that casts out another from his lands, or tenements, by mere *Force*.

Deforceor differs from *Disseisor*, in that a man may disseise without *Force*: and that a man may *deforce* another who never was in possession; as where several persons have a right to lands, as common heirs, and one entering first, keeps out the rest. See **DISSEISOR**.

Deforceor also differs from *Intruder*, in that a man becomes *Intruder* by a wrongful entry only into lands void of a possessor; whereas a *Deforceor* holds out the rightful heir. See **INTRUSION**.

DEFORMITY, a displeasing or painful idea excited in the mind, on occasion of some object which wants of that uniformity, necessary to constitute beauty.

It is an inquiry of some delicacy, and importance, whether there be any such thing as *absolute Deformity*? Our perception of the ideas of beauty, and harmony is justly reckoned a sense; from its affinity to the other senses in this, that the pleasure does not arise from any knowledge of principles, proportions, causes, uses, &c. but strikes at first view; as also in this, that the ideas of beauty, like other sensible ideas, are necessarily pleasant to us, as well as immediately.

But, as the other senses, which give us pleasure, do also give us pain; does this sense of beauty make any objects disagreeable to us, and the occasion of pain?

That many objects give no pleasure to our sense, is obvious; many are certainly void of beauty: but then, says a late ingenious author, there is no form which seems necessarily disagreeable of it self, when we dread no other evil from it, and compare it with nothing better of the kind. Many objects are naturally displeasing, and distasteful to our external senses, as well as others pleasing, and agreeable; as smells, tastes, and some separate sounds: but for our sense of beauty, no composition of objects which give not unpleasant simple ideas, seems positively unpleasant, or painful of it self, had we never observed any thing better of the same kind.

Deformity, then, is only the absence of beauty, or a deficiency in the beauty expected in any species: thus, bad music pleases rustics, who never heard any better; and the finest ear is not offended with tuning of instruments, if it be not too tedious, where no harmony is expected: and yet much smaller dissonancy shall offend amidst the performance, where harmony is expected. A rude heap of stones is no way offensive to one who shall be displeas'd with irregularity in architecture, where beauty was expected. And had there been a species of the form which we now denominate ugly, or *deformed*, and had we never seen or expected greater beauty, we should have received no disgust from it. Though the pleasure would not have been so great in this form as in those we now admire. Our sense of beauty seems designed to give us positive pleasure; but not positive pain, or disgust, any further than what arises from disappointment.

There are indeed many faces which at first view are apt to raise dislike. But this is generally not from any positive *Deformity*, which of it self is positively displeasing, but either from want of expected beauty, or from the carrying some natural indications of morally bad dispositions, which we all acquire a faculty of discerning in countenances, airs, and gestures. That this is not occasioned by any form positively disgusting, appears hence, that if upon long acquaintance we are sure of finding sweetness of temper, humanity, and cheerfulness, though the bodily form continues, it shall give us no disgust. There are horrors raised by some objects, which are only the effect of fear for ourselves, or compassion towards others, when either reason or some foolish association of ideas makes us apprehend danger, and not the effect of any thing in the form it self. For we find, that most of those objects, which excite horror at first, when experience, or reason has removed the fear, may become the occasion of pleasure; as in ravenous beasts, a tempestuous sea, a craggy precipice, a dark shady valley, &c.

This association of ideas makes many objects beautiful and pleasant. The beauty of trees, their cool shades, and their aptness to conceal from observation, have made groves, and woods, the usual retreat of those who love solitude, especially the religious, the pensive, the melancholy, and the amorous: and do not we find, that we have so joined the ideas of those dispositions of mind, with those external objects, that they always occur to us along with them? and according as the habits, or passions contracted, or gratified therein give us pleasure, or pain, the remembrance is pleasurable, or painful. The dim light in Gothic buildings has had an association of a very foreign idea, which Milton expresses by his epithet, *a dim religious light*. After the like manner, the casual conjunction of ideas gives us disgust where there is nothing disagreeable in the form it self. And this, in effect, is the cause of most of our fantastic aversions to the figures of diverse animals, &c. Thus serpents of all kinds, and many insects, really beautiful enough, are beheld with aversion by many people, who have got some accidental ideas of mischief associated to them.

DEFTARDAR *, or **DEFTERDAR**, the treasurer of the revenues of the Turkish empire. See **TREASURER**.

* The word is compounded, first, of **DEFTER**, a Turkish name for a book, register, memoir, &c. which Meninski derives from the Greek *diptēra*, the skin or parchment anciently wrote on. The second word, whereof *Defstardar* is compounded, is **DAR**, a Turkish and Persian word, signifying keeping, or holding, *q. d.* book-keeper of the moneys received, and expended.

Meninski calls him *Supremus thesaurarius*, high treasurer; and *Præfex Cameræ*, president of the exchequer: Cassellus makes him the keeper, and comptroller of the books of receipts, and payments.

The *Defstardar*, or, as Vigenere calls him, *Defterdari*, has in his charge the rolls, and accounts of the militia, and the treasury; he receives all the grand signior's revenues, pays his forces, and furnishes the expences of all publick affairs: in which, his office differs from that of the Chaznadar, who is treasurer of the seraglio or court, as the *Defstardar* is of the state.

Ricaut makes a *Defstardar*, whom he calls *Tesferdar*, in each Beglerbeglic, or government. Vigenere assures us, there are but two, the one for Europe, and the other for Asia: the first resides at Constantinople, and has under him two general commissioners,

missioners, or deputies, one for Hungary, Transylvania, Wallachia, Croatia, Servia, Bulgaria, Bosnia, &c. The other for Greece and the Morea, with the islands of the Archipelago. Each of these has under him as many sub-commissioners, or agents, as there are Sangiacks in his province; which sub-commissioners have as many clerks as there are Sabaffi's in their Sangiackat, to keep the account of the Timariots in their districts. The *Defstader* of Asia has two general deputies, the one for Anatolia, the other for Syria, Arabia, and Egypt; these have likewise their sub-agents, clerks, &c. as those of Europe.

DEGENERATION, the act of failing, or declining from a more perfect, or valuable kind, state, or condition, to a less.

It is a great dispute among naturalists, whether or no animals, plants, &c. be capable of *degenerating* into other species? the affirmative is urged by many as a strong objection against the plant being contained in the seed, and that doctrine of generation wherein that is supposed to be so.

Fortun. Licetus, Lib. IV. *de Spont. vivent. ort.* expressly contends, that the forms of animals *degenerate* into other more imperfect ones: thus, say he, the soul of a calf, after its death, *degenerates* into the souls of the worms, bees, &c. which arise out of its carcass; but the other school-men laugh at this notion.

Others hold, that in the same matter there are diverse forms; and that *Degeneration* is only the putting off one form, and calling forth another latent one: but it is impossible, the form of a worm, and that of a calf, should be actually existing together in the same piece of matter.

Others hold, that *Degeneration* only obtains in vegetables, and define it the change of a plant of one kind into that of another viler kind. Thus, say they, wheat *degenerates* into darnel; barley into oats; ocimum into serpyllum; mint into silybrium; caulis into rapa, &c.

The plantule, or flamen of the future vegetable, they hold to exist in the seed; so that to produce such a plexus, or organism, a matter so and so prepared is only required: and add, that the matter in the soil where the seed is lodged being such as is incapable of producing the said plexus, it must necessarily change into another of a different nature from that the seed required, though in some respects like it, and approaching thereto: thus, darnel and wheat, in many respects agree; so also serpyllum and ocimum, &c. They allow, however, that there is no *Degeneration* in the root, but only in the seed: in as much as the root already supposes a perfect organization.

But our latest and best naturalists maintain the opinion such a *Degeneration*, or transmutation, to be erroneous and a chimera: not but they allow that a plant, by being transplanted to an improper soil, or sun, may be depraved; so as a Dutch rose of an hundred leaves, may only produce another rose far short thereof in number of leaves, colour, smell, &c. Such a depravation is possible, and frequently happens; but a specific transformation seems out of the power of nature; a new form ever supposing a new *Generation*, which again supposes a corruption of the former kind.

DEGLUTITION, in medicine, the act of swallowing the food.

Deglutition is performed, in the first place, by means of the tongue, driving the aliment into the oesophagus, or gullet; and then, by the contraction of the spincter, and the fleshy fibres of the same oesophagus, which lessening the bore, or aperture thereof, protrude the contents downwards into the stomach in our eating.

Deglutition succeeds *Mastication*, and is followed by *Concoction*.

DEGRADATION, in our law-books called *Disgradation*, and *Deposition*, the act of depriving, or stripping a person for ever of a dignity, or degree of honour; and taking away the title, badge, and privileges thereof.

The *Degradations* of a peer, a priest, a knight, a gentleman, an officer, &c. are performed with diverse ceremonies. That which anciently obtained in *degrading* a person from his nobility, is very curious, and deserves to be rehearsed here, after Gelior, and la Colombiere. It was practised in the time of Francis I. upon captain Fangel, who had cowardly given up Fontarabia, whereof he was governor.

On this occasion, twenty or thirty cavaliers without blemish, or reproach, were assembled: before whom the gentleman was accused of treason, and breach of faith, by a king at arms. Two scaffolds were erected, the one for the judges, heralds, and pursuivants, and the other for the guilty cavalier, who was armed at all points, and his shield placed on a stake before him, reversed with the point upwards. On one side assisted twelve priests, in surplices, who sung the vigils of the dead. At the close of each psalm they made a pause, during which the officers of arms stripped the condemned of some piece of his armour, beginning with the helmet, and proceeding thus, till he was quite disarmed: which done, they broke his shield in three pieces with a hammer. Then the king at arms empty'd a balon of hot water on the criminal's

head; and the judges, putting on mourning habits, went to the church: This done, the *Degraded* was drawn from off the scaffold, with a rope tied under his arm-pits, laid on a bier, and covered with mortuary-cloaths; the priest fingering some of the prayers for the dead; and then he was delivered to the civil-judge, and the executioner of justice.

For a more domestic instance: Sir Andrew Harcla, earl of Carlisle, being attainted and convicted, of treason, 189 Edw. III. *ceram regis*; after judgment was pronounced on him, his sword was broke over his head, and his spurs hewn off his heels; Sir Anthony Lucy, the judge, saying to him, "Andrew, now art thou no knight, but a knave." By Stat. 13 *Caroli II.* William, lord Monson, Sir Henry Mildmay, and others, were *degraded* from all titles of honour, dignities, and preeminences, and prohibited to bear, or use the title of lord, knight, esquire, or gentleman, or any coat of arms, for ever afterwards.

As to ecclesiastics, we have an instance of *Degradation* before condemnation to death, in the VIIIth century at Constantinople. It is in the person of the patriarch Constantine, whom Constantine Copronymus caused to be executed. He was made to ascend the Ambo; and the patriarch Nicetas sent some of his bishops to strip him of the pallium, and anathematized him: then they made him go out of the church backwards.

But we have a much later instance in our own history: when Cranmer, archbishop of Canterbury, was *degraded* by order of queen Mary; they dressed him in episcopal robes made only of canvas, put the mitre on his head, and the pastoral staff in his hand: and in this attire shewed him to the people. Which done, they stripped him again piece by piece.

At present, they do not stand so much on the ceremony of *Degradation*, in order to the putting a priest to death; by reason of the delays and difficulties that it would occasion. Pope Boniface pronounced, that six bishops were required to *degrade* a priest: but the difficulty of assembling so many bishops, rendered the punishment frequently impracticable.

With us, a priest, after having been delivered to his ordinary, if he cannot purge himself of the crime laid at his door; his gown, and other robes are stripped over his ears by the common hangman, by which he is declared divested of his orders.

It is decided, however, that *Degradation* does not efface the priestly character.

Degradation only seems to differ from *Deposition* in a few ignominious ceremonies, which custom has added thereto. Accordingly, in the business of Arnoul, archbishop of Rheims, sentenced in the council of Orleans, in 991, it was deliberated, what form they should follow in the deposition, whether that of the canons, that is, simple deposition; or that of custom, viz. *Degradation*. And it was declared, that he should surrender the ring, pastoral staff, and pallium, but that his robes should not be tore off him.

In effect, the canons prescribe no more than a mere reading of the sentence. It is the rest, therefore, added hereto by custom, viz. the stripping off the ornaments, and the tearing the pontifical vestments, that properly constitutes *Degradation*.

DEGRADATION, in painting, expresses the lessening, and rendering dim and confused, the appearance of distant objects in a landscape; so as they shall appear there, as they would do to an eye placed at that distance from them. See **PERSPECTIVE**.

DEGRADED, in heraldry.—A *Crofs* **DEGRADED**, is a cross marked, or divided into steps at each end; diminishing as they ascend towards the middle, or centre: by the French called *Perronné*. See **CROSS**.

DEGREE, in geometry, a division of a circle, including a three hundred and sixtieth part thereof.

Every circle, great and small, is supposed to be divided into 360 parts, called *Degrees*: the *Degree* is subdivided into 60 lesser parts, called *minutes*: the minute into 60 others, called *Seconds*: the second into 60 *Thirds*, &c.—It follows, that the *degrees*, *minutes*, &c. of greater circles, are greater than those of less.

The subdivisions of *Degrees* are fractions, whose denominators proceed in a sexagesimal ratio; that is, a first minute is $\frac{1}{60}$, a second $\frac{1}{3600}$, a third $\frac{1}{216000}$, &c. But these denominators being troublesome, their logarithms are substituted in common use, as indices thereof.

Thus, a *Degree*, as being the integer or unite, is denoted by c, a first minute or prime by 1, a second by 2 or ", a third by 3 or ', &c. Accordingly 3 *Degrees*, 25 *minutes*, 16 *thirds*, were wrote, $3^{\circ} 25' 16''$.

But though the ancient Egyptians, to whom this division is usually ascribed, did, by means heretof, free astronomical calculations from fractions; since sexagesimal fractions may be handled as integers; and were very happy in the choice of such a number of *Degrees* in the circle, as admitted of a just division by 2, 3, 4, 5, 6, 8, and 9. Yet Stevinus, Oughtred, Wallis, &c. with good reason, with the sexagesimal fractions set aside, and decimals taken in their room. For in decimals there is no occasion for reducing lesser fractions into greater, or greater into lesser; which is a tedious article in

DEG

Sexagesimals. Stevinus even holds, that this division of the circle which he contends for, obtained in the wife age, in *Sæculo Sapienti*. Stevin. *Cosmog.* Lib. I. Def. 6. The magnitude or quantity of angles is accounted in *Degrees*. Thus, we say, an angle of 90 *Degrees*; of 70 *Degrees*, 50 minutes; of 25 *Degrees*, 15 minutes, 45 seconds. Such a star is mounted so many *Degrees* above the horizon, declines so many *Degrees* from the equator. Such a town is situate in so many *Degrees* of longitude and latitude.

A sign includes 30 *Degrees* of the ecliptic. *DEGREE* of *Latitude*, is the space of 365184 English feet included between two parallels of latitude. *DEGREE* of *Longitude*, is the space between two meridians; the quantity of which is variable according to the latitude.

These expressions are borrowed from the ancients, who were acquainted with a very large extent of earth from east to west, which they accounted the length, and a much less from north to south, which passed with them for the breadth of the earth. See *LATITUDE* and *LONGITUDE*.

The quantity of a *DEGREE* of a meridian, or other great circle, on the surface of the earth, is variously determined by various observers: the methods too made use of are various. See *EARTH*.—Ptolemy fixes the *Degree* at 68 Arabic miles $\frac{1}{2}$, accounting $7\frac{1}{2}$ stadia to a mile. The Arabs themselves, who made an exact computation of the diameter of the earth, by measuring the distance of two places under the same meridian, in the plains of Seniar, by order of Almamom, only make 56 miles. Kepler determining the semidiameter of the earth by the distance of two mountains, makes a *Degree* 13 German miles; but his method is far from being accurate. Snellius seeking the diameter of the earth, from the distance of two parallels of the equator, finds the quantity of a *Degree* by one method to be 57064 Paris toises, or 342384 feet; and by another method, 57057 toises, or 342342 feet. The mean between which two numbers M. Picart found by mensuration in 1669, from Amiens to Malvoisin, the most sure, and makes the quantity of a *Degree* 57064 toises, or 342360 feet, which reduced to other measures, gives the quantity of a *Degree* of a great circle in

English miles of 50000 feet each	73 $\frac{109}{100}$
Florentine miles of 3000 braccios	63 $\frac{7}{8}$
Common French leagues of 220 toises	25
Rhinland perches of 12 feet	29556

However, M. Caffini, at the command of the king of France, in the year 1700, repeated the same labour, and measuring the space of 6 *Degrees*, 18 minutes, from the observatory at Paris, along the meridian to the city of Colioure in Rouffillon, that the greatness of the interval might diminish the error, found the quantity of a *Degree* to be 57292 toises, or 343742 Paris feet, amounting to 365184 English feet.—On which footing, the quantity of a minute of a degree of a great circle of the earth is 5710 Paris feet, and that of a second, 95 feet.

With which account pretty nearly agrees that of our countryman Mr. Norwood, who about the Year 1635, measured the distance between London and York, and found it 905751 English feet; and finding the difference of latitudes 2° , 28', determined the quantity of one *Degree* to be 367196 English feet, or 57300 Paris toises, or 69 English miles, 288 yards. See *Newt. Princ. Phil. Nat. Math.* prop. 19. p. 378. and *Hist. Acad. R. Scienc. An.* 1700, p. 153.

The quantity of a *Degree* of a great circle, with the distance of any other parallel from the equator being given, the quantity of a *Degree* in that parallel is found by this canon: as the whole sine is to the cosine of the distance of the parallel from the equator; so is the quantity of a *Degree* of the equator to the quantity of a *Degree* of the parallel. Suppose, *e. gr.* the latitude of the parallel 51° , and suppose a *Degree* of the equator 69 miles.

Log. of whole sine	100000000.
Cosine of 51°	97988718.
Log. 69	18388491.
Log. required	16377201.

The number corresponding to which in the tables is 43 $\frac{42}{100}$ miles, nearly; which being multiplied by 5280, the number of feet in a mile, gives the number of English feet in a *Degree* in that parallel.—On which foundation (supposing M. Caffini's proportion of 365184 English feet, or 69 miles, 864 feet to 1 *Degree* of a great circle) is built the following table, exhibiting the quantity of a *Degree* of longitude in each parallel of latitude.

DEG

Deg. of Lat.	Engl. Stat. M. of 5280 Feet	Deg. of Lat.	Engl. Stat. Miles of 5280 Feet.
Eq.	69 864	46	48 338

DEGREE, in civil and canon law, denotes an interval in cognation or kinship, whereby proximity and remoteness of blood are computed.

Degrees are the intervals whereby it is known what persons are nearest to the stock or root.—Or they are the distances of one person from another in the line of consanguinity or affinity, reckoned from some common parent or ancestor. See *CONSANGUINITY*.

We say, the second *Degree*, the third *Degree*; Gregory the great was the first who prohibited marriage to the seventh *Degree*; which restriction was long observed: the second council of Lateran, under Innocent III. refrained the prohibition to the fourth *Degree* inclusive, that is, to cousin germans children. See *MARRIAGE*.

In the civil law, the *Degrees* of kindred or cognation are differently computed from what they are in the canon law.—The first reckons by the number of persons issued from the same stock; each person sprung therefrom making one *Degree*: but with this difference, that in the direct line the order begins with the first *Degree*; and thus the father and son are in the first *Degree*: but in the collateral line there is no first *Degree* reckoned; two brothers being only related in the second *Degree*, by reason the father, who is the common stock, makes the first *Degree*.

The canon law observes the same rule as to the direct line; but in the collateral line, a generation only makes a *Degree*: thus brothers are in the first *Degree*, and cousin germans in the second. Whereas, the civil law puts brothers in the second, and cousins german in the fourth.—So that two *Degrees* in the civil law only make one in the canon law.

DEGREE, in medicine, denotes a certain pitch or intenseness of the elementary qualities.

The *Degrees* usually allowed are four, answering to the number of the peripatetic elements.

In the school philosophy, the same qualities are divided into eight: the least or highest *Degree* of intension is called *utmost*. We

They say, a thing is cold in the second *Degree*, pepper is hot in the third *Degree*, &c.

Fire was held hot in the eighth *Degree*, and dry in the fourth *Degree*.

DEGREES, in chemistry, is understood of the state or intenseness of the fire or heat.

Our *Chemists* distinguish four *Degrees* of fire or heat: The first, is that raised by two or three coals.

The second, that of four or five coals, or rather so much as is sufficient to warm a vessel sensibly; yet so, as that the hand may be held on it a considerable time.

The third *Degree*, is when there is a fire capable of boiling a vessel of five or six pints of water.

The fourth, is when there is fire enough for a furnace.

These *Degrees*, however, are all varied according to the different circumstances of operations, furnaces, vessels, subjects, &c. See **HEAT**.

DEGREES, in music, are the little intervals whereof the concords, or harmonical intervals, are composed. See **INTERVAL** and **CONCORD**.

The musical *Degrees* are three; the greater tone, the lesser tone, and the semi-tone.

The primary cause of the invention of *Degrees*, or intervals less than concords, and whereby the concords are divided, and as it were graduated, Descartes judges to have been this, that if the voice were always to proceed by harmonical intervals, there would be too great a disproportion or inequality in the intenseness thereof, which would weary both the finger and the hearer.

Thus, supposing A and B the distance of a greater third; if the voice were immediately to ascend from A to B, then because B being acuter, strikes the ear with more force than A, left that disproportion should prove uneasy, another sound, C, is put between them; by which, as by a step or *Degree*, we may ascend more easily, and with less unequal force in raising the voice.

Hence it appears, says that author, that the *Degrees* are only certain mediums contrived to be put betwixt the extremes of the concords, for moderating their inequality, but which of themselves have not sweetness enough to satisfy the ear, and are of use only with regard to the concords. So that when the voice has moved one *Degree*, the ear is not yet satisfied till we come to another, which therefore must be a concord with the first found.

The substance of what is here alledged amounts to this, that by a fit division of the concurring intervals into lesser ones, the voice will pass smoothly from one note to another; and the hearer be prepared for a more exquisite relish of the perfect intervals, whose extremes are the proper points in which the ear finds the expected rest and pleasure.

Such is the end and office of the *Degrees* or lesser intervals.—Now there are only three, that experience recommends as agreeable; whose ratios are 8:9, called the *greater tone*; 9:10, called the *lesser tone*; and 15:16, called the *semi-tone*.

By these alone a sound can move upwards or downwards successively, from one extreme of a concord to another, and produce true melody: and by means of these, several voices are also capable of the necessary variety in passing from concord to concord. As to the original of these *Degrees*, they arise out of the simple concords, and are equal to their differences. Thus, 8:9, is the difference of a fifth and fourth; 9:10, is the difference of a lesser third and fourth, or of a fifth and greater sixth; and 15:16, the difference of a greater third and fourth, or of a fifth and lesser sixth.

For the Use of **DEGREES**, in the construction of the scale of music. See **SCALE**.

DEGREE, in universities, denotes a quality conferred on the students or members thereof, as a testimony of their proficiency in the arts or faculties; and entitling them to certain privileges, precedencies, &c.

The *Degrees* are much the same in the several universities: but the laws thereof, and the discipline or exercise previous thereto differ.—The *Degrees* are *Bachelor*, *Master* and *Doctor*; instead of which last, in some foreign universities, they have *Licentiate*.

In each faculty there are but two *Degrees*, viz. *Bachelor* and *Doctor*, which were anciently called *Bachelor* and *Master*: nor do the arts admit of more than two, which still retain the denomination of the ancient *Degrees*, viz. *Bachelor* and *Master*. At Oxford, *Degrees* of master and doctor are only conferred once a year, viz. on the Monday after the seventh of July; when a solemn act is held for the purpose. See **ACT**.

The expenses of a *Degree* of doctor in any of the faculties, in treats and set fees, usually amount to 100*l*. and that of a master of arts, 20 or 30*l*.—There are made yearly about 150 doctors and masters.

The *Degree* of bachelor is only conferred in Lent; and there proceed usually about 200 yearly.

To take the *Degree* of bachelor in arts, four years are required, and three more for master of arts.

At Cambridge, matters are nearly on the same footing, only the discipline is somewhat more severe, and the exercises more difficult. The commencement which answers to the act of Oxford, is the Monday before the first Tuesday in July.—The *Degrees* of bachelor are taken up in Lent, beginning on Ash-Wednesday.

To the *Degree* of bachelor of arts, it is required, that the person have resided in the university near four years; and in his last year have kept philosophy acts, i. e. have defended three questions in natural philosophy, mathematics or ethics, and answered the objections of three several opponents at two several times; as also, that he have opposed three times. After which, being examined by the masters and fellows of the college, he is referred to seek his *Degree* in the schools, where he is to sit three days, and be examined by two masters of arts appointed for the purpose.

The *Degree* of master of arts is not given till above three years after that of bachelor; during which time, the candidate is obliged three several times to maintain two philosophical questions in the public schools, and to answer the objections raised against him by a master of arts.—He must also keep two acts in the bachelors school, and claim one.

To pass bachelor of divinity, the candidate must have seven years master of arts; he must have opposed a bachelor of divinity twice; kept one divinity act; and preached before the university, once in Latin, and once in English.

For the **DEGREE** of doctor. See the article **DOCTOR**.

DECIDE, *DECIDERE*, a term only used in speaking of the condemnation, and execution of the Saviour of the world, by Pontius Pilate, and the Jews; which was an horrible *Decide*.

The Jews, an ingenious author observes, were never more remote from idolatry than at present; never more inviolably attached to the law of Moses, than at present: whence then that load of evils and misfortunes they have for so many ages groaned under, evils incomparably greater and more lasting than all the chastisements wherewith God anciently avenged their most heinous idolatries? whence do they arise, but from the *Decide* they committed in the person of Jesus Christ?

DEJECTION, in medicine, properly signifies the act of ejecting, or evacuating the excrements, by means of the peristaltic motion of the guts.

In which sense it comes to the signification of *Excretion*.

DEJECTION is also, and that more ordinarily, applied to the excrements themselves, thus evacuated; in which sense it is of the same import with *Stool*.

Viscid, glutinous, or as some call them, *unguinous Dejections*, frequent in scorbutic diseases, indicate a colligation of the solids of the body.

DEJECTION, in astrology, is applied to the planets, when in their detriment, i. e. when they have lost of their force, or influence, as is pretended by reason of their being in opposition to some others, which check, and counter-act them.

Or, it is used when a planet is in a sign opposite to that wherein it has its greatest effect, or influence, which is called its *exaltation*. Thus, the sign *Aries* being the exaltation of the sun, the sign *Libra* is its *Dejection*. See **EXALTATION**.

DEIFICATION, in the Pagan theology, the act, or ceremony of deifying their emperors, i. e. of placing them among the Gods, and decreeing divine honours to be rendered them. See **GOD** and **CONSECRATION**.

The *Deification* is the same with *Apotheosis*.

DEINCLINERS, or *DEINCLINING Dials*, are such as both decline and incline, or recline at the same time.

Suppose, for instance, a plane to cut the prime vertical circle at an angle of 30 degrees; and the horizontal plane under an angle of 24 degrees; the elevation of the pole being 52 degrees; a dial drawn on this plane, is called a *Deincliner*. See **DIAL**.

DEIPARA, *Θεοτοκος*. See **MOTHER of God**.

DEISM, the doctrine, or belief of those who hold the existence of a God, as the whole of their religion.

DEISTS, a sect, or class of people, known also under the denomination of *Free-thinkers*, whose distinguishing character it is, not to profess any particular form, or system of religion; but only to acknowledge the existence of a God, without rendering him any external worship or service.

The *Deists* hold, that considering the multiplicity of religions, the numerous pretences to revelation, and the precarious Arguments generally advanced in proof thereof: the best and surest way is, to return to the simplicity of nature, and the belief of one God, which is the only truth agreed to by all nations.

They complain that the freedom of thinking, and reasoning, is oppressed under the yoke of religion; and that the minds of men are ridden, and tyrannized by the necessity imposed on them

them of believing inconceivable mysteries; and contend, that nothing should be required to be assented to, or believed, but what their reason clearly conceives.

The appellation *Deist* is also more particularly given to such as are not altogether without religion, but reject all revelation as an imposition, and believe no more than what natural light discovers to them; as that there is a God; a providence, a future state, with rewards and punishments for the good and the bad; that God must be honoured; and his will, so far as we can learn it, performed; but that each person is to do this after his own manner, and as his own conscience suggests.

The number of *Deists* is said to be daily increasing: in England, a great part of the men of speculation, and letters, are said to incline that way: and the like is observed in some of our neighbour nations, where freedom of speaking, writing, and thinking are indulged.

DEITY, *Godhead*; a common appellation given to God and also by the poets to the heathen Gods and Goddesses.

DEIVIRILE*, a term in the school-theology, signifying something divine and human at the same time. See **THEANDRIC**.

* The word is a compound of *Deus*, God, and *Virilis*, of *Vir*, Man.

DELEGATES, certain persons *delegated*, or appointed by the king's commission under the great seal, to sit upon an appeal to the king in the court of Chancery, in three cases: 1. Upon a sentence given in any ecclesiastical cause by the archbishop, or his official: 2. Upon a sentence given in an ecclesiastical cause in places exempt: 3. Upon a sentence given in the admiral court in suits civil, and marine, by order of the civil law.

Court of DELEGATES, is the highest court for civil affairs concerning the church; for the jurisdiction whereof it was provided 25 H. 8. That it shall be lawful for the subject, in case of defect of justice in the ecclesiastical courts, to appeal to the sovereign in his court of Chancery; whence a commission is directed under the great seal to particular persons therein mentioned, for redress of judgment.

From the highest ecclesiastical court there lies no appeal, but to the court of *Delegates*, and beyond this to no other, except to the house of lords. But the king, of his free-will, may grant a commission of review under the great seal. The citations run all in the king's name.

DELEGATION, a commission extraordinary given a judge to take cognizance of, and determine, some cause which ordinarily does not come before him.

In the civil law, *Delegation* also denotes a sort of surrender, whereby a person substitutes another debtor in his place. See Ulpian. l. 11. ff. *denovationibus & delegationibus*.

This *Delegation* differs from transferring, or translation, in that three persons intervene in a *Delegation*, viz. the creditor, the debtor, and a third, who himself is indebted to the debtor, and on whom the debtor transfers the obligation he was under to pay the creditor, *delegating* him, as it were, for that purpose. But in a simple transfer, it is enough the transferrer and the transferee be present.

DELETERIOUS, (from *deleo*, *necesse*, I hurt) a term sometimes used among naturalists for such things as are of a pernicious, and poisonous nature. See **POISON**.

DELF*, a quarry, or mine, where stone or coal is dug.

* From the Saxon word *Delfan*, to delve, or dig.

DELF of Coal, denotes coal lying in veins underground, before it is dug up.

DELVE, or **DELVE of Coal**, is also a certain quantity dug out of a mine or pit. See **COAL**.

DELF, is also used in heraldry for one of the abatements of honour; being a square in the middle of the escutcheon.

A *Delf* tenne was antiently due to him that recessed from his own challenge, or any way departed from his parole, or word. If there be two, or more *Delfs* in an escutcheon, it is then no longer an abatement: so also, if it be of metal, or charged upon; it then becomes a charge of perfect bearing.

DELIA, in antiquity, feasts celebrated by the Athenians, in honour of Apollo, furnished *Delius*.

The principal ceremony in this feast, was an embassy, or rather a pilgrimage to Apollo of Delos, performed every five years, by a certain number of citizens deputed for that purpose, and called *Delastæ*, *Δελασται*, or *Theori*, *Θεωροι*, *q. d.* the seers; and the first person of the embassy, or deputation, *Architheorus*, *Ἀρχιθεωρος*. To him were added four more of the family of the *Ceryci*, priests descended from Mercury, who resided all the year at Delos, to assist in the temple. The whole deputation set out in five vessels, carrying with them every thing necessary for the feast, and the sacrifices.

The vessels that carried the *Delasts*, or *Theori*, was called *Δελιας*, *Delias*; the four others were the *Parallis*, *Antigonis*, *Ptolemæis*, and *Ammonis*. Though this is a circumstance there is some dispute about.

The *Delasts*, who went aboard, were crowned with laurel. At their arrival, they immediately offered a sacrifice to Apollo: and after the sacrifice, a number of young maids danced round the altar, a dance called in Greek *Τεγασθαι*: wherein, by their various motions, and directions, they represented the turnings and windings of a labyrinth. When the *Delasts* returned to Athens, the people went out to meet them, and received them with all the joy and acclamation imaginable. They never laid aside their crown till their commission was fully completed; and then they consecrated it to some God in his temple.

The whole time of their going and returning, with all the ceremonies thereof, was called the *Delia*; during which time no criminal might be executed, which was a peculiar privilege of this feast, not allowed to any other, not even those of Jupiter. Thus, Plutarch observes, that it was a day consecrated to Jupiter, when Phœbon was made to take the poison he was condemned to; whereas they waited thirty days to give it to Socrates, by reason of the *Delia*.

According to Thucydides, the *Delia* were first instituted in the sixth year of the Peloponnesian war, after the Athenians had expiated the isle of Delos, removed all the tombs out of it, and ordained, that no body should either be born, or die in it; but that all their sick people should be removed into a little Island, called *Rhenia*. Though the Ionians, and the neighbouring islands of Ionia, had long before that time held a sort of *Delia*, that is, feasts and games, like those which the Athenians celebrated afterwards.

DELIAC, **DELIACUS**, among the ancients, denoted a poulterer; or a Person who sold fowls, fatted capons, &c.

The traders in this way were called *Delidæi*, by reason it was the people of the isle of Delos who first bethought themselves thereof. They also fold eggs, as appears from Cicero in his academic questions, lib. IV.—Pliny lib X. c. 30. and Columella, lib. VIII. c. 8. likewise mention the *Deliaci*.

DELIACAL Problem, **Problema DELIACUM**, a famous problem among the ancients, concerning the duplication of the cube. See **DUPLICATION**.

DELIBERATIVE, is applied to that kind, or branch of rhetoric employed in proving a thing; or convincing an assembly thereof, in order to oblige them to put it in execution.

The *deliberative* kind was much in vogue among the Greeks and Romans, when the orators harangued the people.

To have a *deliberative voice* in an assembly, is when a person has a right to give his advice, and his vote therein. In councils, the bishops have *deliberative* voices; those beneath them have only consultative voices.

DELINEATING. See the article **DESIGNING**.

DELINQUENT, a person who has committed some fault or offence.

It is the business of a magistrate to be severe in punishing *Delinquents*.

DELIQUIUM, or **DELIQUIUM animi**, a swooning, or fainting away; called also *Syncope*, *Lipothymia*, *Lipopsychia*, *Echysti*, and *Aphyxia*. See **SYNCOPE**.

DELIQUIUM, in chymistry, is the dissolution or melting of a salt, or calx, by suspending it in a moist cellar.

A salt, or Tartar, or any fixed alkali, set in a cellar, or other cool moist place, and in an open vessel, resolves, or runs into a kind of Liquor, called by the chymists oil of Tartar *per Deliquium*.

DELIQUIUM, is also used in some authors for a distillation by means of fire. See **DISTILLATION**.

DELIRIUM*, *Lighththeadness*, in medicine, a symptom frequent in fevers caused by internal inflammations, wounds, &c. whereby the mind is disordered to a degree of folly, or even phrenzy.

* Some derive the word from *De*, and *Lira*, which among the ancients signified a furrow drawn in a right line; whence *delirare*, a recto aberrare.

Deliriums also frequently arise from immoderate losses of blood, whereby the brain is too much weakened; from the stings of venomous beasts; from the feed, or menses being retained in the womb; from the rotting of a gangrened member, &c.

A disorder in the diaphragm commonly produces a *Delirium*. There are various species and degrees of *Deliriums*. In some the patient is fierce and outrageous; in others, more mild and easy, offering no violence to any body, but only indulging idle, ridiculous discourse; some laugh and sing; others cry and are sullen, &c.

DELIVERY, *Parturition*, or *child-birth*, the bringing forth of a perfect fetus, or child out of its mother's womb; whether it be living or dead. See **FOETUS**, **BIRTH**, &c.

To a *natural delivery*, according to the physicians, are required three conditions: First, that both the mother and the child strive alike, the one to *deliver*, and the other to be *delivered*: The second, that it come into the world head-foremost, which is its natural posture: And the third, that it be quick and easy, without ill accidents.

When

When the child presents its feet foremost, or comes a-crofs or double, it is no natural *Delivery*; and the Latins call such children *Agrippos*, q. d. *agre partii*.

A *legitimate Delivery*, is that which happens at the just term, i. e. in the 10th lunar month. And an *illegitimate*, that which comes either sooner, or later as in the 8th, or after the tenth. Women are indeed *delivered* at 7, 8, 9, 10, and 11 months, and not later. Though there are some physicians who hold, that a *Delivery* may be regular in the 14th month.

It has been observed that *Deliveries* are more happy in the 7th month, than in the 8th, i. e. that the child is easier saved, and more frequently lives, when it comes in the 7th, than when in the 8th month.

Monf. Peyssonnel, a Physician of Lyons, has a Latin treatise expressly on the term of *Delivery*; wherein he undertakes to reconcile all the apparent contradictions of Hippocrates, with respect thereto. He holds, that the shortest term of a *legitimate* birth, according to Hippocrates, is 182 days, or six complete months; and the longest 280 days, or nine months and 10 days; and that the children who come earlier or later than those terms, do not live, or are not *legitimate*.

Bartholine has composed a book, *de infantis partu Viis*, on the extraordinary passages of the fetus; where he gives diverse instances of very extraordinary *Deliveries*. Some have been delivered by the navel, and others by the anus. See Salmuth. *Obs.* 94. *Cent.* 3. *Phil. Transf.* N^o 416. p. 435.

In the year 1686, at Leckerkerck, 8 or 10 leagues from the Hague, the wife of one Christian Claes was *delivered* of five children. The first was a boy, who lived two months; 17 hours afterwards came a second son, who was dead; 24 hours afterwards a third son was born, who lived about two hours; in 24 hours more she had a fourth, dead. Lastly, she died in bringing forth the fifth, who died also in the birth.

DELPHINUS, the DOLPHIN, in astronomy, a constellation of the northern hemisphere; whose stars, according to Ptolemy, are 10; according to Tycho 25 many; and according to Mr. Flamsteed 18. The Longitudes, Latitudes, Magnitudes, &c. whereof are as follow.

Names and Situations of the Stars.	Sig.	Longit. ° ' "	Latitude. North. ° ' "	Magnit.
First of three in the Tail.	☿	8 49 50	28 54 38	6

DELTOIDES, in anatomy, a triangular muscle of the shoulder; thus called from the Greek *Delta*, Δ, and *eidōs*, Form.—See *Tab. Anat. (Myol.) fig. 1. n. 21. fig. 6. n. 10*. It arises, exactly opposite to the trapezius, from one third part of the clavicle, from the acromium, and spine of the scapula, and is inserted tendinous into the middle of the os humeri, which bone it lifts up directly; and it assists with the supra-spinatus, and coracobrachialis, in all the actions of the humerus, except the depression; it being convenient that the arm should be raised, and sustained, in order to its moving on any side.

DELUGE, DILUVIUM, in natural history, a flood, or inundation of water covering the earth, either in the whole, or in part.

We meet with diverse accounts of *Deluges* in ancient history, both sacred and profane: that which happened in Greece, in the time of Deucalion, called *Diluvium Deucalionium*, is famous. This *Deluge* only overflowed Thessaly; its date is fixed to the year before Christ 1529, being the third year before the Israelites coming out of Egypt, according to the computation of Petavius, *Rat. Temp.* P. I. Li. C. 7.

The *Deluge* of Ogyges happened near 300 years before that of Deucalion, 1020 years before the first Olympiad, and 1796 before Jesus Christ, according to the same author, *Rat. Temp.* P. I. Li. C. 4. P. II. Li. C. 5. This only ravaged Attica.

These two *Deluges* are frequently mentioned in ancient Greek authors, under the denomination of *Cataclysmus prior*, and *posterior*.

VOL. I.

Of the like kind were those inundations in the Netherlands, which in 1727 overwhelmed and covered with sea all that part now called the Gulph Dollart in the United Netherlands; and in 1421, all that part between Brabant and Holland.

But the most memorable *Deluge* is that which we particularly, by way of eminence, call the *Deluge*, or the *Universal Deluge*, or *Noah's Flood*; being a general inundation sent by God, to punish the corruption of the then world, by destroying every living thing (Noah, and his family, and what was shut up with him in the ark, only excepted) from off the face of the earth.

This flood makes one of the most considerable events in all history; and one of the greatest epochs in chronology: its history is given us by Moses, Gen. C. VI. and VII. Its time is fixed by the best chronologers to the year from the creation 1656, answering to the year before Christ 2293.—From this flood, the state of the world is divided into *Diluvian*, and *Antediluvian*.

The *Deluge* has been, and remains a mighty subject of inquiry and dispute among naturalists, critics, &c. The points chiefly controverted, may be reduced to three: First, its extent, viz. whether it were *general*, or *partial*. Secondly, its natural cause. And thirdly, its effects.

I. The immense quantity of water requisite to furnish a universal *Deluge*, has occasioned several authors to suspect it only partial. An universal *Deluge*, they think, had been unnecessary, considering the end for which it was brought, viz. to extirpate the wicked inhabitants. The world was then but new, and the people not very many; the holy scriptures only making eight generations from Adam to Noah. It was but a small part of the earth that could be yet inhabited: the country about the Euphrates, which is supposed to have been the scene of the first antediluvian inhabitants, was sufficient to bear them all. Now Providence, say they, which ever acts wisely, and frugally, would never have disproportioned the means to the end so far as to overflow the whole globe, only to drown a little corner of it. They add, that, in the scripture language, the *whole earth* expresses no more than *all the inhabitants*. And on this principle advance, that an overflowing of the Euphrates and Tigris with a vehement rain, &c. might answer all the phenomena of the *Deluge*.

But the *Deluge* was universal. God declared to Noah, Gen. VI. 17. that he was resolved to destroy every thing that had breath under heaven, or had life on the earth, by a flood of waters. Such was the menace: such the execution. The waters, Moses assures us, covered the whole earth, buried all the mountains, and were no less than 15 cubits above the highest of them: every thing perished therein, birds, beasts, men, and all that had life, excepting Noah, and those with him in the ark, Gen. VI. 19. Can an universal *Deluge* be more clearly expressed? If the *Deluge* had only been partial, there had been no necessity to spend 100 years in the building of an ark, and shutting up all the sorts of animals therein, in order to re-stock the world; they had been easily and readily brought from those parts of the world not overflowed, into those that were. At least, all the birds would never have been destroyed, as Moses says they were, so long as they had wings to bear them to those parts where the flood did not reach. If the waters had only overflowed the neighbourhood of the Euphrates and Tigris, they could not be fifteen cubits above the highest mountains; there was no rising to that height, but they must spread themselves, by the laws of gravity, over the rest of the earth: unless, perhaps, they had been retained there by a miracle; and in that case, Moses, no doubt, would have related the miracle, as he did that of the waters of the Red-Sea, and the river Jordan, which were sustained in a heap, to give passage to the Israelites, Exod. XIV. 22. and Josh. III. 16. Add, that in regions far remote from the Euphrates and Tigris, viz. in Italy, France, Switzerland, Germany, England, &c. there are frequently found in places many scores of leagues from any sea, and even in the tops of high mountains, whole trees sunk deep under ground, as also teeth, and bones of animals, fishes entire, seashells, ears of corn, &c. petrified; which the best naturalists are agreed, could never have come there but by the *Deluge*.

II. The *Deluge* allowed universal, the philosophers are solicitous to find water to effect it.

Moses brings it from two funds: *The fountains of the great deep were broken up; and the windows of heaven were opened*. Dr. Burnet, in his *Telluris Theoria Sacra*, shews, that all the waters in the ocean were not near enough to cover the earth 15 cubits above the tops of the highest mountains. According to his computation, no less than 8 oceans were required. Supposing the sea, therefore, drained quite dry, and all the clouds of the atmosphere dissolved into rain, we should still want much the greatest part of the water of a *Deluge*.

To get clear of this embarrass, many of our best naturalists, as Steno, Burnet, Woodward, Scheuchzer, &c. adopt des Cartes's system of the formation of the earth. That philoso-

pher will have the primitive world to have been perfectly round and equal, without mountains, or vales; and accounts for its formation on mechanical principles, by supposing it at first in the condition of a thick turbid fluid, replete with diverse heterogeneous matters, which subsiding by slow degrees, formed themselves into different concentric strata, or beds, by the laws of gravity: and thus, at length, left a dry, solid earth. Dr. Burnet improves on this theory: he supposes the primitive earth to have been no more than an orbicular crust, investing the face of the abyfs, or deep, which grew chinky, clave, burst, and fell down into the water, and so drowned its inhabitants.

The same theorist adds, that by this catastrophe, the globe of earth was not only shook, and broke in a thousand places, but the violence of the shock it then underwent shifted its situation; so that the earth, which before was placed directly under the Zodiac, became thenceforth oblique to the same. Whence arose the difference of seasons, which the antediluvian earth was not exposed to.

But how all this conflicts with the sacred text above cited, which expressly mentions mountains as the standard of the height of the water; or, with that other passage, Gen. VIII. 22. where God, promising not to bring any more Deluges, but that every thing should be restored on its ancient footing, says, *that seed-time and harvest, and cold and heat, and summer and winter, and day and night shall cease no more; we do not see.*

Other authors, supposing a sufficient fund of water in the abyfs, or sea, are only concerned for an expedient to bring it forth: accordingly, some have recourse to a shifting of the earth's centre, which, drawing after it the water out of its channel, overwhelmed the several parts of the earth successively.

The inquisitive Mr. Whiston, in his *New Theory of the Earth*, has a very ingenious hypothesis, and that perfectly new. He shews, from several remarkable co-incidences, that a comet descending in the plane of the ecliptic towards its perihelion, passed just before the earth on the first day of the deluge; the consequences whereof would be, first, that this comet, when it came below the moon, would raise a prodigious, vast and strong tide, both in the small seas, which according to his hypothesis were in the antediluvian earth, for he allows no great ocean there, as in ours; and also in the abyfs, which was under the upper crust of the earth. And that this tide would rise, and increase all the time of the approach of the comet towards the earth; and would be at its greatest height when the comet was at its least distance from it. By the force of which tide, as also by the attraction of the comet, he judges, that the abyfs must put on an elliptic figure, whose surface being considerably larger than the former spherical one; the outward crust of the earth, incumbent on the abyfs, must accommodate it self to that figure, which it could not do while it held solid, and conjoined together. He concludes, therefore, that it must of necessity be extended, and at last broke by the violence of the said tides, and attraction; out of which, the included water issuing, was a great means of the deluge; this answering to what Moses speaks of the *fountains of the great deep being broke open.*

Again, the same comet, he shews, in its descent towards the sun, must have passed so close by the body of the earth, as to involve it in its atmosphere, and tail, for a considerable time; and of consequence, it must have left a vast quantity of its vapours, both expanded and condensed, on its surface; a great part of which being afterwards rarefied by the solar heat, would be drawn up again into the atmosphere, and afterwards return again in violent rains; and this he takes to be what Moses intimates by the *windows of heaven being opened*; and particularly by the *forty days rain*. For as to the following rain, which with this made the whole time of raining 150 days; Mr. Whiston attributes it to the earth coming a second time within the atmosphere of the comet, as the comet was on its return from the sun. Lastly, to remove this vast orb of waters again, he supposes a mighty wind to have arose, which dried up some, and forced the rest into the abyfs again through the clefts by which it came up: only a good quantity remained in the aleveus of the great ocean, now first made, and in lesser seas, lakes, &c.

To the credit of this theory, it must be observed, that it was at first only proposed hypothetically: that is, the author only supposed such a comet, merely as it would account well, and philosophically for the phenomena of the deluge: without any assurance, that there really was any comet so near the earth at that time; and the hypothesis pleased even under such circumstances: but, upon further consideration, he has since, he thinks, proved, that there actually was a comet near the earth at that time, viz. the same great comet which appeared again in 1688. The author no longer, therefore, looks upon it as an hypothesis, but has republished it in a particular tract, entitled, *The Cause of the Deluge demonstrated.*

III. But the great difficulty is yet behind. The orderly strata, or layers of the earth, with the exuviae, or remains of fishes, as their teeth, bones, shells, &c. both marine, and

fluviatile, found in the bodies even of the most solid strata, and in flints, marbles, &c. are not yet dispatched. Those who adhere to Des Cartes's system, as Steno, &c. take the finding of the parts of terrestrial, and aquatic animals, branches of trees, leaves, &c. in the beds, or strata of stone to be a direct proof of the primitive fluidity of the earth. But then they are obliged to have recourse to a second formation of strata, much later than the first; by reason at the time of the first there was neither plant, nor animal in being. Steno, therefore, holds for second formations occasioned at different times by extraordinary inundations, earthquakes, volcano's, &c. — But Burnet, Woodward, Scheuchzer, &c. chuse rather to attribute a second general formation to the *Deluge*: without excluding, however, the particular ones of Steno. But the great objection against this system of fluidity, is mountains; for the whole globe being liquid, whence should such inequalities arise? Mr. Scheuchzer, rather than part with a system which looks so promising, gives into the opinion of those who hold, that after the *Deluge*, God, to remit the waters into their subterranean reservoirs, broke, and displaced, with his own almighty hand, a great number of strata, that were before horizontal, and raised them above the surface of the earth; whence it is, that the strata in mountains, though concentrical, are never horizontal.

Dr. Woodward, taking the several strata for the sediments of a *Deluge*; and considering the circumstances of those fishes, shells, and other exuviae found in them, draws several inferences, which very much illustrate the effects of the *Deluge*. As first, that these marine bodies, and other spoils of salt water fishes, were born forth of the sea, by the universal *Deluge*; and on the return of the water back again, were left behind at land. Secondly, that while the flood covered the globe, all the solid matters, as stones, metals, minerals, and fossils, were totally dissolved, and the cohesion of their corpuscles, destroyed; and that these corpuscles, with those of the less solid bodies, as earth, flesh of animals, and vegetables, were sustained promiscuously in the water, and made one common mass. Thirdly, that all the mass thus sustained, was at length precipitated to the bottom; and that, according to the laws of gravity, the heaviest settling first, and the rest in order. And that the matters thus subsiding, constituted the several strata of stone, earth, coal, &c. Fourthly, That these strata were originally all parallel, even, and regular, and rendered the surface of the earth perfectly spherical; and that the whole mass of water lay upon them, and constituted a fluid sphere encompassing the globe. Fifthly, that after some time, by the force of an agent seated within the earth, these strata were broken on all sides the globe, and their situation varied; being elevated in some places, and depressed in others; whence mountains, valleys, grotto's, &c. with the channel of the sea, islands, &c. In one word, the whole teraqueous globe was put, by this disruption, and dislocation of the strata, into the condition we now behold it in. Sixthly, that upon the disruption of the strata, and the depression of some, and elevation of other parts, which happened towards the end of the *Deluge*; the mass of water fell back again into the depressed, and lowest parts of the earth, into lakes, and other cavities, and the channel of the ocean; and through the fissures, whereby this communicates with the abyfs, which it filled till it came to an equilibrium with the ocean. *Nat. Hist. of Earth. P. I. and II.*

But of all the systems yet advanced, there seems none better calculated to solve the phenomena of those petrified exuviae, than that of Mr. de la Pymie. The antediluvian world, according to this author, had an external sea, as well as land, with mountains, rivers, &c. and the *Deluge* was affected by breaking the subterraneous caverns, and pillars thereof, with dreadful earthquakes, and causing the same to be for the most part, if not wholly, absorbed and swallowed up, and covered by the seas that we now have. Lastly, this earth of ours arose out of the bottom of the antediluvian sea; and in its room, just as many islands are swallowed down, and others thrust up in their stead.

From this system, which is very agreeable to scripture, the great difficulties that clog all the other systems, seem easily solved. It is no longer a wonder, that shells, and shell-fish, and the bones of fishes, and four-footed creatures, with fruits, &c. should be found in beds, and quarries, in mountains, and valleys, and the very bowels of the earth: for here they bred in the antediluvian sea; thither they were elevated with the hills and mountains, in the time of the *Deluge*; and there they fell into, were absorbed, and buried in chasms, and holes, and clefts, that would necessarily happen in the extrusion of the earth. *Phil. Transact. N^o 266.*

DEMAIN, or DEMESNE, in its popular sense, denotes the lord's manour place, with the lands thereto belonging; which he, and his ancestors have from time to time kept in their own manual occupation. See MANOUR.

DEMAIN, or DEMESNE, in a law-sense, signifies, according to Hottoman, *patrimonium domini*, the lord's patrimony; called also *Dmain*, and by the Civilians, *Dmainicum*. See DCMAN.

DEM

The same author proveth those lands to be *Demain*, which a man holdeth originally of himself; and those to be *Feodum*, which he holdeth of a superior lord.

In England, no common person has any *Demain*, simply understood; for all depends either mediately, or immediately on the crown. When a man, therefore, in pleading, would signify his land to be his own, he saith, that he is, or was seized thereof in his *Demain*, as of fee; whereby he means, that although his land be to him and his heirs for ever, yet it is no true *Demain*, but depends upon a superior lord, and he holdeth by service, or rent, in lieu of service, or by both service and rent.

DEMAIN is sometimes also taken, more largely, for lands and tenements, held for life, &c. and sometimes more strictly, for such only as are generally held in fee.

DEMAIN is sometimes again used for a distinction between those lands that the lord of a manour has in his own hands, or in the hands of his lessee, demised upon a rent, for term of years, or life; and such other lands, pertaining to the said manour, which belong to the free, or copy-holders.

The reason why the copy-hold is accounted *Demain*, is, because they, who are tenants to it, are judged in law to have no other right but at the will of the lord; so that it is reputed still, after a sort, to be in the lord's hands: and yet in common speech that is ordinarily called *Demain*, that is, neither free, nor copy free.

DEMAIN, again, is used in a more special signification, in opposition to *Frank-Fee*.

Thus, those lands, which were in the possession of Edward the confessor, are called, *ancient Demain*; and all others are called, *Frank-fee*: and the tenants who hold any of those former lands, are called, *tenants in ancient Demain*; and the others, *tenants in Frank-fee*, and also, *tenants at common law*. The reason is, because tenants in *ancient Demain* cannot be sued out of the lord's court.

DEMAND, in its popular sense, denotes a calling for, or requiring one's due.

DEMAND, in law, has a more special signification, as contradistinguished from *Plaint*: for all civil actions are pursued, either by *Demands* or *Plaints*; according to which the pursuer is called either *Demandant* or *Plaintiff*; viz. in real actions, *Demandant*, and in personal actions, *Plaintiff*.

Where the party pursuing is called *Demandant*, the party pursued is called *Tenant*; and where *Plaintiff*, *Defendant*.

There are two kinds of *Demands*: the one in *Deed*, de *Facto*, as in every precipice; the other in *Law*, de *Jure*; such is entry in land, distress for rent, &c.

If a man release another from all *Demands*, it is the best release the releasee can have, and shall redound most to his advantage. A release of facts is more large than of quarrels or actions; and a release of *Demands* more large and beneficial than either: by a release of all *Demands* to the disseisor, the right of entry into the land, and all contained therein, is released; and he that releaseth all *Demands*, excludes himself from all actions, entries, and seizures. But it is no bar to a writ of error to release an outlawry.

DEMANDANT, *Petens*, he who is actor, or plaintiff in a real action; thus called, because he demands lands, &c.

DEMARCHUS, in antiquity, the chief of a region, or district in the country of Attica.

The Athenians divided their country into certain regions or districts, which they called *demes*, i. e. people; and established a magistrate at the head of each, under the denomination of *demarchos*, *Demarchos*, of *demus*, and *demus*, rule, government.

DEMEMBRE, in heraldry, is when an animal is *dismembered*, i. e. the limbs cut off its body.

DEMESNE. See **DEMAIN**.

DEMI, a word of the same use and effect in the French language, with *Semi*, in the Latin and English; being formed from *dimidium*; and used in composition with other words, to signify *half*.

In words borrowed from the Latins, we use *Semi*; and in those from the French, we retain their *Demi*. See **SEMI**.

DEMI, or **DEMY**, in heraldry, signifies the *half* of a thing; as, a *Demy-Lion*, &c.

Colombiere has what he calls *Croix & demy*, a cross and an half; being a shaft crossed in the upper part like the Calvary cross, and having but one arm at the lower part.

DEMI-AIR, or **DEMI-VOLT**, in horsemanship, is one of the seven artificial motions of an horse; being an air, in which his fore-parts are more raised than in *Terra a Terra*: but the motion of the horse's legs is more quick in the latter than in the *Demy-Volt*.

DEMI-BASTION, is a kind of fortification, that has only one face, and one flank. See **BASTION**.

DEMI-CANNON, a piece of ordnance, usually about 6 inches bore, 5400 pound weight, 10 or 11 feet long, and carrying a shot of 30 or 32 pound weight. It carries point blank 150 paces; its charge of powder is 14 pound weight.

There are also two sizes of *Demi Cannon* above this, which are

DEM

something larger: as, the ordinary *Demi-Cannon*, which is 6 inches $\frac{1}{2}$ bore, 12 feet long, weighs 5600 pound; its charge of powder 17 pound 8 ounces, carries a shot 6 inches and a half diameter, and whose weight is 32 pound: this piece shoots blank 162 paces.

Demi Cannon of the largest size, is 6 inches $\frac{1}{4}$ bore, 12 feet long, 6000 pound weight; its charge is 18 pound of powder, and it carries 180 paces.

DEMI-CULVERING, is a piece of ordnance commonly 4 $\frac{1}{2}$ inches bore, 10 feet long, 2700 pound weight; its charge is 7 pound 4 ounces of powder; and it carries a shot of 10 pound 11 ounces; and shoots point blank 175 paces.

Demi-Culvering of the least size, is 4 $\frac{1}{4}$ inches bore, 10 feet long, 2000 pound weight; it carries a ball of 4 inches diameter, its charge is 6 pound 4 ounces of powder, and its level range is 174 paces.

Demi-Culvering of the largest sort, is 4 inches $\frac{1}{2}$ bore, 10 feet long; its charge of powder is 8 pound and 8 ounces; the ball is 4 $\frac{1}{2}$ inches diameter, weighs 12 pound 11 ounces; and the point blank shoot 178 paces. See **ORDNANCE**.

DEMI-GOD, &c. See the articles **GOD**, **HERO**, &c.

DEMI-GORGE, in fortification, is half the gorge, or entrance into the bastion; not taken directly from angle to angle, where the bastion joins to the curtain; but from the angle of the flank to the centre of the bastion or the angle the two curtains would make, were they thus protracted to meet in the bastion.

DEMI-LUNE, *Half-Moon*, in fortification, an outwork, as EFGHK (*Tab. Fortif. fig. 3.*) consisting of two faces, and two little flanks; frequently built before the angle of a bastion, and sometimes also before the curtain, though now much disused. The gorge terminates in a crescent or half-moon, whence the denomination *Demi-Lune*.

DEMI-QUAVER, is a note in music, two of which are equal to the quaver.

DEMISE, in law, is applied to an estate either in fee-simple, fee-tail, or for term of life; and so it is commonly taken in many writs.

The king's death is, in law, termed, *The Demise* of the king.

DEMOCRACY*, a form of government, wherein the sovereignty, or supreme authority, is lodged in the people, who exercise the same by persons of their own order, deputed for that purpose.

* The word is formed of the Greek *δημος*, people, and *κρατος*, to command, govern.

The most flourishing Democracies were those of Rome and Athens; the modern republics, as Venice, and the United Provinces, are rather Aristocracies than Democracies. The government of Basil, however, is a Democracy; and so are some of the free cities in Germany. See **REPUBLIC**.

DEMONSTRABLE, a term used in the schools, to signify somewhat that may be clearly and evidently proved.

It is *demonstrable*, that the side of a square is incommensurable with the diagonal. The problem of the motion, or rest of the earth, is not *demonstrable*; by reason the same appearances result from either supposition.

DEMONSTRATION, in logic, a syllogism in form, containing a clear and invincible proof of the truth of a proposition.

A *Demonstration* is a convincing argument, the two first propositions whereof are certain, clear, and evident; whence of necessity arises an infallible conclusion.

A *Demonstration* usually consists of three parts: Explication, Preparation, and Conclusion.

The *Explication* is the laying down the things supposed to be given or granted; from which the *Demonstration* is to be made.

The *Preparation* is something to be previously done, according to the nature of the *Demonstration* intended.

The *Conclusion* is a proposition that concludes the thing to be *demonstrated*, fully persuading, and convincing the mind.

The method of *demonstrating* things in mathematics, is the same with that of drawing conclusions from principles in logics. In effect, the *Demonstrations* of mathematicians, are no other than series's of enthymemes; every thing is concluded by force of syllogism, only omitting the premises, which either occur of their own accord, or are recollected by means of quotations. To have the *Demonstration* perfect, the premises of the syllogisms should be proved by new syllogisms, till at length you arrive at a syllogism, wherein the premises are either definitions, or identic propositions.

Indeed it might be *demonstrated*, that there cannot be a genuine *Demonstration*, i. e. such a one as shall give full conviction, unless the thoughts be directed therein according to the rules of syllogism. Clavius, it is known to every body, resolved the *Demonstration* of the first proposition of Euclid into syllogism: Herlinus, and Dalipodius, *demonstrated* the whole six first books of Euclid, and Henrichius, all arithmetic, in the syllogistic form.

Yet people, and even mathematicians, usually imagine, that mathematical *Demonstrations* are conducted in a manner far remote

more from the laws of syllogism; so far are they from allowing, that those derive all their force and conviction from these. But we have men of the first rank on our side the question. M. Leibnitz, for instance, declares that *Demonstration* to be firm and valid, which is in the form prescribed by logic. And Dr. Wallis confesses, that what is proposed to be proved in mathematics, is deduced by means of one or more syllogisms. The great Huygens too observes, that paralogisms frequently happen in mathematics, through want of observing the syllogistic form. See SYLLOGISM.

Problems consist of three parts: a *Proposition*, *Resolution*, and *Demonstration*.

In the *Proposition* is indicated the thing to be done.

In the *Resolution*, the several steps are orderly rehearsed, whereby the thing proposed is performed.

Lastly, in the *Demonstration* it is shewed, that the things enjoined by the *Resolution* being done, that which was required in the proposition is effected. As often, therefore, as a problem is to be demonstrated, it is converted into a theorem; the resolution being the hypothesis, and the proposition the thesis: for the general tenor of all problems to be demonstrated is this, that the thing prescribed in the resolution being performed, the thing required is done.

The school-men make two kinds of *Demonstration*: the one *Direct*, or, *propter quod*; wherein an effect is proved by the next cause: as when it is proved, that the moon is eclipsed, by reason the earth is then between the sun and moon.—The second *Indirect*, or, *quia*; wherein the cause is proved from a remote effect: as when it is proved, that fire is hot, because it burns; or that plants do not breathe, because they are not animals.

Affirmative DEMONSTRATION, is that, which proceeding by affirmative and evident propositions, dependent on each other, ends in the thing to be demonstrated.

Apagogical DEMONSTRATION, which does not prove the thing directly; but shews the impossibility and absurdity which arises from denying it.—Hence it is also called *reductio ad impossibile*, *ad absurdum*, from *απο*, from; and *αγω*, to carry.

Geometrical DEMONSTRATION, is that, framed of reasonings drawn from the elements of Euclid.

Mechanical DEMONSTRATION, is that, the reasonings whereof are drawn from the rules of mechanics.

DEMONSTRATION Apriori, is that, whereby an effect is proved from a cause, either a next, or remote one; or a conclusion proved by something previous, whether it be a cause, or only an antecedent.

DEMONSTRATION Aposteriori, is that, whereby either a cause is proved from an effect; or a conclusion is proved by something posterior, whether it be an effect, or only a consequent.

DEMONSTRATIVE, in rhetoric, one of the genera, or kinds of eloquence; being that which obtains in the composing of panegyrics, invectives, &c.

Rhetoric is divided into three kinds; deliberative, *Demonstrative*, and judiciary. See RHETORIC.

DEMONSTRATIVE, in grammar, is applied to pronouns which serve to shew, point out, or indicate a thing; as, *This here*, *That there*, *Those yonder*, &c.

DEMURRAGE, in traffick, an allowance made to the master of a ship, by the merchants, for staying in a port longer than the time first appointed for his departure.

DEMURRER, in law, a kind of pause, or stop, put to the proceeding of any action, upon some difficult point, which must be determined by the court, before any further progress can be had therein.

In every action, the controversy is either as to fact, or as to law: the first, decided by the jury; the second, by the judge. Now if any thing turn up in the cause so rare and difficult, that the judge cannot pronounce upon it; a *Demurrer*, or stop is made, and a time taken, either for the court to consider and agree of it among themselves; or otherwise for the judges, to meet in the Exchequer-Chamber, there, after hearing council on both sides, to determine what is law.—This *Demurrer* is expressed in our records by, *Moratur in lege*.

In common law, the defendant sometimes *demurreth* to the plaintiff's count or declaration; and sometimes the plaintiff *demurreth* to the defendant's plea, by averring, that it is not a sufficient plea in law, &c.

In chancery, the defendant *demurreth* to the plaintiff's bill, averring it to be defective in such and such a point; and demands the judgment of the court thereupon, whether he shall not be compelled to make any farther or other answer thereunto.

*DENARIATUS Terræ**, in ancient law-books, as much land as is worth a penny by the year. See FARDING-deal.

* *Sibi illa Bartholot tenet unam Acrem, &c* 5 *Denariatus Terræ in eodem Tenemento.* Du Cang.

DENARIUS in antiquity, the Roman penny; a silver coin equivalent to, from six to seven-pence three farthings sterling. See COIN.

The Romans having for a long time used brass money, which they call *As*, quasi *Æs*; or *Libra* and *Pondus*, because it was a

pound weight, began in the year of Rome 485 to coin silver; and coined first the *Denarius*, which was marked with the letter X, because it was worth ten asses, and divided into two quinaris, marked with V, which were subdivided into two Sestertia, marked with these three letters, IIS.

The first, or *consular Denarius*, was worth more than the after, or *imperial*. The first weighed a just drachm, or a 7th part of an ounce, and was worth about seven-pence three-farthings of our money. The second was only the 8th part of an ounce, and worth about six-pence half-penny.

M. Tillemont observes, that the *Denarius* was held sufficient to keep a person handsomely for a day; and upon the whole seems to intimate, that it was equal to twelve French sous, or eleven English pence. But this is to over-rate it.

The impression on the first *Denarius* was on one side the winged head of Rome; and on the other a biga or quadriga. Whence the *Denarii* were denominated *Bigati*, and *Quadrigati*. Afterwards the reverse was a Castor and Pollux, and sometimes a victory, driving a chariot with two, or four horses.

DENARIUS * is also used in our law-books for an English penny.

* *Denarius Angliæ qui nominatur sterlingus, rotundus sine transfura, ponderabit 32 grana frumenti in medio spica; & 20 Denarii faciunt unciam; & 12 uncia faciunt libram.* Stat. Edu. I. de Mensuris.

DENARIUS Dei *, denotes *Earnest-Money*; called also *Argentum Dei*, by the French *Deniers de Dieu*, and in some parts of our country *Arles*.

* *Ita quod nuper mercatorum ab illo contractu possit discedere, vel resipere postquam Denarius Dei inter personas contrahentes datus fuerit & receptus.* Charta Edwardi I.

DENATES, in antiquity, domestic gods, more frequently called *Penates*. See *PENATES*.

Dionysius Halicarnassensis, Lib. I. speaking of the *Dii Penates*, tells us, that the historian Timæus has wrote, that the figure, statue, or effigy of the *Denates*, or *Penates*, was nothing but a crooked iron, or copper rod, and a trojan vessel of potters ware: and that this was all *Æneas* brought from Troy. But, for himself, he assures us, he had seen a temple at Rome, near the forum, where those gods were represented sitting, under the form of two young men, having each of them a dart in his hand: he adds, that the inscription was *DENATES*, for that the ancients, before the invention of the letter P, used a D instead thereof: but Dionysius might be mistaken: for the bottom of the P is frequently so very small on medals, that there is no sensible difference between a P and a D; which might be the case in the inscription that author mentions; for that the ancient inhabitants of Italy had no P, is a mistake sufficiently refuted by many proper names still remaining of the most early ages, e. gr. Capys, Capetus, Picus, Pallas. Nor were the Trojans without the same, witness Palinurus, Paris, Priamus, &c.

DENCHE', *DENCHEA*, or *ENDENCHE'*, in heraldry. See *DANCHE'*.

DENDRITIS, in natural history, a sort of stone, whereon are seen trees, shrubs, and other rustic figures, represented in miniature, in blackish, or yellowish figures.

Some rank the *Dendritis* in the class of Entrochi, which they wrongly call stone-plants: but against this it is urged, first, that the branches of trees, &c. represented on the *Dendritis*, are never confounded together, nor shoot across each other, as those of Entrochi are usually found to do.

Secondly, That the fire strips the *Dendritis* of all its figures, without destroying the stone, or reducing it to ashes; which does not hold of any Entrochus.

From hence it appears, that the figures of the *Dendritis* are accidental, and the effect of a colour applied on the stone not artificially, but by nature. Two polished marbles being applied on each other with oil between; upon parting them again, the oil running into certain tracks, its impression exhibits divers figures like those on the *Dendritis*; the ramification always beginning on the side on which the marbles are begun to be separated. So that it appears, the figures of the *Dendritis* are formed by some bituminous liquor insinuating between the beds, or strata of the stones; and accordingly, we actually find, that the *Dendritis* being exposed to the fire, yields a bituminous smell. This same liquor sometimes also oozes out of the stone it self, filtrating through its pores; it being, in all probability, the cold, and pressure of the upper beds, that forces it forth.

In some *Dendrites*, the figures or signatures penetrate quite through; in others they go but to the middle, and in others not so deep. See Supplement, Article *DENDRITÆ*.

DENDROPHORIA *, in antiquity, the carrying of one or more trees, in ceremony, through a city, at certain feasts, and in honour of certain deities.

* The word is formed of *δενδρον*, tree, and *φορεω*, I bear.

The *Dendrophoria* was performed at the sacrifices of Bacchus, Cybele, and the god Sylvanus. Arnobius, Lib. V. makes mention of that performed at the sacrifices of the mother of the gods. It consisted in carrying a pine in procession through the

the city; which pine was afterwards planted in memory of that where-under Atys, the favourite of this goddess, mutilated himself. The branches of this tree they crowned, in memory of Cybele's doing the same; and they covered its trunk with wool, by reason the goddesses cover'd Atys's breast with the same Matter.

The persons who performed the office of carrying the tree, were called *Dendrophori*.

In the Roman history we find mention made of a company, or college of *Dendrophori*, who attended the army: and the critics have been in great pain to assign their office. Some hold, that they hewed and fashioned the wood for the tents: others, that they provided the wood necessary for the military works, machines of war, &c. Salmastius in his notes on the life of Caracalla by Spartian, owns this the general opinion of all the learned men of his time, but assures us with his usual modesty, that they were all mistaken, and that the *Dendrophori* of the army were the same with those of the feasts and sacrifices.

DENEB, an Arabic term, signifying *tail*; used by astronomers as a denomination of several fixed stars.

Thus *Deneb electæ*, signifies the bright star in the lion's tail; *Deneb adigeæ*, that in the swans tail, &c.

DENIER, the French penny; a small copper coin, twelve whereof make a sol, or French shilling.

The French *Denier* is now about the 23d part of the English penny. It is subdivided into two mailles, and the maille into two oboles. Anciently, *Denier* was a general name for all sorts of moneys in France; as nummus for those in Rome.—

Thus, a piece of gold money, was called *Denier d'Or*; silver money, *Denier d'Argent*: after the same manner as the Romans said, *Nummus Aureus*, and *Nummus Argenteus*.

There were two kinds of *Deniers*; the one *Tournois*, the other *Paris*; whereof the latter was worth a fourth part more than the former, and was called *Monnaie Royale*, or *Fortie Monnoye*, and sometimes *Denier d'Or*, and *Denier à Valeur d'Or*. See *MONEY*, &c.

DENIZEN, in law, an alien enfranchised in England by the king's charter, and donation; and thereby enabled, in many respects, to do as the king's native subjects do; namely, to purchase and possess lands, to hold any office or dignity, &c.

Denizenship is a right inferior to naturalization by parliament: for a stranger naturalized may inherit lands by descent; which a *Denizen* cannot.

Add, that, in the charter, whereby a person is made a *Denizen*, there is usually some clause, or other, which abridges him of that full benefit which natural subjects enjoy.

When a man is thus enfranchised, he is said to be, *ad fidem regis anglie*, or, *under the king's protection*; till such time his goods might be seized to the king's use.

DENOMINATION, a name imposed on any thing, usually expressing some quality predominant therein.

Hence, as the qualities and forms of things are of two kinds, viz. internal, and external; *Denomination* becomes twofold.

Internal DENOMINATION, is that founded on the intrinsic form; thus Peter is *denominated* learned, on account of his learning, which is something internal.

External DENOMINATION, is that founded, or arising from the external form. Thus, a wall is said to be seen, and known, from the vision, and cognition employed upon it; and thus Peter is *denominated*, honoured, by reason of honour, which is not in the person honoured, but in him that honours.

DENOMINATOR, in arithmetic, a term only used in speaking of fractions, or broken numbers. See *FRACTION*. The *Denominator* of a *Fraction* is the number or letter below the line; shewing into how many parts the integer is supposed to be divided by the fraction.

Thus in the fraction $\frac{12}{7}$, seven twelfths, the number 12 is the *Denominator*, and shews, that the integer is here divided into 12 parts. So in the fraction $\frac{a}{b}$, *b* is the *Denominator*.

The *Denominator* always represents an integer.

The number above the line 7, is called the *Numerator*.

DENOMINATOR of a Ratio, is the quotient arising from the division of the antecedent by the consequent.

Thus 6 is the *Denominator* of the Ratio 30:5, because 5)30 (6. The *Denominator* is what we otherwise call the *Exponent* of the Ratio.

DENSITY, that property, or habitude of bodies, whereby they contain such a quantity of matter, under such a bulk.

Accordingly, a body that contains more matter than another, under the same bulk, is said to be *denser* than the other.

Density stands in opposition to *Rarity*.

Hence, since the mass is proportional to the gravity, a *denser* body is specifically heavier than a rarer; and a specifically heavier is *denser* than a specifically lighter.

The *Densities*, and bulks of bodies, are the two great points, whereon, all mechanics, or laws of motion turn: 'tis an axiom, that bodies of the same *Density* contain equal masses, under equal bulks. If the bulks of two bodies be equal, their

Densities are as their masses: consequently, the *Densities* of equal bodies, are as their gravities. If two bodies have the same *Density*, their masses are as their bulks: and hence; the gravities of bodies of the same *Density*, are in the Ratio of their bulks. The masses of two bodies are in a Ratio compounded of their *Densities*, and bulks; consequently, their gravities are in the same Ratio; and if their masses or gravities be equal, their *Densities* are reciprocally as their bulks. The *Densities* of any two bodies are in a Ratio compounded of the direct Ratio of their masses, and their reciprocal one of their bulks.

The Peripatetics define *Density* a secondary quality; whereby a body is full of it self; its parts cohering without any interstice. So that the form of *Density* consists in the immediate coherence of parts. Hence Porphyry in his predicament defines a *dense* body, that whose parts are plac'd so near each other, that no other body can come between them; as gold.

The efficient cause of *Density* they usually attribute to cold: Scaliger, and some others, attribute it to moisture. Many of the moderns take the smallness of the parts of bodies, to contribute much to their *Density*; as by this means the pores are left the smaller: though it is added, that the *Density* of bodies does not only depend on the smallness of the pores, but also on their fiveness; so far as we from having any body absolutely *dense* in the sense of the ancients, that gold itself, the *densest* and heaviest of all natural bodies, Sir Isaac Newton observes, contains a great deal more pore, or vacuity, than substance.

When the pressures of two liquids are equal, the quantities of matter in columns which have equal bases, do not differ; wherefore the bulks, that is, the heights of the columns are inversely as the *Densities*; whence may be deduced a method of comparing them together. For if in communicating tubes there be different fluids, and they remain at rest, their pressures are equal; and by measuring their altitudes the Ratio of their *Densities* is found.

The *Densities* of liquids are also compared together by immersing a solid into them; for if a solid lighter than the liquids to be compared together, be immersed successively into different liquids, the immersed parts will be inversely as the *Densities* of the liquids.—For, because the same solid is made use of, the portions of the different liquors, which in every case would fill the space taken up by the immersed parts, are of the same weight; therefore the bulks of those portions, that is the immersed parts themselves, are inversely as the *Densities*.

DENSITY of the Air, is a property that has much employed the later philosophers, since the discovery of the Torricellian experiment, and the air-pump.

It is demonstrated, that in the same vessel, or even in vessels communicating with each other, at the same distance from the centre, the air has every where the same *Density*.—The *Density of the Air* always increases in proportion to the compression, or the compressing powers.

And hence, the lower air is always *denser* than the upper: yet the *Density* of the lower air is not proportional to the weight of the atmosphere; by reason of heat and cold, which make notable alterations as to rarity, and *Density*. If the air be rendered *denser*, the weight of bodies therein is diminished; and if rarer, increased; by reason bodies lose more in heavier than in lighter mediums.

And hence, if the *Density of the Air* be sensibly altered, bodies, equally heavy in a lighter air, if their specific gravities be considerably different, will have their equilibrium taken away in a *denser* air, and the specifically heavier will preponderate; which is the foundation of the manoscope, an instrument for measuring the alterations in the *Density of the Air*. See *MANOSCOPE*.

DENTAL, *DENTALS*, is applied to certain letters, in the pronunciation whereof the teeth have a principal share.

Grammarians, and especially the Hebrew ones, distinguish the letters into *Dental*, *Labial*, *Guttural*, *Lingual*, *Palatal*, &c.

DENTALIS or *DENTALIUM*, is a kind of shell, which the apothecaries are ordered to pulverize, and use in several medicaments, as an alkali.

The genuine *Dentalis*, described by M. Tournefort, is of a tubular, or conical form, about three inches long; of a shining, greenish white colour; hollow; light, and divided lengthwise by parallel lines, running from top to bottom. It is about the thickness of a quill, and bears some resemblance to a dog's tooth, whence its name.

It is very scarce; and therefore in lieu of it, they usually substitute a shell of diverse colours found among the sand when the sea is withdrawn; but not channeled, or fluted like the *Dentalis*.

Dr. Lister, in the *Philos. Transact.* makes mention of two species of *Dentalia*; the first commonly enough found about the island of Guernsey, &c. being a long, slender, white pipe, a little bending, and tapering, and open at both ends: The other properly called *Entalium*, longer and thicker than the former; and besides, streaked with ridges; whence the Italian term *Intagliata*. See *Supplement* articles *Dentalia* and *Entalia*.

DENTED, *indented, toothed*. See INDENTED.

DENTED *Verge*, among botanists, is applied to such leaves of plants as are notched, or jagged about the edge or rim: of these some are *fine dented*; others *large*, or *deep dented*, i. e. cut into the leaf. See LEAF.

DENTED *Wheel*, *Rota DENTATA*. See the article WHEEL.

DENTES, in anatomy. See the article TOOTH.

DENTICLES, or DENTILS, in architecture, an ornament in corniches, bearing some resemblance to teeth; particularly affected in the Ionic and Corinthian orders; and of late also in the Doric.

They are cut on a little square member, properly called *Denticulus*; and the notches, or ornaments themselves, *Dentils*, by the Italians, *Dentelli*, and *Denticoli*, from *Dens*, tooth, as having the appearance of a set of teeth. — See *Tab. Archit. fig. 30. lit. b b.* and *fig. 28. lit. d d.*

Anciently, *Dentils* were scarce ever used but in the Ionic cornice: yet we find them in the remains of the theatre of Marcellus; and this is an argument with some, that Vitruvius had not the direction of that building. — Vitruvius prescribes the breadth of each *Dentil*, or tooth, to be half its height; and the metopa, or interval between each two, he orders to be $\frac{2}{3}$ of the breadth of the *Dentil*, L. III. c. 4.

The same author, c. 2. of his IVth book, observes, that the Greeks never used *Dentils* underneath modillions; by reason modillions represent purlins; and *Dentils* represent ends of rafters, which can never be placed underneath purlins.

The Romans were not so scrupulous as to this decorum; excepting in the pantheon, where there are no *Dentils* under the modillions, neither in the portico, nor in the inside of the building.

DENTIFORMIS *Processus*, the same as *Pyrenoides*. See PYRENOIDES.

DENTIFRICE, in medicine, *tooth-powder*; a remedy to rub the teeth withal, in order to cleanse, or fasten them.

There are *Dentifrices* of diverse kinds and forms; some in form of a powder, composed of corals, pumice-stone, salt, alum, egg-shells, crabs-claws, harts-horn, cuttle-bone, tartar vitriolated, &c. Others in form of an electuary, consisting of the same powders, mixed up with honey.

There are others, prepared with roots boiled with alum, and dried in the oven. Others in form of a liquor, drawn by distillations from drying herbs, and astrigent medicines.

The Dutch hold butter the best *Dentifrice*, to keep the teeth white and sound; and the Spaniards, urine.

DENTITION, DENTITIO, the act of breeding, or cutting the teeth.

The time of *Dentition*, is usually from about 7 months old, to 17. The Incisors come first; then the Molars; after them the Canini; and lastly the Dentes Sapientiae.

Dentition, Hippocrates observes, is usually preceded with an itching of the gums, and with convulsions, fevers, and looseness; especially when the canine-teeth are cut.

Most of these symptoms Dr. Lister, on this passage of Hippocrates, observes, happen to birds upon moulting, or casting their feathers; on which occasion also they become mute, and sullen.

The germen, or seed of the tooth, says Doléus, is a tender mucous matter, like the white of an egg, contained in the cells, or alveoli of the jaw-bone, which grows harder and bigger every day, till it be fit to break through the gum. In this rupture the poor child is afflicted with terrible symptoms, inflammations of the jaws, gripes, waking, inquietude, terrors, dejections, vomiting, salivation, epilepsy, abscesses, and frequently death.

There are two terms, or periods of *Dentition*; the one, when the tooth, makes its first endeavour to get out of the maxillary bone, and wherein the outer, and upper part of the gum uses to be incompassed with a whitish circle. — The other, when the tooth, considerably enlarged in bulk, renders the gum tumid, and strives with all its force to break its way through the same. The remedies against the symptoms of *Dentition* are abortives, and gentle purgatives. See Supplement article *Dentition*.

DENUNCIATION, a solemn publication, or promulgation of any thing.

All vessels of Enemies are lawful prize after *Denunciation*, or proclamation of war.

The design of the *Denunciation* of excommunicated persons, is, that the sentence may be the more fully executed; that the persons may be known, the entrance into the church refused them, and that other people may be warned not to have any communication with them.

DEOBSTRUENTS are such medicines as open obstructions.

There is something further intimated by *deobstruent*, than by *detergent*: for a medicine may be *deobstruent*, that is not in the strictest sense *detergent*; as, in effect, are most of those which are made of metalline substances; such as steel and mercury; which obtain the appellation *Deobstruents* from their acting by their natural weight, whereby they increase the momentum of the circulating fluid; and make it strike against the secretory

outlets with greater force; because the momentum, or vis percussiva of all projectiles, of which kind is a circulating fluid, is as their solidities, supposing their velocities equal. The more therefore the animal fluids are saturated with dense and solid particles; with the greater force they distend the vessels, and the more easily break through, where the structure favours their escape; and upon that account are medicines which add to these qualities in the fluids called *Deobstruents*.

DEODAND, in our customs, a thing given, or forfeited, as it were, to God, for the pacification of his wrath in a case of misadventure, whereby a man or woman comes to a violent end, without the fault of any reasonable creature.

As, if a horse strike his keeper, and kill him: if a man, in driving a cart, falls so as the cart-wheel runs over him, and presses him to death: if one be felling a tree, and gives warning to the standers by, to look to themselves, yet a man is killed by the fall thereof: in the first place the horse; in the second, the cart-wheel, or the cart and horses; and in the third the tree is, *Deo dandus*, to be given to God, that is to the king, to be distributed to the poor by his almoner, for expiation of this unhappy event; though effected by unreasonable, nay senseless and dead creatures.

Omnia que movent ad mortem sunt Deodanda.

What moves to death; or kills him dead,

Is *Deodand*, and forfeited.

This law seems to be an imitation of that in Exodus, chap. XXI. *If an ox gore a man, or a woman with his horn, so as they die; the ox shall be stoned to death, and his flesh not be eat; so shall his owner be innocent.*

Fleta says, the *Deodand* is to be sold, and the price distributed to the poor, for the soul of the king, his ancestors, and all faithful people departed this life.

DEOPILATIVE, a remedy proper to soften, resolve, and remove obstructions. See OBSTRUCTION.

Deopilatives are the same with what we otherwise call *Deobstruents*. See DEOBSRUENT.

DEPART, a method of refining, or separating gold from silver by means of aqua fortis.

There are three ways of refining gold: the first by antimony; the second by sublimate; and the third, which is the most usual, by aqua fortis. — The two former, see under the article REFINING.

For the operation of the *Depart*, they take at the rate of one pound of impure gold, and two or three of silver; these they fuse together in a crucible, and when fused, cast them into cold water, where they become divided into grains of the bigness of peas. These grains taken out, and dried by the fire, are put in a *departing* vessel, which is a stone matras, and to the metal is added four pounds of aqua fortis. Then taking the vessel, they set it on the coals, and in about an hour's space, the refining is done. — For upon opening the vessel, they find nothing appear therein but the aqua fortis, and the gold reduced into a calx, or sand; the silver being all dissolved, and imbibed by the liquor.

To raise the gold to its due fineness, they usually give it the aqua fortis again and again; using for the first time half a pound; and for the second a quarter of a pound of the water, to eight ounces of metal. If the third water be found good and clear, the operation is ended: and the calx of the gold being washed in repeated waters, is melted down again in a crucible, first by a gentle, and afterwards a vehement fire, to be cast into ingots, or wedges.

It must be added, that the silver, with the impurities of the gold, are so thoroughly incorporated with the water, that to the eye there does not appear any thing beside the pure liquid; yet is not this silver lost. To recover it again out of the menstruum, they divide their stock of aqua fortis into several stone vessels, which they fill up with spring water, observing to put seven or eight times as much of this, as that. This done, in each vessel they put a quantity of copper; and leaving the whole for twenty-four hours, at the end thereof they find the spirits of the aqua fortis have quitted the silver, and are with the copper, leaving the former in form of a calx, or incorporated ashes at bottom. This calx being dried, is melted into an ingot, with a little salt-petre.

To husband the aqua fortis, and make it serve again for a second operation; they distil it in an earthen, or glass alembic; and when the distillation is about a third over, change the recipient. The water of the first recipient, serves for the first operation of *Departing*, and the rest for the subsequent ones.

If the aqua fortis, having quitted the silver, and being united with the copper, be then filtrated, it is called, *aqua secunda*; in which, if you steep an iron plate some hours, you will have another *Departure*: for the menstruum will let go the copper, and prey on the iron, leaving the copper in powder on the iron plate. And filtrating this dissolution, you may get the iron out of it, by laying in it a piece of lapis calaminaris; for the iron in that case will depart to the bottom, and the calamine be dissolved. And if you again filtrate this water, and pour on it the liquor of fixed nitre, you will have another *Depart*, the calamine precipitating to the bottom. And lastly, filtrating this

this water, as before, and evaporating part of it, you will have crystals of salt-petre.

DEPARTURE, or **DEPARTER**, in law, a term properly applied to a person, who first pleading one thing in bar of an action, and that being replied to, he waves it, and insists on something different from his first plea.

Or, it may be applied to a plaintiff, who in his replication shews a new matter from that in his declaration.—So if a man plead a general agreement in bar; and in his rejoinder alledge a special one; it shall be adjudged a *Departure* in pleading. The defendant hereupon demurreth, because it was a *Departure* from the declaration. Coke II. part, fol. 147.

DEPARTURE in *deight* of the court, is when the tenant, or defendant after appearing to the action brought against him, and having a day over in the same term; does not appear at the day, but makes a default.—This is a *Departure* in *deight* of the court, and therefore he shall be condemned.

The *Departure* is always on the part of the tenant, or defendant; and its entry is, *quod prædictus A. licet solemniter ex-actus, non revenit, sed in contemptum curie recessit*.

DEPARTURE, in navigation, is the casting, or veering of a ship, with respect to the meridian it departed, or failed from. Or, it is the difference of longitude, either east or west, between the present meridian the ship is under, and that where the last reckoning or observation was made.

This *Departure* any where, but under the equator, must be accounted according to the number of miles in a degree proper to the parallel the ship is under.

DEPHLEGMATED, in chemistry, an epithet applied to spirits which are well cleared of water or phlegm.

To effect this, they rectify them, *i. e.* distil them over and over, till they be left quite pure.

DEPHLEGMATION, in chemistry, is the act of purifying, or clearing a fluid of its phlegm, or water.

This is performed by distilling the spirit, or other fluid again and again; by which means, the spirituous part all rises, and leaves the phlegm, or water behind.—When the spirit is thus disengaged of all its phlegm, or, at least, as much as it can be, it is called a *dephlegmated spirit*.

DEPILATORY, in medicine, a plaister, or medicine, applied on any hairy place, in order to bring off the hair.

• The word is formed of the particle *de*, and *pilus*, hair.

Depilatories are principally composed of lime and orpiment, which is a very caustic, and even a dangerous mineral.

DEPONENT, in the Latin grammar, a term applied to verbs which have active significations, but passive terminations, or conjugations, and want one of their participles passive.

Such is *minor*, I threaten, which has for participles, *minans*, *minaturus*, and *minatus*, but no *minandus*, which should be the participle passive.

They are called *Deponents*, as having *deposited*, or laid aside their passive signification.

DEPOPULATION, the act of wasting, destroying, desolating, or unpeopling a place. *Coke Instit.* part III. fol. 204. Hence *depopulatores agrorum*. Stat. 4. Hen. IV.

DEPORTATION, a sort of banishment in use among the Romans, whereby some island, or other place was allotted a criminal for the place of his abode, with a prohibition from stirring out of the same on pain of death.

Ulpian makes this difference between *Deportation*, and relegation, that the former confined the party to one certain place for ever; whereas relegation was frequently revoked, and allowed the exile a little more liberty.

By *Deportation* a person lost the rights of a Roman citizen.

DEPOSIT, **DEPOSITUM**, a thing put to the hands of another to be kept gratis.

The civilians divide *Depositum* into *simple* and *judiciary*.

Judiciary-Deposit, is that whose property is contested between several persons, and *deposited* in the hands of some third person, by decree of a judge.

Simple-Deposit is either voluntary, or necessary. Necessary is that done in case of hostility, shipwreck, fire, &c.

Inn-holders are responsible for the baggage brought to them, as being a *necessary Deposit*.

DEPOSITARY, in the French law, a person entrusted as keeper, or guardian of any thing,

Ordinary Depositaries are not to warrant the thing left with them, in case it be lost, or stolen. They are only to answer for a fraud, or breach of faith; not for negligence. But a *necessary Depositary*, as an inn-keeper, is accountable for a theft or robbery, if there have been any negligence in the case: and by the English law, even whether there were any negligence or not.

DEPOSITION, in law, a testimony given in court by a witness upon oath.

In chancery, *Deposition* is a testimony set down in writing, by way of answer to the interrogatories exhibited in chancery, where such witness is called *Deponent*.

DEPOSITION is also used for the sequestering, or depriving a person of his dignity and office.

This *Deposition* only differs from abdication, in that the latter is supposed voluntary, and the act of the dignitary, or officer himself; and the former of compulsion, being the act of a superior power, whose authority extends thereto.—Some say the *Deposition*, and some the abdication of king James II. The pope pretends to a power of *deposing* kings. Gregory VII. we are assured by Onuphrius Panvinus, and Otho de Frisingen, was the first who attempted the *Deposition* of kings.

Deposition does not differ from deprivation: we say indifferently a *deposed*, or deprived bishop, official, &c.

Deposition differs from suspension, in that it absolutely and forever strips, or divests a priest, &c. of all dignity, office, &c. whereas suspension only prohibits, or restrains the exercise thereof.

Deposition only differs from degradation, in that the latter is more formal, and attended with a few more circumstances than the former; but in effect and substance they are the same; those additional circumstances being only matter of show, first set on foot out of zeal and indignation, and kept up by custom, but not warranted by the laws or canons. See **DEGRADATION**.

DEPRECATION, in rhetoric, a figure whereby the orator invokes the aid or assistance of some one; or prays for some great evil or punishment to befall him who speaks falsely; either himself, or his adversary.

DEPRECATORY, or **DEPRECATIVE**, in theology, a term applied to the manner of performing some ceremonies in the form of prayer.

Among the Greeks, the form of absolution is *deprecatory*; being conceived in these terms, *may God absolve you*: whereas in the Latin, and even in some of the reformed churches, it is in the declarative form, *I absolve you*.

DEPRESSION of Equations. See **EQUATION**.

DEPRESSION of the Pole.—So many degrees as you sail, or travel from the pole towards the equator; *i. e.* many you are said to *depress* the pole, because it becomes, respectively, so much lower, or nearer to the horizon.

DEPRESSION of the visible horizon, denotes its sinking or dipping below the true horizontal plane; whether caused by some variation in the atmosphere, or by the different height of the observer's eye above the surface of the sea.

The eye being one foot above the surface of the sea, the visible horizon, or edge of the sea, will be thereby depressed one minute.—At the height of 3 feet, the dip will be 2 minutes;—at 7 feet, 3 minutes;—at 12 feet, 4 minutes;—at 18 feet, 5 minutes;—at 27 feet, 6 minutes.

DEPRESSOR, in anatomy, a name common to diverse muscles, from their office in lowering, or bringing down the parts they are fastened to.

DEPRESSOR labii superioris, is a muscle called also *constrictor alæ nasi*. See **CONSTRUCTOR alæ nasi**.

DEPRESSOR labii inferioris proprius, a muscle placed between the *depressores labiorum communes*, on the part called the chin. It appears to be but one muscle, ascending with a twofold order of fleshy fibres, and terminating in the lower lip. Its office is shewn by its name; it depresses the lower lip. See *Tab. Anat. (Myl.)* fig. 1. n. 6.

DEPRESSOR labiorum communis, by some called *depressor labii superioris*, is common to both lips. It arises with a broad origin from the lower margin of the under jaw, by the side of the chin, and is inserted with a narrow tail into each lip near their coalition; serving to draw them obliquely down. See *Tab. Anat. (Myl.)* fig. 1. n. 7.

DEPRESSOR maxillæ inferioris.

DEPRESSORES oculi, a pair of muscles springing from each corner of the eye, and answered by another pair of like figure and structure in the lower eye-lid. These are often considered together by anatomists as one orbicular muscle; the fibres invironing the eye-lids, and being inserted into them, not unlike the sphincters of other parts.

DEPRIMENS, in anatomy, the same with *Depressor*. See **DEPRESSOR**.

DEPRIVATION, in the canon law, the act of bereaving, divesting, or taking away a spiritual promotion, or dignity.—As when a bishop, vicar, prebend, or the like, is *deposed*, or *deprived* of his preferment for some matter, or fault in fact, or in law. See **DEPOSITION**.

Deprivation is of two kinds; a *beneficio*, & *ab officio*.

DEPRIVATION a *beneficio*, is when for some great crime, a minister is wholly, and for ever *deprived* of his living, or preferment: which differs from suspension, in that the latter is only temporary.

DER

DEPRIVATION *ad officio*, is when a minister is for ever deprived of his orders: which is the same in reality, with what we otherwise call *Deposition* and *Degradation*; and is usually for some heinous crime deserving death, and is performed by the bishop in a solemn manner. See **DEGRADATION**.

DEPTH, in geometry, &c. See **ALTITUDE**, **HEIGHT**, &c. **DEPTH** of a *Squadron*, or *Battalion*, is the number of men in a file; which in a squadron is three, and in a battalion generally six.

We say, the battalion was drawn up six deep; the enemies horse were drawn up five deep.

DEPURATION, in pharmacy, the same as clarification, or purification; viz. the purging a body of all the lees, faeces, and other crass, coarse and excrementitious parts contained therein.

Fermentation serves to *depurate* liquors: syrups, juices, &c. are depurated by passing them through the manica hippocratis, or straining-bag.

DEPUTATION, a mission of certain select persons out of a company, or body, to a prince, or assembly, to treat of matters in their name; or to prosecute some affair therein.

Deputations are more or less solemn, according to the quality of those who send them, and the business they are sent upon. *Deputation* is not properly applied where a single person sends another with such commission; but only where a body are concerned.—The parliament *deputed* the speaker, and six members, to present their address to his majesty. The chapter *deputed* two cannons to solicit their affair in council.

DEPUTY, a person sent, or *deputed* by some community, in their name and behalf.

The several provinces of the French dominions send *Deputies* to the king every year, to present him the Cayer des États: there are always three *Deputies*, one from each order. It is the *Deputy* of the first order, that makes the compliment to the king. In the cities of Turkey, there are always *Deputies* to treat with the grand signior's officers, as to taxes, and other concerns.—These *Deputies* are three or four of the richest, and most considerable among the burghers.

DEPUTY, is also frequently used among us, for an office, or employ; not a dignity: and stands indifferently for a vice, or lieutenant.

Among the ancients, **DEPUTATUS** was applied, first, to armours, or workmen employed in the making of armour in the forges, &c. And secondly, to a sort of active people, who followed the army, and in engagements were trusted to bring off, and take care of the wounded.

DEPUTATUS, ΔΕΠΟΤΑΤΟΣ, was also an inferior officer in the church of Constantinople, whose business was to call persons of condition the patriarch had a mind to speak withal, and to keep off the croud where that prelate walked.

This *Deputy* appears to have been a sort of usher, or tip-staff; but he had likewise the care of the sacred vestments; in which he approached the office of a sacristan.

DERELICTS, in the civil-law, are such goods as are wilfully thrown away, or relinquished by the owner.

DERELICT is also applied to such lands, as the sea receding from, leaves dry, and fit for cultivation.

DERIVATION, in grammar, the affinity one word has with another, by having been originally formed from it.

DERIVATION, in medicine, the act of diverting a humour which flows on some noble part, and drawing it to some other neighbouring part, where it is less dangerous.

Thus, in distillations upon the eyes, or teeth, they apply a blister behind the neck to draw the matter thither: and in a quincy, they prescribe bleeding in the ranula, or veins under the tongue, to divert the humour from falling on the throat.

DERIVATIVE, in grammar, a word which takes its origin from another word, called its *Primitive*.

Such is the word *Derivative* itself, which takes its origin from the primitive *Rivus*, a rivulet, or channel, out of which lesser streams are drawn; and thus *Manhood*, *Deity*, *Lawyer*, &c. are derived from *Man*, *Deus*, *Law*, &c.

DERMA *, in anatomy, the cutis, or skin of an animal; or the tegument investing the whole body immediately under the cuticle, or scarf-skin.

* The word comes from the Greek *δερμν*, to *skin*, or *excavate*. The *Derma* consists of two parts; the corpus reticulare, and papillae pyramidales. See **SKIN**.

DERNIER Ressort. See the article **RESSORT**.

Whatever power is committed by the king to any other, the *Dernier Ressort* is still remaining in himself; so that he may sit in court, and take cognizance of all causes: except in treasons, and other cases, where he himself is a party.

DEROGATION, an act contrary to a preceding one, and that annuls, destroys, and revokes it, either in whole, or part. *Derogations*, in general terms, are not regarded in judicature; they must be in specific, and in formal terms.

A new law imports a *Derogation* of a former one: a second testament is a *Derogation* of a first.

DEROGATORY, a clause importing *Derogation*.

DES

By the French law, if a person own himself indebted in a certain sum; notwithstanding any quittance he has obtained for the same, the act is *derogatory*.

DERVIS *, or **DERVICH**, a name given to a sort of monks among the Turks, who lead a very austere life, and profess extreme poverty; though they are allowed to marry.

* The word is originally Persian, *درویش*, signifying a beggar, or person who has nothing: and by reason the religious, and particularly the followers of Mevelava, profess not to possess any thing: they call both the religious in general, and the Mevelavines in particular, *Dervises*, or *Derviches*.

The *Dervises*, called also *Mevelavines*, are a Mahometan order of religious; the chief, or founder whereof was one *Mevelava*. They are now very numerous. Their chief monastery is that near Coigni in Natolia; where the general makes his residence; and where all the assemblies of the order are held: the other houses being all dependent on this; by a privilege granted to this monastery under Ottoman I.

The *Dervises* affect a great deal of modesty, patience, humility, and charity. They always go bare-legged, and open-breasted, and frequently burn themselves with hot irons, to inure themselves to patience. They always fast on Wednesdays, eating nothing on those days till after sun-set. Tuesdays and Fridays they hold meetings, at which the superior of the house presides. One of them plays all the while on a flute, and the rest dance, turning their bodies round and round with the greatest swiftness imaginable. Long custom to this exercise from their youth, has brought them to such a Habitudo, that it does not discompose them at all. This practice they observe with great strictness, in memory of Mevelava their patriarch's turning miraculously round, as they pretend, for the space of four days, without any food or refreshment; his companion Hamla playing all the while on the flute: after which he fell into an extasy, and therein received wonderful revelations for the establishment of his order. They believe the flute an instrument consecrated by Jacob, and the shepherds of the Old Testament; by reason they sang the praises of God thereon. They profess poverty, chastity, and obedience; and really observe them while they remain *Dervises*; but if they chuse to go out, and marry, they are always allowed.

The generosity of *Dervises* are rank Mountebanks: some apply themselves to legerdemain, postures, &c. to amuse the people; others give into sorcery and magic: but all of them, contrary to Mahomet's precept, are said to drink wine, brandy, and other strong liquors, to give them the degree of gaily their order requires.

Beside their great saint Mevelava; there are particular saints honoured in some particular monasteries: as Kederle, greatly revered in the monasteries of Egypt, and held by some to be St. George; and by others, with more probability, the prophet Elias.

The *Dervises* are great travellers; and under pretence of preaching, and propagating their faith, are continually passing from one place to another: on which account they have been frequently used as spies.

There are also *Derviches* in Persia, called in that country *Abdals*, q. d. servants of God.—They lead a very penurious, austere life, and preach the Alcoran in the streets, coffee-houses, and wherever they can meet with auditors. The Persian *Derviches* retail little but fables to the people, and are in the last contempt among the men of sense, and letters.

DESART, or **DESERT**, a wild, uncultivated, uninhabited place or country: as the *Desarts* of Lybia, of the Thebaid, &c. Geographers use the word in the general for all countries little, or not at all, inhabited. In scripture, we find several places in the Holy Land, or places adjoining thereto, called *Desarts*. The *Desart*, or wilderness, absolutely so called, is that part of Arabia on the south of the Holy Land, wherein the Israelites wandered forty years, from the time of their evacuating Egypt to their entry into the promised land.

The *Desart* of Beersheba was that part of the *Desart* just mentioned, which bordered on the Holy Land, running towards the Mediterranean. The *Desart* of Idumea, is Idumea itself, a barren, mountainous country. The *Desarts* of Betharen, Bethsaida, Cadesch, Damascus, Dibon, Engaddi, Edom, Gibeon, Horeb, Jazer, Juda, Moab, Pharan, Sin, Sinai, Zur, Zin, &c. are so many dry, uncultivated, and in general mountainous places, like our downs, &c. where there are few or no habitations or inhabitants; whence the Hebrews call them by antiphrasis *דִּשְׁרֵי*, which properly signifies *human word*, or *speech*, by reason there is none heard there.

DESART, in cookery. See the article **DESSERT**.

DESCANT in music, the art of composing in several parts.

Descant is three-fold; viz. *Plain*, *Figurative*, and *Double*. *Plain Descant*, is the ground-work, or foundation of musical composition, and consists altogether in the orderly placing of many concords: answering to simple counterpoint.

Figurate, or *Florid Descant*, is that wherein discords are concerned as well, though not so much, as concords. This may be well termed the ornamental or rhetorical part of music; in regard that in this are introduced all the varieties of points,

points, figures, synopses, diversities of measures, and whatsoever else is capable of adorning the composition.

Double DESCANT, is when the parts are so contrived, that the treble may be made the bass: and on the contrary, the bass the treble.

DESCENDANT, in genealogy, a term relative to *Ascendant*, and applied to a Person who is born or issued from some other referred to.

Adam infected all his *Descendants* with original sin. The *Descendants* from the brothers of the maid of Orleans, are confirmed in their exemption from all taxes, and imposts, by a regulation of the year 1634.

DESCENDING, something that falls, or moves from above, downwards.

There are *ascending* and *descending* stars; and *ascending* and *descending* degrees.

There are also *ascending* and *descending* veins springing out of the cava: and *ascending* and *descending* arteries rising out of the aorta.

DESCENDING Latitude, is the latitude of a planet in its return from the nodes to the equator.

DESCENSION, in astronomy, is either *right* or *oblique*.

Right DESCENSION of a *Star*, or *Sign*, is a point, or arch of the equator, which *descends* with the star, or sign below the horizon, in a right sphere.

Oblique DESCENSION, is a point or arch of the equator, which *descends* at the same time with a star, or sign below the horizon, in an oblique sphere.

Descensions, both *right*, and *oblique*, are accounted from the first point of aries, or the vernal interfection; according to the order of the signs; that is, from west to east. And as they are unequal, when it happens that they answer to equal arches of the ecliptic, as, *e. gr.* to the twelve signs of the zodiac, it follows, that sometimes a greater part of the equator rises, or *descends* with a sign, in which case the sign is said to *ascend*, or *descend* rightly: and sometimes again a less part of the equator rises, or sets with the same sign; in which case it is said to *ascend*, and *descend* obliquely. See **ASCENSION**.

Refraction of the DESCENSION, &c. See **REFRACTION**.

DESCENSIONAL Difference, is the difference between the *right*, and *oblique* *Descension* of the same star, or point of the heavens, &c.

DESCENT, or **DISCENT**, in law, an order, or manner wherein lands, and tenements are derived to any man from his ancestors.

Thus, to *make his Descent* from his ancestors, is to shew how, and by what particular degrees, the land in question came to a person from his ancestors.

Descent is either *lineal*, or *collateral*.

Lineal DESCENT, is that conveyed down in a right line from the grand-father to the father, and from the father to the son, from the son to the grand-son, &c.

Collateral DESCENT, is that springing out of the side of the line, or blood; as from a man to his brother, nephew, or the like.

If one dies seized of land, wherein another has right to enter, and it *descends* to his heir; such *Descent* shall take away the other's right of entry, and put him to his action for recovery thereof. Stat. 32. Hen. VIII.

DESCENT, in genealogy and heraldry, the order, or succession of *Descendants* in a line, or family.

We say, one *Descent*, two *Descents*, &c. A gentleman is of perfect blood, who has four *Descents* of gentility, both by his father, and mother's side, *i. e.* whose great-grand-father, grand-father, and father, on both sides, were all gentlemen.

DESCENT, is also used in heraldry, to express the coming down of any thing from above.

Thus a *Lion en Descent*, is a lion with his head towards one of the base points, and his heels towards one of the corners of the chief; as if he were leaping from some high place.

DESCENT, *Fall*, in mechanics, &c. is the motion, or tendency of a body towards the centre of the earth, either directly, or obliquely.

It is to be here observed, first, that a body cannot *descend*, unless it can divide, and separate the medium; which it cannot do, unless it be specifically heavier than the medium. For since bodies cannot penetrate each other, one must give way before the other can move: and again, though a medium, *e. gr.* water be divisible, yet if it be specifically heavier than another, *e. gr.* wood, it is only heavier as it contains more particles of matter in the same bulk, all which have an impulse downwards; and consequently in water there is a greater impulse than in the same bulk of wood.

Secondly, The *descending* body loses as much of its weight, as is the weight of the medium, with the force of its cohesion.

Thirdly, The less the bulk of the *descending* body is, the more of its gravity does it lose in the same medium. For though the proportion of the specific gravity of the one to the other be still the same in a greater or lesser bulk, yet the less the body,

the more the surface, in proportion to the mass; and the more the surface, the more the friction or resistance.

The cause of this *Descent*, or tendency downwards, has been greatly controverted. There are two opposite hypotheses advanced; the one holding it to proceed from an internal, and the other from an external principle. The first maintained by the Peripatetics, and Epicureans, and by the Newtonians; and the latter by the Cartesians, and Gassendists.

The Peripatetics teach, that heavy bodies fall by certain motive power, flowing from their forms towards the centre of the earth, as their proper element, or place in the universe.

These powers they call *Impetus*; and will have them to have been impressed on the several parts of the earth at the creation; being a tendency of the parts to the whole. And they suppose, that it is by means hereof, that the whole is still preserved in its integral state. Adding, that if there were a perfect vacuum in any part of the air round us, a stone placed therein would not at all fall or tend towards the earth, as being no longer a part thereof, nor having the natural *Impetus*.

The ancient Epicureans, or Atomists, with the modern Newtonian philosophers, hold, that all bodies do naturally gravitate, or tend downwards; and that the more strongly, as they contain the more matter; consequently perfectly solid bodies, such as they suppose atoms or primitive corpules to be, the most of all.

The Cartesians ascribe the cause of the *Descent* of bodies to a circular motion of the æther, which they feign for this very purpose. According to them, all circular motion is unnatural; and therefore is continually endeavouring to recede from its centre, and to change into a rectilinear motion; consequently such as have the most motion, recede the most, and in receding depress, or thrust down such as have less motion. And thus the air being moved with the most vehement velocity, recedes more than solid bodies, and by that means drives them towards the centre.

The Gassendists account for the *Descent* of heavy bodies, by supposing certain magnetic rays proceeding out of the earth, and consisting of contiguous particles, which by their continual emission retain the rigidity of rods, or stretched cords.

These rays being diffused every way from the earth, as a centre, strike, or impinge on what solid bodies they meet withal in their progress, and penetrate the same, some directly, and others obliquely, and refractedly, after the manner of rays of light. These rays, say they, are a kind of arms; and the deflections, and curvatures of their extremes, as it were fingers, or hooks, which pull, or draw bodies from above towards the earth. And they add, that these rays being the more rare, as they are more remote from the centre; their effect is the more feeble; and the *Descent* of bodies is the more slow, in proportion as they are higher.

Laws of the DESCENT of Bodies.—1. Heavy bodies in an unresisting medium fall with an uniformly accelerated motion. See the *Laws of uniformly accelerated Motion* under the articles **ACCELERATION**, and **MOTION**.

Hence, 1. The spaces *descended* are in the duplicate ratio of the times, and velocities; and increase according to the uneven numbers 1, 3, 5, 7, 9, &c. 2. The time, and velocities, are in a subduplicate ratio of the spaces. 3. The velocity of *descending* bodies, are proportionate to the times from the beginning of their falls. 4. The spaces described by a falling body, are as the squares of the times from the beginning of the fall.

A body specifically heavier *descends* in a fluid medium specifically lighter, (*e. gr.* the air,) with a force equal to the excess of the weight of the body above an unequal bulk of the medium. For a body only *descends* in a medium with the force remaining, after a part has been spent in overcoming the resistance of the medium. And this resistance is equal to the weight of an equal bulk of the medium: consequently the body only falls with the excess of its weight above that of an equal bulk of the medium.

Hence, the power that sustains a body in a specifically lighter medium, is equal to the excess of the absolute weight of the body above an equal bulk of the medium. Thus 47 $\frac{1}{2}$ pound of copper in water loses 5 $\frac{1}{2}$ of their weight.—A power, therefore, of 42 pounds is able to sustain them.

In supposing heavy bodies to *descend* in an unresisting medium, we conceive them free of all external impediments, from what cause soever. So that we even set aside that oblique impulse given to bodies while in falling, by the rotation of the earth, though this produce no sensible irregularity in a little distance.

Galileo who first discovered the *Law of the Descent* of heavy bodies by reasoning, afterwards confirmed the same by experiments; the result of which, repeated an hundred times over, was, that the *Descent* was as the square of the times.

Grimaldi and Riccioli made experiments to the same effect, though in a different manner, by letting fall a number of balls, weighing eight ounces a piece, from the tops of several towers, and measuring the times of falling by a pendulum. These experiments are exhibited in the following table.

Vibrations of the Pendulum.	Time.	Space at the End of the Time.	Space descended each Time.
		Rom. P. G.	Rom. Foot
5	0 50	10	10
10	1 40	40	30
15	2 30	90	50
20	3 20	160	70
25	4 10	250	90
6	1 0	15	15
12	2 0	60	45
18	3 0	135	75
24	4 0	240	105

Since then the experiments of Riccioli, made in such considerable distances, agree so well to the theory, it is scarce worth taking notice of what is urged to the contrary by Dechales, in his *Mund. Math.* who writes, that he had found by experiment, that heavy bodies in half a second of time, descend $4\frac{1}{2}$ feet; in two $16\frac{1}{2}$; in three 36; in four 60; in five 90; in six 123. It is sufficient, that he deduces the irregularity through the resistance of the air, which we suppose out of the question. II. If an heavy body descend in an unresisting medium through an interval not over-large, the space it describes is the subduplicate of that which it would describe in the same time with the velocity acquired at the end of the fall.

III. The time wherein a body falls from a given height being given, to determine the spaces it fell in the several parts of that time:

Suppose the given altitude = a , the time = t , and the space it fell in 1 part of time x : then

$$\frac{1}{x} : x :: t^2 : a$$

$$\frac{t^2 x - a}{x - a} :: t^2 : a$$

Therefore the space passed over in the second part of time is $a : t^2$; consequently, that passed over in the second time = $3^2 : t^2$; that in the third = $5^2 : t^2$, &c.

E. gr. In the experiments of Riccioli above delivered; the ball fell 240 feet in four seconds. Therefore the space fallen the first second was = 240 : 16 = 15. The space in the second was = 15 . 3 = 45. That in the third = 15 . 5 = 75. And that in the fourth 15 . 7 = 105.

IV. The time wherein a body falls a given space being given; to determine the time wherein it will fall any other given space in the same medium:

Since the spaces are as the squares of the times: to the space which the body falls in the given time, the space in the question, and the square of the given time, find a fourth proportional, which will be the square of the time sought. The square-root, therefore, being extracted therefrom, the problem is solved.

For example, one of Riccioli's balls in four minutes time falling 240 foot, it is inquired in what time it would fall 135 foot? the answer will be found = $\sqrt{(135 : 16 : 240)} = \sqrt{(135 : 15)} = \sqrt{9} = 3$.

V. The space a body falls in a given time being given, to determine the space it will fall in any other given time:

To the square of the time wherein the body falls the given space, the square of the time wherein it should fall the space required, and the given space, seek a fourth proportional; this will be the space required.

For instance, Riccioli's ball falling 60 foot in 2 seconds, it is asked what space it will fall in 4 seconds? the answer is, 16 . 60 : 4 = 4 . 60 = 240.

For the *Laws of the DESCENT of Bodies on inclined Planes.* See *INCLINED PLANE*.

For the *Laws of DESCENT in Cycloids.* See *CYCLOID*, and *PENDULUM*.

Line of swiftest DESCENT, is that which a body falling by the action of gravity describes in the shortest time; which is proved by geometricians to be the cycloid.

DESCENT into a Ditch, is a deep trench, or sap cut through the esplanade, and under the covert way; covered over-head with planks and hurdles; and loaded with earth against artificial fires. See *MOAT*.

In wet ditches the *Descent* is made even to the surface of the water: in dry ditches, it is carried to the bottom of the moat; where traverses are made to lodge and secure the miners.

DESCRIBENT, is a term in geometry, expressing some line or surface, which by its motion produces a plane figure, or a solid.

DESCRIPTION, an imperfect, or unaccurate definition of a thing, giving a sort of knowledge thereof from some accidents and circumstances peculiar to it, which determine it enough to give an idea that may distinguish it from other things; but without explaining its nature or essence.

Grammarians content themselves with *Descriptions*: philosophers require definitions of things. See *DEFINITION*.

A *Description* is an enumeration of diverse attributes of a thing most of which are only accidental: as when a Person is *described* by his deeds, his sayings, his writings, his honours, &c. A *Description*, as to its outward appearance, resembles a *Definition*; and is even convertible with the thing *described*; but does not explain it. For instead of bringing several things essential to the thing *described*, it only brings a number of accidents belonging thereto. *E. gr.* Peter is the tall young man who lives on the green, wears black cloaths, frequents the college, courts N—, &c. where it is evident, we do not give any explication of Peter, as not bringing things that are in Peter, but only circumstances or things about him, tall, young, living, wearing, frequenting, courting, &c. a *Description*, therefore, is no proper answer to the question, *quid est*, what is he? but to that, *quis est*, who is he?

Descriptions, in effect, are principally used for singulars, or individuals: for things of the same species do not differ in essence, but only as to *hic*, and *ille*, which difference contains nothing very notable, or distinguishing. But individuals of the same kind, differ much in accidents; *i. gr.* George is a king; and William a citizen; Charles is a male, and Anne a female; Henry is wise, and John a blockhead, &c. Thus; a *Description* is an accumulation of accidents; whereby things are notably distinguished from each other, though they scarce differ at all in essence.

Some authors call a *Description* a *Quasi-Definition*: as, body is a thing divisible, moveable, solid, extended, &c. which only wants of a definition in this, that instead of the form or essence of a thing, it gives one or more properties arising from the form or essence.

DESCRIPTIONS, in geometry.—To *describe* a circle, ellipsis, parabola, &c. is to construct, or form those figures, with ruler, compasses, &c.

DESERTER, in war, a soldier on the muster-roll, who quits the service without leave; or lifts himself under another officer, into a different regiment.

The punishment of *Desertion* is death.—All soldiers found half a league from a garrison, or army, going towards an enemy's country, or quarter, without a pass, are deemed, and treated as *Deserters*.

The ancient church excommunicated *Deserters*, as having violated their Oath.

DESHABILLE *, a French term, naturalized of late. It properly signifies a night-gown, and other necessities, made use of in dressing, or undressing. Mr. — is not to be spoke without; he is yet in his *Deshabille*, *i. e.* undressed, or in his night-gown.

* The word is a compound of the privative *de*, and *shabiller*, to dress one's self.

*DESHACHE**, in heraldry, is when a beast has its limbs, separated from the body, so as they still remain on the escutcheon, with only a small separation from their natural places.

DESIGN, the plan, or representation of the order, general distribution and construction of a painting, poem, book, building, or the like.

This painter has shewn the first *Design* of his piece, in which the figures are well disposed. The *Design* of that poem, or book is artfully laid. Claudian never fees his whole *Design* together: when he composes a part, he thinks of nothing else; and works up every member, as if it were separate from all the rest.

In building, we use the term *ichnography*, when by *Design* is only meant the plan of a building, or a flat figure drawn on paper.

Orthography, when some face, or side of the building is raised from the ground.

And scenography, when both front and sides are seen in perspective.

DESIGN, in the weaving manufactories, expresses the figures wherewith the workman enriches his stuff, or silk; and which he copies after some painter.

In undertaking such kinds of figured stuffs, it is necessary, that before the first stroke of the shuttle, the whole *Design* be represented on the threads of the warp; we do not mean in colours, but with an infinite number of little packthreads, which being disposed so as to raise the threads of the warp, let the workman see from time to time what kind of silk is to be put in the eye of the shuttle, for woof.

This method of preparing the work, is called *reading the Design*, or reading the figure; which is performed after the following manner.

A paper is provided considerably broader than the stuff, and of a length proportionate to what is intended to be represented thereon. This they divide lengthwise by as many black lines as there are intended to be threads in the warp; and cross these lines by others drawn breadthwise; which with the former make little equal squares. On the paper thus squared, the painter *designs* his figures, and heightens them with colours as he sees fit. When the *Design* is finished, a workman reads it, while another lays it on the simlbot.

Now, to read the *Design*, is to tell the person who manages the loom, the number of squares, or threads comprized in the

the space he is reading; intimating at the same time, whether it is ground, or figure.

To put what is read on the fimbrot, is to fasten little strings to the several packthreads, which are to raise the threads named. And thus they continue to do, till the whole *Design* is read.

Every piece being composed of several repetitions of the same *Design*; when the whole *Design* is drawn, the drawer to re-begin, as I may say, the *Design* afresh, has nothing to do, but to raise the little strings with slip-knots to the top of the fimbrot which he had let down to the bottom. And this he is to repeat as often as is necessary, till the whole be manufactured.

The ribbond-Weavers have likewise a *Design*, but much more simple than that now described. It is drawn on paper, with lines, and squares, representing the threads of the warp, and woof. But in lieu of lines, whereof the figures of the former consist, these only consist of points, or dots, placed in certain of the little squares, formed by the intersection of the lines. These points mark the threads of the warp that are to be raised; and the spaces left blank, denote the threads that are to keep their situation. The rest is managed as in the former.

DESIGN, is particularly used in painting, for the first idea of a large work drawn roughly, and in little; with intention to be executed, and finished in large.

In this sense, the *Design* is the simple contour, or outline of the figures, or things intended to be represented; or the lines that terminate, and circumscribe them.

Such a *Design* is sometimes drawn in crayons, or ink; without any shadows at all: sometimes it is hatched, that is, the shadows are expressed by sensible lines, usually drawn across each other with the pen, crayon, or graver. Sometimes, again, the shadows are done with the crayon rubbed, so as there do not appear any lines: sometimes, the grain, or strokes of the crayon appear, as not being rubbed: sometimes the *Design* is washed, that is, the shadows are done with a pencil, in Indian ink, or some other liquor: and sometimes the *Design* is coloured, that is, colours are laid on much like those intended for the grand work.

The qualities, or conditions required in a *Design*, are correctness, good taste, elegance, character, diversity, expression, and perspective.

Correctness depends principally on the justness of the proportions, and a knowledge of anatomy. Taste is an idea or manner of *designing*, which arises either from the complexion and natural disposition, or from education, one's master, studies, &c. Elegance gives the figures a kind of delicacy which strikes people of judgment, and a certain agreeableness which pleases every body. The character is what is peculiar to each thing; in which there must be a diversity; in as much as every thing has its particular character to distinguish it. The expression is the representation of an object according to its character, and the several circumstances it is supposed to be in. The perspective is the representation of the parts of a painting, or figure, according to the situation they are in with respect to the point of sight.

The *Design*, or *Draught*, is a part of the greatest import, and extent in painting. It is acquired chiefly by habit and application; rules being of less avail here than in any of the other branches of the art, as colouring, clair-obscur, expression, &c.

The principal rules that regard the *Design*, are: that novices accustom themselves to copy good originals at first sight: not to use squares in drawing; for fear of stinting and confining their judgment: to stay till they can *design* well after the life before they begin the practice of perspective rules: in *designing* after the life, to learn to adjust the bigness of their figures to the visual angle, and the distance of the eye from the model or object: to mark out all the parts of their *Design*, before they begin to shadow: to make their contours in great pieces, without taking notice of the little muscles, and other breaks: to make themselves masters of the rules of perspective: to observe every stroke as to its perpendicular parallel and distance; and particularly so to compare, and oppose the parts that meet upon, and traverse the perpendicular, as to form a kind of square in the mind; which is the great, and almost the only rule of *designing* justly: to have a regard not only to the model, but also to the part already *designed*; there being no such thing as *designing* with strict justness, but by comparing and proportioning every part to the first.

The rest relates to perspective: as, that those objects be seen at one view, whose rays meet in a point: that the eye and object be always conceived as immovable: that the space, or medium between them, be conceived transparent: and that the eye, object, and picture, be at a just distance; which is usually double the bigness of the subject or picture. See **PERSPECTIVE**.

DESIGNATION, the act of marking or indicating, and making a thing known.—The *Designation* of such an estate is made by the tenants, hutments, and boundings. Among the Romans there were *Designations* of the consuls, and other magistrates, some time before their election.

DESIGNATOR *, a Roman officer, who assigned and marked each person his place, and rank in public ceremonies, shews, processions, &c.

* The word is formed from the verb *designare*, to design.

The *Designator* was a kind of marshal, or master of the ceremonies, who regulated the seats, march, order, &c.

There were *Designators* at funeral solemnities, and at the games, theatres, and shews, who not only assigned every body his place, but also led him to it; as appears, from the prologue to the *Pænulus* of Plautus.

Much of the same nature were the *agenotheta* of the Greeks.

DESIGNING, the art of delineating, or drawing the appearance of natural objects by lines, on a plain.

To *design* according to the rules of mathematics, makes the object of perspective.

To *design* by the Camera Obscura. See **CAMERA Obscura**.

Mechanical Method of DESIGNING Objects. Provide a square piece of glass fitted into a frame, ABCD, (*Tab. Perspective fig. 15.*) and wash, or smear it over with water, wherein a little gum has been dissolved. When it is well dried again, turn it towards the object, or objects to be *designed*, so as that the whole thereof may be seen through a dioptra, or sight GH, fixed thereto. Then proceed to work; and applying the eye to the sight, with a pen and ink draw every thing on the glass, as you see it appear thereon. Having finished the draught, lay a fair, moist paper thereon; and pressing it pretty tight down, the whole will be transferred from the glass to the paper.—This method is very good, easy, and exact; and deserves to be more used by painters.

DESAVOHAMENTUM. See **ADVOWING**.

DESPOT, a title or quality given to the princes of Walachia, Servia, and some of the neighbouring countries.

The word in its first origin signified the same with the Latin *berus*, and the English *master*. But in time it underwent the same fate on medals, as, among the Latins, Cæsar did with regard to Augustus; BACIAETC, answering to Augustus, and ΔΕCΠΟΤΗC, *Despotes*, to Cæsar. See **CÆSAR**.

Thus, Nicephorus, having ordered his son Stauracius to be crowned; the son, out of respect, would only take the name ΔΕCΠΟΤΗC; leaving to his father that of BACIAETC. For it is to be noted, that it was just about the time that the emperors began to cease to use Latin inscriptions.

This delicacy, however, did not last long; for the following emperors preferred the quality of ΔΕCΠΟΤΗC to that of BACIAETC, particularly Constantine, Michael Ducas, Nicephorus Botoniates, Romanus Diogenes, the Commeni, and some others.

In imitation of the princes, the princesses likewise assumed the title of ΔΕCΠΟΙΝΑ

It was the emperor Alexius, surnamed the Angel, that created the dignity of *Despot*; and made it the first after that of emperor, above that of Augustus, or Sebastocrator, and Cæsar. See **AUGUST**.

The *Despotes* were usually the emperors sons, or sons in law, and their colleagues, or co-partners in the empire, as well as their presumptive heirs.—The *Despots* that were sons of the emperors, had more privileges and authority, than those that were only sons in law. Codin, p. 38. describes the habit, and ornaments of the *Despot*. See the notes of Fa. Goar on that author.

Under the successors of Constantine the Great, the title, *Despot of Sparta*, was given to the emperor's son, or brother, who had the city of Sparta, or Lacedæmon, by way of Apanlage.

DESPOTISM, or **DESPOTIC Government**, a form of government wherein the prince is absolute and arbitrary, doing whatever he lists, without being checked by any other power. Such are most of the eastern governments, as those of the Mogol, Grand Signior, Sophi of Persia, &c.

DESPOUILLE, in heraldry, is the whole case, skin, or slough of a beast; with the head, feet, tail, and all appurtenances; so that being filled, or stuffed, it looks like the entire creature.

DESPUMATION, the clarification of any liquor, by throwing up its foulness in a froth, and taking that off.

DESQUAMATION, expresses the flaking, or scaling of carious bones. See **EXFOLIATION**.

DESSERT, or **DESART**, the last service brought on the tables of people of quality; when the meats are all taken off.

The *Dessert* consists of fruits, pastry-works, confections, &c.

DESSICATIVE, or **DESICCATIVE**, in medicine, a remedy that has the virtue of drying up superfluous moisture; used to skin over old sores, &c.—We say, a *Desiccative* unguent, &c. pimpinella is held deterfice, *desiccative*, and vulnerary. Lemery.

DESTILLATION, or *Distillation* in chemistry. See **DESTILLATION**.

DESTINIES, in mythology. See the article **PARCÆ**.

DESTINY, the order, disposition, or chain of second causes appointed by providence; and importing, or carrying with it a necessity of event.

According to many of the heathen philosophers, *Destiny* was a secret and invincible power, or virtue, which with incomprehensible wisdom, conducted what to us appears irregular, and fortuitous. This amounts to what we call *God*.

The Stoics by *Destiny* understood a certain concatenation of things, which from all eternity follow each other of absolute necessity; there being no power able to interrupt their connexion. This answers in a great degree to our idea of providence.

But the Stoics made even the gods themselves subject to the necessity of this *Destiny*. The truth is, the Stoics rather define what the word *Destiny* should signify, than what it did signify in common language: for they had no distinct idea of this power to which they attributed those events. They had only a vague, confused idea of I know not what chimæra, or unknown cause, to which they referred that invariable disposition, and the eternal concatenation of all things. There is no real being that the name *Destiny* can agree to. The heathen philosophers, who had framed a notion thereof, supposed it to exist, without knowing precisely what they meant by it. But men, not daring on the one side, to impute to providence the evils and misfortunes that befall them, as they imagined undeservedly; and on the other side, not being willing to allow that it was their own fault; formed this phantom of *Destiny*, to bear the weight of all the evil.

DESTRUCTION, passively taken, is the corruption, or annihilation of something before existing. See **CORRUPTION**.

A thing passes from *esse* to *non-esse*, either by corruption, when nothing of the substance is lost, but only the accidents, viz. the disposition of parts: or, by annihilation, when both substance and accidents are lost.

DESUDATION, expresses a profuse, and inordinate sweating; followed by the eruption of sudamina, or heat-pimples. See **SUDAMINA**.

DESULTOR, in antiquity, a vaulter, or leaper, who jumped off one horse upon another.

Among the Scythians, Indians, and Numidians, the cavaliers, or horsemen who served in the wars, were very expert *Desultores*; that is, they always carried with them at least two horses, and when that, they were mounted on, grew weary, or wanted breath, they leaped with great agility and address upon the other which they led in their hand.

The Greeks and Romans borrowed the same practice from those barbarous nations; but they only used it in their games, races, and funeral solemnities; and never, that we read of, in war.

The *Desultores*, therefore, were among the people of Asia, and Africa, soldiers; but among the Romans, &c. they were no more than tumblers, and posture-masters. Eustathius on *Homer's Iliad*, Lib. IV. assures us, that instead of two, they had sometimes four, or six horses, all abreast; and would jump from the first to the fourth, or sixth, which was the masterpiece of their art.

DETACHED Pieces, in fortification, are demi-lunes, ravelins, horn and crown-works, and even bastions when separated, or at a distance from the body of the place.

In painting, the figures are said to be well *detached*, or loosened, when they stand free, and disengaged from each other, are no where confounded together, but stand out with a strong relief from the ground, and from each other.

DETACHMENT, a military term, signifying a certain number of soldiers, taken out of several regiments or companies equally, to be employed in some particular enterprise; as to form a kind of flying camp, to relieve a party already engaged in battle, to join a separate army, to assist at the siege of a place, or to enter into some garrison.

DETENTION, the possession, or holding of lands, or the like, from some other claimant.

The word is chiefly used in an ill sense, for an unjust withholding, &c.

The canons condemn a person who has intruded into a benefice, to make restitution of all the fruits thereof, during the time of his unjust *Detention*.

DETERIORATION, an act whereby a thing is impaired or rendered worse.

When the *Deterioration* of a commodity, seized by an officer, arises from the fault of the keeper, he is answerable for the same.

J. Frederic Mayer, professor at Leipzig, printed a treatise of *Deterioration*, in the year 1695, under the title of *Traſſatus de Deterioratione*.

DETERGENT, in medicine, is applied to remedies that cleanse, mundify, and carry off viscid, and glutinous humours. The plant buckshorn, *deterges*, and consolidates wounds. Rhaponticum is aperitive, and good against the gravel and stone; it also *deterges*, and expels poison.

Detergents are not only softening, and adhesive, but also, by a peculiar activity or disposition to motion, joined with a suitable configuration of parts, are apt to abrade, and carry along with them such particles as they lay hold of in their passage.—All medicines of this intention are supposed to cleanse, and heal, that is, incarnate, or fill up with new flesh all ulcerations, and foulness occasioned thereby, whether internal, or external.

To do this, in all internal cases especially, the medicine must be supposed to maintain its primary properties, until it arrives at the place of action, and there it does what entitles it to the appellation of a *Detergent*, and a vulnerary: first by its adhesive quality, which consists in the comparative largeness of surface, and flexibility of its component parts; by which it very readily falls into contact with, and adheres to, the slough of ulcerous exudations, which by their loose situations are easily carried along with the medicine; and when such matter is so carried away, which is the cleansing, and *deterging* part, what was instrumental in this office, will afterwards stick, and adhere to the cutaneous filaments, until by their addition, and the protrusion of proper nourishment *ab interna* to the same place, the waste is made up, that is, the ulcer is healed. Quincy.

After the like manner is the operation of *Detergents* to be accounted for in external application. By the warmth of their parts they rarify, and by their adhesive quality, they join with, and take off along with them, in every dressing, what is thrown upon the place to which they are applied; until a more convenient matter is brought thither by the circulating juices, which they assist in adhering to, and incarnating the eroded cavities. Only this may be taken notice of that internally, whatsoever of this kind is mixed with the animal fluids, by the known laws of circulation, will be first separated, and left behind. For all those parts, which are specifically heavier, will move nearest the axis of the canals, because their moments are the greatest, and will carry them as near as can be in straight lines; but the lighter parts will always be jostled to the sides, where they soonest meet with outlets to get quite off, or are struck into such cavities as we are here speaking of, in which they adhere, and make part of the substance.

This is understood of the milder sort of *Detergents*; and it is easy to conceive from hence, how an increase of those qualities of activity and adhesion conjointly, may make a medicine arise to the greatest efficacy in this respect. And it is upon this foot, that all those medicines operate, which are given to cleanse obstructions, or foulnesses in any of the viscera, or passages; and which may be increased in efficacy so far, as to fetch off even the membranes, and part of the capillary vessels.

DETERMINE Problem, is that which has but one, or at least but a certain number of solutions; in contra-distinction to an *indeterminate* problem, which admits of infinite solutions.

Such *e. gr.* is the problem, To describe an Isosceles triangle on a given line, whose angles at the base shall be double that at the vertex: which has only one solution; as that which follows has two, viz. To find an Isosceles triangle, whose area and perimeter are given.

A *determinate* problem may either be simple, or linear, plane, solid, or surfold.

DETERMINATION, in physics, the disposition or tendency of a body towards one way, rather than another.

Heavy bodies have a *Determination* towards the centre of the earth.

DETERMINATION, is also used for the action whereby a cause or agent is limited, or restrained to act, or not act, this, or that, and in this, or in that manner.

Determinations, say the schoolmen, proceed either from an efficient cause; in which case the *Determination* is called *efficient*; as when an artist determines an instrument to a certain action: or from the form, as that determines the indifference of the matter; and thus our senses are said to be *Determinations* to have ideas upon the presence of external objects.

Or the *Determination* is from the matter or subject that receives the action; and thus, the heating of fire upon clay determines it to harden, upon wax to soften, &c. Or it is from the object; as when we say, Colour determines the visive power: or lastly, it is from the end, as the end determines the desire.

Determinations again are either moral or physical: a moral *Determination* is that proceeding from a cause which operates morally, *i. e.* by commanding, persuading, or advising some effect.

Physical Determination, is an act whereby God excites and applies a second cause to act, antecedently to all operation of the creature.—Such a *Determination*, the Thomists and Dominicans maintain necessary to all, and singular action of every creature. The Jesuits, on the contrary, deny that God thus determines even second causes; and hold, that God exerts no influence on second causes, but only with the second cause on the action. And thus they exclude a physical *Determination* both from natural causes, as supposing them already determined by nature to act; so that there needs no other external *Determination* from God to the several actions; and from free causes, as supposing such a *Predetermination* contrary to our natural liberty.

A *Determination* to be pleased with certain forms, or ideas, a late ingenious author calls, an *Internal Sense*; and a *Determination* to be pleased with virtuous actions, characters, manners, &c. a *Moral Sense*.

DETERSIVES, in medicine, the same with *Detergent*. See **DETERGENT**.

A clyster is a *deterfive* medicine which cleanses the lower venter. *Deterfive* unguents are also called *Mundificatives*. The leaves and summits of the strawberry are *deterfive* and astringent.

DETINUE, a writ which lies against a man, who having goods or chattels delivered to keep, refuses to re-deliver them. *Detinue* answers, in great measure, to the *Acta Depositi* of the Civilians.—He takes his *Action of Detinue*, to recover the thing *detained*, not the damages sustained by the *Detinue*.

DETONATION *, in chemistry, the noise which some minerals and other Bodies, make when they begin to heat in crucibles; by the volatile parts rushing out with impetuosity, and the humidity escaping.

* The word is formed of *de*, and *tono*, I thunder.

Detonation is much the same with *Decrepitation*, only its action is more forcible, and the noise is greater—*aurum fulminans* heated, &c. goes off with a violent crack, i. e. makes a great *Detonation*.

Detonation takes away the impure volatile sulphur from bodies.

DETONATION denotes the act or operation of expelling the impure, volatile, and sulphureous part out of antimony, and leaving behind the fixed and internal parts.

This is chiefly performed by means of saltpetre, &c. See **ANTIMONY**.

DETRANCHE, among the French heralds, signifies a line bend-wise, which does not come from the very dexter angle, but either from some part of the upper edge, and thence falling athwart or diagonally; or from part of the dexter-side. They say, *Tranché, Detranché, and Retranché*, to denote, that there are two diagonal lines, making two partitions in the escutcheon, and coming from the angles, and a third from some of the other parts abovementioned. See **TRANCHE**.

DEVASTAVERUNT, or **DEVASTAVIT**, *Bona Testatoris*, a writ lying against executors, and administrators, for paying legacies, and debts on simple contract without specialties, before debts on bonds and specialties.—In which case, the executors are as liable to actions, as if they had notoriously wasted the goods of the testator, or converted them to their own use; and are compellable to pay such debts by specialty out of their own goods.—

DEVENERUNT, a writ anciently directed to the escheator, on the death of the heir of a tenant of the king holding in capite, within age, and in the king's custody; commanding the escheator to enquire, upon the oaths of good and lawful men, what lands and tenements, by the death of the tenant come to the king.

DEVIATION, in the old astronomy, a motion of the deferent, or excentric, whereby it advances to, or recedes from the ecliptic. See **DEFERENT**.

The greatest *Deviation* of Mercury is sixteen minutes; that of Venus is only ten.

DEVIL *, **DIABOLUS**, an evil angel; one of those celestial spirits cast down from heaven, for pretending to equal himself with God.

* The word is formed from the French *Diable*, of the Latin *Diabolus*, which comes from the Greek *διαβολος*, *Accuser*, or *Calumniator*.

The Æthiopians paint the *Devil* white, to be even with the Europeans, who paint him black. *Ludolph*.

We find no mention of the word *Devil* in the Old Testament, but only of Satan. Nor do we meet with the word *Devil* in any heathen authors, in the signification attached to it among Christians, that is, as a creature revolted from God; their theology went no farther than to evil Genii, or Demons who harassed and persecuted mankind. Thus, the Chaldeans, believed both a good principle, and an evil principle, which was an enemy of mankind.

The relations we have of the religion of the Americans, assure us of some idolatrous nations who worship the *Devil*: but the term *Devil* must not here be taken in the common sense: those people have an idea of two collateral independent beings, one whereof is good, and the other evil. And they place the earth under the guidance and direction of that evil being; which our authors, with some impropriety, call the *Devil*.

DEVISE, in heraldry, a name common to all figures, ciphers, characters, rebus's, motto's, &c. which, by their allusion to the names of persons or families, denote their qualities, nobility, or the like.

Devise, in this sense, is of a much older standing than heraldry it self; being that which gave the first rise to armories: thus, the Eagle was the *Devise* of the Roman empire; SPQR was the *Devise* of the Roman people; and still continues to be what they call the *escutcheon of the city of Rome*.

The first *Devises* were mere letters distributed on the borders of the liveries, housings, and banners, and at length on the shields. Thus the K was the *Devise* of the French kings of the name of Charles, from Charles V. to Charles IX.

There were also *Devises* by rebus's, equivocal, or allusions,

both to names and arms. The dukes of Guise took for their *Devise* an A in an O, to signify *chacun A son tour*, every one in his turn. And the house of Senefai, in *virtute & honore senefices*. Some that had towers in their arms, *turris mea Deus*, &c.

There are also ænigmatical *Devises*: as that of the Golden Fleece, with *Aure n'aurai*, intimating that Philip the Good, who instituted that order, renounced every other woman, but Isabella of Portugal, whom he then married.

Devises sometimes contain entire proverbs; as that of Cæsar Borgia, *aut Cæsar, aut Nihil*.

The word *Devise* is formed from the Latin *dividere*, and was applied to the things just mentioned, as well as those hereafter mentioned, by reason they served to divide, separate, and distinguish persons, parties, &c. Fa. Menetrier observes, that there are as many different kinds of *Devises*, as there are different manners of distinguishing one another, or as there are simple figures, or words, capable of expressing qualities, offices, virtues, actions, &c. of persons, and of notifying or distinguishing them from others.

DEVISE, is now taken in a more restrained sense for an emblem; or a representation of some natural body, with a motto, or sentence applied in a figurative sense to the advantage of some person.

In this sense, the figure, or image, is called the *Body*, and the motto the *Soul* of the *Devise*.

A *Devise* is a sort of metaphor, representing one object by another wherewith it has some resemblance. So that a *Devise* is only true, when it contains a metaphorical similitude, and may it self be reduced into a comparison. Lastly, it is a metaphor painted, and visible, and that strikes the eye. All these circumstances are required to a *Devise*; and without them, a figure only makes a hieroglyphic, and a motto only a sentence.

Fa. Bouhours gives an accurate explication of the word *Devise*, in an extract inserted in the *Mémoires de Trevoux*. A *Devise*, says he, is a composition, or assemblage of figures drawn from nature and art, called the *Body*; and of a few words adapted to the figure, called the *Soul*. Such a compound, adds he, we make use of to denote our thought, or intention by comparison; for the essence of the *Devise* consists in a comparison taken from nature or art, and founded on a metaphor.

This he illustrates in the following instance: A young nobleman of great courage and ambition, bore for his *Devise*, in the last caroual at the court of France, a rocket mounted in the air, with this Italian motto, *poco duri purché m'inalzi*, may I last but a short time, provided I mount high; which seems to hold forth the following discourse: as the rocket rises a great pitch, though it only endures a little while; so it does not concern me to live long, provided I attain to glory and eminence; which is a just comparison.

On this footing, a *Devise*, to define it rightly, is a painted metaphor; or rather, an ænigma inverted: for, whereas ænigma's represent nature or art by the events of history, and the adventures of fables, a *Devise* is a representation of human qualities by natural or artificial bodies.

Thus, to express the character of Louis XIV. a sun was painted, which yet, luminous as it is, has more power than lustre. And the better to determine the sense of the painting to this signification, the Castilian motto is added, *ma virtut que lux*. The personal merit of Mary, Queen of Scots, was represented by a pomegranate, with these words, *mon prix n'est pas de ma couronne*; and the talent of an apostolical person, who became all things to all men, by a looking-glass, with those words of St. Paul, *omnibus omnia*.

Devises are used on coins, counters, seals, shields, triumphal arches, artificial fire-works, and other solemnities. They are a sort of images, very pertinently, and artfully representing the enterprizes and intrigues of war, love, piety, study, fortune, &c.

The French have distinguished themselves in this way, especially since the time of cardinal Mazarin, who had a wonderful fancy for *Devises*.

The Italians have reduced the making of *Devises* into an art, and laid down the laws and rules thereof. Some of the principal are, 1. That there be nothing monstrous or extravagant in the figures; and nothing contrary to the nature of things, or to the common opinion of mankind. 2. That figures be not joined which have no affinity or relation to each other; the metaphor being to be founded on something real, and not on hazard or imagination; excepting some whimsical combinations established in mythology, which custom, and the authority of the poets have made pass for natural. 3. That the human body be never taken into *Devises*; as this would be to compare a man with himself. 4. That there be a sort of unity in the figures which compose the body: we do not mean, that there must only be a simple figure; but that, if there be several, they must have a relation and subordination to each other: so that there be one principal figure whereon all the rest depend. Though still the fewer figures there are in the body of the *Devise*, and the less they are confused, the more

perfect and elegant is the *Devise*. 5. The motto, which is to animate the figure, must agree to accurately thereto, as that it could not serve for any other. 6. Nothing is to be named that appears to the eye, and which the bare inspection might notify. 7. The motto is not to have a compleat sense of it self, for being to make a compound with the figure, it must only be a part, and consequently must not signify the whole. If the words alone have a compleat signification, you have a full and distinct notion independently of the figure; whereas the signification should result from both. 8. The shorter the motto, the more beautiful: and a suspension of the sense, which leaves somewhat to guess, is one of the principal graces of the *Devise*. Lastly, it is accounted a happiness, where the words of a poet are applied in a sense which he never dreamed of, and yet so pertinently, that it should seem they had been intended for the same.

DEVISE, or DIVISE, in common law, the act whereby a testator gives, or bequeaths, his lands, or goods, by his last will in writing.

He who makes the *Devise*, is called the *Devisor*, and he, to whom it is made, the *Devisee*.

The words of a will the law interprets in a larger, and more favourable sense than those of a deed: for if land be *devised* to a man to have to him for ever, or to have to him, and his assigns; in those cases the *Devisee* shall have a fee simple. Yet if given in the same manner be *seoffment*, he shall have but an estate for life.

So, if one *devise* land to an infant in his mother's belly; it is a good and valid *Devise*; though it is otherwise by *seoffment*, grant, or gift: for in those cases there ought to be one of ability to receive presently, otherwise it is void. See *WILL*, and *DEED*.

DEUNX, a division of the Roman libra, or pound; containing 12 ounces; or eleven twelfths of any thing. See *AS*.

DEVOLVED, something acquired by right of *Devolution*. Such a right is *devolved* to the crown. Such an estate *devolved* on M—— by the death of N——.

The word is also used for a right acquired by a superior, of conferring a benefice, when the inferior, and ordinary collator, has neglected to confer, or has conferred it on an unqualified person.

If a patron neglects to present to a benefice in six months, the presentation lapses, or *devolves* upon the bishop, and from thence to the primate.

DEVOLUTION, in the French law, a right acquired by descent, or succession, from degree to degree.

Devolution, in general, is an impediment provided by the customs of several provinces, whereby the husband who survives his wife, or the wife surviving her husband, is prohibited to alienate the real, and immoveable effects of the deceased; and obliged to preserve them for the children issued from that marriage. So that they may succeed thereto in exclusion of those born of a second marriage.

DEVOTION, a sincere, ardent worship of God.

Monf. Jurieu defines *Devotion* a softening, and yielding of heart, with an inward consolation, which the souls of believers feel in the exercises of piety.

Under the name of *Devotions* are usually understood certain religious practices, which a person makes it a rule to discharge regularly: and with reason, if this exactitude be founded on solid piety; otherwise it is vanity, or superstition.

DEVOTION, among the Romans, was a sort of sacrifice, or ceremony, whereby they consecrated themselves to the service of some person.

The ancients had a notion, that the life of one might be redeemed by the death of another: and hence were those *Devotions* so frequent for the lives of the emperors.

The *Devotion* of Decius, who, after *devoting* himself to his country, threw himself into the hands of his enemies, and was killed, is said to have gained the Romans the victory.

But *Devotion* to any particular person was not known till Augustus. The day after the title Augustus had been given Octavius; Pacuvius, a tribune of the People, began to say, he would *devote*, and consecrate himself to him, as was practised among the barbarous nations, to obey him even at the expence of life, if he were commanded. His example was immediately followed by all the rest; and it came at length to be established into a custom, never to go to salute the emperor, without declaring they were *devoted* to him. Augustus, though seeming to oppose this vile and infamous flattery, yet rewarded the author.

DEVOURING, in heraldry.—When fishes are born in an escutcheon, in a feeding posture, the heralds denominate it *devouring*; by reason fishes swallow all their food whole.

DEUTEROCANONICAL*, in the school-theology, an appellation given to certain books of holy scripture, which were added to the canon after the rest; either by reason they were not wrote till after the compilation of the canon, or by reason of some dispute as to their canonicity.

* The word is Greek, being compounded of *deuteros*, second, and *kanonikos*, canonical.

The Jews, it is certain, acknowledge several books in their canon, which were put there later than the rest. They say, that under Eldras, a great assembly of their doctors, which they call by way of eminence, the *Great Synagogue*, made the collection of the sacred books, which we now have in the Hebrew Old Testament. And they agree, that they put books therein which had not been so before the Babylonish captivity; such are those of Daniel, Ezekiel, Haggai, &c. and those of Eldras and Nehemiah.

And the Romish church has since added others to the canon, that were not, nor could not be in the canon of the Jews; by reason some of them were not composed till after. Such is the book of Ecclesiasticus; with several of the Apocryphal books, as that of the Maccabees, Wisdom, &c. Others were added still later, by reason their canonicity had not been yet examined: and till such examen, and judgment, they might be set aside at pleasure.

But since that church has pronounced as to the canonicity of these books, there is no more room now for her members to doubt of them, than there was for the Jews to doubt of those of the canon of Eldras. And the *Deuterocanonical* books are with them as canonical, as the proto-canonical. The only difference between them consisting in this, that the canonicity of the one was not generally known, examined, and settled so soon as that of the others.

The *Deuterocanonical* books in the modern canon, are the book of Esther, either the whole, or at least the seven last chapters thereof. The epistle to the Hebrews; that of James; and that of Jude; the second of St. Peter; the second, and third of St. John; and the Revelation. The *Deuterocanonical* parts of books, are, the hymn of the three Children; the prayer of Azariah; the histories of Sufannah, of Bel, and the Dragon; the last chapter of St. Mark; the bloody Sweat, and the appearance of the Angel, related in St. Luke, chapter xxii; and the history of the adulterous Woman in St. John, chapter viii.

DEUTERONOMY*, one of the sacred books of the old testament; being the last of those written by Moses.

* The word is Greek, compounded of *deuteros*, second, and *nomos*, law.

It does not appear that Moses made any division of what he wrote into books; or that he gave different names and titles to the different parts of his work: nor do the Jews, even at this day, distinguish them in the copies they use in the synagogues; but write them all running as one single work, without any other distinction beside that of little and great parafches. It is true, in the other copies, used by private persons, they are divided into five parts, as among us; but they give them no other name, but the first word wherewith each division begins: much as we do in quoting a decree, or chapter of the canon-law.

Thus, the first part of Moses's work they call *בראשית* *Bereschit*, because beginning with that word. The second they call *ויקרא* *Vajickra*; the third *ויקרא* *Vajickra*; the fourth, *ויקרא* *Vajickra*; and the fifth, *אלה* *Elle* *haddebarim*; which is one of the first words thereof. This custom is very ancient among the Rabbins, as appears from the ancient commentaries on those books, called, *בראשית רבא* *Bereschit Rabba*, *ויקרא רבא* *Vajickra Rabba*, &c. and from the prologus galatus of St. Jerom.

It was the Greeks, when they first translated the law, that gave the five parts, into which it was divided, the names of Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. Accordingly the names are Greek, excepting that of Leviticus, which is Hebrew; and they express what is contained in those books, or at least the most remarkable things contained therein: which is the usual Greek manner of giving titles.

The book of Deuteronomy was so called, because this last part of the work of Moses comprehends a repetition, or recapitulation, which that legislator made to the Israelites before his death, of the law he had before delivered them at large. And hence Deuteronomy is still called by the Rabbins *משנה תורה* *Mischneh*, repetition, *משנה תורה* *Repetition of the Law*, second Law. They likewise call it *ספר תורה* *the Books of Reprimands*, on account of the XXVIIIth chapter, which is full of blessings promised to such as keep the law, and of curses threatened to such as transgress it.

The Book of Deuteronomy was written the fortieth year after the delivery from Egypt, in the country of the Moabites beyond Jordan: Moses being then in the 120th year of his age. It contains in Hebrew, eleven parafches, though only ten in the edition of the Rabbins at Venice; XX chapters, and 955 verses. In the Greek, Latin, and other versions it contains XXXIV chapters. The last is not of Moses. Some say it was added by Joshua immediately after Moses's death; which is the most probable opinion. Others will have it added by Eldras.

DEW, *Ror*, a thin, light, insensible mist, or rain, falling while the sun is below the horizon.

Naturalists usually rank *Dew* among the number of meteors of the watery kind. Some define it a vapour liquified, and let fall in drops: others, a vapour having a like relation to frost, as rain has to snow, &c.—Among the dissertations of Mont. Huet, is a letter to shew that *Dew* does not fall, but rises. To us, *Dew* appears only to differ from rain as more, and less. Its origin, and matter, no doubt is from the vapours, and exhalations of the earth and water, raised as shewn under the article *VAPOUR*. The thin vesiculae, whereof vapours consist, being once detached from their bodies, we all know, keep rising in the atmosphere, till they arrive at such a stage of the air, as is of the same specific gravity with themselves: then their rise is stopped. Now, as it is the warmth, or fire, that, dilating the parts of water, forms the vesiculae specifically lighter than air, and capable of ascending therein; so when that heat declines, or is lost, as by the approach, or contiguity of any colder body, the vesiculae condense, become heavier, and descend. In the day-time, therefore, the sun warming the atmosphere by a continual influx of his rays, the vapours once raised, continue their progress, as meeting with nothing to increase their gravity, till such time as they are got out of the reach of the reflected warmth of the earth, in the middle region of the atmosphere. Here condensing, they form clouds; from which proceed rain, as shewn under *CLOUDS* and *RAIN*. But when the sun is below the horizon, the case is somewhat different: for the atmosphere then cooling, the vapours raised by the warmth of the earth, and that of the rays of the sun lodged therein during the preceding day, begin to condense apace, as soon as they are got into the air, spending their stock of fire and heat on the cold, moist air they pass through. Their ascent, therefore, becomes short; and by that time they are got a few fathoms high, being exhausted of their fire, and restored to the natural dimensions, and gravity of their constituent water; they precipitate, and fall back again in little spherules, or drops, as is the Case of rain.

From these principles the other phenomena of *Dews* are easily accounted for. Hence, *e. gr.* it is, that *Dews* are more copious in the spring, than in the other seasons; there being then a greater stock of vapour in readiness, through the small expence thereof in the winter's cold and frost, than at other times. Hence, what Pliny relates of Egypt, that it abounds in *Dews* throughout all the heats of summer; for the air there being too hot to coagulate the vapours in the day-time, they never gather into clouds, and hence they have no rain; but we know that in climates where the days are excessive hot; the nights are remarkably cold; so that the vapours raised after sunset, are readily condensed into *Dews*. Or, perhaps, that notable coldness is rather the effect, than the cause of the quantity of *Dews*. For a deal of vapour being raised by the great heat of the earth, and the stock of fire spent on it in the day-time, the influx of such a quantity of cold moisture must greatly chill the air.

May-Dew whitens linnen, and wax; the *Dew* of autumn is converted into a white frost. Out of *Dew* putrefied by the sun, arise diverse insects which change apace from one species into another: what remains is converted into a fine, white salt, with angles like those of salt-petre, after a number of evaporations, calcinations, and fixations.

There is a spirit drawn from *May-Dew*, which has wonderful virtues attributed to it. The method of collecting and preparing it, is prescribed by Hanneman, physician at Kiel. The *Dew* is to be gathered in clean linnen cloths, exposed to the sun in close vials; then distilled, and the spirit thrown upon the caput mortuum; this is to be repeated till the earth unite with the spirit, and become liquid; which happens about the seventh, or eighth cohabitation, or distillation. By such means you gain a very red, odoriferous spirit. Stollerfoht, a physician of Lubec, thinks *May-Dew* should be gathered in glass-plates, especially in still weather, and before sun-rise. And Etmuller is of the same opinion. It might likewise be collected with a glass funnel, exposed to the air, having a crooked neck to bring the *Dew* into a vial in a chamber. See *Philos. Transact.* N^o. 3. Hoffman, and others. It is apparently from the preparation of this *Dew*, that the brothers of the Rosy-Crooks took their denomination.

In the *Philosoph. Transact.* we have an account of a very extraordinary kind of *Dew*. For a good part of the winter 1695, says the bishop of Cloyne, there fell in many parts of the provinces of Munster, and Leinster, a kind of thick *Dew*, which the country-people called *Butter*, from its consistency and colour; being soft, clammy, and of a dark yellow. It fell always in the night, and chiefly in low, moorish places, on the top of the grass, and oft on the thatch of cabins. It was seldom observed in the same place twice. It commonly lay on the earth a fortnight without changing colour, but then dried, and turned black. It fell in lumps; and had a strong smell like that of graves.—Mr. R. Vans, in the same transactions, gives an account of the like at the same time, in Limerick, and Tipperary; adding, that if one rubbed it with the hand, it melted; but laying it by the fire, it dried, and grew hard.

DEXTANS, in antiquity. See the article *As*.

DEXTER, in heraldry, is applied to the right side, as *snifter* is to the left.

DEXTER-BASE, is the right side of the base.

DEXTER-CHIEF, the angle on the right hand of the chief.

DEXTER-POINT. See the article *POINT*.

The word is pure Latin, signifying right-handed; whence the word *Dexterity* for address, and ability in the performing of any thing.

DEXTROCHERE*, or **DESTROCHERE**, in heraldry is applied to the right arm, painted in a shield, sometimes naked, sometimes clothed, or adorned with a bracelet, and sometimes armed, or holding some moveable, or member used in the arms.

* The word is formed from the Latin *Dextrocherium*, which signifies a bracelet wore on the right wrist, mentioned in the acts of the martyrdom of St. Agnes, and the life of the emperor Maximus.

The *Dextrochere* is sometimes placed as the crest.

DEY, the title of the sovereign prince of the kingdom of Algiers.

The governors of the several provinces under him, are called *Beys*.

DIA, ΔIA , the beginning of diverse terms in medicine, chirurgery, pharmacy, &c. Where these three letters commence the name of a remedy, unguent, plaister, cataplasm, &c. they signify composition, and mixture; as in *Diaplasma*, *Diachylon*, &c.

DIA is likewise the beginning of many terms in the other arts; as, *Diameter*, *Dialogue*, &c. on all which occasions, *Dia*, which is an inseparable particle, or preposition, is borrowed from the Greek *δια*, *ex*, or *cum*; which begins the same words in the Greek.

Indeed we have words wherein *Dia* is no preposition borrowed from a foreign language; though it is possible, the words themselves may: as in *Diamant*, *Dial*, &c.

DIABETES*, $\Delta\text{IABHTH\Xi}$, in medicine, a hasty, and profuse evacuation of the drink by the urinary passages; accompanied with an ardent thirst, and leanness of the whole body.

* The word is derived from the Greek *διαβαίνω*, to *per-vade*, or *pass quick*.

The drink thus discharged, is usually a little altered from what it was when taken down, and turned chylous, and milky; but sometimes not at all.

The *Diabetes* seems owing to a too great laxity of the fibres of the arteries of the kidneys; or too great a quantity of sharp salts in the blood, which dissolve the mass of blood, or disunite the parts thereof; so that the serosity is easily separated from the thicker parts.

According to Quincy, the evident, and most common cause of the *Diabetes* is the too great use of spirituous liquors, wherewith the serum becomes so impregnated, that it will not attract, and join with the cruor, or globules of the blood, but runs off through the kidneys sweet, or insipid.

There is another kind of *Diabetes*, wherein the person affected renders a great deal more by urine, than he drinks, nay, sometimes more than he both eats and drinks. Some physicians attribute this excessive quantity of liquor to the air he respire, which, they suppose, becomes converted into water; or, at least, the water in the air respired is here absorbed, and collected. But others, with more probability, attribute it to a coagulation of the blood, fat, and even the solid parts of the body. See *Supplement*, Article *DIABETES*.

DIABETES, in hydraulics, is applied to a siphon, the two legs, or branches whereof are inclosed in one another; as in the glass described by Hero, which runs itself quite empty, without being inverted, as soon as the water is arrived at the height of the upper branch of the siphon.

DIABOTANUM, in pharmacy and chirurgery, denotes a plaister, wherewith wens, &c. are resolved, and dissolved.—The *Diabotanum* is sovereign for the hydatides.

DIABROSIS*, in medicine, a solution of the continuity of a part, caused by sharp, corrosive humours gnawing, and devouring the same.

* The word is Greek, compounded of *δια*, *per*, through; and *βρωω*, to eat.

DIACARTHAMI, in pharmacy, an electuary, composed of turbith, manna, scammony, hermodactyle, and other purgatives; with the addition of the pulp of the seed of the *Carthamus*, which gives it the denomination.

Diacarthami chiefly purges *pituita*. It is prescribed in diseases of the brain; and is frequently mixed in medicines along with other purgatives: It is now wholly out of use.

DIACARYON*, or **DIANUCUM**, in pharmacy. See *DIANUCUM*.

* The word is formed from *δια*, and *καρυα*, walnut. Galen is said to have prepared his *Diacaryon* with the juice of walnuts, mixed with as much honey as sufficed to render it an agreeable composition.

DIACAUSTIC Curves, or *Causitic by refraction*, is a species of caustic curves, whose genesis may be thus conceived.

Imagine an infinite number of rays, as *BA*, *BM*, *BD*, &c. (*Tab. Geom. fig. 23.*) issuing from the same luminous point, *B*,
to

to be refracted from, or to the perpendicular MC, in the curve AMD; and so, as that CE, the lines of the angles of incidence CME be always to CG, the lines of the refracted angles CMG, in a given ratio: then the curve line, which touches all the refracted rays, is called the *Diaconitic*.

DIACHALCITIS, in chirurgery and pharmacy, a plaister which formerly used to be applied after the amputation of a cancer, and on many other occasions.

The *emplastrum Diachalcitidis* is composed of oil, axungia, and chalcitis; from the last of which drugs it derives its name.

DIACHYLON, in pharmacy, a name given to diverse plaisters, on account of the mucilages mixed therein, which are viscid juices, called by the Greeks *χυμαί*, drawn from certain plants. See **MUCILAGE**.

White, or simple DIACHYLON, should be compounded of common oil, litharge of gold, and mucilages drawn from marshmallow roots, fenugreek, and anniseeds. It is proper to soften, digest, ripen, and resolve.

The **DIACHYLON**, called *Ireatum*, has for its basis the common white *Diachylon*, with a pound of which, an ounce of powder of iris is mixed. This plaister digests, incises, and ripens with more force than the simple *Diachylon*.

There is also the *Great DIACHYLON*, *Diachylon magnum*, composed of litharge of gold, oils of orris, camomile, and dill, turpentine, resin of the pine, yellow wax, and mucilages of linch and fenugreek, with new figs, raisins of Damascus, ichthyocolla, juices of orris, squills, and hyssop. This *Diachylon* softens schirrus's, and resolves and dissipates tumours. It is called the *Great*, not only on account of its extraordinary virtues, but also because compounded of a greater number of ingredients than the rest.

The **DIACHYLON Gummatum**, or *Diachylon cum Gummi*, is the *great Diachylon* with the addition of gum ammoniac, galbanum, and sagapenum, dissolved with wine, and boiled to the consistence of honey. This plaister is the most powerful of all for digesting, ripening, and resolving.

DIACODIUM *, in pharmacy, a syrup prepared from poppy heads; called also the *syrupus de meconio*.

* The word is formed from the Greek *δια*, per and *κασις*, poppy-heads.

The Ancients had two kinds: *simple*, and *compound*.

The *Simple DIACODIUM*, was a kind of opiate, made of the juice expressed from the heads of white poppies, and boiled up with sugar. See **OPIATE**.

It was prescribed to soften sharp, ferous humours, to appease coughs, and to provoke sleep.—This preparation was of great use among the ancients; but is now laid aside, since it has been found, that the syrup made of an infusion of white poppy heads, which is what we now call *Diacodium*, produces the same effect.

Compound DIACODIUM was made of the *simple*, with the addition of the troches of hamec, hypocistis, myrrh, saffron, and balsamines. It was used to stop, and soften catarrhs, hæmorrhoids, and fluxes of the belly.

DIACONISSA, and **DIACONATE**. See **DEACON**, and **DEACONY**.

DIACONICON *, *Sacrify*, a place adjoining to the ancient churches, where the sacred vestments, with the vessels, and other ornaments of the altar were preserved.

* The word is Greek, formed from *διακονω*, *I serve*, *I minister*, by reason here was kept every thing belonging to divine service. It was also call'd *Ἀσπασινον*, and in Latin *Salutatorium*; because it was here that the bishop received and saluted strangers. Sometimes, too, it was called *Μυσταγωγιον*, or *Mystagogue*, *Μυστα*, by reason of the tables kept therein, for disposing the sacred ornaments on; or rather from *Μυσταγω*, a sort of inn, or house for the lodging of soldiers in.

The first council of Laodicea, in the 21st canon, forbids the priests living in the *Diaconicon*, or *το διακονικον*; or touching the holy utensils. An ancient Latin version of those canons renders it, *in secretario*: but the copy at Rome, as well as Dionysius Exiguus, retain the word *Diaconicon* in Latin. It is true Zonaras and Balsamon understand that expression in the 21st canon of the order of a deacon, and not of a building, to which opinion Leo Allatius also adheres in his treatise, *De Templis Græcorum*: but all the other interpreters are agreed as to its being a *Sacrify*. Beside the ornaments of the priesthood and the altar, there were likewise here deposited the relics of the church.

DIACOUSTICS *, or **DIAPHONICS**, the consideration of the properties of sound refracted in passing through different mediums; that is, out of a denser into a more subtle, or out of a more subtle into a denser medium. See **SOUND**.

* The word is formed from the Greek *δια*, per, through, which intimates a passage; and *αυση*, *I hear*, q. d. the consideration of the passage of the sounds we hear.

DIACRII, in antiquity, was the name of a party or faction at Athens.

That city, we read was divided into two parties: the one favourers of an oligarchy, who would only have a few persons employed in the government. The other consisted of such as were for a democratical, or popular government, wherein the whole people should have a share.—The first were called *Diacrii*, and the latter *Pediaci*; the latter inha-

biting the houses, and the former the upper quarter, or part of the city.

The laws of Solon imported, that Pistratus should be chief of the *Diacrii*. Though the scholiast, on Aristophanes's comedy, *the Wasps*, affirms, that Pandion distributed the quarter of the *Diacrii* among his sons, and put Lycus at their head.

DIACYDONITES *, in pharmacy, is applied to things and remedies, wherein quinces are a principal ingredient.

* The word comes from *δια*, and *κυδιστω*, *Quince*.

Confectio Diacydonites, or *Diacydonium*, is marmalade, a confectio of quinces, or wherein quinces have a chief share.

DIADEM *, **ΔΙΑΔΗΜΑ**, in antiquity, a head-band, or fillet, wore by kings as a badge of their royalty; while the crown was left to the Gods.

* The word comes from the Latin *Diadema*, of the Greek *διαδῆμα*, a little band encompassing the head, of the verb *διαδῆμι*, cingo, I gird.

The *Diadem* was a sort of ribbon, or fillet wove of silk, thread, or wool, more or less broad. It was tied round the temples, and forehead; the two ends being knotted behind and let fall on the neck.

It was usually white, and quite plain, though sometimes embroidered with gold, and set with pearls, and precious stones.—

In later times it likewise came to be twisted round crowns, laurels, &c. and even appears to have been wore on diverse parts of the body: thus Phavorinus observes, that Pompey was suspected of aspiring to the royalty, because of his wearing a white garter, which was no other than a ligature for an ulcer he had on his leg, but which the people construed a *Diadem*.

Pliny, lib. 7. c. 5. observes, that Bacchus was the first inventor of the *Diadem*: Athenæus assures us, that it was the togers, and good fellows, who first made use of it, to preserve themselves from the fumes of wine, by tying it tight round their heads; and that it long afterwards came to be a royal ornament.

The *Diadem* remained a long time the peculiar badge of kings; at length it was assumed by the Roman emperors, as the mark of imperial dignity.

Authors are not agreed about the time when the Roman emperors first assumed the *Diadem*. Some refer it to Caligula, others to Aurelian, and others to Constantine the Great. The younger Victor says positively, that Aurelian took the *Diadem*, which no emperor had dared to do before him. For though it should seem from the same writer, that Caligula had done the like, yet Suetonius assures us, he had it only in view, and that he never executed it. Heliogabalus, indeed, took a *Diadem*; but it was only in the palace he wore it, and never appeared with it in public. Jornandes even goes as low as Dioclesian for the introduction of the *Diadem*; but it is certain, there is a medal of Aurelian, with a crown like one of our ducal crowns, which is sustained by a border of pearls, that bears a very great affinity to a *Diadem*. And the authors, who have explained that medal, are all agreed that it is one. Mr. Spanheim also allows Aurelian to have taken it: his successors imitated him therein; and yet the ornament did not become common till the time of Constantine.—After him the emperors were allowed to wear it; accordingly we find them represented therewith on medals; though till then, we have no instance either of crown, or *Diadem* on a woman's head, in all the Roman empire.

An author of the fifth century, quoted by Bollandus, pretends that Constantine first wore the *Diadem*, and that he only took it to bind his hair, and keep it in order. But this is not very probable; and it is certain, that at least some emperors had wore it before him, as Aurelian, and Carinus.

Eusebius gives it to Constantius Chlorus, when only Cæsar; which is confirmed by one of his medals, wherein he is represented with a *Diadem*, adorned with rays; though even after Constantine, when the *Diadem* was become the usual ornament of the Augusti, it was not always given to the Cæsars. Indeed, we see it on some of the medals of Julian, while only Cæsar; though it is pretty certain, he did not wear it till he became Augustus.—Du Cange will not assert, that Constantine first took the *Diadem*; but only, that he first made it into a kind of cask, or close-crown, as is seen in some of his medals, and those of his successors.

DIADREM, in heraldry, is applied to certain circles, or rims, serving to bind, or inclose the crowns of sovereign princes; and to bear the globe, and cross, or the flower de luces for their crest.

The crowns of sovereigns differ in this, that some are bound with a greater, and some with a less number of *Diadems*.

Prelates likewise appear to have anciently worn a sort of *Diadem*: thus Baronius writes, that St. James the Apostle wore a gold plate on his forehead, as a mark of his episcopal dignity.

In blazoning, the bandage about the heads of Moors, on shields, is sometimes also called *Diadem*.

DIÆRESIS *, in chirurgery, the operation of dividing, and separating parts whose union, and continuity were an obstacle to the cure; or which were joined, and conglutinated contrary to the order of nature.

* The word in its original Greek *διαίρεσις*, signifies *Division*.

There

There are five manners of performing the *Diæresis*, viz. by cutting, pricking, tearing, drawing, and burning.

DIÆRESIS, is also used in medicine for the destroying, or consuming of the vessels, or canals of an animal body: when, from some cutting, or obstructing Humour certain passages are made, which naturally ought not to have been, or certain natural passages are dilated beyond their ordinary dimensions; so that the juices which should have been contained therein, extravasate, or run out.

DIÆRESIS, in grammar, is a figure whereby a diphthong is divided into two syllables: as *Aulæ* into *Aulai*, *Piæ* into *Piatai*, *Aquæ* into *Aquai*.

DIÆRESIS, is also used in the general for any division of one syllable into two: as in that verse of Tibullus, *Stamina non ulli dissoluenda Deo*, for *dissoluenda*.

This is usually noted by two points placed over a letter, to shew that it is to be sounded by itself, and not joined with any other so as to make a diphthong: thus *Æra*, by the points over the *e*, is distinguished from *Æra*.

It is also a kind of metaplasm, or addition to a word, by dividing one syllable into two; as *Aulæ*, by a *Diæresis*, is a word of three syllables, instead of *Aulæ*.

DIAGLYPHICE, the art of engraving, cutting, or otherwise working hollow, or concave figures, in metals; such as seals, intaglias, the matrices or coins for medals, &c. See **SCULPTURE**.

DIAGNOSTIC *, in medicine, a term applied to those signs, or symptoms, which indicate, or discover the present state of a disease, its nature, and cause.

* The word is compounded of the Greek, *δια*, *per*, through, or by; and *γνωσκω*, *I know*.

The physicians have *Diagnostic*, as well as *Prognostic*, signs; the first with regard to the present state of the disease, and the patient; and the second to the future.

DIAGONAL, in geometry, a right line drawn a-crośs a parallelogram, or other quadrilateral figure, from the vertex of one angle to that of another.

Such is the line PN (*Tab. Geometr. fig. 24.*) drawn from the angle P, to N.

Some authors call it *Diameter*, and others the *Diametral* of the figure.

It is demonstrated, 1. that every *Diagonal* divides a parallelogram into two equal parts: 2. two *Diagonals* drawn in any parallelogram, bisect each other: 3. the *Diagonal* of a square is incommensurable with one of its sides.

Add, 4. a very noble theorem in elementary geometry, first demonstrated by Mr. Lagny, in the *Memoires de l'Académie Royale des Sciences*, An. 1706. is that the sum of the squares of the two *Diagonals* of every parallelogram, is equal to the sum of the squares of the four sides.

It is evident, at first sight, that the famed 47th proposition of Euclid, so richly worth the hecatomb it cost its author, is only a particular case of this proposition: for if the parallelogram be re-angled, it follows of course, that the two *Diagonals* are equal; and, of consequence, that the square of a *Diagonal*, or, which is the same thing, the square of the hypothenuse of a right angle, is equal to the squares of the two sides. If a parallelogram be oblique-angled, and of consequence, the two *Diagonals* unequal, as is the more usual case; the proposition becomes of more extensive use.

The demonstration in oblique-angled parallelograms is thus: suppose the oblique-angled parallelogram ABCD, (*Tab. Geomet. fig. 25.*) whereof BD is the greater *Diagonal*, and AC the lesser: from the point A, of the obtuse angle DAB, let fall a perpendicular AE, to the side CD; and from the point B another perpendicular BF to the side DC. Then are the triangles ADE, BCF equal, and similar, as AD is equal to BC, and the angle ADE, BCF, as well as AED, BCF, are also equal; consequently DE is equal to CF. Now, by Euclid, *prop. 12. lib. 2.* in the obtuse-angled triangle BDC, the square of the side BD is equal to the sum of the squares of BC, and CD, and over and above, to double the rectangle of CF by CD; and by the 13th, *lib. 2.* in the triangle DAC, the square of the side AC is equal to the sum of the squares of AD, and CD, abating double the rectangle of the same CD, by DE, equal to CF. Consequently, the former exceeds precisely compensating this defect; the sum of the squares of the two *Diagonals* is equal to the sum of the squares of the four sides. Q. E. D.

Hence, in every rhombus, or lozange, knowing one side, and a *Diagonal*; the other *Diagonal* will likewise be known: for as the four sides are equal; subtracting the square of the given *Diagonal* from quadruple the square of the given side; the remainder is the square of the *Diagonal* required.

The proposition is likewise of great use in the theory of compound motions: for in an oblique-angled parallelogram, the greater *Diagonal* being the subtense of an obtuse; and the lesser, of an acute angle, which is the complement of the former; the greater will be the greater, and the less the less, as the

VOL. I.

obtuse angle is the greater; so that if the obtuse angle be conceived to grow till it be infinitely great with regard to the acute one, or which amounts to the same thing, if the two contiguous sides of the parallelogram be extended directly, end to end in a right line; the great *Diagonal* becomes the sum of the two sides, and the lesser one, nothing. Now, two contiguous sides of a parallelogram being known, together with the angle they include, it is easy to find the subtense of that angle, i. e. one of the *Diagonals* of the parallelogram, in numbers; which done, Mr. de Lagny's proposition gives the other. Which second *Diagonal* thus found, is the line that would be described by a body impelled at the same time by two forces, which should have the same ratio to each other, as the contiguous sides have, and act in those two directions; which *Diagonal* the body would describe in the same time, as it would have described either of the contiguous sides in, if only impelled by the force corresponding thereto. This is one of the great uses of the proposition: for the ratio of two forces, and the angle they make, being given, it is frequently necessary to determine, in numbers, the line a body impelled by the two forces would describe in a certain time.

All the sides of a rectilinear figure, as AB, BC, CD, DE, (*fig. 26.*) excepting one EA, and the angles O, and Y, being given; to find the *Diagonal*.

In the triangle ABE, the sides AB, and AE being given, the angle Q is easily found by trigonometry; and from this, the *Diagonal* BE. And after the like manner the triangle BCD is resolved, and the *Diagonal* BD found.

Since ichnographies, or plans, are best taken by having all the sides, and *Diagonals*; the use of this problem in planimetry is of some importance; especially to such as are willing to have their work accurate, though at the expence of calculation.

DIAGRAM, in geometry, &c. a scheme, for the explanation or demonstration of any figure, or the properties thereto belonging.

DIAGRAM, or **DIAGRAMMA**, in the ancient music, was what we call the *Scale*, or *Gammut*, in the modern.

The extent of the *Diagramma*, which they also called *Systema perfectum*, was a disdiapason, or two octaves in the ratio 1:4. In that space they had eighteen chords, though these had not all different sounds.

To explain it, they represent to us eighteen chords, or strings of an instrument, as the lyre, supposed to be tuned according to the proportions in any of the Genera, viz. Diatonic, Enharmonic, or Chromatic.

As the lyre was improved, and more chords added to it; so was the *Diagramma*: by such means it came from 4 chords to 7, then 8, then 10, then 14, and at last 18.

To each of these chords, or sounds, they gave a particular name, taken from its situation in the *Diagramma*, or the Lyre. Their names, and order, commencing from the lowest, are as follow: *Prostambanomenos*, *Hypate-Hypaton*, *Parhypate-Hypaton*, *Lychanos-Hypaton*, *Hypate-Meson*, *Parhypate-Meson*, *Lychanos-Meson*, *Mese*, *Trite-Synemmenon*, *Paranete-Synemmenon*, *Nete-Synemmenon*, *Para-Mese*, *Trite-Diazeugmenon*, *Paranete-Diazeugmenon*, *Nete-Diazeugmenon*, *Hyperbolean*, *Paranete-Hyperbolean*, *Nete-Hyperbolean*.

Guido Aretime improved this scale, or *Diagram*, very greatly. Finding it of too small extent, he added five more chords, or notes to it; laid them all down on a staff of five lines; and instead of the long Greek names above-mentioned, named all his notes by Gregory's seven letters. See **NOTE**.

The first, or lowest note of his scale, he marked *Γ*, and called *Gamma*; whence the whole scale came to be denominated, See **GAMMUT**.

DIAGRYDIUM, in pharmacy, is scammony prepared or corrected for medicinal use.

The preparation is ordinarily performed by baking the scammony in a quince. Others make it receive the fumes of lighted sulphur, whence it is called, *sulphurated*, or *Diagrydium sulphuratum*. Some incorporate it with a quantity of spirit of vitriol rectified, sufficient to make a sort of liquid paste, which is afterwards set to dry in the sun, or by a gentle fire. And this preparation they call *Diagrydium Rosatum*.—The end of all these preparations is to correct the scammony; but the generality of authors now are of opinion, it has nothing that needs correction, and that it may be used in its natural state. See **SCAMMONY**.

DIAHEXAPLA, among farriers, a drink made for horses, denominated from the six Ingredients it consists of; viz. birthwort, gentian roots, juniper berries, bayberries, myrrh, and ivory shavings.—It is esteemed a good stomachick, and cures bites of venomous beasts, colds, consumptions, &c.

DIAL *, or **Sun-DIAL**, an instrument serving to measure time, by means of the shadow of the sun.

* The word is formed from the Latin *dies*, day, because indicating the hour of the day. See **HOUR**.

The ancients also call it *sciatberium*, from its doing it by the shadow.

DIAL

DIAL is more accurately defined, a draught, or description of certain lines on a plane, or surface of a body given, so contrived, as that the shadow of a style, or ray of the sun passed through a hole therein, shall touch certain points at certain hours.

The diversity of *Sun-Dials* arises from the different situation of the planes, and the different figure of the surfaces whereon they are described; whence they become denominated *equinoctial*, *horizontal*, *vertical*, *polar*, *direct*, *erect*, *declining*, *inclining*, *reclining*, *cylindrical*, &c.

Dials are sometimes distinguished into *primary*, and *secondary*.

Primary DIALS, are those either drawn on the plane of the horizon, called *horizontal Dials*; or perpendicular thereto, on the planes either of the meridian, or prime vertical, called *vertical Dials*: to which number are also usually added those drawn on the polar, and equinoctial planes, though neither horizontal, nor vertical.

Equinoctial DIAL, is that described on an equinoctial plane, or a plane representing that of the equinoctial.

A plane oblique to the horizon, either hangs over towards it, and makes an acute angle with the plane of the horizon; or it falls off backwards from it, and makes an obtuse angle therewith. This latter is called a *reclining plane*; which, if it recline back equal to the complement of the latitude of the place, then it lies in the plane of the equinoctial; and a *Dial* drawn thereon, is denominated an *equinoctial Dial*.

Equinoctial Dials are usually distinguished into *upper*, which look towards the Zenith; and *lower*, which respect the Nadir.

Now as the sun only illumines the upper surface of an equinoctial plane, while he is in our hemisphere, or on the northern side of the equator; an *upper equinoctial Dial* will only shew the hour, during the spring, and summer-season.

And again, as the sun only illumines the lower surface of an equinoctial plane, while he is in the southern hemisphere, or on the other side the equator; a *lower equinoctial Dial* will only shew the hour in autumn, and winter.

To have an *equinoctial Dial*, therefore, that shall serve all the year round, the *upper* and *lower* must be joined together; that is, it must be drawn on each side of the plane.

And since the sun shines on one side or on the other of an equinoctial plane the whole day; such a *Dial* will shew all the hours of an artificial day.

To describe an equinoctial *DIAL* geometrically.—The *equinoctial* is the first, easiest, and most natural of all *Dials*: but the necessity of drawing it double, prevents its being much in use. However, as its structure shews the reason of the other kinds; and as it even furnishes a good mechanical method of drawing all the other kinds of *Dials*, it shall be here laid down.

First, then, to describe an *upper equinoctial DIAL*: From a centre C (*Tab. Dialling*, fig. 4.) describe a circle ABDE, and by two diameters AD, and BE, intersecting each other at right angles, divide it into quadrants AB, BD, DE, and EA. Subdivide each quadrant into six equal parts by the right lines C1, C2, C3, &c. which lines will be hour-lines. Through the centre C drive a style, or pin, perpendicular to the plane ABDE.

The *Dial* thus described, being raised so as to be in the plane of the equator, the line C12, in the plane of the meridian, and the point A looking towards the south; the shadow of the style will shew the hours both of the forenoon and afternoon.

For, horary circles include arches of the equator of fifteen degrees each. Consequently the plane ABDE being supposed in the plane of the equator, the horary circles will likewise include arches of 15 degrees of the circle ABDE. Wherefore, since the angles 12 C11, 11 C10, 10 C9, &c. are each here supposed 15 degrees, the lines C12, C11, C10, C9, &c. are intersections of horary circles, with the plane of the equinoctial. Again, since the style passing through the centre C, represents the axis of the world; its distance from the centre of the earth being inconsiderable, and it being the common diameter of the horary circles; its shadow will cover the hour-line C12, when the sun is in the meridian; or circle of 12 a-clock; C11, when in the circle of 11 a clock; C10, when in the circle of 10 a-clock, &c.

Secondly, To describe a *lower equinoctial DIAL*: The method is the same as that for the *upper Dial* already described; except that no hour-lines are to be drawn beyond that of 6 a-clock.

Thirdly, To describe an *universal equinoctial DIAL*: Join two metal, or ivory planes ABCD, and CDEF (*fig. 5.*) so as to be moveable at the joint. On the upper surface of the plane ABCD, describe an *upper equinoctial Dial*, and upon the lower a *lower*, as already directed; and through the centre I drive a style. In the plane DEF cut a box, and put a magnetical needle G therein; fit on the same plane a brass quadrant nicely graduated, and passing through a hole cut in the plane ABCD. Now, since this may be so placed, by means of the needle, as that the line I12, shall be in the plane of the me-

DIAL

ridian: and, by means of the quadrant, may be so raised, as that the angle BCE shall be equal to the elevation or the equal tor; it will serve as a *Dial* in any part of the world.

Horizontal DIAL, is that described on a horizontal plane, or a plane parallel to the horizon.

Since the sun may illumine a horizontal plane at all times of the year, while he is above the horizon; a *horizontal Dial* may shew all the hours of the artificial day, throughout the year: so that a more perfect *Dial* than this kind cannot be required.

To describe an horizontal *DIAL* geometrically. Draw a meridian line AB, (*fig. 6.*) on the given immovable plane; or assume it, at pleasure, on a moveable one. See *MERIDIAN Line*. From a point taken at pleasure, as C, erect a perpendicular CD, and make the angle CAD equal to the elevation of the pole. In D make another angle CDE equal likewise to the elevation of the pole, and draw the right line DE meeting AB in E. Then make EB equal to ED, and from the centre B with the radius EB, describe a quadrant EBF, which divide into six equal parts. Through E draw the right line GH, cutting AB at right angles. From the centre B through the several divisions of the quadrant EF draw right lines Ba, Bb, Bc, Bd, BH, meeting the line GH, in the points a b c d H. From E upon the right line EG set off the intervals Ea, Eb, &c. viz. Ea from E to e, Eb from E to f, Ec from E to g, &c. From the centre A describe a little circle, and applying a little ruler to A, and the several points of division a, b, c, d, H, and e, f, g, h, G, draw the lines A11, A10, A9, A8, A7, and A1, A2, A3, A4, A5. Through A draw a right line 6, 6 perpendicular to AB. Continue the right line A7, beyond the little circle to 7, A8 to 8, A5 to 5, and A4 to 4. Round the whole scheme draw a square, circle, or oval figure. And lastly in A fix an index, making an angle DAC with the meridian AB equal to the elevation of the pole: or in C erect a perpendicular style equal to CD; or at AE fix a triangular plate ADE perpendicular to the plane of the *Dial*.

In this case, the lines A11, A10, A9, &c. are the hour-lines of the forenoon; and A1, A2, A3, &c. those of the afternoon: and the shadows of any of the gnomons, or styles above-mentioned, at the several hours, will fall on the respective hour-lines.

To describe a horizontal *DIAL*, trigonometrically. In large *Dials*, where the utmost accuracy is required, geometrical lines are best set aside; and in lieu thereof, the lines of the *Dial* are to be determined by trigonometrical calculation. M. Clapiès, in the *Mémoires de l'Académie Royale des Sciences*, An. 1707, has done the World good service herein; having rendered the calculation of the hour-lines, which before had been operose enough, exceeding easy and expeditious: his canon, or analogies we shall lay down under the respective kinds of *Dials*.

And, first, for a *horizontal Dial*: the elevation of the pole of the place being given, to find the angles, which the hour-lines make with the meridian, in the centre of the *Dial*.

The *analogy*, or *canon*, is thus: As the whole fine is to the fine of the elevation of the pole of the place; so is the tangent of the sun's distance from the meridian, for the hour required; to the tangent of the angle required. That is, as the side AC, (*fig. 7.*) is to DC: so is the tangent of FDC; to the tangent FC, of the angle FAC. See *TANGENT*, &c.

Vertical DIAL, is that drawn on the plane of a vertical circle.

Of these there are several varieties, according to the vertical pitched upon. The verticals chiefly used are the prime vertical, and the meridian; from which respectively arise *south*, *north*, *east*, and *west Dials*.

Dials which respect the cardinal points of the horizon, are particularly called *direct Dials*. See *DIRECT*.

If any other vertical be chose, the *Dial* is said to *decline*.

Further, if the circle, whose plane is used, be perpendicular to the horizon, as is supposed to be the case in all those now mentioned; the *Dials* are particularly denominated *erect*. E. gr. *erect south*, *erect north*, &c.

Otherwise, the plane being oblique to the horizon, they are said either to *incline*, or *recline*.

South DIAL, or more particular an *erect direct south DIAL*, is that described on the surface of the prime vertical circle looking towards the south.

Since the sun then illumines the plane of the prime vertical looking to the south, when, in its progress he passes from the prime vertical to the meridian, or returns back from this to that; in which he is employed six hours before, and six after noon; a *south Dial* shews the hours from six in the morning to six at night.

To draw a vertical *south DIAL*. On the plane of the prime vertical looking southwards, draw a meridian line AB, (*fig. 8.*) and taking the interval AC at pleasure for the magnitude of the future *Dial*; in C erect a perpendicular of an indefinite length CD, and making an angle CAD equal to the elevation of the equator, draw a right line AD meeting the perpen-

DIAL

dicular CD in D. Then in the point D make the angle CDE likewise equal to the elevation of the equator, and draw the right line DE cutting the meridian in E. Through E draw the right line GH, cutting the meridian AB at right angles. Take EB equal to ED, and with this radius describe a quadrant EF.—The rest is performed as in a *horizontal Dial*, except that the hours of the afternoon are to be wrote on the right hand, and those of the forenoon on the left; as may be conceived from the figure. Lastly, in the point A fix an oblique style in an angle equal to the elevation of the equator: or in C erect a perpendicular style equal to CD: or, lastly, a triangular plate ADE upon AE, so as to be perpendicular to the plane of the *Dial*.

Then will the shadow of any of these indexes touch the several hour-lines at their respective hours.

North Dial, or *erect direct north Dial*, is that described on the surface of the prime vertical looking northward.

Since the sun only illumines this surface, while he advances from the east to the prime vertical, and proceeds from the same vertical to the west; and since he is in the prime vertical at six a-clock in the morning, and at six in the evening; a *north Dial* shews the hours before six in the morning, and those after six in the evening. And hence, as in autumn and winter-time, the sun does not rise before six, and sets before six in the evening; a *north Dial* is of no use all that time: but this being joined with a *south Dial*, it supplies the defects thereof.

To describe a vertical north *DIAL*. Draw a meridian line EB, (fig. 9.) and from A describe a little circle at pleasure. At A make the angle DAC equal to the elevation of the equator, and from the point C taken at pleasure, erect a perpendicular CD meeting AD in D. Make another angle CDE likewise equal to the elevation of the equator, and draw likewise a line DE meeting AE in E. Then take EB equal to ED. And through I draw GH, cutting SB at right angles. And from the centre B with the radius IB describe a quadrant; which divide into six equal parts. Through the two extreme divisions draw lines from the centre B, viz. Bd, and BH, meeting GH in d, and H, and make Ih equal to Id, and IG equal to IH. Then applying a ruler to A and d, and H; and again to A and h, and G, draw the right lines A5, A4, A7, and A8. Lastly, in A fix an oblique index AD, making an angle DAE with the meridian line in the plane of the meridian, equal to the elevation of the equator: or a perpendicular index in C equal to CD: or, instead of an index, a triangular plate EDA on the meridian line EA, perpendicular to the plane of the *Dial*.

Then will A4, A5, A6, be the hours of the forenoon; and A6, A7, and A8, those of the afternoon; and accordingly will be pointed out by the shadow of the several indexes.

Or thus: in a *south Dial*, (fig. 8.) if the hour-lines 4 and 5, as also 7 and 8, be continued beyond the line 6 A 6; and the triangle ADE turned about its pole A till AE fall directly against A 12; it is evident, a *north Dial* is hereby had: only observing what has been said about writing the hours.

To draw a vertical north, or south *Dial* trigonometrically.

These only differ from the *horizontal Dial*, in that the angle CAB is equal to the complement of the elevation of the pole of the place; so that the same analogy serves as for the horizontal one: only making the second term the complement of the elevation of the pole of the place.

East Dial, or *erect direct east Dial*, is that drawn on the plane of the meridian, looking to the east.

Since the sun only illumines the plane of the meridian looking eastward, before noon; an *east Dial* can only shew the hours till twelve o'clock.

To draw an *east Dial*. On the eastern side of the plane of the meridian draw a right line AB, (fig. 11.) parallel to the horizon, and to this join AK, making with it an angle KAB, equal to the elevation of the equator. Then with the radius DE describe a circle, and through the centre D draw EC perpendicular to AK; by which means the circle will be divided into 4 quadrants. Each of these quadrants sub-divide into six equal parts. And from the centre D through the several divisions draw right lines, D4, D5, D6, D7, D8, D9, D10, D11. Lastly, in D erect a style equal to the radius DE, perpendicular to the plane; or, on two little pieces perpendicularly fixed in EC, and equal to the same radius DE, fit an iron rod parallel to EC.

Thus will each index at the several hours project a shadow to the respective hour-lines 4, 5, 6, 7, 8, 9, 10, 11.

West Dial, or *erect direct west Dial*, is that described on the western side of the meridian.

As the sun only illumines that side of the plane of the meridian, looking to the west after noon, a *West Dial* can only shew the hours from noon to night.

This, therefore, joined with an *East Dial*, shews all hours of the day.

To draw a *west Dial*. The construction is perfectly the same as that of an *east Dial*: only that its situation is inverted, and the hours are wrote accordingly.

DIAL

Polar Dial, is that described on a plane passing through the poles of the world, and the east, and west points of the horizon.

It is of two kinds: the first looking up towards the zenith, and called *upper*; the latter down to the nadir, called *lower*.

The *polar Dial*, therefore, is inclined to the horizon in an angle equal to the elevation of the pole.

Since the polar plane PQQS (fig. 12.) passes through the east and west points O and S, a quadrant of the equator is intercepted between it, and the meridian: consequently the *upper* surface is illumined by the sun from six in the morning to six at night; and the *lower* from the sun's rise to six in the morning, and from six in the evening to sun-set. A *lower polar Dial*, therefore, shews the hour of the morning from sun-rise to six a-clock, and that of the evening from six to sun-set; and an *upper*, the hours from six in the morning to six in the evening.

To draw an *upper polar Dial*. Draw a right line AB (fig. 13.) parallel to the horizon, and if the plane be immovable, find the meridian line CE. Divide CE into two equal parts, and through C draw a right line FG parallel to AB. Then from the centre D with the interval DE, describe a quadrant, which divide into six equal parts. And from the same centre D through the several points of division draw right lines D1, D2, D3, D4, D5; and the intervals E1, E2, E3, E4, E5, set off the contrary way, viz. E11, 10, 9, 8, and 7. From the points 5, 4, 3, 2, 1, &c. raise perpendiculars meeting the line FG in the correspondent points. Lastly, in D erect a perpendicular style equal to DE; or on two equal pieces E and C, fix a cross iron rod. Then will 12, 12, 11, 22, 33, &c. be hour-lines, to be pointed out at the proper times by the shadow of the indices.

An *upper polar Dial* only differs in situation, and the manner of writing the hours, from *east*, and *west Dials* joined together in the line of six a-clock.

A *lower polar Dial* is had by putting out the hours of the forenoon 9, 10, and 11, and those of the afternoon 1, 2, and 3, with the noon-hour 12 itself: and only leaving the hours 7 and 8 of the morning, and 4 and 5 in the evening.

To draw all the primary *DIALS* on the same block, or post.

1. Let the plane ABCD (fig. 14.) in the proper position of the block be supposed horizontal; and thereon describe a *Horizontal Dial*. See *Horizontal Dial*.

2. Draw the right lines EM, and FL parallel to DC, which accordingly, in the proper position of the block, will be parallel to the horizon. Then let the plane BNMCL make an angle with EM, equal to the elevation of the pole of the place; and thereon describe an *upper polar Dial*.

3. Let the opposite plane ADE make with EM an angle DEM, equal to the elevation of the equator; and on this draw an *upper equinoctial Dial*.

4. Let the plane KLHI make with FL an angle HLF equal to the elevation of the equator: and on this describe a *lower equinoctial Dial*.

5. Let the opposite plane FG make with FL an angle GFL equal to the elevation of the pole: and here draw a *lower polar Dial*.

6. Let the plane MNKL, and the opposite one CF be perpendicular to FL; and on that draw a *south Dial*, and on this a *north Dial*.

7. On the plane EMLF describe a *west Dial*; and on the opposite plane an *east Dial*.

If then the block be so placed, as that the plane MNKL looks to the south, and the plane of the meridian bisect it in the line of 12 a-clock in the *horizontal Dial* ABCD, and *south Dial* MNKL; all the hours of the day will be indicated by several planes at once.

Secondary DIALS are all those drawn on the planes of other circles, beside the horizon, prime vertical, equinoctial, and polar circles: or those, which either decline, incline, recline or demcline.

Declining DIALS are erect, or vertical *Dials*, which decline from any of the cardinal points; or, they are such as cut either the plane of the prime vertical, or of the horizon at oblique angles.

The use of *declining Dials* is very frequent; as the walls of houses, whereon *Dials* are usually drawn, commonly deviate from the cardinal points.

Of *declining Dials* there are several kinds, which are denominated from the cardinal points, which they seem most to respect, but from which they have a real declination: *decliners from the south*, and *from the north*, and even from the zenith.

To draw a vertical declining *Dial* trigonometrically.

1. The declination of the plane, and the elevation of the pole of the place, being given: to find the angle formed in the centre of the *Dial*, by the meridian and substyle.

Canon: As the whole sine is to the tangent of the complement of the height of the pole of the place GF; (fig. 15.) so is the sine of the angle of the declination of the plane GFD to the tangent GD, of the angle required, GAD.

2. The declination of the plane being given, and the elevation of the pole of the place; to find the angle formed in the centre of a vertical declining *Dial*, by the substyle and axis.

Canon: As the whole sine is to the sine of the complement

of the elevation of the pole GF; so is the sine of the complement of the declination of the plane DGF, to the side DF, the sine of the angle DAB required.

3. The declination of the plane, and the elevation of the pole, given; to find the difference of longitudes, that is, the arch of the equator comprehended between the meridian of the place, and the meridian of the plane.

Canon: As the whole sine is to the sine of the height of the pole of the place; so is the tangent of the complement of the Declination of the plane, to the tangent of the complement of the difference of longitudes.

4. The angle of the difference of longitudes, and that of the axis, with the substyle, being given; to find the angles formed in the centre of a *vertical declining Dial*, between the substyle and hour-lines.

This problem admits of three cases. For the hour-lines, whose angles are sought, may be either, 1. Between the meridian, and substyle; or, 2. Beyond the substyle; or, 3. On that side the meridian where the substyle is not. In the two first cases, the difference is to be taken between the sun's distance from the meridian that hour, and the angle of the difference of longitudes found by the last problem: and in the third case, the sum of those two angles is to be taken; and the following canon used.

Canon: As the whole sine is to the sine of the angle between the axis and substyle; so is the tangent of the difference of the sun's distance from the meridian, and the difference of longitudes, or of the sum of those two angles; to the tangent of the angle required.

5. The angle formed by the substyle, with the hour-lines, and that of the substyle, with the meridian, given; to find the angles formed between the meridian, and hour-lines in the centre of *vertical declining Dials*.

1. The angles of the hour-lines between the meridian, and substyle, are found by subtracting the angle formed by the substyle, with the hour-line, from the angle formed by the substyle, with the meridian.

2. The angles beyond the substyle, and on the side opposite to that of the meridian, are found by adding those two angles.

3. Those on the other side the meridian, are found by taking their difference.

To describe a vertical DIAL, declining from the south to the east, or west, geometrically. Find the declination of the plane, as already taught under the article DECLINATION, and DECLINATOR. Then draw upon a paper a *horizontal Dial*, supposing the line of contingency of the horizontal, with the equinoctial plane to be GH, (fig. 16.) Through the point E, wherein the meridian line AE cuts the same, draw a right line IK, making with GH an angle HEK equal to the declination of the given plane. Thus, as GH represents the intersection of the prime vertical, with the horizon; IK will be the intersection of the inclining plane, and the horizon; whence we also conceive, that the part IE must be raised above GE, in case the given plane decline to the west; or it must be depressed below the same GE, in case it decline to the east. Draw a right line parallel to the horizon on the given plane, or wall, to answer to IK, and assuming a point therein, answering to E set off from the right line IK on the paper, the several horary distances E 1, E 2, E 3, &c. Then from the point E erect a perpendicular EC, equal to the distance of the centre of the *horizontal Dial*, from its line of contingency. Draw lines thence to the several points of the hour lines E 1, E 2, E 3, &c. let fall a perpendicular AD from the centre of the *horizontal Dial* A to the line of contingency IK, and transfer the distance ED from the point E upon the wall; then will CD be the substyle line.

Wherefore, joining AD and DC at right angles; the hypothenuse AC will be an oblique index to be fastened on the wall in the point C, according to the angle DCA.

To draw a vertical DIAL declining from the north towards the east and west. Take the declination of the plane, as already taught: then, as *north Dials* are only *south Dials* inverted, draw a *vertical Dial* declining from the south, and invert it in such manner, as that the centre C look to the horizon, and the point E to the zenith; and the hours on the right hand set off towards the left, and contrarywise; omitting all hour-lines, which in such a plane cannot be shewn.

For the practice the best way is, after drawing a *south decliner* upon paper, to prick the several points thereof through with a pin; then applying the face of the paper to the wall, the back-side thereof will shew you all the points necessary for the *north declining Dial*.

Inclined DIALS, are those drawn on planes not erect, but inclining, or leaning forward towards the south, or southern side of the horizon, in an angle, either greater or less than the equinoctial plane.

Such an inclined plane may be conceived by supposing one part of the plane of the equator lifted up toward the zenith, and the other depressed toward the nadir; and thus to revolve upon a line drawn from the east to the west points of the horizon.

To draw an inclined DIAL. 1. The inclination of the plane, as DC (fig. 17.) being found by a declinator, as taught under DECLINATOR; if it fall between the equinoctial plane CE, and the vertical one CB, in such manner, as that the angle of inclination DCA is greater than the elevation of the equator ECA: on the upper side draw a *north Dial*; and on the lower a *south Dial* to an elevation of the equator, which is equal to the aggregate of the elevation of the equator of the given place, and the complement of the inclination to a quadrant.

2. If the inclined plane GF fall between the horizontal one CA, and the equinoctial CE, so as that the angle of inclination FCA is less than the elevation of the equator ECA: describe an *horizontal Dial* to an elevation of the pole, equal to the aggregate of the elevation of the pole of the given place, and the inclination of the plane.

Dials thus inclined, are drawn after the same manner as *primary Dials*, except, that the index in the former case must be fitted under the angle ADC, and in the latter under the angle DFC: and that the distance of the centre of the *Dial* from the line of contingency in the former case is DC, and in the latter FC.

Reclining DIALS, are those drawn on planes not erect, but reclined, or leaning backwards from the zenith towards the north, in an angle greater, or lesser than the polar plane.

A *reclined plane* may be conceived by supposing one part of the polar plane raised towards the zenith, and the other depressed towards the nadir: and thus revolving about a line drawn from east to west. — To find the reclination of a plane. See RECLINATION.

To draw a reclining DIAL. 1. If the *reclined plane* HC fall between the vertical plane BC, and the polar plane IC; so as that the angle of reclination BCH is less than the distance of the pole from the zenith BCI: describe two vertical *south* and *north Dials* to an elevation of the equator, equal to the difference between the elevation of the equator of the given place, and the angle of reclination.

2. If the *reclined plane*, as KC fall between the polar plane IC, and the horizontal one CL; so as that the angle of reclination BCK is greater than the distance of the pole from the zenith ICB: describe a *horizontal Dial* thereon to an elevation of the pole, equal to the difference between the angle of reclination, and the elevation of the equator of the given place.

To draw inclining, and reclining DIALS trigonometrically. The inclination, or reclination of the plane, and the elevation of the pole being known; to find the angles made in the centre of an *inclining, or reclining Dial*, by the meridian, and hour-lines.

Such *Dial* is properly a *horizontal Dial*, for a latitude equal to the particular elevation of the pole on the plane of the *Dial*. Its angles, therefore, are found by the canon laid down for *horizontal Dials*.

As to the elevation of the pole, on the *Dial* plane, it is thus found: the plane being *inclined*; either its *inclination* is greater than the elevation of the pole of the place; or less; or it is equal thereto. In the two first cases, for upper *south*, or lower *north Dials*, the particular elevation of the pole on the plane, is had by taking the difference between the elevation of the pole of the place, and the inclination of the plane: and in the latter case, the *Dial* is a *polar Dial*, wherein the hour-lines will be parallel, by reason that the plane being placed on the axis of the world, neither of the poles can be represented thereon.

For upper *north*, and lower *south Dials*: 1. If the inclination be greater than the complement of the elevation, the complement of the inclination must be added to the complement of the elevation. 2. If it be less, the inclination must be added to the elevation. 3. If it be equal, the *Dial* will be an *equinoctial Dial*, wherein the angles at the centre will be equal to the sun's distance from the meridian.

Deinclined DIALS, are those which both *decline*, and *incline*, or *recline*. See DEINCLINED.

The use of *inclined, reclined*, and especially *deinclined Dials*, is very rare; the geometrical, and trigonometrical construction of these last, therefore, as being somewhat intricate withal, we here chuse to omit, and refer such as may have a fancy for such a *Dial*, to an universal mechanical method of drawing all kinds of *Dials* here subjoined.

An easy method to describe a DIAL, on any kind of plane, by means of an equinoctial Dial or circle. Suppose e. gr. a *Dial* required on a horizontal plane; if the plane be immovable, as ABDC (fig. 18.) find a meridian line GF: or if moveable, assume the meridian at pleasure. Then by means of the triangle EKF, whose base is applied on the meridian line, raise the equinoctial *Dial* H, till the index GI becomes parallel to the axis of the world, (which is had, if the angle KEF be equal to the elevation of the pole) and the 12 o'clock line on the *Dial* hang over the meridian line of the plane, or the base of the triangle. If then in the nighttime a lighted candle being successively applied to the axis GI, so as the shadow of the index, or style GF fall upon one hour-

DIA

line after another; the same shadow will mark out the several hour-lines on the plane ABCD.

Noting the points, therefore, on the shadow, draw lines through them to G: then an index being fixed in G, according to the angle IGF, its shadow will point out the several hours by the light of the sun.

If a *Dial* were required on a vertical plane; having raised the equinoctial circle; as above directed, push forward the index GI, till the tip thereof I, touch the plane.

If the plane be *inclined* to the horizon, the elevation of the pole should be found on the same; and the angle of the triangle KEF should be made equal thereto.

Note, Beside the several species of *Dials*, abovementioned, which are said to be with *centres*, there are others, called *Dials without centres*.

Dials without Centres, are those whose hour-lines do really converge, but so slowly that the centre they converge towards, cannot be expressed on the given plane.

Horizontal Dials without Centres are to be made for places, the elevation of whose pole is either very small; or very great.

Vertical Dials without Centres are for places, the elevation of whose pole is very great.

For the Furniture of *DIALS*. See FURNITURE.

Ring-DIAL.	} See	Ring Dial.
Portable-DIAL.		Ring Dial.
Quadrantal-DIAL.		Herodistic Quadrant.
Reflecting-DIAL.		Reflecting Dial.

Nocturnal, or Night-DIAL, is that which shews the hours of the night.

Of this there are two kinds, *Lunar*, and *Siderial*.

Moon-DIAL, or *Lunar-DIAL*, is that which shews the hour of the night, by means of the light, or shadow of the moon projected thereon from an index.

To describe a *Moon-DIAL*. Suppose, e. gr. a horizontal *Moon-Dial* required: draw first a horizontal *Sun-Dial*: then erect two perpendiculars AB, and CD, (fig. 19.) to the line of 12 a-clock, and dividing the interval GF into 12 equal parts; through the several points of division draw lines parallel thereto. Now, appropriating the first line CD to the day of the new moon, and the second to the day when the moon comes an hour later to the meridian than the sun, their interfections with the hour-lines will give points, through which to draw a curve line 12, 12, for the meridian line of the moon. After the like manner determine the other hour-lines 1. 1, 2. 2, 3. 3, &c. which the shadow of the moon projected from the style of the *Dial* intersects at the respective hours. Then blot out the hour-lines of the *Sun-Dial*, together with the perpendiculars, whereby the lunar-hours were drawn, and divide the interval GF, by other parallel lines into 15 equal parts, answering to the 15 days between new and full moon. Lastly, to these lines write the several days of the moon's age.

Now, the moon's age being learnt from a calendar, the interfection of the line of the moon's age, with the lunar hour-lines, will give the hour of the night.

After the same manner may any other *Sun-Dial* be converted into a *Moon-Dial*.

To draw a *Portable Moon-DIAL*. On a plane that may be raised according to the elevation of the equator describe a circle AB (fig. 26.) and divide its circumference into 20 equal parts. From the same centre C describe another moveable circle DE, which divide into 24 equal parts, or hours. In the centre C erect an index, as for an equinoctial *Dial*.

This *Dial* being duly placed after the manner of an equinoctial *Dial*, and the 12 a-clock line brought to the day of the moon's age: the shadow of the index will give the hour.

To use a *Solar*, as a *Lunar-DIAL*, i. e. to find the hour of the night by a *Sun-Dial*.—Observe the hour which the shadow of the index points at by moon-light: find the moon's age in the calendar, and multiply the number of days by 1, the product is the number of hours to be added to the hour shewn by the shadow, to give the hour required.

DIALECT, ΔΙΑΛΕΚΤΟΣ, the peculiar language of some province; or part of a nation, formed by corruption of the general, or national language.

Homer could speak five different languages in one verse, i. e. five *Dialects*, viz. the *Attic*, *Ionic*, *Eolic*, the *Doric*, and the common *Dialect* of the Greeks.

The *Bolognese*, *Bergamasque*, *Toscan*, &c. are the *Dialects* of the Italian. The *Gascon*, and *Picard*, are *Dialects* of the French.

DIALECTICA *, *DIALECTICS*, ΔΙΑΛΕΚΤΙΚΗ, the art of reasoning and disputing justly.

* The word comes from the Greek διαλογος, I discourse; formed of δια, and λω, dico, I say.

Zeno Elates was the first who discovered the natural series of principles, and conclusions, observed in reasoning, and formed an art thereof, in form of a dialogue, which for this reason was called *Dialectica*.

The *Dialectica* of the ancients is usually divided into several

DIA

kinds: the first was *Eleatica*, that of Zeno Eleates, which was threefold: viz. *Consecutionum*, *Colloquutionum*, and *Contentionum*.—The first consisting of rules for deducing, or drawing conclusions: the second, the art of dialogue, which became of such universal use in philosophy, that all reasoning was called *Interrogation*. Then, syllogism being laid aside, the philosophers did all by dialogue; it lying on the respondent, to conclude, and argue from the several concessions made.

The last part of Zeno's *Dialectics*, *Eecumen*, was contentious, or the art of disputing, and contradicting; though some, particularly Laertius, ascribe this part to Protagoras, a disciple of Zeno.

The second is the *Dialectica Megarica*, whose author is Euclid, not the mathematician, but another, of Megara. He gave much into the method of Zeno, and Protagoras: Though there are two things appropriated to him: the first, that he impugned the demonstrations of others, not by assumptions, but conclusions; continually making illations, and throwing in *Ergo*, *Ergo*, *Ergo*. The second, that he set aside all arguments drawn from comparison, or similitude, as invalid.

He was succeeded by Eubulides, from whom the sophistry way of reasoning is said to be derived. In his time the art is described as manifold: *Mentis*, *Fallens*, *Eluctra*, *Obvelata*, *Aerualis*, *Convulsa*, and *Calva*. See SOPHIST.

The third is the *Dialectics* of Plato, which he proposes as a kind of analysis, to direct the human mind, by dividing, defining, and bringing things to the first truth; where being arrived, and stopping there a little, it applies it self to explain sensible things; but with a view to return to the first truth, where alone it can rest. Such is the idea of Plato's analysis.

The fourth is Aristotle's *Dialectics*, containing the doctrine of simple words, delivered in his book of *Predicaments*: the doctrine of propositions, in his book, *de Interpretatione*: and that of the several kinds of syllogism, in his books of analytics, topics, and elenchus's.

The fifth is the *Dialectics* of the Stoics, which they call a part of philosophy, and divide into rhetoric, and *Dialectic*: to which some add oric, or definitive, whereby things are justly defined; comprehending likewise the canons, or criterions of truth.

The Stoics, before they come to treat of syllogisms, have two principal places, the one about the word signifying; the other about the thing signified. On occasion of the first, they consider abundance of things belonging to the grammarians province, what, and how many letters, what is a word, diction, speech, &c. On occasion of the latter, they consider things themselves, not as without the mind, but as in it, received in by means of the senses. Accordingly, they first teach, that *nil fit in intellectu, quod non prius fuerit in sensu*, whatever is in the mind, came thither by the senses: and that, *aut incurfione sui*, as Plato, who meets the light; *aut similitudine*, as Cæsar by his effigy; *aut proportionem*, either by enlarging, as a giant, or by diminishing, as a pigmy; *aut translationem*, as a cyclops; *aut compositionem*, as a centaur; *aut contrarium*, as death; *aut privationem*, as a blind man.

The sixth is Epicurus's *Dialectics*. For though he seems to have despised *Dialectic*, he cultivated it with vigour: he was only averse to that of the Stoics, who, he thought, attributed too much thereto; as pronouncing him alone wise, who was well versed in *Dialectics*. For this reason Epicurus seeming to set aside the common *Dialectics*, had recourse to another way, viz. to certain canons, which he substituted in their stead, the collection whereof he called *Canonica*. And as all questions in philosophy are either, *de re*, or *de voce*; he gave separate rules for each.

DIALECTICAL Arguments, in logic, are such as are only probable, and do not convince, or determine the mind absolutely to either side of the question.

DIALLING, the art of drawing sun, moon, and star-dials, on any given plane, or on the surface of any given body. See *DIAL*.

The Greeks and Latins call this art *Gnomonica*, and *Sciatherica*, by reason it distinguishes the hours by the shadow of a gnomon. Some call it *Photo-sciatherica*, by reason the hours are sometimes shewn by the light of the sun. Lastly, other call it *Horologigraphy*.

The antiquity of dials is beyond doubt. Some attribute their invention to Anaximenes Milesius; and others to Thales. Vitruvius mentions one made by the ancient Chaldee historian Berosus, on a reclining plane, almost parallel to the equinoctial. Aristarchus Samius invented the hemispherical dial. And there were at the same time some spherical ones, with a needle for a gnomon. The discus of Aristarchus, was an horizontal dial, with its limb raised up all around, to prevent the shadow stretching too far.

But it was late ere the Romans became acquainted with dials. The first sun dial at Rome was set up by Papyrius Cursor, about the year of the city 460, before which time,

says Pliny, there is no mention of any account of time but by the sun's rising, and setting: The first Dial was set up at or near the temple of Quirinus, but it went ill: about 30 years after, M. Valerius Messala being consul, brought out of Sicily another dial, which he set up on a pillar near the forum; but for want of its being made for that latitude, it could not go true. They made use of it 99 years; till Martius Philippus set up another more exact.

But there seem to have been dials among the Jews much earlier than any of these. Witness the dial of Ahaz, who began to reign 400 years before Alexander, and within 12 years of the building of Rome; mentioned by Isaiah, chap. XXXVIII. verse 8.

Dialling is wholly founded on the first motion of the heavenly bodies, and chiefly the sun; or rather on the diurnal rotation of the earth; so that the elements of spherics, and the spherical astronomy should be mastered, ere a person advances to the doctrine of *dialling*. The doctrine, or theory, we say, for as to the practice, or the operations themselves distinct from the demonstrations, nothing is more easy, and obvious.

The first professed writer on *dialling*, is Clavius; who demonstrates all, both the theory, and the operations, after the rigid manner of the ancient mathematicians; but so intricately, that probably no body, ever read them all. Dechales, and Ozanam, give much easier in their *Courses*, and Wolfius in his *Elements*. M. Picard has given a new method of making large dials, by calculating the hour-lines; and Mr. de la Hire, in his *dialling*, printed in 1683, a geometrical method of drawing hour-lines from certain points, determined by observation. Eberhardus Walperus, in 1625, published his *dialling*, wherein he lays down a method of drawing the primary dials on a very easy foundation. The same foundation is described at length by Sebastian Munster, in his *Rudimenta Mathematica*, published in 1551. Sturmius, in 1672, published a new edition of Walperus's *dialling*, with the addition of a whole second part, about inclining, and declining dials, &c. In 1708, the same work, with Sturmius's additions, was republished with the addition of a fourth part, containing Picard's, and de la Hire's methods of drawing large Dials, which makes much the best, and fullest book on the subject. Peterfon, Michael, and Muller, have each wrote on *dialling*, in the German tongue; Coetius in his *Horologigraphia plana*, printed in 1689; Gauppenius, in his *Gnomonica Mechanica*, and Bion, in his *Use of Mathematical Instruments*.

DIALLING-Globe, is an instrument made of brass, or wood, with a plane fitted to the horizon, and an index; particularly contrived to draw all sorts of dials, and to give a clear exhibition of the principles of that art.

DIALLING-Sphere, is an instrument made of brass, with several semi-circles sliding over one another, on a moving horizon, to demonstrate the nature of the doctrine of spherical triangles, and to give a true idea of the drawing of dials on all manner of planes.

DIALLING-Lines, or *Scales*, are graduated lines, placed on rules, or the edges of quadrants, and other instruments, to expedite the construction of dials.

The principal of these lines are, 1. A scale of six hours, which is only a double tangent, or two lines of tangents each of 45 degrees, joined together in the middle, and equal to the whole line of sines, with the declination set against the meridian altitudes in the latitude of London, suppose, or whatever place it is made for. The radius of which line of sines is equal to the *dialling* scale of six hours. 2. A line of latitudes, which is fitted to the hour-scale, and is made by this canon; as the radius is to the chord of 90 degrees; so are the tangents of each respective degree of the line of latitudes, to the tangents of other arches. And then the natural sines of those arches are the numbers, which taken from a diagonal scale of equal parts, will graduate the divisions of the line of latitude to any radius. The line of hours, and latitudes is general for pricking down all dials with centres.

DIALLING, in a mine, called also *Plumming*, is the using of a compass, (which they call *Dial*) and a long line, to know which way the load, or vein of ore inclines, or where to shift an air-shaft, or bring an adit to a desired place. See *MINE*. See Supplement Article *Plumming*.

DIALIA, in antiquity, sacrifices performed by the flamen *Dialis*, or priest of Jupiter.

It was not, however, of such absolute necessity, that the *Dialia* were performed by the flamen *Dialis*; but that others might officiate. We find in Tacitus, *Annal.* Lib. III. cap. 58. that if he were sick, or detained by any other public employ, the pontifices took his place.

DIALIS*, in antiquity, a Latin term, signifying somewhat that belongs to Jupiter.

* The word is formed from *Διος*, the genitive of *Ζεύς*, Jupiter. Flamen *DIALIS*. See the article *FLAMEN*.

DIALOGUE*, a conversation of two, or more persons, either by word of mouth, or in writing.

* The word is formed from the Latin *Dialogus*, of the Greek *Διάλογος*, which signifies the same.

Dialogue, is greatly recommended by many authors, and is

the most ancient form of writing; and that wherein the first authors wrote most of their pieces. The archbishop of Cambray gives a fine account of the advantages of *Dialogue*, at the head of his pastoral instruction. — The holy Spirit himself has not disdain'd to teach us in *Dialogue*, viz. patience, in the book of Job, and love of God, in the Canticles. Justin Martyr opened this way, in his controversy against the Jews; and Minutius Felix followed it in his against the idolaters. It is in this form, that Origen judg'd he could best refute the error of Marcion. The great Athanasius thought it no diminution to the majesty of mysteries of faith, to maintain them by the familiarity of *Dialogue*. This way of writing St. Basil also chose as the most proper to convey those rules, which have since illumined all the east. The arts of *Dialogue* were admirably put in practice by Gregory Nazianzen, and his brother Cæsarius, for conveying the sublimest truths. Sulpitius Severus could not do better, than publish the wonders of solitude in a kind of conversations. A volume of St. Cyril of Alexandria, is almost filled with *Dialogues*, wherein he explains the most dogmatical truths, relating to the incarnation. The mystery of Jesus Christ is treated of in the same manner by the learned Theodoret. St. Chrysostom found no method more promising to express the eminence, and danger of the priesthood. Who is not acquainted with the beautiful *Dialogue* of St. Jerom, wherein he refutes the Luciferians? who does not admire St. Augustine's *Dialogues*, and especially those on free will, where he goes back to the origin of sin; against the Manichees? The tradition of the solitaires in the desert, is finely illustrated in the conferences of Cassian, which have spread the same light through the west, that the east received from St. Basil. Gregory the Great deem'd *Dialogue* worthy the gravity of the apostolic see. The *Dialogues* of St. Maximus, on the subject of the trinity, are famous throughout all the church. St. Anselm shew'd the force of his genius in his *Dialogues* on the fundamentals of religion. — Profane antiquity likewise made use of the art of *Dialogue*, and that, not only on humorous, and comical subjects, as Lucian did, but also on the most serious and abstract; such are the *Dialogues* of Plato, and those of Cicero, which turn altogether on subjects of philosophy, or politics. Among the moderns, the principal *Dialogists*, are M. de Fenelon, archbishop of Cambray, M. Fafchal, in his *Provincial Letters*; F. Bohours, in his *Entretiens d'Ariste, &c. d'Eugene*; M. Fontenelle, in his *Dialogues of the dead*, and plurality of worlds, &c.

DIALOGUE, in music, is a composition for at least two voices, or two instruments, which answer each other; and which frequently uniting at the close, make a trio with the thorough-bass.

Such are many of the scenes in the Italian and French opera's. **DIALTHEA**, in pharmacy, an unguent thus call'd from its basis, which is root of the *althæa*, or marsh-mallow.

It consists of mucilages drawn from that root, and from linseed and fennugreek seed. The other ingredients are common oil, wax, resin, and turpentine.

It is esteem'd proper to soften, and dissolve; as swage pains of the side, soften callus's, and strengthen the nerves. — It is applied, by rubbing it on the part affected.

DIALYSIS, in grammar, a character, consisting of two points placed over two vowels of a word, which would otherwise make a diphthong; but are hereby parted into two syllables. As in, *Mosaic*. See *DIERESIS*.

DIAMARGARITON, in pharmacy, a medicine denominated from pearls, call'd in Latin *margaritæ*; which are a principal ingredient therein.

There are two kinds: the *hot* and the *cold*, but both are diffus'd at this time.

Hot **DIAMARGARITON**, is a powder compos'd of pearls, peltitory, ginger, nutmeg, cinnamon, and diverse other hot ingredients — It is reputed hysseric, it strengthens the womb, promotes the menses, and assists digestion.

Cold **DIAMARGARITON**, is a solid electuary, compos'd of pearls ground fine, and white sugar dissolved in rose water, or that of bugloss, and boiled to a consistence. — It strengthens the stomach, moderates the too abundant acids, stops the spitting of blood, and loosens the belly.

Compound cold **DIAMARGARITON**, is a powder made of pearls, red roses, flowers of nenuphar, and violet, lignum aloes, red and citron sandal, tormentil root, seeds of melon, endive, &c. — It is cardiac and strengthening, facilitates respiration, and corrects malignant humours.

DIAMASTIGOSIS, in antiquity. — It was a custom among the Lacedæmonians, for the children of the most distinguished families, to slash and tear each others bodies with rods before the altars of the gods; the fathers, and mothers, who were present at the spectacle, animating and exciting them all the while, not to give the least sign of pain, or concern. This practice they call'd *Diamastigghis*, a Greek term, derived from *διαμαρτυρον*, I whip, scourge.

The design hereof, apparently, was no other than to harden their youth, and insure them betimes to blows, wounds, &c. that they might despise them when they came to war

D I A

DIAMETER, in geometry, a right line passing through the centre of a circle, and terminated on each side by the circumference thereof.

Or, *Diameter* may be defined a chord passing through the centre of a circle.—Such is the line AE (*Tab. Geometry*, fig. 27.) passing through the centre C.

Half a *Diameter*, as CD, drawn from the centre C to the circumference, is called the *Semi-Diameter*, or *Radius*. The *Diameter* divides the circumference into equal parts.—And hence we have a method of describing a semi-circle upon any line; assuming a point therein for the centre. The *Diameter* is the greatest of all the chords.

To find the ratio of the *DIAMETER* to the circumference.—This has been greatly fought for by the mathematicians: and no wonder; in as much as if this were justly given, the quadrature of the circle were achieved.

Archimedes first proposed a method of finding it, by regular polygons inscribed in a circle, till arriving at a side subtending an exceeding small arch, and then seeking a side of similar polygon circumscribed: each of these being multiplied by the number of sides of the polygon, give the perimeter of the polygon both inscribed, and circumscribed. In which case, the ratio of the *Diameter* to the circumference of the circle, is greater than that of the same *Diameter* to the perimeter of the circumscribed polygon, but less than that of the *Diameter* to the perimeter of the polygon inscribed. The difference between both gives the ratio of the *Diameter* to the circumference in numbers nearly true.

That divine author, as already observed, by polygons of 96 sides, found the ratio of the *Diameter* to the circumference to be as 7 to 22; viz. supposing the *Diameter* 1, the perimeter of the inscribed polygon is found $3\frac{1}{2}$, and that of the circumscribed $3\frac{1}{2}$.

After his example, later Authors have found out ratio's yet nearer truth; but none spent so much time on it as Van Ceulen, who, after immense pains, found, that supposing the *Diameter* 1, the circumference is less than $3.14159265358979323846264338387950$, and yet greater than the same number with only the last figure 0 changed into 1. But as such prolix numbers are too unweildy for practice, many of our present practical geometers assume the *Diameter* to be to the circumference as 100 to 314.1; or in greater circles as 10000 to 31415; in which proportion Ptolemy, Vieta, and Huygens agree with Van Ceulen.

Ad. Metius gives us the ratio 113 to 355, which is the most accurate of all those expressed in small numbers; as not erring 3 in 1000000.

The *DIAMETER* of a circle being given, to find the circumference, and area; and the circumference being given, to find the *Diameter*.—The ratio of the *Diameter* to the circumference being had, as in the last article, that of the circumference to the *Diameter* is had likewise. Then the circumference being multiplied into the fourth part of the *Diameter*, gives the area of the circle.—Thus, if the *Diameter* be 100, the circumference will be 314, and the area of the circle 7850. But the square of the *Diameter* is 10000: therefore, this is to the area of the circle as 10000 to 7850, that is as 1000 to 785 nearly.

The area of a circle being given, to find the *DIAMETER*.—To 785, 1000, and the given area of the circle 246176, find a fourth proportional, viz. 3113600, which is the square of the *Diameter*. Out of this extract the square-root, and it is the *Diameter* itself.

DIAMETER of a conic section, is a right line, as AD, (*Tab. Conics*, fig. 5.) bisecting all the ordinates MM, &c. in P, &c. See CONIC.

This, when it cuts the said lines at right angles, is more particularly called the *axis of the curve*, or *section*.

Transverse DIAMETER, is a right line, as AB (*Tab. Conics*, fig. 6. N^o 2.) which being continued each way between two curves, bisects parallel right lines between the same, as MM.

Conjugate DIAMETER, is a right line, bisecting lines drawn parallel to the transverse *Diameter*. See CONJUGATE.

DIAMETER of a sphere, is the *Diameter* of the semi-circle by whose rotation the sphere is generated; called also the *axis of the sphere*.

DIAMETER of gravity, is a right line passing through the centre of gravity.

DIAMETER, in astronomy.—The *Diameters* of the heavenly bodies, are either *apparent*, i. e. such as they appear to the eye; or *real*, i. e. such as they are in themselves.

The *apparent DIAMETERS* measured with a micrometer, are found different, in different circumstances and parts of their orbits.

<i>Huygens</i>			1 25
<i>of Mercury accord. to Tycho</i>	3 57	2 10	1 29
<i>Hevelius</i>	0 11	0 6	0 4

The great difference between Tycho, and the other two astronomers, is owing to this, that Tycho, in imitation of the ancients, measured the *Diameters*, as they appear to the naked eye; whereas Hevelius and Huygens used telescopes, whereby a deal of spurious lustre, which otherwise makes them appear bigger than they are, is taken off.

For the true *DIAMETERS* of the sun, and planets, and their proportion to each other. See SEMIDIAMETER.

DIAMETER of a Column, is its thickness just above the base. From this the module is taken, which measures all the other parts of the column.

DIAMETER of the Diminution, is that taken from the top of the shaft. See DIMINUTION.

DIAMETER of the Swelling, is that taken at the height of one third from the base.

DIAMOND in natural history, by the ancients called *Adamant*, a precious stone, the first in rank, value, hardness, and lustre, of all gems.

The goodness of *Diamonds* consist in their water, or colour, lustre, and weight: the most perfect colour is the white. Their defects are veins, flaws, specks of red or black sand, and a bluish or yellowish cast.

In Europe, the lapidaries examine the goodness of their rough *Diamonds*, their water, points, &c. by day-light: in the Indies, they do it by night; in order to which, a hole is made in a wall a foot square, and therein a lamp is placed, with a thick wick, by the light whereof they judge of the stone, holding it in their fingers.

The water, called *Calestis*, is the worst of all, and yet is somewhat difficult to discover in a rough *Diamond*. The only infallible way is to examine it in the shade of some tufted tree. As to the distinguishing of *Diamonds* from other stones, Dr. Wall, in the *Philosophical Transactions*, seems to have found an infallible method: a *Diamond*, with an easy, slight friction in the dark, with any soft, animal substance, as the finger, woollen, silk, or the like appears luminous in its whole body: nay, if you keep rubbing for some time, and then expose it to the eye, it will remain so for some time. If the sun be 18 degrees below the horizon; holding up a piece of bays, or flannel stretched tight between both hands, at some distance from the eye; and another rubbing the other side of the bays, or flannel, pretty briskly with a *Diamond*; the light is much more vivid and pleasant than any other way. But what Dr. Wall judges most surprizing is, that a *Diamond*, being exposed to the open air, in view of the sky, gives almost the same light of itself, without rubbing, as if rubbed in a dark room: but, if in the open air, you put the hand, or any thing a little over it, to prevent its immediate communication with the sky; it gives no light; which is a distinguishing criterion of a *Diamond*.

Rough DIAMOND, is that not yet cut, but just as it comes out of the mine.

Brilliant DIAMOND, is that cut in faces both a-top, and bottom, and whose table, or principal face a-top is flat.

Rose DIAMOND, is that quite flat underneath, but its upper part cut in diverse little faces, usually triangles, the uppermost whereof terminate in a point.

Table DIAMOND, is that which has a large square face a-top, encompassed with four lesser.

Diamonds are found in the East-Indies, and that principally in the kingdoms of Golconda, Visapour, Bengale, and the island of Borneo. There are four mines, or rather two mines, and two rivers, whence *Diamonds* are drawn.—The mines are, 1. that of Raolconda, in the province of Carnatica, five days journey from Golconda, and eight from Visapour. It has been discovered about 200 years. 2. That of Gani, or Coulour, seven days journey from Golconda, eastwardly. It was discovered

vered 120 years ago by a peasant, who digging in the ground found a natural fragment of 25 carats. 3. That of Soumelpour, a large town in the kingdom of Bengale, near the *Diamond-mine*. This is the most ancient of them all: it should rather be called that of Goual, which is the name of the river, in the land whereof these stones are found. Lastly, the fourth mine, or rather the second river, is that of Succadan, in the island of Borneo.

DIAMOND-mine of Raolconda.—In the neighbourhood of this mine the earth is sandy, and full of rocks, and copse. In these rocks are found several little veins, of half, and sometimes a whole inch broad, out of which the miners, with a kind of hooked irons, draw the sand, or earth, wherein the *Diamonds* are; breaking the rocks when the vein terminates, that the track may be found again, and continued. When a sufficient quantity of earth, or sand is drawn forth, they wash it two or three times, to separate the stones therefrom. The miners work quite naked, except for a thin linnen cloth before them; and besides this precaution, they have likewise inspectors, to prevent their concealing of stones: which, however, in spite of all this care, they frequently find means to do, by watching opportunities when they are not observed, and swallowing them down.

DIAMOND-mine of Gani, or Coulour.—In this mine are found a great number of stones from 10 to 40 carats, and even more; and it was there that the famous *Diamond* of Aureng-Zeb, the Great Mogul, which before it was cut, weighed 793 carats, was found. The stones of this mine are not very clear; their water is usually tinged with the quality of the soil; being black where that is marshy, red where it partakes of red, and sometimes green, and yellow, if the ground happen to be of those colours.—Another defect of some consequence is a kind of greasiness appearing on these *Diamonds*, when cut, which takes off part of their lustre.—There are usually no less than 60000 persons, men, women, and children at work in this mine. When the miners have found a place where they intend to dig, they level another somewhat bigger in the neighbourhood thereof, and inclose it with walls about two foot high, only leaving apertures from space to space, to give passage to the water. After a few superstitious ceremonies, and a kind of fast, which the master of the mine makes the workmen, to encourage them, every one goes to his business, the men digging the earth in the place first discovered, and the women and children carrying it off into the other walled round. They dig 12 or 14 feet deep, and till such time as they find water. Then they cease digging, and the water thus found serves to wash the earth two or three times, after which it is let out at an aperture reserved for that purpose. This earth being well washed, and well dried, they sift it in a kind of open sieve, or riddle, much as we do corn in Europe; then they thrash it, and sift it afresh; and lastly, they search it well with the hands to find the *Diamonds*. They work naked here, as in the mine of Raolconda, and are watched after the like manner by inspectors.

DIAMOND-mine of Soumelpour, or river Goual.—Soumelpour is a large town built all of earth, and covered with branches of cacao-trees: the river Goual runs by the foot thereof, in its passing from the high mountains towards the south to the Ganges, where it loses its name. It is from this river that are brought all our fine *Diamond* points, or sparks, called *natural sparks*. They never begin to seek for *Diamonds* in this river till after the great rains are over, that is, after the month of December; and they usually even wait till the water is grown clear, which is not before January. The season at hand, eight, or ten thousand persons of all ages, and sexes, come out of Soumelpour, and the neighbouring villages. The most experienced among them search, and examine the sand of the river, going up it from Soumelpour to the very mountain whence it springs. A great sign that there are *Diamonds* near, is, the finding of those stones which we Europeans call thunderstones. When all the sand of the river, which at that time is very low, has been well examined, they proceed to take up that wherein they judge *Diamonds* likely to be found; which is done after the following manner: they dam the place round with stones, earth, and fascines, and lading out the water, dig about two feet deep: the sand thus got is carried into a place walled round on the bank of the river.—The rest is performed after the same manner as at Coulour, and the workmen are watched with equal strictness.

DIAMOND-mine in the island of Borneo, or river of Succadan.—We are but little acquainted with this mine; the queen who reigns in that part of the island not allowing strangers to have any commerce in these stones: though there are very fine ones to be bought at Batavia, brought thither by stealth. They were anciently imagined to be softer than those of the other mines, but experience shews, they are in no respect inferior to them. Beside these four *Diamond* mines, there have been two other discovered; one of them between Coulour and Raolconda, and the other in the province of Carnatica; but they were both closed up almost as soon as discovered: that of Carnatica, by reason the water of the *Diamonds* was always either black, or yellow; and the other, on account of their cracking, and flying in pieces when cut and ground.

The *Diamond*, we have already observed, is the hardest of all

precious stones. It can only be cut, and ground by it self, and its own substance. To bring it to that perfection which augments its price so considerably, they begin by rubbing several against each other, while rough; after having first glued them to the ends of two wooden blocks, thick enough to be held in the hand. It is the powder thus rubbed off the stones, and received in a little box for the purpose, that serves to grind and polish the others.

Diamonds are cut, and polished by means of a mill, which turns a wheel of soft iron sprinkled over with *Diamond* dust mixed with oil of olives. The same dust, well ground, and diluted with water and vinegar, is used in the sawing of *Diamonds*; which is performed with an iron, or bra's wire, as fine as a hair. Sometimes in lieu of sawing the *Diamonds*, they cleave them, especially if there be any visible plates in them. But the Europeans are not usually daring, or expert enough to run the risque of cleaving, for fear of breaking.

A rough *Diamond* must be chosen uniform, of a good shape, transparent, not quite white, and free of flaws, and shivers. Black, rugged, dirty, flawey, veiny stones, and all such as are not fit for cutting, they use to pound in a steel mortar made for that purpose; and when pulverized, they serve to saw, cut, and polish the rest. Shivers are occasioned in *Diamonds* by this, that the miners, to get them more easily out of the vein, which winds between two rocks, are often forced to break the rocks with huge iron wedges, which shakes, and fills the stone with cracks and shivers. The ancients had two mistaken notions with regard to the *Diamond*: the first, that it became soft, by steeping it in hot goat's blood. And the second, that it was malleable, or bore the hammer. Experience shews us the contrary; there being nothing capable of mollifying the hardness of this stone; though its hardness be not such, that it will endure being struck at pleasure with the hammer.

The finest *Diamonds* now in the world are that of the Great Mogul, weighing 279 carats; that of the great duke of Tuscany, weighing 139 carats; and that known in France under the name of *grand fancy*, which is one of the crown jewels, weighing 106 carats, whence its name *Sancy*, which is a corruption of *cut six*, that is 106. Tavernier, by a rule which he had made for estimating the value of *Diamonds*, computes that of the Great Mogul at 11723278 French livres, equivalent to 770244 pound sterling; and that of the duke of Tuscany, at 2608335 livres, or 105374 pound sterling. The following is a rate, or manner of estimating the value of *Diamonds*, drawn up by a person well versed in such matters, and which, for its curiosity, as well as the use it may be of to persons who deal in precious stones, we judge, will not be unacceptable.

Table DIAMONDS.

Dutch Cut.					
A <i>Diamond</i> weighing	Lib.	Sh.	Lib.	Sh.	Sterl.
1. Grain, is worth from	1.	0	to 1.	1.

Antwerp Cut.

A <i>Diamond</i> weighing	Lib. Sh.	Lib. Sh. Sterl.
1. Grain, is worth from	0 15.	to 0 18.
1½	0 6.	to 1. 10.
2.	2. 2.	to 2. 5.
3.	3. 12.	to 3. 15.
4.	6. 0	to 6. 7.
5.	10. 10.	to 11. 5.
6.	13. 10.	to 15. 0
7.	18. 15.	to 22. 10.
8.	24. 0	to 26. 0
9.	33. 15.	—
10.	37. 0	to 40. 0
12.	55. 0	to 58. 0
15.	112. 0	to 130. 0
18.	247. 0	—
24.	315. 0	—
40.	900. 0	to 970. 0
50.	2200. 0	to 2300. 0
60.	3500. 0	to 4500. 0

It must be observed, however, that defects in the water, or shape; red, or black spots; shivers, and other failings, frequently found in these stones, reduce the price by one third, and sometimes more.

As to *Brilliant DIAMONDS* of very small cut, the price is always less by one third, than that of *Diamonds* of a larger cut; though the weights be the same: the reason is, that the latter shew themselves a great deal more when set in their collets, than the former.

Attempts have been made to produce *artificial Diamonds*, but with no great success.

The *falsitious Diamond*: made in France, called *Temple-Diamonds*, on account of the temple at Paris, where the best of them are made, fall vastly short of the genuine ones; accordingly they are but little valued, though the consumption thereof is pretty considerable for the habits of the actors on the stage, &c. See *Supplement*, Articles *DIAMOND* and *PASTES*.

DIAMOND is an instrument of considerable use in the glass-manufacture, for squaring the large plates, or pieces; and among glaziers, for cutting their glass.

These *Diamonds* are differently fitted up. That used for looking-glasses, and other large pieces, is set in an iron ferril two inches long, and a quarter of an inch in diameter. The rest of the cavity of the ferril is filled with melted lead, which keeps the *Diamond* firm in its place.

The glaziers have a handle of box, or ebony, fitted into the ferril to hold it by. In the former there is a little piece of box crossing the ferril, in form of a little plane, covered at bottom with a thin copper-plate.

DIAMOND, in heraldry, is used to express the black colour in the achievements of noblemen.

Gwiliam dislikes the way of blazoning the coats of peers by precious stones, instead of metals, or colour. But the English practice allows it. See *COLOUR*.

DIAMOND GLASS. See the article *GLASS*.

DIAMORUM, *DIAMORON*, a composition in pharmacy, of which there are two kinds; *simple*, and *compound*.—

Simple DIAMORUM, is the common syrup of mulberries, made of the juice of that fruit, boiled up with sugar.—It is good against diseases of the throat, and to stop dysenteries.

There is also a sort of *simple Diamorum* made of mulberry juice and honey, otherwise called *Mulberry Rob*.—

Compound DIAMORUM, is made with mulberry juice, verjuice, myrrh, and saffron.—It is used to deterge phlegm from the stomach, and breast, and to ease respiration.

DIANA's Tree, *Arbor Diana*. See the article *ARBOR*.

DIANUCUM *, in pharmacy, a kind of rob, made of the juice of green walnuts, and sugar, boiled together by a moderate fire, to the consistence of honey.

* The word is formed from *dia*, and *nux*, *nuci*, nut.

It is good to strengthen the stomach, promote sweat, and resist poison.

DIAPALMA, in pharmacy, a defficative, or drying plaister, said to be so denominated from the wood of the palm-tree, whereof the spatula is to be made, that is to stir it while boiling. It is composed of common oil, hog's fat, and litharge of gold.—It is good to dry, resolve, deterge, and cicatrize: and is the plaister most used for wounds, and ulcers.

DIAPASMA *, a common name for all powders sprinkled on the body; whether as perfumes or otherwise.

* The word comes from the Greek *διαπασσεν*, *inpergere*, to sprinkle.

DIAPASON, in music, a musical interval, otherwise called *Octave*.

The *Diapason* is the first, and most perfect of the concords: if considered *simply*, it is but one harmonical interval; though if considered *diatonically*, by tones, and semi-tones, it contains seven degrees, *viz.* three greater tones, two lesser tones, and two greater semi-tones.

The interval of a *Diapason*, that is, the proportion of its grave sound to its acute, is as 2 to 1.

DIAPASON, among musical instrument-makers, is a kind of rule, or scale, whereby they adjust the pipes of their organs, and cut the holes of their flutes, haut-bois, &c. in due proportion, for performing the tones, semi-tones, and concords justly. A square being divided into eight equal parallelograms; the points wherein a digonal intersects all these parallelograms, expresses all the usual intervals in music: and on this principle it is, that the *Diapason* is founded.

There is a particular kind of *Diapason* for trumpets; serving as a standard, or measure, for the different magnitudes they must have to perform the four parts of music.

There is another for sack-buts, and serpents, shewing how far they are to be lengthened, or shortened, to rise or fall from one tone or interval to another.

The bell-founders have likewise a *Diapason*, or scale, serving to regulate the size, thickness, weight, &c. of their bells.

DIAPASONIAEX, in music, a kind of compound concord; whereof there are two sorts: the *greater*, which is in the ratio of 10 to 3; and the *less*, in that of 16 to 5.

DIAPASONDIAPENTE, in music, a compound consonance, in the ratio of triple of 9 to 3.

VOL. I.

*The *Diapason-diapente* is a symphony made when the voice proceeds from the 1st to the 12th tone. The word is properly a term in the Greek music: we should now call it a *twelfth*. **DIAPASONDIATESSARON**, in music, a compound concord, in the ratio of 8 to 3.

The *Diapason-diatesaron* is a symphony wherein the voice proceeds from the first tone to the eleventh.—This the moderns would rather call an *eleven*.

DIAPASONDITONE, in music, a compound concord; in the proportion of 10 to 4, or 5 to 2.

DIAPASONSEMITONE, a compound concord, whose terms are in the proportion of 12 to 5.

DIAPEDESIS *, *ΔΙΑΠΗΔΗΣΙΣ*, in medicine, an opening of blood through the coats of the veins, or arteries; occasioned either by the blood's becoming too much dissolved, or attenuated; or by the pores of the vessels becoming too patent, and open.

* The word is compounded of *δια*, through; and *πῆδαι*, I leap.

There are some able physicians who deny there can be any such a tenuity of blood, as that it shall exude through the vessels, without any aperture made therein.

DIAPENTE *, in the ancient music, an interval making the second of the perfect concords; answering to what in the modern music which we more usually call a *perfect fifth*.

* The word is formed of *δια*, and *πέντε*, five.

The *Diapente* is a simple concord; yet if considered diatonically, it contains four terms, *viz.* two greater tones, a lesser tone, and a greater semi-tone. The *Diapente* is the greater part of the *diapason*, or octave, harmonically divided. It is produced when the voice passes from its first tone to its fifth.

DIAPENTE, is also used in pharmacy, for a compound of five several drugs, or ingredients.

DIAPHANOUS *, in philosophy, a thing transparent, or that gives passage to the rays of light; as water, air, glass, talc, fine porcelain, &c. See *TRANSPARENT*.

* The word is formed of *δια*, through, and *φανω*, I shew.

DIAPHANEITY, in the schools, the quality of a transparent body; or that which denominates it such. See *TRANSPARENCY*.

The Cartesians hold the *Diaphaneity* of a body to consist in the rectitude of its pores; that is, in their being situate in right lines; so as that there is no intermediate substance to prevent the passage of the rays; and hence they argue, that the rending glass malleable is an impossibility: for as soon as it becomes malleable, its pores will cease to be situate directly against each other; and of consequence it will lose its *Diaphaneity*, the principal character of glass.

Sir Isaac Newton accounts for *Diaphaneity* from another principle, *viz.* from the homogeneity, and similarity between the medium, wherewith the pores are filled, and the matter of the body itself.—For the refractions the rays undergo in passing thus out of the matter into the pores, *i. e.* out of one medium into another, being but small, the progress of the ray is not so much interrupted, but that it can make its way through the body.

DIAPHOENIC, *DIAPHOENICUM*, in pharmacy, a soft, purgative electuary; thus called from the Dates, which make its basis; the palm-tree, whose fruit they are, being called by Greeks *φαινι*. See *DATE*.

The other ingredients are penidies, almonds, turbit, ginger, white pepper, mace, cinnamon, rice, fennel, and carrot seeds, and honey.

The *Electuarium Diaphanicum* purges chiefly serosities, and excites the menses.—It is also used in dropsies, lethargies, apoplexies, and palsies.

DIAPHORESIS, *ΔΙΑΦΟΡΗΣΙΣ*, in medicine, includes all discharges made through the skin; both sensible, and insensible: whence *Diaphoretic*, &c. See *PERSPIRATION*.

DIAPHORETIC, in medicine, is applied to remedies that promote the expulsion of humours by insensible perspiration.

Diaphoretic is much of the same import as *Sudorific*: except that the latter promotes sensible, and the former insensible perspiration.—Their only difference, therefore, is in the degree of activity.

DIAPHORETIC Antimony, or *mineral Diaphoretic*, is a preparation of antimony, the process whereof see under the article *ANTIMONY*.

DIAPHRAGM *, *DIAPHRAGMA*, in anatomy, a part, popularly called the *Midriff*, and by anatomists, *Septum Transversum*, it is a nervous muscle, separating the breast, or thorax, from the abdomen, or lower venter; and serving as a partition between the natural, and the vital parts as they are called.

* It was Plato, as Galen informs us, that first called it *Diaphragm*, from the verb *διαφραγναι*, to separate, or be between two. Till his time it had been called *pneves*, *understanding*; from a notion, that an inflammation of this part produced phrenzy: which is not at all warranted by experience, no more than that other tradition, that a transverse section of the *Diaphragm* with a sword causes the patient to die laughing.

Its figure is round, resembling a rayfish, or thornback. It consists of two circles, the one membranous, the other fleshy; though

though others will have both of them muscular : of two arteries ; and two veins, called *Phrenicæ* ; and several branches of nerves.

The first, or superior circle arises from the sternum, and the ends of the last ribs : the second, or inferior, comes from the vertebrae of the loins. The upper is covered a-top with a membrane derived from the pleura ; and the lower is lined at bottom with another from the peritonæum.

Its situation is oblique, being extended from the cartilago xiphoides, by the extremes of the ribs, to the region of the loins. It is pierced in the middle for the passage of the vena cava ; and in its lower part for the aorta, thoracic duct, and vena azygos. In its natural disposition it is convex on the upper side towards the breast, and concave on the lower towards the belly. Hence it has two motions ; the one of contraction, the other of relaxation.

By the contraction, or swelling of the fibres, the *Diaphragm* becomes flat on each side ; the consequence of which is, that the cavity of the breast is enlarged, to give liberty for the lungs to receive the air in inspiration ; and the cavity of the abdomen is lessened, and consequently the stomach and intestines pressed, for the distribution of the chyle. In its relaxation, whereby it resumes its natural situation, the cavity of the breast is diminished, and the lungs pressed for the expulsion of the air in expiration.

On the *Diaphragm*, also, in great measure, depend the actions of coughing, sneezing, yawning, laughing, the hiccup, &c. between which motions there is some connection caused by the communication of the nerves of different parts, which meet in the *Diaphragm*.

Dr. Hook observes, that an animal may be kept alive, without thorax, or *Diaphragm*, by blowing air into the lungs with a bellows ; of which he had made the experiment.

DIAPHRAGM is also a general name, given to all partitions, or separations between two parts of a thing ; as the little perforated partitions in the tubes of long telescopes.

DIAPHRAGMATIC, is applied to the arteries, veins, and nerves distributed through the diaphragm.

They are also called *Phrenicæ*, or *Phreneticæ*.

DIAPRE, or **DIAPERD**, in heraldry, a dividing of a field into planes, or compartments, in the manner of fret-work ; and filling the same with variety of figures.

This chiefly obtains on bordures, which are *diapered*, or fretted over, and the frets charged with things proper to bordures : as in *Tab. Herald. fig. 18*.

DIAPRUNUM, in pharmacy, a soft, purgative electuary, thus called from the pulp of Damascus *prunes*, which make its base.

Diaprunum, is either *simple*, or *compound*.

Simple, or *lenitive* **DIAPRUNUM**, consists of the pulp aforementioned, with cassia, tamarins, rhubarb, red roses, violet seeds, faunders wood, both red and citron, scrapings of ivory, liquorice juice, and the four cold seeds. It is good to prepare, and soften the humours.

Compound, or *solutive* **DIAPRUNUM**, is only the *simple*, with the addition of half an ounce of scammony to every pound of the electuary, to render it more purgative.

DIARRHODON *, **ΔΙΑΡΡΟΔΟΝ**, in pharmacy, a name given to diverse compositions, wherein roses are a principal ingredient.

* The word is formed of *Δια*, and *ῥόδον*, *Rose*.

DIARRHODON *Abbatis*, is a cordial powder, so denominated from the abbot who invented it. It consists of red roses, red, and citron faunders, lignum aloes, cinnamon, rhaponticum, spike-nard, ivory, harts-horn, saffron, mastic, pearls, amber-gris, musk, &c. It is used to strengthen the heart, stomach, and liver, to assist in digestion, and to prevent vomiting.

There are also *Trochisci* **DIARRHODON**, composed of red roses, shavings of ivory, the faunders, liquorice, mastic, saffron, camphor, and rose-water. They are good to fortify the heart, stomach, and liver, and to stop dysenteries, and other fluxes of the belly.

Pillule **DIARRHODON** are composed of aloes, *Trochisci* *Diarrhodon*, wormwood leaves, mastic, and rock-salt. They first purge, then fortify the stomach, promote digestion, and prevent a stinking breath. But all these compositions are out of use at present.

DIARRHOEA *, **ΔΙΑΡΡΟΙΑ**, in medicine, a looseness, or flux of the belly ; or a profuse evacuation of liquid excrements by stool.

* The word is formed of the Greek *Δια*, through, and *ῥέω*, to flow. The word, in the general, is used for any kind of flux of the belly ; but properly for that wherein the humour, or excrement flows out either pure, or mixed with, or without pain, in a fluid state.

Diarrhoea's are of diverse kinds, distinguished by the diversity of the excrements : some being bilious ; some serous ; some pituitous ; and some purulent.

The purulent always arise from some abscess burst in the body ; the rest either from morbid humours irritating the intestines, and expressing the juices out of the adjacent parts ;

or from a laxness of the intestinal fibres ; or an extraordinary fermentation in the blood, whereby it discharges its excrements into the intestines.

There are also *Diarrhoea*'s arising from unwholesome foods, and the stoppage of the other excretions, particularly perspiration. It is a standing observation, that such as perspire but little, are ever subject to a *Diarrhoea* ; and on the contrary, people who perspire much, are commonly colicive.

Baglivi mentions *Diarrhoea*'s as one usual great effect of grief ; as likewise of immediate anger ; without which a fever would, in these cases, be produced.

In the cure of *Diarrhoea*'s, from whatever cause they arise, the stomach must be corroborated, and sudorifics are to be mixed with absorbents. The patient is to drink sparingly. Quince and wine burnt with aromatics is good. Wainwright observes, that a flannel shirt contributes much to the cure of an habitual *Diarrhoea*.

Stolterfoht, a physician of Lubeck, relates, that a mechanic of that city had a continual *Diarrhoea* from 30, to the age of 65 years, which always gave him five or six stools a day, yet he was in good health all the while, having a good appetite, and sufficient strength and vigour. But in his 65th year taking some astringent medicines, he stopped his flux ; upon which he was immediately seized with a violent pain in the kidneys, difficulty of breathing, and loss of digestion ; he threw up his food as he took it, grew cold at the extremities of the body, swelled in the thighs, had an insupportable thirst, and more appetite, and urined, with much difficulty, a thin watery humour, destitute of all sulphur. See *Supplement Article Diarrhoea*.

DIARTHROSIS *, in anatomy, a kind of articulation, or juncture of the bones which being pretty lax, affords room for a manifest motion. See *ARTICULATION*.

* The word comes from *Δια*, and *ἄρθρον*, *Juncture*, *Assemblage*.

It is opposed to *Synarthrosis*, wherein the articulation is so close, that there is no sensible motion at all.

Diarthrosis is of three kinds : 1. When the head of the bone is big, and long, and the cavity that receives it, deep ; it is called *Enarthrosis* : such is that of the thigh, with the hip. 2. When the head of the bone is flat, and the cavity that receives it superficial, it is called *Arthrodia* : such is that of the jaws, with the bones of the temples. 3. When two bones receive each other reciprocally, and are moveable in each other, it is called *Ginglymus* : thus the cubitus receives the radius, at the same time that the radius receives the cubitus.

DIARTHROSIS *Synarthroidalis*, called also *Amphiarthrosis*, is a kind of neutral, or dubious articulation ; being neither absolutely *Diarthrosis*, as not having a manifest motion ; nor absolutely *Synarthrosis*, as not being quite immovable.

Thus the articulations of the ribs, with the vertebrae, and those of the bones of the carpus, and tarsus, among each other, are *Synarthroidal Diarthroses*.

DIARY *Fever*, is a Fever of one day. See *EPHEMERA*.

DIASCORDIUM, in pharmacy, a kind of electuary, first described by Fracastorius, and denominated from *scordium*, which is a chief ingredient therein.

The other ingredients are red roses, bole, storax, cinnamon, cassia, lignea, dittany, tormentile roots, bistort, gentian, galbanum, amber, terra sigillata, opium, long pepper, ginger, mel rosatum, and malmsey wine.

It is an astringent, and is used against malignant fevers, the plague, worms, the colic, and to provoke sleep, and resist punction.

DIASEBESTEN, in pharmacy, a soft, purgative electuary, whereof sebestens are the basis.

The other ingredients are prunes, tamarinds, juices of iris, anguria, and mercurialis, penidies, *simple* diaprunum, violet seed, the four cold seeds, and diagyridium. It is good in intermitting, and continued fevers, appeases thirst, promotes sleep, and expels the morbid humours by urine.

DIASENNA, in pharmacy, a soft, purgative electuary, thus called from *senna*, which is its base.

The other ingredients are sugar candy, cinnamon, lapis lazuli, silk, cloves, galanga minor, black pepper, nardus indica, seed of basilicum, flowers of cloves, cardamons, saffron, ginger, zedoary, rosemary flowers, long pepper, lapis armenus, and honey. *Diassenna* eases and comforts the melancholic, and splenetic ; and is good against all diseases arising from an atrabilis.

DIASTEM, **DIASTEMA**, in music, a name the ancients gave to a simple interval ; in contra-distinction to a compound interval, which they called a *Sytem*.

Musicians divide intervals into two kinds : one of them called *Sytem*, which is to contain at least two intervals in any kind of music whatever ; but many, contain more.

The other, called *Diastem*, is a mere, or single interval ; the proper signification of the Greek *διαστημα*, being *interval*.

DIASTOLE *, in anatomy, expresses that motion of the heart, and arteries, whereby those parts dilate, or distend themselves : the other opposite motion being called the *Systole* of the heart, and arteries ; wherein they contract themselves. See *HEART*, and *ARTERY*.

* The word is Greek, formed from the verb *διαστέλλω*, to separate, open, dilate.

The *Diastole* of the heart is properly the recess of the parietes of the two ventricles from each other; or the enlargement of their cavities and diminution of their lengths, and their approximation to a spherical form.

The *Diastole*, or dilatation of the heart, arises from the blood being brought, by the veins, into its ventricles; and that of the arteries, from the blood being thrown into their cavities by the contraction of the heart. So that the *Diastole* of the heart, and arteries, is not affected at the same time; the *Diastole* of the heart happening when the arteries are contracted, and that of the arteries when the heart is contracted.

What we call the beating of the pulse, is only the *Diastole* of the arteries.

The lungs and breast have likewise their systole, and *Diastole*; so has the brain.

The true cause of the *Diastole* of the heart was but lamely accounted for before Dr. Drake: that the heart is a muscle, is made evident beyond all doubt by Dr. Lower; and that the motion of all muscles consists in constriction, is not to be doubted.—By such means the systole is easily accounted for.

But in as much as the heart has no antagonist muscle, the *Diastole* has puzzled the greatest wits. Dr. Lower unhappily attributes it to a motion of restitution. As the motion of the heart, says he, is performed by contraction; and as the fibres of the heart are alone formed for contraction; it is evident, all the motion of the heart lies in its systole; and that the fibres, in the several contractions, being stretched beyond their tone, as soon as the natus is over, the heart relaxes again by a motion of restitution; *a nullo enim cordis motu, nisi tensionem ejus remittente, & ab irridente sanguine, Diastole, ejus libratu visibus succedit.* de Corde, p. 75.

Mr. Cowper accounts for the *Diastole* from the analogy the heart of an animal bears to the pendulums of those artificial automata, clocks and watches: its motion, he says, is performed like that of other muscles, the blood doing the office of a pondus, or weight.—Both these notions Dr. Drake refutes; and with great reason and probability maintains the weight of the atmosphere to be the pondus, or counterpoise to the contractile force of the heart.

It has long been known, that the dura mater has a systole and *Diastole*, exactly corresponding to those of the heart. But its cause was not so well known: Dr. Ridley, in the *Philosoph. Transact.* having bored a hole in the upper part of the bregma of a dog, first perceived the alternate vibrations of the dura mater; then, continuing the hole to the brain, he found both by his eyes, and even afterwards by touch, very sensibly, that there was a like brisk systole and *Diastole* of the brain. See BRAIN, and DURA-MATER.

DIASTOLE, in grammar, a figure whereby a syllable naturally short, is made long.

Thus it is, that Virgil begins a verse with the word *Italus*, the first syllable whereof is naturally short.

DIASTYLE, in the ancient architecture, an edifice, where the columns stand at such a distance one from another, that three diameters, or six modules, are allowed for the intercolumniation.—See *Tab. Architect.* fig. 47.

DIASYRMUS, ΔΙΑΣΥΡΜΟΣ, in rhetoric, a figure whereby we shortly answer, or rather evade, a thing which it would be tedious to reply to inform.—

E. gr. What matters it to reply to an argument foreign to the purpose.

DIATESSARON *, in pharmacy, a sort of theriaca, thus called because consisting of four ingredients, which are roots of aristolochia, and gentian, bay-berries, and myrrh.

* The word is Greek, compounded of δια, and τεσσαρα, four, q. d. a composition of four drugs.

It is also called *Theriaca Pauperum*, because made at a very easy expence, and in a short time. It is good against stings of venomous beasts, epilepsies, convulsions, colics, to strengthen the stomach, and promote the menses.

DIATESSARON, in the ancient music a concord or harmonical interval, composed of one greater tone, one lesser, and one greater semi-tone; its proportion being as 4 to 3.

In the modern music, it is called a perfect fourth.

DIATHESIS, a term used by some writers, in the same sense with constitution.

DIATONIC, an epithet given to the common music, as it proceeds by tones, or degrees, both ascending, and descending.

Authors divide the genera or kinds of music into *Diatonic*, *Chromatic*, and *Enharmonic*.

Diatonic music only allows of three degrees; the greater and lesser tone, and the greater semi-tone.

Hence *Diatonic* music appears the most natural, and of consequence is the most ancient.

In the *Diatonic* music there is a tone between every two notes, except between *mi* and *fa*, and *si* and *ut*, where there is only a greater semi-tone.

DIATRAGACANTH, in pharmacy, is a name applied to certain powders, whereof gum tragacanth is the base.—There are two kinds, cold and hot.

Powder of cold *Diatragnanth* is composed of the gums adra-

ganth and arabic, liquirice, starch, white poppy seed, and the four great cold seeds. It is good to thicken and soften the too sharp, and subtle ferous humours falling on the breast, to assuage coughs, and to promote spitting.

Powder of hot *Diatragnanth* is composed of gum adraganth, cinnamon, hyssop, almonds, linseed, and fenugreek, liquorice, and ginger. It is good against asthma's, to promote expectoration, strengthen the stomach, and assist digestion.

DIAZEUTIC Tone, in the ancient Greek music, was that which disjoined two fourths, one on each side of it, and which being joined to either, made a fifth.

This in their music was from *mesé* to *paramésé*; that is, in ours, from A to B: supposing *mi* to stand in *be-fa-be-mi*. They allowed to this *Diazeutic Tone*, which is our *la*, *mi*, the proportion of 9 to 8, as being the unalterable difference of diapente and diatessaron.

DICHOTOMY *, *Bissection*, a term used by astronomers for that phasis, or appearance of the moon; wherein she is bisected, or shews just half her disk, or circle.

* The word is Greek, formed of διχοτομῆαι, I bisect, or cut in two, of δις, twice; and τομῆαι, I cut.

The time of the moon's *Dichotomy*, is of considerable use in fixing the sun's distance from the earth. But it is very difficult to fix the precise moment when the moon is bisected, or in her true *Dichotomy*. Observation informs us, that when she is 30 minutes distant from the quadratures, she appears bisected; but she appears so too in the quadratures themselves, and some time afterwards, as Ricciolus acknowledges in his *Almagest*. So that she appears *dichotomized* at least for the space of a whole hour: in which time, any moment may be taken for the true point of the *Dichotomy*, as well as any other. But the infinite number of moments of time give an infinite diversity of distances. The moment in which the true *Dichotomy* happens, being thus uncertain; but it being granted withal that it happens before the quadrature Ricciolus takes the middle point between the quadrature, and the time when it is first dubious; whether the moon be *dichotomized*, or not, for the true *Dichotomy*. Keil.

DICHOTOMY, in botany a term us'd to express that division of the branches, which we see in mistletoe, and in the greater part of the sea fucus's, in which each branch is divided into two.

DICTAMNUM, ΔΙΤΤΑΝΥ, a medicinal plant, much valued among the ancients, and particularly applauded by their poets. It was esteemed a specific for wounds of arrows, which it drew out with wonderful ease, and according to them, only grew in the island of Crete, and even only in a little obscure corner thereof; whence its appellation *Dictamnus Creticus*. It is still found in that island.—M. Tournesort, who was in Crete describes the place where it grows, and says it flourishes there almost all the year.

The modern *Dictamnus albus*, called also *White Dittany*, or *Fraxinella*, from its leaves, which resemble those of the ash, called by the Latins *Fraxinus*, is scarce in less esteem than that of the ancients. Its root, wherein all its virtue is lodged, is about the thickness of a finger, and is frequently divided into a number of little branches; its colour is white, its taste bitter, its smell strong, somewhat like that of a he-goat, its stem is about two foot high, reddish, and full of leaves; at the top of the stem is a flower not unlike a spike or ear; in the middle of the flower is a pistil with five little pieces at the bottom wherein the seed is contained, which is black, shining, and oval. (See *Supplement* article *Flaxinella*.) The root is excellent against the bite of venomous beasts, as also against worms, the colic, &c. It must be chosen white, both inside and outside, not fibrous, and well cleaned.

There are several other kinds of dittany, but all of less value; as the *bastard dittany*, whose leaves are much less; and the *wild dittany*, which some say neither bears flowers, nor fruit. The ancients have a tradition, that the wounded deer first discovered the virtue of the *Dictamnus Creticus*, which being eaten, presently forc'd out the arrows sticking in them. Thus Pliny Lib. VIII. c. 27. And the like account we have from Cicero de Natur. Deor. Lib. II. Virgil. *Æneid*. Lib. XII. v. 412. Tertull. de Penit. c. 11. Though Cicero, more prudent and reserved than Pliny, is contented to speak of it as by hearsay. Aristotle Lib. de Mirabilib. *Auscult.* relates it of the roe-buck. Pliny says expressly, that the juice of this plant taken inwardly, expels arrows, and cures wounds made with other weapons: he adds, that it stops suppurations, provokes the menses, and delivery, and is good in frictions and fumigations.

DICTATE, **DICTAMEN**, in the schools, a suggestion, motion, or sentiment of a man's conscience. See CONSCIENCE. A good action becomes evil if done contrary to the *Dictates* of one's own conscience.

DICTATE, **DICTATA**, is likewise used in the schools for a lesson, or exercise, wherein the master reading, or speaking something, the scholars take it down in writing after him.—Here the act of the master is likewise called *dictating*.

DICTATOR, a Roman magistrate, created by the senate, or people, on some extraordinary, and eminent occasion, to command, with sovereign authority, for a certain time, or

dinarly

dinarily limited to six months; though the office was sometimes continued to twelve.

Recourse was never had to such an officer, but in dangerous, and difficult times; as in sudden wars, popular factions, &c. He had absolute, and monarchic power while his *Dictature* lasted: and some will even have it, his power went beyond that of the kings. He was arbiter of peace and war, and had command of life and death, without any appeals lying to the people. Twenty four axes were born before him, whereas only twelve before the consuls.

The origin of this office was unknown even in Livy's time; though some ancient authors spake of T. Lartius Flavius as the first *Dictator*, who was appointed in the year of Rome 255 *. Sylla was the first perpetual *Dictator*, and Cæsar the next. After Cæsar there were no more *Dictators*. The first *Dictator* chose from among the people, was Marcus Rutilius, in 399.

* *Sed nec anno, nec quibus consulibus—nec quis primum dictator creatus sit, satis constat: Apud veterimos tamen autores, T. Lartium Dictatorem primum, Sp. Cassium magistrum equitum creatos invenio. Consulatus legere. Liv. lib. 2.*

Dionysius Halicarnassensis derives the word *ab edicendo*, because they ordained, and appointed what they pleased. But Varro will have the word taken hence, that the consul named him, which the Latins call *dicere*. Lib. IV. *de lingua Latina*. *Dictator quod a consule dicebatur, cujus dicto audientes omnes essent.*

DICTION, the phrase, elocution, or style of a writer, or speaker.

The *Dictio* or language of an orator should be pure, proper to the subject, rich without affectation, strong and close without dryness, and suitable to the person, time, place, and audience.

The *Dictio* of tragedy is accounted the fourth of the essential parts thereof: it is of the least importance of any; yet must peculiar care be taken herein to make every passion speak its proper language.

DICTIONARY, a collection, or catalogue of all the words of a language, or art, with their significations; ranged in the order of the alphabet.

What the Latins, and we after them, call *Dictionary*; the Greeks call *Lexicon*.

For the proper character, nature, office, &c. of a *Dictionary*, see the preface to this work. See also the article **VOCABULARY**.

The most ancient *Dictionaries* for the Latin Tongue, are, that called *Papias*, compiled by Solomon, abbot of St. Gall, bishop of Constance, who lived about the year 1409; another made in 1496, called *Gemma Vocabulorum*: a third in 1502, called *Gemma Gemmarum*; and a fourth by Dionysius Neffor, a cordelier.

The most celebrated old Latin *Dictionary* is that of Ambrose Calepine, a hermit of St. Augustin at Bergamo, and son of the count of Calepin. Conrad Gesner is said to have augmented this with four thousand words. Paulus Manutius increased it still more; and Passerat after him; and yet Matthias Martinus made two volumes of their omissions.

There is another noted Latin *Dictionary* of Crispinus: to say nothing of Cowper, Holyoake, Gouldman, Littleton, Cole, and numerous others of less consideration.

For the Greek, we have those of Henry Stephens, and Scapula: for the Spanish, that of Covarruvias: for the Italian, that of the Academy della Crusca: for the French, those of Nicod, Fa. Monet, Fa. Gaudin, Furetiere, Richelet, Treux, and that of the French academy: for the English, we have yet scarce any worth the mentioning; unless, perhaps, those of Loyd, Philips, Kersey, and Bailey; but a very complete and accurate one is expected daily from Mr. Johnson.

Junius has a *Dictionary*, or alphabet of the Gothic, Runic, and Anglo-Saxon. There is another in the Malayan, which is a dead language, famous throughout the East Indies; where it stands in stead of the Latin among us.

There are also historical, and geographical *Dictionaries*: as that of Charles Stephens, which is translated into French, and augmented by Morery: another of Hofmann, printed at Basil in 1677, in two volumes folio; which were followed by a continuation of as many volumes in 1683; another of Mr. Bayle, under the title of historical and critical *Dictionary*, first printed at Rotterdam in 1697, in two large volumes: a philosophical *Dictionary*, by Mr. Chauvin of Berlin: besides several law *Dictionaries*, physical *Dictionaries*, family *Dictionaries*, *Dictionaries* of arts, of commerce, &c.

DIDACTIC *, in the schools, signifies the manner of speaking, or writing adapted to teach, or explain the nature of things.

* The word is formed from the Greek *διδασκω*, *docere*, I teach. There are many words that are only used in the *Didactic*, and dogmatic way.

DIDYMI, **ΔΙΔΥΜΟΙ**, the same with *Gemelli*, or *Twins*.

DIEM clausit extremum, a writ issued out of chancery to the executor of the county, upon the death of any of the king's tenants in capite, to enquire by a jury of what lands he died seized, and of what value, and who was the next heir to him.

DIES. See the article **DAY**.

DIES, in common law. There are two kinds of *days*: *juridici*, & *non juridici*.

DIES juridici, or *festi*, are all days wherein justice is administered in court.

DIES non juridici, or *nefesti*, are all sundays in the year: and in easter term, the least of the ascension of our Lord: in trinity term, the nativity of St. John the baptist: in michaelmas term, the feast of all saints, and all souls: and in hilly term, the purification of the blessed virgin.

The same distinction holds not only as to legal proceedings in court, &c. but also as to contracts.

DIES, in some ancient authors, is also used for daily provision. *Et reddebat didimium diem mellis*, q. d. as much honey as served the king's family half a day.

DIES datus, is a day, or time of respite given to the tenant, or defendant by the court.

DIESIS, in music, a division of a tone, lesser than a semi-tone; or an interval consisting of a lesser, or imperfect semi-tone.

The *Diesis* is the smallest, and softest change, or inflexion of the voice imaginable. It is also called a *Feint*, and is expressed by a St. Andrew's cross, or falter.

Aristotle call *Dieses* the elements of voice, as letters are those of discourse. Indeed, Aristotle's *Dieses* were apparently different from ours: And we find Vitruvius expressly making the *Diesis* a fourth part of the tone. But the Pythagoreans, who are held the inventors of the name *Diesis*, did not make it so small: they only divided the tone into two unequal parts, and called the lesser, *Diesis*, which we call the lesser semi-tone; and the greater, which we call the greater semi-tone, they called *Anatome*.

But in after-times, when the tone came to be divided into three and four parts, the name *Diesis* was retained to them all. And hence those different authors, we meet withal in authors, of the quantity of the *Diesis*.

Enharmonical DIESIS, is the difference between a greater, and lesser semi-tone. See **tone**, **GENUS**, **DIATONIC SCALE**, &c. *Dieses* are divided into three kinds: the *lesser enharmonical Diesis*, or *simple Diesis*, denoted by a single cross, raises the note following by two commas, or about $\frac{1}{2}$ of a tone: the *chromatic*, or *double Diesis*, denoted by a double cross, raises the following note by a lesser semi-tone, or about four commas; which is the common *Diesis*: The *greater enharmonical Diesis*, denoted by a triple cross, raises the note by six or seven commas, or about $\frac{3}{4}$ of a tone. None but the *double Diesis* is used in music. A flat is frequently used to take away the *Diesis*, and a *Diesis* to take away a flat.

When semi-tones are placed where regular tones should be; or a tone where there should be a semi-tone; it is called a *Diesis*, or *Feint*.

DIESPITER *, in antiquity, a name given to *Jupiter*.

* Some authors will have it the same with *Dies pater*, *Jupiter* father: *Jupiter* being called in Greek, *Zeus*, or *Deus* whence the oblique case *Jovis*, &c. Others hold *Diespiter* to signify *Dies pater*, father of the day. St. Augustin derives the name from *Dies*, day, and *pater*, production, bringing forth; it being *Jupiter* that brings forth the day. Of which sentiment were Servius, and Macrobius; the former adding, that in the language of the *Osici*, they called him *Lucentius*, as *Diespiter* in Latin.

Struvius Antiq. Rom. Synt. C. I. seems to intimate, that *Diespiter* signified *Phos*: But, if that be his meaning, he is apparently mistaken. For both in Cicero, and in the inscription he quotes from Gruter XXI. 8. we have only *Dies pater*, and not *Diespiter*.

DIET *, **ΔΙΕΤΑ**, in medicine, &c. a regimen, or course of living, proper in regard to health.

* The word *Diet*, in this sense, comes from *Dieta*, which signified anciently a banquetting room; and at length a table of the states, by reason the Germans held most of their councils at table.

A *spare Diet* is a sovereign remedy against all diseases arising from repletion.

It is founded on this, that nature ought not to be busied, and distracted in the concocting of food; but left wholly to her work of digesting, and expelling the morbid matter.

The word is formed from the Greek *διαίτα*, which signifies *regimen*, or *rule of life*, prescribed by physicians. And as the physicians usually order a *spare*, *feant*, *modicum*, less than is usually taken; *Diet* has with many passed into a name for this retrenchment, or diminution of the ordinary quantity of food, whether it be by advice of a physician, or by a person's own choice: provided it be to remove, or prevent some disorder.

For the advantages of a *spare simple Diet*, see **ABSTINENCE**.

Dr. Cheyne shews, how one may supply the place of medicines by *Diet*: any one, says he, may in effect lose a pound of blood, take a purge, or a sweat, by dropping the great meal, or abstaining from animal food, and strong liquors for four or five days, in chronic cases, as effectually as by opening a vein,

swal-

swallowing a dose of pills, or taking a sudorific bolus. He advises therefore all gentlemen of a sedentary life, and of learned professions, to use as much abstinence as possibly they can, consistently with the preservation of their strength, and the freedom of spirits. This they ought to have recourse to, as soon as they find any heaviness, inquietudes, restless nights, or aversion to application: either by lessening one half their usual quantity of animal food, and strong liquors, till such time as they regain their wonted freedom, or by living a due time wholly on *vegetable Diets*, as sago, rice, pudding, and the like, and drinking only wine and water.

DIET, or *Dyst*, is also used for an assembly of the states, or circles of the empire, or Poland, to deliberate, and concert measures for the publick good.

The *Diets* of the empire are ordinarily held at Ratisbon.

The general *Diet* of Poland is by the laws only to be held every two years. But pressing occasions convene them every year. The laws also confine their sitting to 15 days; but they frequently protract it to six weeks. The usual place is at Warsaw, the capital of the kingdom; though it has been often held at other places: in effect, as by the laws every third *Diet* is to be convened at Grodno, in Lithuania; whenever for particular reasons it is judged meet to baulk the turn, and hold it elsewhere, the nobility of the grand dutchy must consent to it. It is the king who fixes the time, and summons it by circular letters sent to all the palatines. In an interregnum, the archbishop of Gnesna calls the *Diet*.

The several particular *Diets* which are held six weeks before the general one, do each send three deputies chose out of the members thereof.

In Poland there are likewise *Diets* on horseback, held in the campagne, or country. Such are those wherein they chuse their king. They are called *Pospolites*.

There are likewise *Diets* held in Switzerland: *Diets* of the protestant cantons; *Diets* of the catholic cantons; and general *Diets*. They first assemble at Araw, and are convoked by the canton of Zurich: the second at Lucern, convoked by the canton of that name. The third, composed of the deputies of all the cantons, both protestant and catholic, is held twice a year, at the end of June, and the beginning of December, and meets at Baden. It is the canton of Zurich which has the right of convening it.

DIETA, in our old law-books, denotes a days-journey—*omnis rationabilis Dieta constat ex viginti miliaribus*. *Pleta*.

DIETETIC, **DIATETICA**, that part of physick, which considers the way of living with relation to food, suitable to particular cases. See **DIET**.

DIEU & mon droit, q. d. *God and my right*, the motto of the earms of England, first given by king Richard I. to intimate, that he held not his empire in vassalage of any mortal. It was afterwards taken up by Edward III. when he first claimed the crown of France; and was continued without interruption to the time of king William III. who used the motto, *je maintiendrai*; though he commanded the former to be retained on the great seal. The same is to be understood of the late queen Anne, who used the motto, *semper eadem*; which had been before used by queen Elizabeth.

DIFFAMATORY, a term chiefly used in the phrase *diffamatory libel*, signifying a writing intended to scandalize, or discredit a person, &c.

By the Roman law, and the ancient ordonnances of France, the authors of *diffamatory libels* were punished with death. See *Baldwin Comment. ad Leges de Libellis famosis*.

But the historian tells us, that cardinal Ximenes was insensible to all *diffamatory libels*: he found it but reasonable, to leave inferiors the liberty of venting their grief by writings, which only live while the person is offended at them, and lose all their spirit and malignity when despised, or disregarded.

DIFFARRICATION *, among the Romans, a ceremony whereby the divorce of their priests was solemnized.

* The word comes from the neposition, *dis*, which is used in composition for division, or separation; and *farreatio*, a ceremony with wheat; of *far*, wheat.

Diffarrication was properly the dissolving of marriages contracted by consarrication; which were those of the pontifices, or priests. Festus says, it was performed with a wheat cake. Vigenere will have consarrication and *Diffarrication* to be the same thing.

DIFFERENCE, in logic, an essential attribute belonging to some species, and not found in the genus; being the idea that defines the species.

Thus, body and spirit are the two species of substance, which in their ideas include something more than is included in the idea of substance. In body, for instance, is found impenetrability, and extension; in spirit, a power of thinking, and reasoning. So that the *Difference* of body is impenetrable extension; and the *Difference* of spirit is cogitation.

VOL. I.

DIFFERENCE, in mathematics, the excess of one quantity above another.

This angle is 60 degrees, and that 90; their *Difference* is 30. When a less quantity is subtracted from a greater, what remains is called the *Difference*.

DIFFERENCE of longitude of two places, is an arch of the equator intercepted between the meridians of the places.

ASCENSIONAL DIFFERENCE, in astronomy. See **ASCENSIONAL**.

DIFFERENCES *, in heraldry, certain additaments to coat armour, whereby something is altered, or added, to distinguish the younger families from the elder, or to shew how far they are removed from the principal house.

* They are called in Latin *Diminutiones*, and *Discornicula Armorum*, and by the French *Bras-arms*.

Of these *Differences* Sylv. Morgan gives us nine, which obtain principally among us: viz. the *label*, which denotes the first and eldest son: the *rescent*, the second: the *mullet*, the third: the *martlet*, the fourth: the *annulet*, the fifth: the *flower de lis*, the sixth: the *rose*, the seventh: the *eight foil*, the eighth: and the *cross moline*, the ninth. See each under its proper article, **LABEL**, &c.

Again, as the first *Differences* are single for the sons of the first house, or descent; the sons of the younger houses are differed by combined or putting the said *Differences* upon each other. As the first *Differences* are the *label*, *rescent*, &c. for the first house; the *Difference* for the second house is the *label* on a *rescent*, for the first of that house: for the third brother of the second house a *mullet* on a *rescent*, &c.

The original of *Differences* is controverted. Camden will have them to have begun about the time of king Richard. Paradin assigns *Differences* wore as early as the year 870. The president Fauchet observes *Differences* to have been hereditary in the French families before the time of Louis le Gros, who came to the crown in the year 1110. Moreau refers them to the time of St. Louis, and Lallouette, Belle-forest, &c. to that of Philip Augustus.—The occasion of their rise is well accounted for by Colombiere.

All nations, says he, prefer the eldest brothers to the younger; whence those, in a direct line, succeeding to their fathers, and becoming masters of their lands, took on them their coat armour, without any change, or alteration; and transmitted the same again to their eldest sons: the younger brothers, or bastards not being allowed to bear the same arms, without some additional mark, to distinguish them from the elder. Hence some heralds, he goes on, have endeavoured to confine them to certain fixed, and determinate figures, for distinguishing the second from the first, the third from the second; and so on to the sixth: assigning the second a *label*, the third a *bordure*, the fourth an *orle*, the fifth a *battoon*, and the sixth a *bend*, or *cotice*.

And the descendants of these to bear double *Differences*, or *Differences* charged on one another, viz. the eldest son of the second son to retain his paternal coat, with the *Difference* of the *label* of three points; the second the *label* of four points; the third such a *label* on a chief; the fourth a *label* charged with certain figures, as *eaglets*, *lionels*, *martlets*, *rescents*, *roses*, &c. And for the same reason, the second son of the third son shall bear a *bordure* engrailed, the third a *bordure* charged with bezants, or *tourteaux*, &c.

But the same author judges the fixing any certain invariable *Differences* at all an abuse; by reason they may happen not to be agreeable to the paternal coat, but very much deface, and blemish it. He adds, that many other figures beside those abovementioned, may be used as *Differences*; as shells, bezants, cinque-foils, and a thousand more. Some younger families have made the *Difference* in their arms by only diminishing the ordinaries, or changing the posture; and others by only changing the metal, or colour.

It must be added, that the *Difference* may be of metal on metal, or colour on colour; which in other cases is false heraldry.

DIFFERENTIAL, **DIFFERENTIALE**, in the higher geometry, an infinitely small quantity, or a particle of quantity so small as to be less than any assignable one.

It is called a *differential*, or *differential quantity*, because frequently considered as the difference of two quantities; and as such it is the foundation of the *differential calculus*: Sir Isaac Newton, and the English, call it a *Moment*, as being considered as the momentary increase of quantity. Mr. Leibnitz, and others, call it also an *Infinitesimal*. See **INFINITESIMAL**.

DIFFERENTIAL, of the first, second, &c. Degree. See **DIFFERENTIO-DIFFERENTIAL**.

DIFFERENTIAL calculus, or *method*, is a method of differencing quantities; that is, of finding a *differential*, or infinitely small quantity, which taken an infinite number of times, is equal to a given quantity.

This method is one of the finest, and subtlest in all mathematics; Mr. Leibnitz, who claims the invention thereof to himself.

himself, calls it *differentialis calculus*, as considering the infinitely small quantities found hereby as the differences of the quantities; and accordingly expressing them by the letter *d* prefixed; as the differential of *x* by *dx*; that of *y* by *dy*, &c. Sir Isaac Newton, who has a better title to the discovery, calls it the *method of fluxions*, as considering the infinitely little quantities rather as fluxions, or momentary increments, *i. gr.* of a line, generated by the fluxion of a point; of a surface, by the flux of a line; or a solid, by the flux of a surface; and instead of *d* notes them by a dot; *e. gr.* the fluxion of *x*, he writes \dot{x} ; that of *y*, \dot{y} , &c. which is the only difference between the *differential calculus*, and the *method of fluxions*.—For the history, doctrine, use, &c. thereof, see *FLUXIONS*.

DIFFERENTIAL-DIFFERENTIAL Calculus, is a method of differencing differential quantities.

As the sign of a Differential is the letter *d*; that of a Differential of *dx*, is *ddx*, and the Differential of *ddx*, *ddd*, or *d⁴x*, *d⁵x*, &c. or $x, x^2, x^3, \&c.$

Thus, we have powers, or degrees of Differentials.

The Differential of an ordinary quantity is called a Differential of the first power, or degree; as *dx*.

DIFFERENTIAL of the second power, or degree, is an infinitesimal of a differential quantity of the first degree; as *ddx*, or *ddx*, or *dx²*, *dx²*, &c.

DIFFERENTIAL of the third Degree, is an infinitesimal of a differential quantity of the second degree; *ddd*, *dx³*, *dx³dx*, and so on.

The powers of Differentials, as *dx²*, are differenced after the same manner, as the powers of ordinary quantities.

And again, as compound Differentials either multiply, or divide each other, or are powers of Differentials of the first degree; Differentials are differenced after the same manner as ordinary quantities. And, therefore, the *Differential-Differential Calculus*, is the same in effect, with the *Differential*.

DIFFERENTIAL, in the doctrine of logarithms. Kepler calls the logarithms of Tangents, *Differentiales*; which we usually call *artificial tangents*. See *LOGARITHM* and *TANGENT*.

DIFFORM, is a word used in opposition to *Uniform*, and signifies, that there is no regularity in the form, or appearance of a thing.

The botanists use it as a distinction of the flowers of several species of plants.

DIFFUSE, DIFFUSIVE, is chiefly used for a prolix manner of writing, &c.

A dictionary cannot well be too *diffusive*: for a man is never too much informed of the word he wanted; and he is not obliged to read that part of the explication which does not concern him.

A *diffusive* style is proper for discourses in the demonstrative kind. Demosthenes is close, and concise; Cicero on the contrary is *diffusive*.

DIFFUSION, the act whereby a body is spread, or stretched out, so as to take up more space.

The school-men make three kinds of *Diffusion*: the first that whereby a pure quality is *diffused*; as cold, force, &c. This they distinguish into *equal*, whereby equal portions, or degrees of the quality are distributed upon equal parts of the medium; thus, when a direct motion is impressed on a moveable, all the parts of the moveable receive an equal impetus; and *unequal*, when unequal degrees of the quality are distributed on different parts of the subject; thus it is, that force is impressed on a lever, and cold propagated through a medium.

The second kind of *Diffusion* is that performed by the motion of bodies; such is the *Diffusion* of light, sound, smell, magnetic, electric virtues, &c.

The third is performed partly by the motion of corpuscles, and partly by the *Diffusion* of a quality; and thus they hold fire to be *diffused*.

But the modern philosophers reject the notion of qualities, and their *Diffusion*. According to them, there is no other *Diffusion*, but that of corporeal substance, emitted in minute effluvia, or particles, into a kind of atmosphere all around the body; which *Diffusion* of corpuscles some call *atmospherical*, as being supposed to be terminated by a circle, whereof the *diffusing* body is the centre. Every body, it is now proved, has its sphere of activity, or *diffusion*, within which the particles, or corpuscles, torn from it, and flying away, have a sensible effect, as we see in odorous, sonorous, &c. bodies. See *QUALITY*; where the physical law of the *Diffusion* of qualities is laid down.

DIGAMMA. See *F*.

DIGAMY, the same with *Bigamy*. See *BIGAMY*.

DIGASTRICUS*, in anatomy, a muscle of the lower jaw, thus called, after a double belly.—See *Tab. Anat. Myol.* fig. 1.

* The word is formed from *dyo*, twice; and *γαστρ*, belly.

It arises fleshy from the upper part of the processus mastoideus, and descending, contracts into a round tendon, which passes through the stilo-hyoideus, and an annular ligament, which is fastened to the os hyoides; then it grows fleshy again, and ascends towards the middle of the edge of the lower jaw,

where it is inserted. When it acts, it pulleth the lower jaw down, by the help of an annular pully, which alters its direction.

DIGEST, DIGESTUM, a collection of the Roman laws, ranged and *digested* under proper titles, by order of the emperor Justinian.

That prince gave his chancellor Tribonianus a commission for this purpose; who, in consequence thereof, chose sixteen juriconsulti, or lawyers, to work upon the same. These, accordingly, took out the best, and finest decisions from the two thousand volumes of the ancient juriconsulti, and reduced them all into one body; which was published in the year 529, under the name of the *Digest*. To this the emperor gave the force of a law, by a letter at the head of the work, which serves it as a preface.

The *Digest* makes the first part of the Roman law, and the first volume of the corpus, or body of the civil law.

It was translated into Greek under the same emperor, and called *Pandecta*.

The usual method of quoting it is by a double *ff*, on account of the Greek name *Pandecta*, which being first abbreviated by a figure of two IIII, to abbreviate it yet further, the two characters were joined into one IIII, which the Latin copists mistook for *ff*.

Cujas says, that *Digest* is a common name for all books disposed in a good order and oeconomy: and hence it is, that Tertullian calls the gospel of St. Luke, a *Digest*.

DIGESTOR, or DIGESTER, an artificial means, or instrument, serving to *digest*, or dissolve meats out of the stomach, by a way analogous to that of animal digestion.

Mr. Leigh, in the *Philosoph. Transact.* gives us an artificial *Digester*, to illustrate the natural one: it is prepared from spirit of sulphur, spirit of harts-horn, the chyle of a dog, and its saliva. A piece of veal, mutton, beef, or the like, of the bigness of a nut, being put in a dram of this preparation, and set on a *digesting* furnace two hours; it drew from the flesh a juice, that had the colour and taste of chyle, and left the meat light, dry, and insipid.

Dr. Havers prepares a *Digester* of oil of turpentine, mixed with oil of vitriol; in which, raw flesh, and crumbs of bread being put, and the whole committed for four hours to *digest* in balneo marie, the meat is found dissolved, and the whole together forms a thickish pulp: hence, those authors, each of them, conclude the food in the stomach to be *digested* by some such menstrua.

But the most celebrated *Digester*, is an instrument of that name, invented by Papin, the effect whereof bears a more near resemblance to the operation of the stomach. It is a sort of vessel, wherein meat being put, together with so much water as serves exactly to fill it, a lid is screwed close on, so as to admit of no external air. Then, by the application of two or three lighted charcoals, or even a single small lamp-flame, the meat is in a few minutes (six or eight) reduced into a perfect pulp, or rather liquor. By a little increase of the fire, or the addition of a few minutes in time, the hardest bones themselves are brought into a pulp or jelly. The effect is accounted for from the strict closure of the engine, which excluding the intrusion, or escape of air, the succussions occasioned by the expansions, and oscillations of the air included in the flesh, are equable and strong, and so resolve the whole into one seemingly homogeneous body, and mix the aqueous, saline, oleous, and other particles, so strongly together, as scarce to be separable, but while hot, to appear one liquor, and when a cold jelly, of a strength proportionate to the quantity of flesh or bones dissolved in the water. This experiment seems to hold a close analogy with the operation of the stomach. For though the stomach do not ordinarily dissolve, either so strongly, or so quick; yet in proportion to its heat and constriction, Dr. Drake takes it to do the same thing: thereby breaking and resolving into small, the bodies which it included, so mixed, *inter minima*, with its humours.—These, thus reduced into a fluor, and intimately mixed with the liquids of the drink, and juices of the stomach, compose that lactescent liquor, called *Chyle*, or *Chyme*. See *CHYLE*.

DIGESTION, in medicine, that change of the food taken in at the mouth, which it undergoes in the stomach, in order to afford fit matter to compose, or increase an animal, till it arrives at its destined bulk; and to repair the loss of those particles, which the body, in its natural state, necessary undergoes.

The operation of *Digestion* succeeds to mastication, and deglutition.

It includes chylification, and is succeeded by sanguification, and nutrition.

The cause, manner, and means of *Digestion*, have been infinitely controverted: it would be tedious to enter into all the systems, and hypotheses, that have been framed by philosophers and physicians, to account for this important operation. Some contend, that it is done by a kind of elixation, or boiling of the solid, and grosser parts of the food, in the liquid, by the heat of the stomach, and of the adjacent parts, the liver, spleen, &c.

Others

Others will have it done by attrition ; as if the stomach by those repeated motions, which are the effects of respiration, rubbed, or ground off the minuter particles from the grosser matters ; and agitating, and driving the rest against each other, attenuated, and dissolved them.

Others think the bilious juice ; others the spirits, &c. chiefly concerned in the affair.

Others will have the food dissolved by a menstruum, or dissolvent : but these are greatly divided as to the nature and origin of this menstruum ; some supposing it an acid, furnished by the glands of the stomach ; others a nitroaereous spirit, which by penetrating the mass of food, breaks the connexion of the most solid parts ; and others, a saline juice, which divides and volatilizes the parts of the food.

Others again suppose *Digestion* to be performed by means of a ferment, or leaven ; which, mixing with the aliment, excites an intestine motion in the parts thereof, by whose mutual collisions, the parts are attenuated and dissolved.

But these, too, differ in their opinions of this ferment ; some taking it to be the remains of the food last *digested*, which by its continuance in the stomach, has contracted an acid quality, which renders it a ferment : others take the ferment, or principles of fermentation to be contained in the aliment it self ; which when inclosed in the stomach, and heated thereby, being put in motion, enters on its office of fermentation : but these, too, are divided ; some taking it to be the spirituous part ; and some the air in foods.

Others suppose the matter of this ferment supplied by the glands of the stomach : and lastly, others contend for the saliva, and make that the ferment serving principally for the *Digestion* of the food.

All these systems are now reduced to three principal ones ; which we still find explained, and defended in the several later writings on that subject : the first holding *Digestion* to be performed by fermentation ; the second by trituration ; and the third by fermentation and trituration together.

The first opinion was for a long time the only one. The retainers of it hold, that the food, after it is received into the stomach is there impregnated with certain menstruous juices, which being assisted by the natural heat of the stomach, raise a fermentation in the foods, which dissolves, attenuates, and converts them into chyle.

This was originally the system of the ancients ; who, though they only express themselves in general terms, as dissolving, softening, subdividing, concretion, qualities, &c. yet seem to have the notion of what we call *Fermentation*. Thus Empedocles and Hippocrates teach, that *Digestion* is performed by a putrefaction of the foods, after the like manner as the same Empedocles holds water to be converted by putrefaction into wine. Hippocrates and Aristotle use the term *Concoction*, which we likewise find in Erotian, Plutarch, and Aëtius, to express the manner of fruits ripening, the must's changing into wine, and paste's rising. Hippocrates expressly names *Efferescence*, and *Fermentation*, *de veteri medicina*, c. 5. and Galen likewise, *L. de Confectu*, c. 2. And in another place he asserts, that a certain ferous juice of the stomach concurs with the bile and spirits to effect *Digestion*. To say nothing of Cicero, who, according to the prevailing opinion of his time, attributes *Digestion* to the heat of the stomach. *Lib. II. de Nat. Deor.*

The juices, or ferments in the stomach, to whose action *Digestion* is supposed owing, are, the saliva, bile, and pancreatic juice. This is so true, that in certain voracious animals, which eat, and *digest* fast, particularly wolves, ottriches, and porcupines, the bile discharges it self immediately into the cavity of the stomach ; and we have observed a disposition analogous thereto in a man that had been a great eater.

There are only three marks to know the fermentation of dough and must by : first, in that the dough rises, and swells ; and the must bubbles and rarifies. Secondly, In that the bread and wine made by these fermentations, have different tastes and qualities from those the flower and must had before. Thirdly, In that the bread and wine, by distillation, yield principles that differ in many respects from those drawn from flower and must. Now, all these characters are found in the change made in the food by *Digestion*.

Against this system it is objected by Mr. Hecquet, and others, that in every 24 hours there is prepared a pound of saliva, half a pound of bile, and at least two ounces of pancreatic juice ; to which is to be added the stomach-liquor, resembling saliva ; the whole amounting to about two pounds, or 13824 grains of leaven. Now, say they, it is allowed by the chemists, that one grain of ferment is sufficient for 800 grains of matter to be fermented ; consequently 2 pounds of ferment would suffice for 1200 pounds of food : whereas a man ordinarily does not take above 4 pounds in a day.

Now, say they, is an argument, that fermentation is not the only, or principal intention of these juices ; since, if it had, they would have been better proportioned to the occasion. And, further, it furnishes an objection, since such a quantity of saline, menstruous humour, having so little business to employ it in fermenting the food, must act on the

stomach, corrode and destroy the fine membrane it is lined withal, and do many other mischiefs.

But to this it is answered, 1. That, according to Mr. Hecquet himself, the faculty of fermenting only belongs to the salts ; and that, by his own computation, half a pound of bile only contains 30 grains of salt ; and a pound of saliva, with two ounces of pancreatic juice, and the stomach-liquor, contain but 14 grains more : so that the real saline ferment of the stomach produced each day, only amounts to about 44 grains, which seems scarce enough for two pounds of food. But Mr. Hecquet diminishes the quantity of these salts too much, which Verheyen, and others, make a great deal more. To which is also to be added the volatile salt, mixed with the phlegm and spirits. 2. It is not true, that there is always required a grain, and only a grain of leaven for 800 grains of matter. Experience contradicts this rule. In some fermentations there is no need of any leaven at all, and in others a deal less will serve. As to the ferments acting on the membranes of the stomach ; it is certain, it does act on, and vellicate the same, when there is no food to employ it ; and this it is, that occasions the sensation of hunger. But as fast as these are corroded, they are repaired again by the nourishment proper to them. The stomach is sometimes gnawed, and incommoded by the menstruum ; but ordinarily it is preserved by a viscid matter, wherewith its inner coat is lined.

Another objection against this doctrine, is, that the chyle yields no inflammable spirit ; which it should, were it the effect of fermentation : but M. Astruc answers, that all fermentations do not produce any such spirit : that of dough, for instance, affords none, nor that of rotten fruits, nor of acids, or pure alkalis. The inflammable spirit, in effect, requires a fine attenuated sulphur, which is not found in all fermentations.

The second system was invented, or at least renewed in the present age ; and has been maintained with a deal of zeal and vivacity, as is commonly the case in any thing that has the appearance of novelty. Those who espouse this opinion, contend, that it is a mere continual attrition, or grinding, that breaks, attenuates, and reduces the food, and with the addition of a proper fluid, forms it into that whitish substance, called *Chyle* ; much as corn is ground between the stones of a mill. Which opinion seems to be confirmed by something observed in birds : their gizzard, or crop, is composed of two strong, solid, compact muscles, which rubbing against each other, and being assisted by little angular stones, or grains of sand swallowed by the birds, break and grind the dry food those animals live on : and when the sand is grown smooth, they cast them off with the other excrements, and swallow fresh grains. This sentiment is thus explained by an able assertor thereof, Mr. Hecquet, in his treatise of *Digestion*. Every thing in the body is vascular : consequently, every thing therein is hollow : every thing therein lives after its manner ; consequently, every thing is in motion : animal life being nothing but motion ; and consequently, all the vessels are in motion. Now the parts of a body, that are to move, will move most readily towards those sides, where they find the least resistance. But the place of the least resistance in tubes is the cavity ; consequently, the motion of the parts of vessels is towards their axes. The parts of vessels that are to move, are the parietes, or sides, because flexible and elastic ; and this motion can only be effected by an approximation of those parts ; consequently, the motion of the vessels consist in an approximation of their parietes : it is, therefore, a sort of contraction, pressure, or coarctation. Hence, as all the parts of the body are only vessels, they all undergo a systole, pressure, or contraction.

Further, all these vessels contain juices in their cavities ; and, therefore, all the juices, or liquids in the body, are continually compressed. This pressure is the action of an elastic force ; consequently, the pressure will be such as is the force ; and, therefore, alternative : consequently, it is a pulse, or palpitation ; and therefore the juices are continually beaten.—Now, these juices are exceedingly divisible ; and consequently they are continually attenuated, and divided : and a division effected by a pulsation, or beating, is a trituration ; and consequently, the juices in the body are continually triturated, or ground.—The reason why the compressive force should be alternative, is, that the membranes, which compose the vessels, consist of two plans, or series of fibres ; the one longitudinal, the other circular, cutting the longitudinal, at right angles : the longitudinal are tendinous, and elastic ; the circular are muscular, or motive, like sphincters, which compress : the circular are over the longitudinal, and embrace, or gird them round : the former, we have already observed, are elastic ; and their elasticity opposes the compression of the latter. From this opposition, or resistance, arises a reciprocal action, and re-action, which is the alternative grinding force required. See TRITURATION.

To such as account for *Digestion* from a ferment, those philosophers object, that *Digestion* is a dissolution ; that to prepare the matters for this dissolution, they must be softened ; that the proper effect of acid ferments, is, to gnaw, or tear the hardest matters, and to harden the softer, to thicken the fluid, fix the fat, and coagulate the milky ; consequently, that an acid

acid ferment should rather impede, than promote *Digestion*. Add, that beside the force to grind the juices, and the vessels to compress them, there are likewise liquors to dilute and temper them, viz. the saliva, and stomach-liquor. And mineral matters, which the stomach-liquor cannot dissolve, are found to be worn, and polished after having stayed some time in the stomach. Now polishing is the effect of triture, or grinding, not of corrosion. Accordingly we find pelotons, or balls of hairs, or threads in the stomach of cattle, very smooth and shining, and far from having any marks of corrosion.

The authors who are for the trituration require three things for *Digestion* to proceed: a liquor, to wet and dilute the food, which they find in the saliva, and stomach-liquor: a vessel, which is the stomach: and a moving power to grind, which they imagine to have found in the muscles of the stomach, diaphragm, and abdomen. The moving force in the muscles of the stomach they maintain to be equivalent to the weight of 248235 pounds; and the force of the stomach alone, to a weight of 12951 pounds: a power more than equal to that of one of the ablest mill-stones. See *Traité de la Digestion par M. Hecquet*.

Borelli, on the footing of the equilibrium of fluids, has demonstrated, that the force of the flexor of the last articulation of the thumb is equal to 3720 pounds: whence Pitcairn deduces, that the force of the fibres of the stomach is equal to 12951, and that of the diaphragm, and muscles of the lower venter, to 248235 pounds. His way of estimating is this: The flexor only weighs 122 grains, and yet may sustain 3720 pounds: consequently, the fibres of the stomach weighing 8 ounces, and the diaphragm with the muscles of the lower venter, weighing together 8223 grains, have the force abovementioned.—But this argumentation seems founded on a mistake; for it is not in virtue of its weight of 122 grains, that the flexor muscle is equivalent to 3720 pounds: besides that it would follow hence, that the heavier the muscles of the stomach, diaphragm, and abdomen, are; the more force they would have, and consequently, the more easy, and expeditious would the *Digestion* be: which is false.

The patrons of this system compare the brain to the arbor, or screw of a press, the heart to a piston, the lungs to bellows, the mouth to a mill-stone, or a pestle, the stomach to a press, and the intestines to a receiver, or vat. They contend, that Castellus, a physician of Messina, was the first of the moderns, who expressly espoused the system of ferments, and that he was followed by Van Helmont, and Willis.

But even the partisans of trituration are not perfectly agreed amongst themselves: Pitcairn will have it performed by a total contraction of the stomach: and Mr. Hecquet, by a successive peristaltic, or vermicular contraction.

Attruc, in his treatise, *de la Cause de la Digestion*, refutes this system of trituration at large. He makes a strong opposition to the calculus, which raises the moving force of the stomach, &c. so very high. The contraction of the fibres of the stomach, to compress the food, he shews, cannot exceed three ounces; and it is even gratis that he allows so much: that of the diaphragm and abdomen, he computes at about 4 pounds. He observes, that Pitcairn, surprized in all probability, with what he had asserted of this force, durst not pursue the proportion whereon his calculus was founded, and according to which, one of the forces would have been found equivalent to 117888 pounds, and the other to 250734; which together make 368622 pounds.

The diaphragm in its motion has two powers; the one direct, which is that whereby its muscles draw from the centre towards the circumference; the other lateral, whereby it rests, or presses on the stomach: the latter is very small in comparison of the former. Now, what seems to have deceived Pitcairn, and Hecquet, is, their taking the direct for the lateral force; the contraction of the fibres for their pressure on the stomach. And the same oversight they are guilty of in the muscles of the abdomen, whose pressure against the abdomen is only lateral. Add, that there are voracious animals without any diaphragm at all; as fishes, which respire through their gills: and others that have only a single membrane; as birds, in whom the muscles of the lower venter are very small and feeble and in a situation that incapacitates them from acting at all on the stomach.

The membranes of the stomach being very soft, and having only a slender motion, seem very unfit for the office of a mill-stone. It is true, in certain fowls, the stomach consists of a close, compact, fleshy muscle, exceeding strong, so as to break little stones and bits of glass. But to this it is urged, that it is no *Digestion*, which in these animals is effected in the intestines. And the structure of our stomach compared with the gizzard or crop of granivorous birds, does on the contrary, furnish a very cogent argument against trituration. The gizzard, is provided on the out-side with four fleshy muscles, the tendons whereof meet in two opposite points: the inside is lined with a hard, thick, cartilagenous membrane; especially in the places where the tendons meet. By this mechanism nature plainly intimates the office of the gizzard to be the grinding of the grain by the friction of its papillies, or sides: whereas, the membrane in the stomach of a

man is exceedingly thin and fine, furnished with few fleshy fibres, covered with a tender, sensible kind of villi and the stomach it self is of a great capacity. And the stomach in rapacious birds, who devour huge pieces of raw flesh without chewing, is still a finer membrane. Lastly, on the foot of the system of trituration there seems no accounting for hunger, nausea, indigestions, crudities, &c.

In the system of trituration it seems impossible to explain why certain things easy to grind, e.g. cabbage-leaves cannot be *digested* in certain stomachs, which yet find no difficulty in *digging* more hard, and solid meats, as beef and mutton: whereas the difference of dissolvents gives a natural and easy solution. Hydropic people continue to *digest*, notwithstanding the fibres of the stomach, as well as the rest of the body, are extremely relaxed through the redundancy of moisture. And the total, prompt change of nature induced in foods, can be the effect of nothing else but fermentation; which even discovers it self by belches, &c. while it goes on. The iron, needles, pins, &c. sometimes found undissolved in the stomach, are no objection to the system of fermentation; it being notorious, that no dissolvent dissolves all bodies.

In birds, which feed on grain, the fermentation is manifest, first in the crop, where the grain is prepared for *Digestion*, by being macerated in a liquor like the saliva; and afterwards in the gizzard, where the *Digestion* is perfected by a dissolvent poured into it by a conglomerate gland.—But the thing is still more apparent in ruminating animals, which are provided with four stomachs; the two first whereof, though formed of a nervous membrane, make but little alteration in the aliment, for want of a ferment, or menstruum; so that it returns to be chewed again; and only becomes well *digested* in the fourth stomach, whether a dissolvent is poured from a conglomerate gland.

The partisans of the third opinion allow it incontestable, that there are acids in the stomach, which mix with the foods, and act on them; and they hold likewise, that their action is aided, and promoted by the motion of systole, and diastole in the viscera: they add, that the acids produce a fermentation; and the oscillatory motion of the viscera a trituration; and that thus *Digestion* is the effect of fermentation, and trituration at the same time.

Be it as it will with each of the three systems, thus much we may venture to lay down from them all, as the real process of *Digestion*: the end of this operation being to prepare the foods, so as that they may serve for nutrition; those foods must be considered from the time the man takes them in, till being converted into chyle, they mix with the blood, which conveys them into all parts of the body. The foods then we take, are either crude, as oysters, fruits, certain pulse, &c. or dressed, as flesh, and fish, which are roasted, boiled, fried, &c. and seasoned a thousand diverse ways with salt, pepper, and other spices, vinegar, wine, &c. this is done to heighten and enrich the taste, as much as to assist *Digestion*.

Further, there are some foods we swallow without chewing, as liquids; and others, which we break and communicate by chewing, as bread, flesh, &c. It is of these last we shall here speak, as undergoing more preparations, and more changes to fit them for nutrition, than the others.

The food, then, is first broke, and divided by the teeth, and, at the same time, moistened with a liquor supplied by the salivary glands, and thus is formed into a kind of paste.

Thus prepared, it is passed through the oesophagus into the stomach, there to ferment. This fermentation is caused, 1. By the salivary juice, which is a ferment, and has the same effect on the aliment, that leaven, or yeast has on paste. 2. By the heat of the stomach, viscera of the abdomen, and even excrements; which here has nearly the same effect on foods, as a dunghill has on matters laid by the chemists to *digest* therein. 3. By the remains of foods left adhering in the rugæ, or folds of the stomach, and there turned sour, and acrimonious. 4. By the compression of the muscles of the abdomen, and diaphragm. 5. By the liquor which the repeated compression of these muscles occasions to drip from the glands of the stomach. And 6. According to the sentiment of some modern physicians, by the air it self, which being mixed, and embarrased in the aliments, dilates by the heat of the stomach, and separates the parts of the foods. These causes all contribute to attenuate, and divide the food, so as to convert it into a ciceritious matter, called *Chyle*.

From the stomach the chyle descends into the duodenum, where it is further perfected by the pancreatic juice, and the bile, which thin it, precipitate its grosser parts, and render it more fluid. The chyle thus perfected and attenuated, enters the lacteal veins, which convey it into the receptaculum chyli, where it is further diluted by the lymphæ, which is brought hither in abundance. Hence it arises into the thoracic duct, and enters the subclavian vein; where being taken up by the ascending cava, it is pour'd into the right ventricle of the heart. The chyle thus mixing with the blood, embarrasses the globules thereof, and thus abates its motion: and hence that inclination to go to sleep after meals. But, by degrees, the blood commu-

communicates its motion to the chyle; and by its volatile, and exalted parts, together with the saline and nitrous parts of the air, subtilizes, and gives it its last perfection. Then the *Digestion* is finished: and the foods being by so many changes rendered the immediate matter of nutrition, are carried by the blood into all parts of the body, to repair and fill the vacancies of such as are continually dissipating, and exhaling; or even to add new ones.

As to the grosser parts of the foods separated from the chyle by the bile and pancreatic juice, they assume the colour of excrements from the bile; and their rank smell they derive from the coarser sulphurs thereof. These sulphurs, and salts of the excrements, serve, after they have passed through the intestines, and are arrived at the last, which is the rectum, to vellicate the muscles thereof, and dispose them to relax, and thus to apprise nature of a necessity to discharge.

The separation of the urine from the blood may be esteemed a part of perfect *Digestion*; the design of such separation being to render the blood more pure and balsamic, and of consequence more fit for nutrition; which the salts, the urine abounds withal, greatly prevented. This separation is thus performed: the branches of the emulgent arteries, which terminate in the glands, whereof the substance of the kidneys is composed, carry the blood thither; where a serosity is separated from the blood, by means of the pores in the glands of the kidneys: those pores representing the holes in a sieve, which only let pass such things as are of a less diameter than themselves. This serosity, called urine, is discharged hence into several little tubes, which, joining into a kind of pyramids, yield their humour into the pelvis, whence it runs through the ureters into the bladder.

DIGESTION, in chemistry, is a preparation of plants, minerals, metals, or other bodies, by putting them with some proper fluid in a vessel, and heating them gradually over a gentle fire, like the heat of an animal body.

Digestion is a previous kind of disposition to a perfect dissolution of a body, made by means of fire, or fiery particles, striking against and loosening the pores of the body, and attenuating the parts of their fluids, that their connexion with the harder matter may be more easily and perfectly dissolved. Bohnius seems to describe it pretty adequately by an insensible action and reaction of the particles of a mass moved together by some subtle, ambient fluid, to which it is exposed for *Digestion*. By calling *Digestion* a reciprocal action, their motion is intimated, by means whereof they are torn from the contiguous ones; and in a word, differently modified: so that the motion ended, the digested mass differs either wholly, or in part, from the same mass before *Digestion*; sometimes in colour, sometimes in smell, sometimes in transparency, sometimes in taste, sometimes in consistence, and other affections.

That *Digestion* is effected by motion, is evident from an observation of Dr. Grew; who, bringing a mixture of salt of tartar, and oil of turpentine, several days journey with him in a coach to London, found it had undergone a more intimate mixture, than if it had been exposed to a long *Digestion*.

Digestion is ordinarily confounded with maceration; but the two things differ, in that there is heat required to *Digestion*; whereas maceration is done in the cold.

Digestion is usually performed with the addition of some menstruum suitable to the matter: thus, roses and poppies heads are put to digest in oil, or water, to make unguents, or syrups: calcined lead, and cerus, and digested in distilled vinegar, to make the magistery thereof, or the sal saturni.—Hence Dr. Friend defines *Digestion* to be the solution of bodies, made by menstrooms, with the assistance of fire.

The use of *Digestion*, in pharmacy, is to extract the more volatile particles, and mix them intimately with the menstruum. To this end a gentle fire is commonly used, that the corpuscles, which are most volatile, may separate as it were of their own accord: for a fierce fire forces out the fæces, as well as the finer particles; and if it does not abate the strength of the liquor, as is often the case, it will not fail of spoiling its clearness.

To conceive the nature of chemical *Digestion*, it may be necessary to shew how the particles of bodies can, by this process, be diffused every way, and sustained in the menstruum; which deserves the more to be accounted for, because those solid particles have not the same specific gravity, as the liquors have in which they swim. Though the nature of a perfectly fluid body be such, as that the particles, which constitute it, do very readily give way upon the smallest impulse, and recede from one another; yet there is found in most liquors some degree of tenacity: and from hence arises such a cohesion of parts, as cannot be broken without some force. And though, indeed, this force of cohesion in liquors seems to be but little, or almost none at all, when compared with what we experience in solids; yet we find it can make some resistance. And, as the force in liquors is either stronger or weaker, so it produces a variety of effects, differing more or less from

the phenomena, which would naturally flow from a perfect fluid: so that, though by the laws of hydrostatics, every corpuscle, how subtil soever, if put into a fluid which is specifically lighter, must necessarily sink to the bottom; yet we find that some heavy bodies, such as gold, &c. when reduced into thin plates, will be sustained in spirit of wine. This force, therefore, of tenacity, which resists the motion of bodies in a fluid, is proportional to the number of parts which are to be separated, or to the surface of the body which we would have move in the fluid. Hence it is, that since the surface of a body may be enlarged, without altering any thing of its gravity; the resistance of a fluid may be so augmented, as to equal the force of gravity which carries the body downwards. And a body, though specifically heavier than a fluid in which it is immersed, may be very well sustained in that fluid, provided it is reduced into very small particles: because the gravity of a body, thus reduced into small particles, decreases in a much greater proportion than the surface does, or, which is proportional to it, the resistance of the fluid: so that at length the resistance, arising from its tenacity, will be equal to the gravity of the particles, and so will hinder its descent. And, therefore, both in solution and digestion, it is a general rule, that if the gravity of a body be to the tenacity of the fluid, as P to 1; and if the body be then subdivided, so that the diameters of the parts be to that of the whole, as 1 to P; the resistance, which the particles will meet with in their descent, will be equal to their gravity: for, since their weight is $\frac{1}{P^3}$, but their surface $\frac{1}{P^2}$, the gravity will be to the resistance as $\frac{1}{P^3}$ to $\frac{1}{P^2}$ or as 1 to P. So that by this we may understand how the corpuscles of metals swim in menstrooms which are specifically lighter; as gold, in the spirit of nitre, which is drawn off from bezoar mineral, though the gravity of gold be fifteen times greater. And, in the same manner, we may understand how corpuscles, specifically heavier, are suspended in any other menstruum. And it is for the same reason, that such as are lighter cannot rise up to the surface: for the pressure of fluids being equal every way, the superior parts act reciprocally on the inferior; so that the same force, which keeps the heavy particles from sinking, will not permit those which are lighter to ascend.

DIGESTION, in chirurgery, expresses a disposition in abscesses, to ripen, and come to suppuration.

Tumours, arising on the parotides of children, are of easy *Digestion*: They ripen in a little time. Dionis.

DIGESTION is also used for maturation, or that state of a disease, wherein the morbid matter is so changed in bulk, figure, cohesion, mobility, &c. by the use of proper medicines, or even by the force of nature, as to be less noxious and hurtful, and consequently to abate the violence of the distemper.

The Greeks call it *μασάω*. The matter of the disease so far digested, as to become next a-kin to salubrious, or healthy matter, is said to be *resolved*.

DIGESTIVE faculty. The ancient philosophers admitted a *digestive faculty*, or quality in the human body; as not knowing how otherwise to account for the act of *Digestion*.

DIGESTIVE is also used in medicine for such remedies as strengthen, and increase the tone of the stomach, and assist in the *Digestion* of foods.—To this class belong all stomachics, and strengtheners, or corroborants.

DIGESTIVE, in chirurgery, denotes a sort of unguent, plaister, or the like, that ripens, and prepares the matter of wounds, &c. for suppuration.

The common *Digestive* is composed of turpentine, yolk of eggs, oil of St. John's wort, unguentum, basilicum, and tincture of aloes.

The wound must be dressed the first day with a *Digestive*, to bring it to suppuration.

DIGITATED, among botanists, is a term applied to the leaf of a plant, which either consists of many simple leaves set together upon one foot-stalk; as in the cinque-foil, vetches, &c. or else when there are many deep gashes, or cuts in the leaf; as in those of Dragons, hops, &c.

DIGIT, **DIGITUS**, in anatomy. See the article **FINGER**.

DIGIT, in astronomy, is the measure whereby we estimate eclipses; amounting to the 12th part of the diameter of the luminary eclipsed.

The diameter of the body, or disk of the sun, or moon, is divided into twelve parts, called *Digits*; and an eclipse is said to be of ten *Digits*, when ten of those parts are hid.

These *Digits*, Wolfius, and some others call *Digiti Ecliptici*.

DIGIT, in arithmetick, signifies any integer, or number under ten; as 1, 2, 3, 4, 5, 6, 7, 8, 9.

DIGIT, is also a measure taken from the breadth of the finger.

A *Digit* is properly 3 fourths of an inch, and equivalent to 4 grains of barley, laid breadth-wise so as to touch each other.

DIGLYPH, a kind of imperfect triglyph, console, or the like, with only two channels, or engravings, instead of three. See **TRIGLYPH**.

DIGNITARY, in the canon law, a person who holds a *Dignity*, that is, a benefice which gives him some pre-eminence in the choir, above mere priests, and canons.

Such is a dean, and arch-deacon; though the word is now abusively applied to a mere prebendary, or canon.

Dignities are sometimes simple, sometimes with cure of souls, and sometimes with jurisdiction and administration of sacred things. The canons even define *dignity*, *administratio cum jurisdictione & potestate conjuncta*. If the *Dignity* have no contentious, or exterior jurisdiction, it is a simple parsonage, and only gives pre-eminence. See **BENEFICE**, **PARSONAGE**, &c. Of *Dignities*, including prebends, Camden reckons in England 544 in number.

DIGNITY, a quality that denotes a man (*dignus*) worthy.

DIHELIOS, in the elliptical astronomy, a name which Kepler gives to that ordinate of the ellipsis, which passes through the focus, wherein the sun is supposed to be placed.

DIKE *, a *Ditch*, or *Drain*, made for the passage of waters.

* The word seems formed from the verb, to *Dig*: though others chuse to derive it from the Dutch, *Diik*, a dam, sea-bank, or wall.

DIKE *, or *Dyke*, also denotes a work of stone, timber, or fascines, raised to oppose the entrance, or passage of the waters of the sea, a river, lake, or the like.

* The word comes from the Flemish *Dyk*, or *Diik*, a heap of earth to bound, or stem the water. Junius and Menage take the Flemish to have borrowed their word from the Greek *τρυγξ*, wall. Guichard derives it from the Hebrew *Digbab*.

These *Dikes* are usually elevations of earth, with hurdles of stakes, stones, and other matters.

The *Dike* of Rochel is made with vessels fastened to the bottom. The *Dikes* of Holland are frequently broke through, and large tracts of land are then drowned.

DILAPIDATION, a wastful destroying, or letting buildings, especially parsonage houses, run to ruin and decay, for want of necessary reparation.

The money recovered for *Dilapidations*, by 14 Eliz. 11. must be employed in the repair of the same houses.

DILATATION, in physics, a motion of the parts of a body, whereby it expands, or opens itself so as to occupy a greater space.

The generality of authors confound *Dilatation* with rarefaction; but the more accurate, especially foreigners, distinguish between them: defining *Dilatation* to be the expansion of a body, into a greater bulk, by its own elastic power: and rarefaction, the like expansion produced by means of heat.

The moderns have observed, that bodies, which, after being compressed, and again left at liberty, restore themselves perfectly, do endeavour to *dilate* themselves with the same force whereby they are compressed; and accordingly, they sustain a force, and raise a weight equal to that whereby they are compressed.

Again, bodies, in *dilating* by their elastic power, exert a greater force at the beginning of their *Dilatation*, than towards the end; as being at first more compressed: and the greater the compression, the greater the elastic power, and endeavour to *dilate*. So that these three, the compressing power, the compression, and the elastic power, are always equal.

Again, the motion, whereby compressed bodies restore themselves, is usually accelerated: thus, when compressed air begins to restore it self, and *dilate* into a greater space, it is still compressed; and consequently, a new impetus is impressed thereon, from the *dilatative* cause; and the former remaining, with the increase of the cause, the effect, that is, the motion and velocity must be increased likewise: thus an arrow shot from a bow does not quit the string, till after that be perfectly restored to its natural state; nor does the arrow move a whit swifter than the string: and if the string, before it have perfectly restored it self to its right line, be stopped, the arrow will not go its full length; which is a proof, that it is continually acquiring a new impetus from the string. And since projects, at the beginning of their motion, are little or nothing retarded, but rather accelerated, it is evident, that the motion of a string restoring itself, is likewise accelerated. Indeed, it may happen, that where the compression is only partial, the motion of *Dilatation* shall not be accelerated, but retarded. As is evident in the compression of a sponge, soft bread, gawze, &c.

DILATATION, in medicine, &c. denotes the laying open any orifice, or the lips of a wound wider; or the extension of any vessel, or the like.

DILATATORSÆ ALÆ NASI, in anatomy a pair of muscles common to the *Alæ Nasi*, and upper lip.

They arise thin, broad, and fleshy, from the cheek-bones under the orbits of the eyes, and descend obliquely with a two-fold order of fleshy fibres in each muscle; which partly terminate in the upper lip, and partly in the *alæ nasi*.—They

draw the *alæ* from each other, and widen the external openings of the nostrils.

DILEMMA *, **ΔΙΑΛΗΜΜΑ**, in logic, an argument consisting of two, or more propositions, so disposed, that grant what you will of them, you will be pressed by the conclusion.

* The word is formed from the Greek *δις*, *bis*, twice; and *λημμα*, *sumptio*.

A *Dilemma* is an argument consisting of two contrary parts, or sides, either of which catches the adversary. And hence it is also called *sylogismus cornutus*, a horned syllogism, its horns being so disposed, that if you avoid the one, you run upon the other.

It is also called *crocodillus*, by reason that as the crocodile leads such as follow it, into the water, and pursues such as fly it, to destroy them; so, whatever the adversary either assents, or denies in this kind of syllogism, is turned to his disadvantage.

For an example: A philosopher once dissuaded a man from marrying, by this argument: Either the woman you marry will be handsome, or ugly: if handsome, she will give you jealousy; if ugly, displeasure.

Cicero uses this fine *Dilemma*, to prove, that all pain is to be bore with patience: *omnis dolor aut est vehementis, aut levis: si levis, facile feretur; si vehementis, certe brevis futurus est.*

The same orator, by another *Dilemma*, proves that no messengers shall be sent to Anthony: *legatos decernitis; si ut deprecantur, contemnet: si ut imperetis, non audiet.*

Nor must we here omit that beautiful *Dilemma* of Tertullian, whereby he clears the christians, and accuses Trajan, who had forbid the seeking them out, and yet ordered them to be punished when found: *O sententiam necessitate confusam! inquit inquirendas, ut innocentes; & mandat puniendos, ut nocentes: parit & sevit, diffultat & animadvertit! quid tantis injuriis censura circumveniet? si damnas, cur non inquis? si non inquis, cur non absolves?*

For a *Dilemma* to be legitimate, there are two things required:

1. A full enumeration of parts: thus that of Aristippus above-mentioned, whereby he dissuades from marriage, is invalid, as being defective in the enumeration; there being a middle degree, or form between *handsome* and *ugly*.

2. That the *Dilemma* press the adversary alone, and that the person who makes it, be not liable to have it retorted upon him. This was the case in that celebrated *Dilemma* of the sophist Protagoras, which the Areopagites, with all their wisdom, were not able to resolve.

A youth named Evathlus, put himself to Protagoras, to learn dialectics, upon the condition, that he should pay him a large sum of money, the first cause he pleaded, in case he gained the fame. Evathlus, when fully instructed, refusing to pay the condition; Protagoras brings his action, arguing thus: You must pay the money, however, the cause go; for if I gain, you must pay in consequence of the sentence, as being cast in the cause: and if you gain it, you must pay in pursuance of our covenant. Nay, retorts Evathlus, which way soever the cause go, you will have nothing: for if I prevail, the sentence gives it, that nothing is due to you; and if I lose, then there is nothing due by the covenant.

After the like manner, an ancient priestess dissuading her son from haranguing the people, by this *Dilemma*: *nam si iusta fueris, says she, habebis Deos irratos: sin vero j, ha, iratis habebis homines*: the youth thus returned the *Dilemma* on his mother; *imo, says he, expedit ad populum verba facere, nam si iusta dixerò Dii me amabunt; si injusta homines.*

DILUTE—To *dilute* a body, is to render it liquid; or, if it were liquid before, to render it more so, by the addition of a thinner thereto.

Those things thus added, are called *Diluents*, or *Dilutors*; such are common wheats, pitans, and juleps, which in respect of the blood in a state of viscosity are thinner, and therefore are said to thin, or *dilute* it.—Flower must be well *diluted*, to make it into paste. Oker is *diluted* with oil, to paint beams, doors, &c.

DIMENSION, the extension of a body, considered as measureable.

Hence, as we conceive a body extended, and measureable both in length, breadth, and depth; we conceive a *prime Dimension*, viz. length, breadth, and thickness.—The first called a *Line*, the second a *Surface*, the third a *Solid*.

DIMENSION, is particularly used with regard to the powers of the roots, or values of the unknown quantities of equations, which are called the *Dimensions* of those roots. See **ROOT**.

Thus in a simple equation, the unknown quantity is only of *one Dimension*, as $x = a + b$: 2. In a quadratic equation it is of *two Dimensions*, as $x^2 = a^2 + b^2$. In a cubic, of *three*, as $x^3 + a^3 = b^3$, &c.

DIMINISHED COLUMN, in architecture. See **COLUMN**.

DIMINISHED INTERVAL, in music, is a defective interval, or an interval which is short of its just quantity by a lesser semitone. See **INTERVAL**.

DIMINUTION, in rhetoric, the augmenting, and exaggerating what you have to say, by an expression that seems to weaken, and *diminish* it.

As, for instance, when a man says with a certain Tone, This woman is not ugly; meaning, she is very handsome. Some authors take *Diminution* in a stricter sense, viz. for saying less than a man really means; as, You are not indeed to be commended; where a greater reproach is secretly meant.

DIMINUTION, in music, is when there are a number of words which are to make tones, and several hasty motions in the space of a cadence; several quavers, and semi-quavers, corresponding to a crotchet, or minim.

DIMINUTIO, in heraldry, a term used by Latin writers, for what we more usually call *Differences*, and the French *Brisures*. See *DIFFERENCE*.

DIMINUTION, in architecture, a contraction of the upper part of a column, whereby its diameter is made less than that of the lower part.—See *Tab. Archit. fig. 39*.

To attain these two important points in architecture, strength, and the appearance of strength, all architects have made their columns lesser above than below; which is called their *Diminution*. Some have likewise made them a little bigger towards the middle than at the bottom, which is called their *Swelling*. The Gothic architects, indeed, observe neither *Diminution*, nor swelling: their columns are perfectly cylindrical; for which reason they are properly called *Pillars*, in contradistinction to columns.

The *Diminution* generally commences from one third of the height of the column. Some make it begin from the very basis, and hold tapering to the capital; but that has not so good an effect. Vitruvius would have the *Diminution* of columns differ according to their height, and not according to their diameter. Thus, a column of 15 foot high, he *diminishes* a sixth part of its diameter, and another of 50 foot, only an eighth part; but we do not find this rule observed in the antique. The difference of orders, Mr. Perrault observes, does not infer a difference of *Diminution*; there being small and great *Diminutions* in different works of the same order: excepting, however, the Tuscan, which Vitruvius *diminishes* by a fourth part; though Vignola only makes it a fifth, and the Trajan column a ninth. The *Diminutions* are very differently adjusted in the different antique buildings, as well as by the different modern authors.

DIMINUTIVE, in grammar, a word formed from some other, to soften, or *diminish* the force, and effect thereof: or to signify a thing that is little in its kind.

Thus *cellule* is a diminutive of *cell*, *globule* of *globe*, *hillock*, of *hill*, &c.

The Italians abound in *Diminutives*; every author being at liberty to make as many as he pleases. The French are a good deal more reserved in that respect; though their old authors were very whit as licentious as the Italians, witness Belleau, &c.

In English we have very few; not that, as some have said of the French, our language is hard, and incapable of the softest expressions, but by reason we lay all our tenderness in our sentiments; or rather, our language is tender like a person of discretion, who always speaks sense, even in speaking of his passion.

In Latin, Italian, English, and most other tongues, *Diminutives* are formed from primitives, by the addition of a few letters, or syllables: in French, the case is frequently otherwise, the *Diminutive* being sometimes shorter than the primitive, sometimes of the same length.

Some grammarians call *at least* a *diminutive* conjunction, as serving to lessen, or *diminish* the force of what went before.

DIMISSORY Letters, *Litteræ Dimissoriae*, in the canon law, a letter given by a bishop to a candidate for holy orders, having a title in his diocese; directed to some other bishop, and giving leave for the bearer to be ordained by him.

When a person produces letters of ordination, or tonsure conferred by any other than his own diocesan, he must at the same time produce the *Letters Dimissory* given by his own bishop, on pain of nullity.—

Letters Dimissory cannot be given by the chapter, *sede vacante*; this being deemed an act of voluntary jurisdiction, which ought to be reserved to the successor.

DIMOERITEÆ *, a name given the Apollinarists, who, at first held, that the word only assumed a human body, without taking a reasonable soul like ours: but being at length convinced by formal texts of scripture, they allowed, that he did assume a soul, but without understanding; the word supplying the want of that faculty.

* From this way of separating the understanding from the soul, they became denominated *Dimoerites*, q. d. dividers, separators of *Divia*, and *poisiva*, I divide.

DINNER *, the great meal, or that taken about the middle of the day.

* The word is formed from the French *Dîner*, which du Cange derives from the barbarous Latin *dignare*. Henry Stephens derives it from the Greek *δένειν*; and will have it wrote *Dip-*

ner. Menage deduces it from the Italian *dinare*, to dine; and that from the Latin *desinere*, to leave off work.

Monks are said to *dine* at eleven o'clock, the common people at twelve, and the men of business at two. The Grand Tartar, emperor of China, after he has *dined*, makes publication by his heralds, that he gives leave to all the other kings and potentates of the earth, to go to *Dinner*; as if they waited for his leave.

In the general, it is agreed to be the most salutary, to make a spare supper, and to eat the more plentifully at *Dinner*; especially for tender, valetudinary people. This is the sentiment of the *Sebola Salernitana*:

Ex magna cæna non deo fit maxima pana:
Ut sis nocte levis, fit tibi cæna brevis.

Yet Bernardinus Paternus, an eminent Italian physician, maintains the contrary in a treatise expressly on the subject. The Romans, we are assur'd, never minded *Dinner*; but deferred their good cheer to the evening, which they made their grand meal.

DIOCESE *, or **DIOCESS**, the circuit, or extent of the jurisdiction of a bishop. See *BISHOP*.

* The word is formed from the Greek *διοικησις*, Government, Administration, formed of *διοικω*, which the ancient glossaries render *administro*, moderor, ordino; hence *διοικησις* τῆς πόλεως, the Administration, or Government of a city.

DIOCESS, is also used in ancient authors, &c. for the province of a metropolitan. See *PROVINCE*, and *METROPOLITAN*. *Dioecesis*, *διοικησις*, was originally a civil government, or præfecture composed of diverse provinces.

The first division of the empire into *Dioeceses* is ordinarily ascribed to Constantine; who distributed the whole Roman state into four, viz. the *Dioecesis* of Italy, the *Dioecesis* of Illyria, that of the East, and that of Africa. And yet long time before Constantine, Strabo, who wrote under Tiberius, takes notice, Lib. XIII. p. 432. that the Romans had divided Asia into *Dioeceses*, and complains of the confusion such a division occasioned in geography, Asia being no longer divided by people, but by *Dioeceses*, each whereof had a tribunal, or court, where justice was administered. Constantine, then, was only the institutor of those large *Dioeceses*, which comprehended several metropolises, and governments; the former *Dioeceses* only comprehending one jurisdiction, or district, or the country that had resort to one judge, as appears from this passage in Strabo, and before Strabo, from Cicero himself, Lib. III. *epist. ad famil. ep. 9.* and Lib. XIII. *ep. 67.*

Thus, at first, a province included diverse *Dioeceses*; and afterwards a *Dioecesis* came to comprize diverse provinces. In after-times the Roman empire became divided into XIII *Dioeceses*, or præfectures; though including Rome, and the suburbicary regions, there were XIV. These XIV *Dioeceses* comprehended 120 provinces: each province had a pro-consul, who resided in the capital or metropolis; and each *Dioecesis* of the empire had a consul, who resided in the principal city of the district.

On this civil constitution, the ecclesiastical one was afterwards regulated: each *Dioecesis* had an ecclesiastical vicar or primate, who judged finally of all the concerns of the church within his territory.

At present there is some further alteration: for *Dioeceses* does not now signify an assemblage of diverse provinces; but is limited to a single province under a metropolitan, or even to the single jurisdiction of a bishop.

Gul. Brito affirms *Dioecesis* to be properly the territory, and extent of a baptismal, or parochial church; whence diverse authors use the word to signify a simple parish.

DIOCLETIAN Epochæ. See the article *EPOCHÆ*.

DIONYSIA *, or **DIONYSIACA**, solemn feasts held among the ancients in honour of Bacchus.

* The word is formed from the Greek *Διονυσία*, of *Διονυσος*, Bacchus; and that of *Διός*, the genitive of *Zeus*, Jupiter, and *Νύξ*, a city in Egypt on the frontiers of Arabia, where Bacchus is said to have been educated by the nymphs.

The *Dionysia* are the same with what are otherwise called *Orgia*, and by the Romans *Bacchanalia* and *Liberalia*. There were diverse festivals under the denomination of *Διονυσία*, *Dionysia*, but the chief were two: viz. 1st, The ancient *Ἀρχαῖα*, probably the same with *μυσάα*, or the greater *Dionysia*, sometimes also called by way of eminence *Διονυσία*, without any other addition, as being the most celebrated of all Bacchus's festivals at Athens, where it was held in the month Elaphebolion. 2^{dy}, The New, *Νεωτέρα*, probably the same with *μικρά*, or the lesser *Dionysia*, held in autumn as a sort of preparation to the greater. Some will have this the same with *Διονυσία λυαία*, so called from *λυρος*, a wine-press, and place it in the month Lenæon.

DIONYSIAN Period. See the article *PERIOD*.

DIOPTER, or **DIOPTRA**, in writers of astronomy, is frequently used for the hole or index pierced in the pinnula, or sight of an alidade. See *SIGHTS*.

DIOPTRA, among surgeons, denotes an instrument whereby to dilate the matrix, or anus, and inspect any ulcers therein, called also *Speculum Matricis*, and *Dilatatorium*.

DIOPTRA.

DIOPTRICS *, the doctrine of refracted vision, called also *Anaclostics*.

* The word is originally Greek, formed of *dia*, *per*, through, and *optique*, *I see*.

Dioptrics is properly the third branch of optics; its office being to consider, and explain the effects of light refracted by passing through different mediums, as air, water, glass, &c. and especially lenses.

The laws of *Dioptrics*, see delivered under the articles **REFRACTION**, **LENS**, &c. and the application thereof, in the construction of telescopes, microscopes, and other dioptrical instruments, under the articles **TELESCOPES**, and **MICROSCOPES**.

DIPHRYGES *, or **DIPHRYX**, in the ancient pharmacy, the scoria, or calx of melted copper gathered in the furnace, when the metal was run out.

* The word is formed from the Greek *dis*, twice; and *φρυγην*, to roast.

Dioscorides distinguishes three very different kinds of *Diphryges*: one made of a kind of clay, or bole dried in the sun; another made of marcasite, or pyrites burnt; and a third that of the feces of copper.

The last is moderately sharp, and astringent, and is reputed good for ulcers that cicatrize with difficulty.

DIPHTHONG, ΔΙΦΘΟΓΟΣ, in grammar, a double vowel, or the union, or mixture of two vowels pronounced together, so as only to make one syllable: as (1) the Latin *ae*, or *æ*, *oe*, or *ø*; (2) the Greek *ai*, *ei* (3), the English, *ai*, *au*, &c. See **VOWEL**, and **SYLLABLE**.

(1) The word is Greek; and is compounded of *dis*, twice; and *phryges*, found.

(2) *As* answers to *ai*, the proper; and *a* the improper *Diphthong* of the Greeks, e. g. *Αἰσας*, *Αἰας*; *σπαινα*, *σπαινα*, &c.

—And, on the contrary, the Romans, when they had occasion to divide their *ae*, changed it into the Greek, *ai*: e. g. *aulal*, for *aulae*, &c.

(3) *Ai*, by some, is made a Latin *Diphthong*, as in *ais*, *Caius*, &c. —But in *ais*, and *ait*, it manifestly belongs to the latter syllable: and the Greeks write not *Tai os*, but *Tai os*: whence it seems plain that *ai*, in the Latin tongue, is not a *Diphthong*, as in the Greek.

The Latins pronounced the two vowels in their *Diphthongs* much as we do; with this exception, that the two were not heard equally, but the one was somewhat weaker than the other, though the division was made with all the delicacy imaginable. Among us, most of the Latin *Diphthongs* are lost in the pronunciation: their *æ* and *œ* are only spoke as *e*'s; so also the English *ea*, *oe*, &c. though wrote with two characters, are pronounced as simple sounds.

In English, French, and diverse other languages, one may distinguish *Diphthongs* with regard to the eye, from *Diphthongs* with regard to the ear.

A *Diphthong* with regard to the eye, is formed of two vowels meeting in the same syllable, whether the particular sound of each of them be heard in the pronunciation, or whether the sound of one of them be drowned; or lastly, whether a new sound different from either of them result from both. In the two latter cases, it is with some impropriety, that we call them *Diphthongs*. The first only are real *Diphthongs*, as being such both to the eye and ear.

Diphthongs, with regard to the ear, are either formed of two vowels, meeting in the same syllable, whose sounds are severally heard; or of three vowels in the same syllable, which only afford two sounds in the pronunciation.

On this last occasion, *Diphthongs*, with regard to the ear, are triphthongs with regard to the eye.

English *Diphthongs*, with regard both to the eye and ear, called proper *Diphthongs*, are *ai*, as in *fair*; *au*, in *laud*; *ee*, in *bleed*; *oi*, in *void*; *oo*, in *food*; and *ou*, in *house*.

English improper *Diphthongs*, or *Diphthongs* with regard to the eye, are *aa*, pronounced only like *a*, as in *Aaron*; *ea*, like *a* as in *swear*, *heart*; or like *e*, as *already*; or like *ee*, as *veal*: *eo*, like *e*, in *seoffe*; or like *o*, in *George*: *eu*, or *ew*, like *u*, as *Deuteronomy*: *ie*, like *e*, as *cieling*, *field*: *ai*, like *a*, in *feign*; or like *e*, in *deceit*: *oa*, as in *clowk*, *doat*: *oe* as in *doe*, *oecomy*: *ue*, as in *gues*: and *ui*, as in *guile*, *recruit*.

DIPLOE, in anatomy, a spongy, medullary substance, separating the two tables of the cranium, and together with them constituting the skull.

The substance of the *Diploe*, being spongy, easily imbibes the blood, and is found separated into an infinite number of little cells of different magnitudes, which receive little branches of arteries from the brain, and give passage to the little veins that proceed to the sinus's of the dura mater.

DIPLOMA, an instrument given by some colleges, and societies, on taking a degree, or passing examination; as a proof of qualification for any advancement to title, or prebeminence.

DIPPING-NEEDLE, or *Inclinator*-Needle, a magnetical needle, so hung, as that instead of playing horizontally, and pointing out north and south, one end dips, or inclines to the horizon, and the other points to a certain degree of elevation above it. Or, a *Dipping-Needle* may be defined with Mr. Whiston, to be a long straight piece of steel, (represented *Tab. Navigation fig.*

11.) every way equally poised on its centre, and afterwards touched with a lead stone; but so contrived, as not to play on the point of a pin, as does the common horizontal-needle, but to twing in a vertical plane, about an axis parallel to the horizon: and this in order to discover the exact tendency of the power of magnetism.

The inventor of the *Dipping-Needle*, Mr. Whiston observes, was, without all question, an Englishman, Robert Norman by name, a compass-maker at Wapping, about the year 1576; this is not only testified by his own account, in his *New Attractive*; but was allowed by Dr. Gilbert, and other writers of that time. The occasion of the discovery he himself relates: viz. that it being his custom to finish, and hang the needles of his compasses, before he touched them; he always found, that immediately after the touch, the north-point would bend, or decline downward, under the horizon; inasmuch, that to balance the needle again, he was always forced to put a piece of wax on the south-end, as a counterpoize.

The constancy of this effect led him at length to observe the precise quantity of the *Dip*, or to measure the greatest angle which the needle would make with the horizon.

This in the year 1576 he found at London to be 71° 50'. But the *Dip* varies as well as the horizontal direction; and is now found at the same place, to be 75° 10'.

Burrows, Gilbert, Ridley, Bond, &c. endeavoured to apply this discovery of the *Dip*, to the finding of the latitude; and the last author, going further, likewise proposed the finding of the longitude thereby: but for want of observations, and experiments, he could go no length.

Mr. Whiston, being furnished with the further observations of Col. Windham, Dr. Halley, Mr. Pound, Mr. Cunningham, Pere Noel, Pere Feuille, and his own, has improved very much on the doctrine, and use of the *Dipping-Needle*, brought it to more certain rules, and endeavoured in good earnest to find the longitude thereby.

In order to this, he observes, 1st, That the true tendency of the north, or fourth end of every magnetic needle is not to that point in the horizon to which the horizontal needle points, but towards another directly under it, in the same vertical, and in different degrees under it, in different ages, and at different places.

2^{dly}, That the power by which a horizontal needle is governed, and all our navigation ordinarily directed, is proved to be but one quarter of the power, by which the *Dipping-Needle* is moved; which should render the latter far the more effectual and accurate instrument.

3^{dly}, That a *Dipping-Needle* a foot long, will plainly shew an alteration of the angle of inclination in these parts of the world in half a quarter of a degree, or 7 1/2 geographical miles; i. e. supposing that distance taken along, or near a meridian, And a needle of four foot, in two or three miles.

4^{thly}, A *Dipping-Needle* four foot long, in these parts of the world, will shew an equal alteration along a parallel; as one of a foot long, will shew along a meridian, i. e. this will with equal exactness shew the longitude, as that the latitude.

This depends on the position of the lines of equal *Dip*, in these parts of the world, which are found to lie about 14 or 15 degrees from the parallels.

Hence he argues, that as we can have needles of 5, 6, 7, 8, or more feet long, which will move with strength sufficient for exact observation; and since microscopes may be applied to the viewing the smallest divisions of degrees on the limb of the instrument, it is evident, the longitude at land may be found thereby to less than four miles.

And as there have been many observations made at sea with the same instrument by Noel, Feuille, &c. which have determined the *Dip* usually within a degree, sometimes within 1/2 or 3/4 of a degree, and this with small needles of 5, or 6, or at the most 9 inches long; it is evident, the longitude may be found even at sea, to less than half a quarter of a degree.

Thus much premised, the observation it self follows.

To find the longitude, or latitude by the *DIPPING-Needle*.—If the lines of equal *Dip* below the horizon be drawn on maps, or sea-charts, from good observations, it will be easy from the longitude known to find the latitude; and from the latitude known to find the longitude, either at sea, or land. Suppose, e. g. you were travelling, or sailing along the meridian of London, and found the angle of *Dip*, with a needle of one foot to be 75°; the chart will shew, that this meridian, and the line of *Dip* meet in the latitude of 53° 11'; which, therefore, is the latitude sought. See **LATITUDE**.

Or, suppose you were travelling, or sailing along the parallel of London, i. e. in 51° 32' north latitude, and you find the angle of *Dip* to be 74°. This parallel, and the line of this *Dip* will meet in the map in 1° 46' of east longitude from London; which is, therefore, the longitude sought.

DIPTERE *, or **DIPTERON**, in the ancient architecture, a temple surrounded with a double row of columns, which form a sort of portico's, called *Wings*, or *Iles*.

* The word is Greek, formed from *dis*, twice; and *πτερον*, ala, wing.

DIPTOTES, in grammar, a kind of irregular nouns, having only two cases; as, *fortis, forte*.

DIPTYCHA *, in antiquity, a public register, wherein were wrote the names of the consuls, and other magistrates, among the heathens; and of bishops, and defunct, as well as surviving, brethren among the christians.

* The word *Diptycha* is formed from the Greek *διπλῶν*, or *διπλῶν*, and that from *διπλῶν*, a masculine noun derived from *πτύχω*, *I fold, or plait*. From its future *πτύξω* is formed *πτύξ*, a *Fold, or Plait*, to which adding, *δις*, twice, we have *διπλῶν*, in the genitive *διπλῶν*, whence the nominative neuter *διπλῶν*, q. d. *a Book folded in two leaves*: though there were some in three, and others in four, or five leaves.—An ingenious author imagines this name to have been first given them to distinguish them from the books that were rolled, called *Volumina*. See **VOLUME** and **BOOK**.

Justinian, offended at pope Vigili, for refusing to subscribe the condemnation of the three chapters, gave orders for his name to be erased out of the *Diptycha*. Du Pin. The emperor commanded the name of the new patriarch to be entered in the *Diptycha Sacra*.

It is certain, there were prophane *Diptycha* in the Greek empire, as well as sacred ones in the Greek church. The former were the matricula, or register, wherein the names of the magistrates were entered: in which sense *Diptycha* is a term in the Greek chancery.

Sacred DIPTYCHA. The word is plural; *Diptycha* being a double catalogue, in one whereof was wrote the names of the living, and in the other those of the dead, which were to be rehearsed during the office. We meet with something not unlike the *sacred Diptychs* of the Greeks, in the canon of the mass, according to the Latin usage; where the people are enjoined to pray once for the living, and once for the dead; several saints are invoked in different times, &c.

Gentian Hervet explains the word *Diptychs*, *διπλῶν*, by *altar-cloths*: Meursius, by that *libelli ecclesiastici*, church-books; but neither of those authors, though in other respects of great abilities, and well versed in the Greek antiquity, has given the genuine signification of the word. The *Diptycha* were neither altar-cloths, nor church-books, but a sort of tables, or tablets, alike in figure to the two tables of stone given to Moses; on one of these tables was wrote the names of the deceased, and on the other those of the living, for whom prayers were to be offered; which the deacon read over, when mass was celebrated.

In these *Diptycha* were entered the names of bishops, who had governed their flocks aright; and these were never expunged out of the same, unless they were convicted of hereby, or some other gross crime. In the *Diptycha* were likewise entered the names of such as had done any signal service to the church, whether they were living or dead, and mention was made of them in the celebration of the liturgy.

The jesuite Rosweyde affirms, that few names were entered in the *sacred Diptychs*, but those of bishops and patriarchs; and doubts very much, whether the sacred Delta, mentioned by the pretended St. Dionysius, *Eccles. Hierarch.* c. 2. wherein were entered the names of the new baptized, with their god-fathers and god-mothers, were the same with the *Diptycha*. He allows, however, that the names of the emperors, and other great persons, distinguished by their faith, and their merits, or benefactions to the church, were used to be entered. Meursius, in his *Glossarium Græco-Barbarum*, imagines them to have wrote the term, *Diptycha*, by reason there were two books, in one of which were wrote the living, and in the other the dead. But Fa. Rosweyde shews, he is mistaken: For in effect, there was usually but one, the living being entered on one side thereof, and the dead on the other. And that if the living, and dead, were each wrote in a several book, each of them was called *Diptycha*, and not both together.

Casaubon in his observations on Athenæus, Lib. VI. c. 14. supposes the christians to have borrowed the custom of writing names in a book, and rehearsing them at mass, from the heathens, who entered the names of persons they would do any signal honour to, in the verses of the Sali; as was done to Germanicus, and Verus, sons of the emperor Marcus Aurelius, and long time before, during the age of the republic, to Mamurcus Veturius, and Lucia Volumina, as we are told by Tacitus, Lib. II. Spartian, Ovid, Festus, Plutarch, &c. But Fa. Rosweyde does not approve this notion of Casaubon. The pretended St. Dionysius, a very ancient author, says the contrary, and asserts the first establishment of this usage to have been founded on scripture, 2 Tim. II. 19. Psalm CXVI. 15. Rosweyde adds Ecclesiastic. XLIV. 1. and takes these to have been the passages the ancient church had a view to, rather than the Salian verses.

The prophane *Diptycha* were frequently sent as presents to princes, &c. On which occasion they were finely gilt, and embellished; as appears from Symmachus, Lib. II. Ep. 81. Those presented were usually of ivory. The first law, de *Expens. Ludor. C. Theod.* forbids all magistrates below consuls, to make presents of *Diptycha* of ivory in the public ceremonies.

Fa. Rosweyde owns himself at a loss for the origin of this custom of making presents of *Diptychs*. Lud. Carrion, Lib. II. *Emendat.* c. 6. supposes it to have arose hence, that such presents were at first made to the persons who had been nominated *Questors*, to whom they were to be of use. Many imagine the *Diptycha* to have originally been a kind of table-books used by lovers. In effect Papias defines them, *tabellæ in quibus amores scribebantur*.

DIRECT, in optics.—**DIRECT Vision** is that performed by direct rays; in contra-distinction to vision by refracted, or reflected rays.

Direct Vision, is the subject of optics, which prescribes the laws, and rules thereof.

DIRECT Rays, are those which pass in right lines from the luminary to the eye, without being turned out of their rectilinear direction by any intermediate body, or either opaque or pellucid. See **RAY**.

DIRECT, in arithmetic. The *Rule of three DIRECT* is that oppositely to the inverse. See **RULE of Proportion**.

DIRECT, in astronomy. We consider the planets in three states, viz. *direct, stationary, and retrograde*. See **PLANET**. They are said to be *direct*, when they appear to move forward, according to the succession of the signs; and *retrograde*, when they go the contrary way.

DIRECT, in matters of genealogy, is understood of the principal line, or the line of ascendants, and descendants; in contra-distinction to the collateral-line.

Thus the house of Bourbon is said to descend in a *direct* line from St. Louis.—The heirs in a *direct* line always precede those in the collateral lines.

A very good historian uses the phrase **DIRECT Speech**, or *Harangue*, when he introduces any one speaking, or haranguing of himself: when the historian speaks, and only rehearses the chief points of what was delivered by the speaker; it is called an *indirect Speech*.

DIRECT { *East*
 { *East*
 { *West* } *Dials* are those whose planes lye directly

open to the east, or west points of the heavens, or parallel to the meridian of the place. See **DIAL**.

DIRECT South, or North { *Inclining*
 { *Reclining* } *Dials*, See **DIAL**.

DIRECT Sphere. See the article **RIGHT Sphere**.

DIRECTION, in astronomy, the motion, and other phenomena of a planet, when *direct*. See **PLANET**.

DIRECTION, in astrology, is a kind of calculus, whereby they pretend to find the time wherein any notable accident shall befall the person whose horoscope is drawn.

For instance, having established the sun, moon, or ascendant, as masters, or significators of life; and Mars, or Saturn, as promoters, or portenders of death; the *Direction* is a calculation of the time wherein the significator shall meet the portender.

The significator they likewise call *Appeta*, or giver of life; and the promoter, *Anereta*, *Promissor*, or giver of death.

They work the *Directions* of all the principal points of the heavens, and stars, as the ascendant, mid-heaven, sun, moon, and part of fortune. The like is done for the planets, and fixed stars, but all differently, according to the different authors.

DIRECTION, or *line of DIRECTION*, in mechanics, is particularly used for a line passing from the centre of the earth through the centre of gravity of a body, and the support or fulcrum that bears it.

A man must necessarily fall down, as soon as the centre of his gravity is out of the *line of Direction*.

Line of DIRECTION, in mechanics, also denotes that wherein a body moves, or endeavours to proceed.

Angle of DIRECTION, in mechanics, is that comprehended between the lines of *Direction* of two conspiring powers.

DIRECTION of the load-stone, that property whereby the magnet, or a needle touched by it, always presents one of its ends towards one of the poles of the world, and the opposite end to the other pole.

The attractive property of the magnet was known long before its *Direction*; and the *Directive* long before the inclinatory.

DIRECTION magnetical, is also used in the general for the tendency, or turning of our earth, and all magnetical bodies to certain points.

The situation of the earth, we know, is such, that its axis is in the axis of the universe; and therefore its poles, and cardinal points, exactly correspond to those thereof. This situation does account for hence, that it is the most commodious with regard to the aspects, and influences of the heavenly bodies, and renders it the fittest habitation for man. Others hold this position of the earth an effect of a magnetic virtue; and suppose a celestial pole, endued with a like magnetic virtue; which extending as far as our earth, draws the correspondent part thereof, the pole, towards it self.

DIRECTLY. In geometry, we say, two lines lye *directly* against each other, when they are parts of the same right line.

in mechanics, a body is said to strike, or impinge *directly* against another, if it strike in a right line perpendicular to the point of contact.

A sphere, particularly, strikes *directly* against another, when the line of *Direction* passes through both their centres. See *PERCUSSION*.

DIRECTOR Penis, in anatomy, a muscle of the penis, called more usually *Erector*.—See *Tab. Anat.* (Splanch.) fig. 15. lit. ee, see also the article *ERECTOR*.

DIRIGENT, a term in geometry, expressing the line of motion, along with a descript line, or surface is carried in the genesis of any plane, or solid figure.

Thus, if the line AB (*Tab. Geometry*, fig. 33.) move parallel to it self, and along the line AC, so that the point A always keeps in the line AC, a parallelogram, as ABCD, will be formed, of which the side AB is the descript, and the line AC the *Dirigent*.—So also, if the surface ABCD be supposed to be carried along the line CE, in a position always parallel to itself in its first situation, the solid ADEH will be formed, where the surface AD is the descript, and the line CE, is the *Dirigent*.

DIS, an inseparable particle prefixed to diverse words; the effect whereof is, either to give them a signification contrary to what the simple words had: as in *Disgrace*, *Disparity*, *Disproportion*, &c. Or to intimate a separation, detachment, distribution, &c. as in *discerning*, *discouraging*, *distraught*, *disposing*, &c.

DISABILITY, in law, is when a man is made incapable to inherit lands, or take any benefit, which otherwise he might do; which may happen four ways, viz. by the act of the ancestor; by the act of the party; by the act of law; and by the act of God.

DISABILITY by the act of the ancestor, is, where a man is attained of treason, or felony: by which attainer his blood is corrupted, and thereby himself and his children are *disabled* to inherit.

DISABILITY by the act of the party himself; is where a man binds himself by obligation, that upon a surrender of a lease he will grant a new estate to the lessee: and afterwards he grants the reversion to another, which puts it out of his power to perform it.

DISABILITY by the act of the law, is when a man by the sole act of law, without any thing by him done, is rendered incapable of the benefit of the law: as, an alien born; so that, if a man born out of the king's liegeance, will sue an action, the tenant, or defendant, may say, he was born in such a country out of the king's liegeance, and demand judgment, if he shall be answered; for the law is our birth-right, to which an alien is a stranger, and therefore *disabled* from taking any benefit thereby.

DISABILITY by the act of God, as when the party is *non compos mentis*, or, *non sana memorie*, which so *disables* him, that in all cases, where he gives, or passes any thing, or estate from him, after his death it may be disannulled, and voided.

DISARMING, the act of depriving a person of the use or possession of arms. See *ARMS*.

On the conclusion of a peace, it is usual for both sides to *disarm*. We have diverse laws for *Disarming* papists, and all recusants. Under K. George I. a law was made for *Disarming* the Highlanders; none of whom, except peers, or gentlemen of 400 *l. per ann.* are to wear any arms, in the field, on the road, or at market. 1. G. I. stat. 2. c. 54.

The game law has, in effect, *disarmed* all the common people of England, having under 100 *l.* a year in landed estate, except the servants of lords of manors.—Yet by the ancient policy of England, the whole nation was obliged to bear arms.

DISC, or **DISK**, **DISCUS**, in antiquity, a kind of round quoit, or a piece of stone, or metal, about a foot over, used by the ancients in their exercises.

The *Discus* of the ancients was flat and round, resembling the apparent figure of the sun.

The exercise of the *Discus* was one of those practised in the solemnities of their public games: it consisted in pitching, or throwing a *Discus* either upward, or straight forward; and he who threw it highest, or furthest, bore away the prize. Those who practised at this game, were called *Discoboli*, i. e. throwers of the *Discus*.

The Poets tell us, that Hyacinth, a favourite of Apollo, playing at the *Discus* with that god, was killed by a blow of Apollo's *Discus*, which his rival Zephyrus diverted from its course, and cast on the boy's head.

The *Discus* was thrown by means of a little cord made of hair, as appears from Claudian Lib. II. in *Eutrop.* Carm. 20, v. 359. & seq. Ovid describes this sport *Metam.* Lib. X. v. 175.

The Romans learnt the game of the *Discus* of the Greeks, and practised it among themselves. Dempster, *Paralleip. in Res. Antiq. Rom.* L. V. c. 1. and Pet. Faber, *Agonisticon*, L. II. c. 1. treat of the diversion of the *Discus*.

DISC, or **DISK**, in astronomy, the body, or face of the sun, or moon; such as it appears to us.

The *Disc* is conceived to be divided into twelve equal parts, called *Digits*; by means whereof it is, that the magnitude of an eclipse is measured, or estimated. Such an eclipse was

so many digits, or parts of the sun, or moon's *Disc*. Mercury and Venus are sometimes seen in the sun's *Disc*, transiting the sun's *Disc*.

In a total eclipse of either of those luminaries, the whole *Disc* is obscured, or darkened; in a partial eclipse, only part of them. See *ECLIPSE*.—Half the moon's *Disc* was immersed in the shadow of the earth in such an eclipse.

DISC, in optics, the magnitude of a telescope glass; or the width of its aperture, whatever its figure be, whether a plain, convex, meniscus, or the like.

DISC, **DISCUS**, in botany, is applied to the central, or middle part of radiated flowers; as being round, and plain like a quoit.

This is sometimes also called the *Pelvis*, or *Basin*.—The *Disc* is composed of several flosculi perpendicularly placed.

DISC, in the Greek liturgy, is nearly the same thing with the *Patena* in the Latin. See *PATENA*.

In the Greek church the consecrated bread is laid on a *Discus*, as in the Latin church it is on a *Patena*. The *Discus* only differs from the *Patena*, in that it is bigger, and deeper, as resembling a plate, which was the proper signification of the word *Discus* among the ancients.

DISCENT. See the article *DESCENT*.

DISCERNING, an act of the mind whereby it distinguishes between ideas.

On this faculty of *Discerning*, depends the evidence and certainty of several, even general propositions, which pass for innate truths; and which in reality flow from this clear *discerning* faculty of the mind, whereby it perceives two ideas to be the same, or to be different.

In being able nicely to distinguish one thing from another, where there is the least difference, consists in great measure that exactness of judgment, and clearness of reason, which is to be observed in one man above another; which is quite opposite to wit, this consists most in the assemblage of ideas, and putting those together with quickness and variety, which have the least resemblance, to form agreeable visions; whereas judgment separates carefully those ideas, wherein can be found the least difference, to prevent error, and delusion. To the well-distinguishing our ideas, it chiefly contributes, that they be clear, and determinate, and when they are so, there will not arise any confusion, or mistake about them, though the senses should convey them from the same object differently on different occasions. See *JUDGMENT*.

DISCIPLINE, primarily signifies instruction, and government; but the word is figuratively applied to a stated method of living, according to the rules of some profession.

We say the *military Discipline*, the *ecclesiastical*, or *church Discipline*, the *regular*, or *monastic Discipline*, &c.

We do not say *civil Discipline*, but instead thereof *policy*.

DISCIPLINE, is also used in a peculiar sense, for the chastisement, or bodily punishment inflicted on a religious, who has been caught delinquent; or even for that which the religious voluntarily undergo, or inflict on themselves by way of mortification.

Among all the austerities practised by the ancient monks and solitaries, Dupin observes, there is no mention made of *Discipline*: in effect, it does not appear to have been in use in antiquity, unless to punish the monks, who had been taken tripping. It is commonly said to be St. Dominic, and Peter Damian, who first introduced the use of *Discipline*: but Fa. Mabillon notes, that Guy, abbot of Pomposa, and others, had practised it before them. It is pretty certain, the practice was first established in the eleventh century, with design to redeem the penances the canons imposed on diverse offences; and at length, they came not only to redeem for themselves, but also for others. See Fa. Mabillon.

DISCIPLINE, is also frequently used for the instrument, where-with a monk chastises, or mortifies himself; which is usually made of ropes, knotted hair, or twisted parchment; sometimes of broken rods. St. Jerom is painted with *Disciplines* of iron chains, armed with spur rowels, &c. See *FLAGELLATION*.

DISCLAIMER, in law, a plea, containing an express denial, renouncing, or *disclaiming* of a thing alleged.

As, if the tenant sue a replevin upon a distress taken by the lord, and the lord avow the taking, saying, that he holds of him as his lord, and that he distrained for rent not paid, or service not performed; then the tenant denying to hold of such lord, is said to *disclaim*: and the lord proving the tenant to hold of him, the tenant loses his land.

Also a man denying himself to be of the blood, or kindred of another in his plea, is said to *disclaim* his blood. If a man arraigned of felony, *disclaim* goods; being cleared, he loses them.

DISCONTINUANCE, an interruption, intermission, or cessation of the course of a thing: as, *Discontinuance* of possession, of a plea, process, &c.

The effect of a *Discontinuance of possession*, is, that a man may not enter on his own land, or tenement alienated, whatever his right be to it, of himself, or by his own authority; but must bring his writ, and seek to recover possession by law. As if a man alien the lands he holdeth in right of his wife.

or a tenant in tail make any feoffment, or lease for life not warranted by the Stat. 32 Hen. VIII. by fine, or livery of seisin; such alienations are called *Discontinuances*.

The effect of *Discontinuance of plea*, is, that the opportunity of prosecution is lost, and not recoverable, but by beginning a new suit. For to be *discontinued*, and to be put off without a day, are the same thing; and are nothing less than to be finally dismissed the court.

If a justice-seat be *discontinued* by the not coming of the justices, the King commonly renews the same by his writ, &c.

DISCORD, in music, the relation of two sounds, which are always, and of themselves, disagreeable, whether applied in succession or consonance.

If two simple sounds be in such a relation of tune, that is, have such a difference of tune; as that being sounded together, they make a mixture, or compound sound, which the ear receives with displeasure; it is called a *Discord*: as, on the contrary, if it receive it with pleasure, it is called a *Concord*: And whatever two sounds make an agreeable, or disagreeable compound, they will have the same effects respectively, if they be applied in succession.

As concords are denominated harmonical intervals; so may *Discords* be denominated unharmonical intervals.

Discords are distinguished into *concinuous*, and *inconcinuous* intervals.

Concinuous Discords, by the ancients called *Ecmeli*, are such as are apt, or fit for music, next to, and in combination with concords. These are relations, which in themselves are neither very agreeable, nor very disagreeable; and have only a good effect in music by their opposition, as they heighten, and illustrate the more natural and essential principles of the pleasure we seek for; or, as by their mixture, and combination with them, they produce a variety necessary to our being better pleased. Notwithstanding this, they are still called *Discords*; as the bitterness of some things may help to set off the sweetness of others, and yet they may still be bitter.

Inconcinuous Discords, by the ancients called *Emeli*, are such as are never chosen in music; as having too great a harshness in them, though even the greatest *Discord* is not without its use.

The essential principals of harmony, harmonical intervals, or concords, are but few, in number only eight; the indefinite number of other ratios are all *Discords*. Hence Mr. Malcolms shews the necessity of taking some of the less untoward of these *Discords* into the system of music: In order to this, he considers the effect of having none but harmonical intervals in the system of music.

1. With respect to a single voice: if that should move always from one degree of tune to another, so as every note, or sound to the next; were in the ratio of some concord; the variety, which is the life of music, would soon be exhausted. For to move by no other, than harmonical intervals, would not only want variety, and so weary us with a tedious repetition of the same things, but the very perfection of such relations of sounds would cloy the ear, in the same manner as sweet and luscious things do the taste; which for that reason, are artfully seasoned with the mixture of lower and bitter.

2. With respect to music in parts, i. e. when two or more voices join in consonance, the general rule is, that the successive sounds of each be so ordered, that the several voices shall be all concords. Now there ought to be a variety in the choice of these successive concords, and also in the method of their successions; all which depends on the movement of the single parts. So that, if these could only move in an agreeable manner by harmonical distances, there are but a few different ways wherein they could move from concord to concord; and hereby we should lose much of the ravishment of sounds in consonance. As to this part then, the thing demanded is a variety of ways whereby each single voice, or more in consonance, may move agreeably in the successive sounds, so as to pass from concord to concord, and meet at every note in the same, or a different concord, from what they stood in at the last note.

In what cases, and for what reasons *Discords* are allowed, the rules of composition must teach: but only joining these two considerations, &c. we see how imperfect music would be without any other intervals than concords.

Beside the *concinuous Discords*, used designedly in music, there are several other *Discord* relations, which happen unavoidably, in a kind of accidental and indirect manner. Thus, in the succession of several notes, there are to be considered not only the relations of those which succeed others immediately, but also of those betwixt which each other notes intervene. Now the immediate succession may be conducted so as to produce good melody, yet among the distant notes there may be very gross *Discords*, that would not be tolerable in immediate succession, and far less in consonance. And such *Discords* are actually contained in the scale of music. Thus, taking any one species, e. gr. that with the greater third, and marking the degrees betwixt each term and the next; though the pro-

gression be melodious, as the terms refer to one common fundamental, yet there are several *Discords* among the mutual relations of the terms, e. gr. from 4th to 7th g, is 32 : 45; and from 2d g to 6th g, is 27 : 40; and from 2d g to 4th, is 27 : 32; all *Discords*.

The species of counterpoint, wherein there is a mixture of *Discords*, is called *figurative counterpoint*; of which there are two kinds: That wherein the *Discords* are introduced occasionally, to serve as transitions from concord to concord; and that wherein the *Discord* bears a chief part in the harmony.

Upon the unaccented parts of the measure, *Discords* may transiently pass without any offence to the ear: This is called *Supposition*, by reason the transient *Discord* supposes a concord immediately following.

The harmony of *Discords* is that wherein the *Discords* are made use of as a solid and substantial part of the harmony: For, by a proper interposition of a *Discord*, the succeeding concords receive an additional lustre. Thus the *Discords* are in music what the strong shades are in painting.

The *Discords* are the 5th when joined with the 6th; the 4th joined with the 5th; the 9th is of its own nature a *Discord*; so is the 7th.

These *Discords* are always to be introduced into the harmony with due preparation, and must be succeeded by concords: which is commonly called the *resolution of the Discord*. The *Discord* is prepared by substituting first in the harmony in quality of a concord; that is, the same note, which becomes the *Discord*, is first a concord to the bass-note immediately preceding that to which it is a *Discord*.

The *Discord* is resolved by being immediately succeeded by a concord descending from it by the distance only of greater 2d, or lesser 2d.

Apple of Discord, *Pomum Discordia*, a phrase used to signify the subject, or occasion of some misunderstanding in a society. It is borrowed from the heathen mythology: The poets feign, that at the marriage of Thetis and Peleus, the goddesses of *Discord* threw a golden apple, whereon were wrote these words, *to the fairest*; which immediately stirred up a dissension between Juno, Pallas, and Venus, each pretending a title to the apple.

DISCOVERY, in dramatic poetry, a manner of unravelling a plot, or fable, very frequent in tragedies, comedies, and romances; wherein, by some unforeseen accident, a *Discovery* is made of the name, fortune, quality, and other circumstances of a principal person, which were before unknown. A late author defines the *Discovery* a change, which bringing us from ignorance to knowledge, produces either love or hatred in those whom the poet has a design to make either happy, or miserable.—For a *Discovery* should never be in vain, by leaving those who thus discover one another in the same situation and sentiments they were in before: in effect, those *Discoveries*, which are immediately followed by a peripetia, or change of fortune of some principal character, whereon the unravelling depends, are always the most beautiful.

One of the finest *Discoveries* ever brought upon the stage, is that of Oedipus in Sophocles; for the minute he finds himself the son of that Jocasta, who was then his wife, he becomes of the most happy, the most miserable of all men.

There are three sorts of *Discoveries*: The first by certain marks in the body, either natural, or accidental: such is that of Ulysses, who having received a wound in the thigh by a boar; before the Trojan war, is discovered by the old nurse, upon washing his legs after his return home incognito.

The second by tokens: as the easiest of things, which the priests found with Ion when he was exposed, discovers Creusa, whom he was a going to kill, to be his mother.

The third is made by remembrance: that is, when the sight, or hearing of any thing occasions us to recollect our mistresses. Thus, when Ulysses heard Demodocus sing his actions at Troy, the memory of them struck him, and drew tears from his eyes, which discovered him to Alcinoüs.

But the finest sort is, that which arises from the subject, or incidents of the fable; as that of Oedipus from his excessive curiosity, and the letter that Iphigenia sent by Pylades.

DISCOUNT, in commerce, a sum deducted, or retained in hand, upon paying a greater. See **DEDUCTION**.

The term is much used among mechanics, and manufacturers, who keep workmen, journeymen, labourers, &c. for the sums advanced them before hand, which are discounted when the payments are made in course.

DISCOUNT, is more particularly used for an allowance made on a bill of exchange, or any other debt not yet become due; to induce the acceptor, or debtor, to advance the money.

Discounts are also frequently given for the payment of dubious, or bad debts.

DISCOUNT, is also used among merchants when they buy commodities on trust, with a condition, that the seller shall discount so much with him per cent. for each payment made before the time expired. See **PROMPT Payment**.

The

The *Sieur de la Porte* distinguishes between these two kinds of *Discount*: The first, or that upon bills of exchange, is reckoned like the exchange, at the rate of so much *per cent*. E. gr. at 2 *per cent*. *Discount* on an hundred pounds, there is only ninety-eight pounds to pay: whereas that on commodities, is not only laid on the hundred pound, but on the hundred and *Discount* added together. So that *discounting* for goods at 10 *per cent*. there is only eight abated on an hundred and eight, and not on the hundred. This last, he says, is the true *Discount*.

DISCOUNT, is also used with less propriety for the tare, or waste of any commodity, sum, &c. There are 12 shillings *Discount* in this bag.

The cag of oil sent me from Spain leaks; there are fifty pints *Discount*.

DISCOURSE, an operation of the human mind, whereby it passes, or proceeds from one thing to another, that is, from a known thing to an unknown.

The school-men define it in an act of cognition, whereby the mind deduces one thing from another: this it does, when in consequence of an assent given to one proposition, it yields assent to another: so that *Discourse* consists in a dependancy of assents; and supposes such an order between the acts, that that belonging to the consequent arises from that belonging to the antecedent. So that the intellect is then said, *discurre*, to *Discourse*; when, from an assent to one, or more propositions, it infers, or draws an assent to another.

The object of *Discourse*, therefore, or that about which the intellect is employed in *discoursing*, is the connexion of extremes considered with regard to some third, or medium: thus, when it judges, that every reasonable animal is risible, affirming, that there is a connexion between risibility, and rationality; and then finds, there is likewise a connexion between man and risible have likewise a connexion, as both are connected with rational: it is said to *Discourse*. Hence it appears, that *Discourse*, wherein men use to value themselves, does really betray the infirmity of the human understanding; as it denotes a chain or scale of several successive acts of cognition necessary to arrive at a truth. So that there is no *Discourse* in God, who understands all things originally and truly.

DISCOUS Flower. Botanists reckon two classes of plants with a *Discous Flower*. 1. Such as have the flower compounded, and the seed pappous, but the leaves and stalks not milky when broken. 2. The corymbiferous plants, whose flowers are compounded into a *Discous* figure, but their seeds not pappous.—Of the former kind are the daisies, chamomile, groundels, &c. and of the latter, are dandelions, wormwood, &c. These are distinctions founded by Mr. Ray, but not regarded by the later Botanists.

DISCRETE, or **DISJUNCT**, *Proportion*, is, when the ratio between two or more pairs of numbers, or quantities is the same, and yet there is not the same proportion between all the four numbers.

Thus, if the numbers 6 : 8 :: 3 : 4, be consider'd; the ratio between the first pair, 6 and 8, is the same as that between 3 and 4, and therefore these numbers are proportional; but it is only *discretely*, or *disjunctly*, for 6 is not to 8, as 8 to 3; that is, the proportion is broken off between 8 and 3, and is not continued all along, as it is in these following, which are called *Continual Proportionals*, viz. 3 : 6 :: 12 : 24.

DISCRETE Quantity, is such as is not continued and joined together.

Such is a number, whose parts being distinct units, cannot be united into one continuum; for in a continuum there are no actual determinate parts before division, but they are potentially infinite; wherefore it is usually and truly said, that continued quantity is divisible in infinitum. See **CONTINUITY**.

DISCRETIVE Propositions, are those where various judgments are made, and denoted by the particles, *but*, *notwithstanding*, or by words of the like nature either expressed, or understood. Thus, fortune may deprive me of my wealth, *but* not of my virtue: they, who cross the seas, change their climate, *but* not their disposition, are called *Discretive Propositions*.

DISCUS, among the ancients, a name given to a round shield, consecrated to the memory of some famous hero; and hung up in the temples of their gods, as a trophy of some great action.

From the figure of this *Discus*, or rather of that which the Greeks and Romans used to divert themselves with, especially at their public games, and which was a round quoit of brass, comes the word so much in use among astronomers, viz. the *Disk* of the sun, or moon. See **DISK**.

DISCUSSION, in matters of literature, signifies a clear treating, or handling of any point, or problem. The word imports a shaking off, or dispelling the difficulties and obscurities with which a thing was embarrassed. We say, such a

point was well *discussed*, when it was well treated of, and cleared up.

DISCUSSION is also used, in a medicinal sense, for a dispersing the matter of any tumor, or swelling through the pores of the body; or an evacuation of some thin matter gathered in any part, by insensible perspiration.

DISCUTIENTS, in medicine, either repellers or remedies proper to open the pores, and evacuate the redundant or peccant humours of the body by insensible perspiration or otherwise.

Discutients are in this last sense the same with what we otherwise call *Diaphoretics*.

DISDIAPASON, in music, a compound concord, in the quadruple ratio of 4 to 1, or of 8 to 2.

The *Disdiapason* is produced when the voice goes from the first tone to the 15th, and may be called a *Fifteenth*.

The voice ordinarily does not go further than from its first tone to the *Disdiapason*; i. e. it does not go beyond the compass of a double octave, for the *Disdiapason* is an octave doubled. It may sometimes rise several tones above a *Disdiapason*, but the effort or struggle disfigures it, and makes it false. In reality, the ancient scale, or diagramma, only extended to a *Disdiapason*.

DISDIAPASON-Diapente, in music, a concord in a sextuple ratio, of 1 to 6.

DISDIAPASON-Diateffaron, a compound concord in the proportion of 16 to 3.

DISDIAPASON-Ditone, a compound consonance in the proportion of 10 to 2.

DISDIAPASON-Semi-ditone, a compound concord in the proportion of 24 to 5.

DISEASE, in medicine, that state of a living body, wherein it is prevented the exercise of any of its functions, whether vital, natural, or animal.

Or, *Disease* is an indisposition contrary to nature, whereby the action of some part is immediately injured.

Or, *Disease* is a depraved, and disorderly state of the solid, and fluid parts; whereby all, or some of the functions either of the body, or mind, or both, are either abolished, or impaired.

An ingenious author of a late Latin treatise, *de purgatione*, holds the essence of a *Disease* to consist in a want of that equilibrium between the solid and fluid parts, which is necessary to the maintenance of health: others add, that all *Diseases* arise either from too lax, or too strict a tension of the fibres. Of all animals, man is subject to the most *Diseases*; and of men, the studious and speculative are most exposed thereto. Other animals have their *Diseases*; but they are in small number: nor are plants without them; though their maladies scarce exceed half a score. The ancients deified their *Diseases*: Vossius de *Idolol.* Lib. VIII. C. V.

Several authors have given us very compendious theories of *Diseases*; reducing them all to some one general disaffection: Bontecoe deduces all the *Diseases* of the human frame from the Scorbutus: Muggrave from the Arthritis: Dr. Woodward from the Bile: others imagine all *Diseases* the effects of a virus, which has lurked in the seed ever since the sin of Adam: Helmont, and Serenus the Dane, take them to depend on some extraneous ferment, formed in or out of us: lastly, it appearing from the observations of Pliny, Kercher, Langius, and Bonomo, that there are little worms in feverish blood, pustules, carbo's, and the itch; diverse physicians have took occasion to suspect, that all *Diseases* arise from insects.

Some *Diseases* only impair the use of the part, as the ophthalmia, gout, &c. Others destroy it entirely, as the gutta serena, palsy, &c. Some effect of the whole body, as the fever, apoplexy, epilepsy, &c. Others only impair a part, as the Asthma, colic, dropsy, &c. Some only affect the body, as the gout: Others disturb the mind, as melancholy, delirium, &c. Lastly, others affect both the body and mind, as the mania, phrenzy, &c.

As the actions, or conditions of the body, so also the *Diseases*, or defects thereof, may be reduced to three general heads, viz. 1. *Diseases* of the solid parts. 2. Those of the fluid parts. And, 3. *Diseases* compounded of both.

A popular syllabus of *Diseases* may be given, as follows: the solid parts, i. e. the bones, and flesh, may be disordered five ways, viz. They may be rendered turgid by tumors; cut with wounds; corroded by ulcers, or caries; removed out of their places, as in hernia's, prolapsus's, and dislocations; or discontinued by fractures, and contusions.

Diseases of the fluids are either in the mass of the blood, or the spirits: those of the blood are reducible to two kinds; those that thicken, and inspissate, or which amounts to the same, retard its motion; and those which attenuate, and dissolve, and of consequence accelerate it.

To this latter kind belong fevers, and feverish affections alone: all the other *Diseases* of the blood belong to the former.

In too thick a state of the blood, its principles are too crass, and its molecules too big, whence a lentor, lazy motion, and even stoppage, particularly in the sinuous passages of the glands: and hence obstructions, inflammations, cirrhos, fistulae, verrucae, pustules, oedemata, impetigines, and other tumours, and congestions both in the viscera, and habit of the body: and hence again, drowsiness, melancholy, hypochondriacal affections, &c. If this thick blood be too much replete with sharp acid salts, it will destroy the texture of the parts, and break out in ulcers, as in phthisical, scrophulous, scorbutic, and venereal diseases, gangrenes, carbo's, cancers, and other erosive tumours, according to the quality and degree of faltness and acrimony. And from the same source arise cephalalgia's, cardialgia's, colics, gouts, rheumatism's, pleuritis, &c. which by abrading the solid substance, frequently emaciate the body.

The *Diseases* of the animal spirits, arise either, 1. from an intermission, or retardation of their motion; or a diminution of their quantity: or, 2. from a disorder in their crasis, or quality.

To the first class are reduced the catalepis, apoplexy, coma, carus, palsy, stupor, tremor, &c. To the second belong the mania, phrensy, delirium, foolishness, melancholy, vertigo, spasms, epilepsy, hysterical affections, horror, &c. Add, that as all *Diseases* of the blood arise from external causes, viz. some one or more of the non-naturals, as food, air, evacuation, &c. so those of the spirits generally proceed from disorders of the blood.

Lastly, the *Diseases* of the fluids, whether those in the blood, or spirits, are seldom confined long thereto; but they presently come to disturb, and impede some of the functions of the solid parts, and at last corrupt the substance of the solids themselves. Hence compound, or complicated *Diseases*; which are infinitely various.

The learned Boerhaave furnishes us a much more accurate, and scientific division of *Diseases*, into those of the *Solids*, and *Fluids*.

DISEASES of the Solids, he considers either as of the simple, and similar parts, or of the organical.

Similar Diseases, are, 1. Those of the last, and smallest fibres; which are reducible to too great tension, and laxness, too great strength, or weakness, and a solution of their continuity.

2. Those of the membranes, which being only assemblages of the fibres just mentioned, are subject to the same disorders.

3. Those of the last, and smallest canals, which are formed of such membranes.

4. Of the membranes composed of such canals.

5. Of canals composed of such membranes, which are all the greater vessels of the body.

6. Of the solid parts, which are composed of canals compressed, and grown together, so as to be void of humour to distend them; or canals growing into one consistent part, the humour hardening together with the vessel that contained it.

Lastly, supposing these parts all sound, *Diseases* may befall them with respect to their structure, from a vice, or vicious application of the matter of nutrition.

Organical Diseases—An organical part, consisting of the several simple parts above-mentioned, and fitted to perform any office by means of some humour contained in it: may be considered, either in it self, as a solid part, or with respect to the humour it contains: in the first view, *organical Diseases* are reducible to four classes.

1. Disorders in the figure, and the circumstances thereof, as roughness, solidity, cavity, &c. To this belong the *Avaromias*, when one vessel opens into another; the *Διαπνθσις*, when a rupture is made; *Διαρρηξις*, when a breach is occasioned by corrosion; the *Εμπαξις*, which is a total obstruction of the cavity, by a viscous, grumous matter; the *Στενωσις*, or narrowness of the passage; the *Θαλας*, or compression of the sides of the cavity; *Συμπεσις*, when the sides are quite join'd; and *Συμψνσις*, when the vessel is so emptied, that the sides falling together, the cavity is lost. See *ΔΙΑΠΕΣΙΣ*, *ΔΙΑΡΡΗΞΙΣ*, &c.

2. In the number, where it is either deficient or redundant: but the parts seldom err in this respect, so as to occasion a *Disease*.

3. In magnitude; to which belong Nodes, Exostoses, and Callus's.

4. In the situation, and connexion; as when the ligaments are too long, or too short, when broke, or depraved; also distortions, luxations, subluxations, hernia, or ruptures in the groin, scrotum, bladder; prociencia of the womb, bladder, and rectum; disorders of the tendons, and muscles, particularly their flying out of their places; the relaxation, or rupture of the membranous ligament that should retain them. Lastly, there is a *Disease* common both to similar and organical parts, called *solution of continuity*.

DISEASES of the fluids, considering those fluids simply, and in themselves, may be reduced to disorders in respect of quantity and quality: but considering them as contained in solids, they may err, too, in place, and proportion.

As to the first, such an abundance of the humours, as disturbs the animal functions, is called a *Plethora*: As to *Diseases*, from the defect of humours, we scarce know of any.

As to the second, such quality of the humours, as disturbs the animal functions, is called *Cachymia*. Now, this is either in the fluids considered in themselves, their own parts, and composition; or considered as they concur towards constituting some part of the body.

If the morbid quality be considered in the particles of the humour, it must either consist in an augmentation of bulk, whence the emphraxis, atrophy, symphyllis, and synæchis; or in the diminution thereof, as in the diapnoe, and ceneangia; or in an increase of solidity, whence too great an attenuation; or a decay thereof, whence a lentor, stagnation, and cohesion; or in the figure, as when of spherical it becomes angular, and consequently, with respect to the part it is applied to, sharp; whence acrimonies, both acid, alkaline, muriatic, ammoniac, saponaceous, vitriolic, &c. and oleosities; or in rigidity, and flexibility; or in elasticity; or in cohesion, and divisibility. See *ATROPHY*, &c.

Again, all the juices being considered together, the principal disorders they are subject too, are too great fluidity, or tenacity; or too much velocity in their vessels, or too little.

Lastly, considering the fluids as contained in the solids, there arise diverse *Diseases* merely from their changing of place; these may be reduced to two classes, viz. the grosser humours intruding themselves into the finer canals; and the humours extravasating, or getting out among the solid parts; whence inflammations, anburyasma's, varices, erichymoses, oedema's, pustules, dropsy, spongy swellings of the head, breast, abdomen, and uterus; and emphysema's.

Add, that the humours collected, and stagnating among the parts, grow putrid, purulent, ichorous, erosive, and sharp; and thus destroy the tender stamina, or solids; whence sinus's, fistula's, ulcers, gangrenes, sphacelus's, cancers, and the like.

These are the prime differences of the *Diseases* of the body; and from these arise most of the rest: so that they may be regarded, not only as *Diseases*, but as the causes of *Diseases*. See each further explained under its respective article in this work.

There is also another division of *Diseases*, in use among physicians, taken from certain external accidents, which are common to a great many different *Diseases*: which distinction, too, has its use; though they generally run it too far. *Diseases*, are by this distinguished, 1. With respect to their cause, into idiopathy, sympathy, deuteropathy, hereditary, connate, and acquired. 2. With respect to their subject, into *Diseases* of old age, children, adults, men, women, maids, pregnant, parturient, and into endemical, epidemical, &c. 3. With respect to duration, into most acute, which terminate in four days; acute in twenty; and chronic, which are all those of longer continuance. 4. With respect to seasons, into vernal, autumnal, continued, and intermitting. 5. With respect to their effects, into benign, malignant, curable, incurable, mortal, and contagious. And, 6. With respect to their state, into beginning, progress, state, declension, and end.

DISEASES of plants. M. Tournesort, in an express dissertation on this subject, in the *memoires de l'académie des sciences*, refers all the *Diseases* of plants to the following causes.

1. The too great abundance of the nutritious juice. 2. The defect, or want of this juice. 3. Some ill qualities it acquires. 4. Its unequal distribution in different parts of the plant. And, 5. External accidents.

The *Diseases* principally observed by our gardeners, are, 1. barrenness, when the tree, though seeming fresh and healthy, bears no blossoms; or if it does, they soon fall; or if they set, the fruit drops before it comes to maturity.

2. Blasting of the buds, occasioned by a frost happening when the leaves and blossoms are wet. By this means the pores are shut, and the vital juices suffocated; when, if the sun break out on a sudden, they turn yellow, with round fiery specks growing on them; whence frequently proceed tumours like warts, which rotting, grow full of maggots. Mr. Mortimer adds, that the want of rain at blossoming time, often occasions the dropping off of the blossoms for want of sap: he therefore, recommends the watering them.

3. Consumption, proceeding from a want of sustenance, through the failure of the nourishing juices; or from obstructions of the veins and roots; or ill digestion, and secretion of humours, &c.

4. The moss; an account of which, see under the article Moss.

5. The jaundice, which though it does not hinder the tree from appearing sound, yet when it begins to sprout, the leaves become

become of a whitish green, and, as they grow bigger, turn yellow. This frequently arises from external causes, as the mildew; but chiefly from a stony, or chalky soil, impregnated with an acid salt.

6. Mildew, a kind of epidemical *Disease*, most frequent and fatal in the spring season. It is properly a corrosive, and nipping dew, proceeding from pent up vapours now exhaled, and returned back on the tender opening buds, which infects them by its acrimony, and obstructs the circulation of the nutritive juices. By which means the leaves begin to fade and wither, and both the blossoms and fruit are much prejudiced.

7. A thick fog, or too abundant dew, Agricola assures us, occasion the same *Diseases* as the mildew, only in a less degree.

8. Falling of the leaves, which happens when the trees sprouting too soon, are either surprized by excessive heat, or violent cold.

9. Uredo, or scorching, of which there are two kinds; the first happening upon the fall of a subtil dew, or small rain, immediately followed by the piercing beams of the sun, which suddenly closes the pores before dilated, and burns up the leaves: the second happening from the like fervour in the internal parts of the tree, viz. in the pith; occasioned by some inward failing. Agricola imputes it to the fault of the gardeners, who, in transplanting trees, frequently cut of the lesser filaments, and roots, as also the greater roots, without covering the wounds with wax, or the like.

10. Scurf, or leprosy, a *Disease* chiefly of the bark, caused by a too great dilatation of the pores, whereby too much perspirable matter transuding, it hangs and hardens on the bark, which by this means chaps, and cracks; and thus a sort of lepra is formed, perspiration is obstructed, &c. Add, that this scurfy skin proves a harbour for vermin, which live both on the bark and tree.

11. The worm, a little animal generated in the corrupted substance of the bark, blossoms, fruit-leaves, pith, and roots. M. Gentil mentions another kind, called *cocchifiers*, which stick to the roots of young tender trees and bark, and kill them. There is a third sort, called *breezes*, or gad-flies, which gnaw the bark.—The worm is a very frequent *Disease*; whereby young hopeful trees are all of a sudden brought to languish, and decay.

12. Rotten roots, occasioned chiefly by their being planted too deep. This *Disease* is incurable.

13. Blights. A particular account whereof, see under the article BLIGHT.

DISEMBOGUE. When a ship passes out of the mouth of some great gulph, or bay, they call it *disemboguing*—They say also of a river, that at such a place, or after it has run so many leagues, it *disembogues* it self into the sea.

DISFRANCHISING, the taking away one's freedom, or privilege.

DISHERISON, an old word of the same import as *disinheriting*—Our lord the king considering his own damage, and *Disherison* of the crown, &c. Stat. 8. Richard II. Henry IV.

DISHERITOR, a person who *disherits*, or puts another out of his inheritance—The sheriff shall forthwith be punished as a *Disheritor* of our lord the king, and his crown. Stat. 3. Edw. I.

DISJUNCT Proportion. See **DISCRETE Proportion.**

DISJUNCTIVE, something that separates, or disjoins.

Thus *or*, *neither*, &c. are called *disjunctive conjunctions*; which, in connecting a discourse, do yet separate the parts thereof. *E. gr.* aut Cæsar, aut nullus; either Cæsar or nothing. He *neither* advanced, *nor* gave back.

Disjunctive Conjunctions may also be called *partitive*, *distributive*, and *alternative*.

DISJUNCTIVE Propositions, in logic, are compound propositions consisting of two members, or parts, connected by a disjunctive conjunction.

The first proposition of a dilemma is usually a *disjunctive* proposition:

You must either obey the king, or be a rebel.

But you must not be a rebel.

Therefore you must obey the king.

DISK. See the articles **DISC.** and **DISCUS.**

DISLOCATION, the putting a bone out of joint, by some violence; usually called by physicians, *Luxation*. See **LUXATION.**

DISMEMBERED, in heraldry, is applied to birds that have neither feet, nor legs: as also to lions, and other animals, whose members are separated. See **MEMBERED.**

DISMES, Decima, in our law-books, tiths. See the article **TITH.**

DISMOUNTING, in the military art, the act of unhorsing—Thus, to *dismount* the cavalry, the dragoons, or the like, is to make them light.

DISMOUNT the Canon, is to break their carriages, wheels, and axletrees, whereby to render them unserviceable.

Horses are also *dismounted* when they are rendered unfit for service.

DISORIENTATED, a term applied to a thing that is turned or removed from the east, to which it was originally directed.

The dials drawn on this stone do not go well, by reason it has been moved and *disorientated*: it no longer looks east and west.

But the word is most frequently used in a figurative sense, for the disconcerting, or putting a man out of his way, or element. Speak of law to a physician, or of physic to a lawyer, and they will both be *disorientated*.

And. Marvel. uses the word *disoccidentated*, instead of *disorientated*: Geneva had *disoccidentated* our geographer.

DISPARAGEMENT *, is properly used for the matching an heir, &c. in marriage, below his, or her degree, or condition; or against the rules of decency.

* The word is a compound of the private particle *Dis*; and *Par*, equal.

DISPATCH, a letter on some affair of state, or other business of importance, sent, with care and expedition, by a courier express.

The business of *Dispatches* lies on the secretaries of state, and their clerks. The king gives directions to his ministers abroad by *Dispatches*.

The word is also used for the packet, or mail containing such letters. The courier has delivered his *Dispatches*.

The French, during the reign of Louis XIV. had a *Conseil des Depêches*, Council of *Dispatches*, held in the king's presence, at which the Dauphin, the duke of Orleans, the chancellor, and four secretaries of state assisted.

DISPAUPER. When any person, by reason of his poverty (attested by his own oath of not being worth five pounds, his debts being paid) is admitted to sue in *forma pauperis*: if afterwards, before the suit be ended, the same party have any land, or personal estate fall to him; or that the court, wherein his suit is depending, thinks fit for that, or other reason, to take away the privilege from him; he is then said to be *dispaupered*.

DISPENSARY, or DISPENSATORY, a name given to diverse collections of recipes for compound medicines, wherein are specified the ingredients, proportions, and chief circumstances of the preparation and mixture: the same with what we otherwise call a *pharmaceutia*, or *antidatory*.

Such are the *Dispensaries* of Mesue, Cordus, that of the college of physicians at London, Quincy, &c.

The apothecaries in and about London, are obliged to make up their compound medicines according to the formulas prescribed in the *college Dispensary*; and are enjoined to keep always ready in their shops all the medicines there enumerated.

DISPENSARY, is likewise used for a magazine, or office of medicines kept ready to be *dispensed* at the prime cost of the ingredients, for the benefit of the sick poor.

Of which kind we have had two, or three in London maintained by the college of physicians. One at the college it self, first begun in the year 1606: another in St. Peter's alley, Cornhill: and a third near Covent-garden: where the best medicines were sold for their intrinsic value, and patients were advised every day, but Sunday, at one of the three places.

DISPENSATION, in law, &c. a permission to do something contrary to the standing laws; or a relaxation, or suspension of a law on some just occasion.

Some confound *Dispensation* with equity; but they are very different things: For equity is only the correction, or modification of a law, which is too general; but a *Dispensation* suspends the obligation of the law it self, and can, therefore, be only given by the legislative power.

The king of France grants *Dispensations* of age to some officers to be admitted before the legal age. But the greatest dealer in *Dispensations* is the pope, who claims the office *jure divino*, and extends it to every thing. Indeed, the more sober of the Romanists themselves deny, that he can give a *Dispensation* for a thing contrary either to the divine law, or the law of nature; and confine him to what is contrary to positive laws, as to things relating to fasts, marriages, holding several benefices, &c. And even in these things they put bounds: Thus, say they, a *Dispensation* in the fifth degree of affinity, as of father and daughter, brother and sister, would be abusive, and null. But it is certain, the papal see does not apprehend it self under any such severe restrictions.

The right of giving *Dispensations*, they thus prove: it is certain the church has power to make laws; a power which the apostles themselves exercised, and which their successors have continued to exercise after them. Whoever can make a law, can annul it; and much more can he *dispense* with it in certain cases: the church then may *dispense* with the laws it self has made; and we find it to have done accordingly in all ages. In the primitive times it was left to the judgment of the bishops to *dispense* with the length of the penance enjoined by the canons; and the IVth council of Carthage allows of the

trad-

translation of bishops, and priests, when the churches occasions should require it.

The author of a treatise of *Dispensations*, printed in 1713, reduces all the causes of *Dispensation* to the necessity and public service of the church, and not to the private advantages of the persons who solicit the *Dispensation*; otherwise, causes he observes will never be wanting.

The same author maintains, that all *Dispensations*, should be dispatched *gratis*: Marcellus II. he observes, was resolved to have it so. That pope used to say, that if *Dispensations* were just, they should be granted *gratis*; and if unjust, they were to be refused. And pope Pius V. refused a large sum of money offered by a Spanish lord for a *Dispensation*, which that pope granted, because he judged it just. The nine prelates, whom Paul III. consulted for the reformation of the court of Rome, recommended the same thing; except for *Dispensations* of marriages contracted malgré some known impediment.

DISPENSATION, in pharmacy, the disposition and arrangement of several medicines, either simple or compound, all weighed in their proper doses, or quantities; in order to be employed in the making a composition.

DISPERSION, in dioptrics.—*Point of DISPERSION*, is a point from which refracted rays begin to diverge, when their refraction renders them divergent.

It is called *Point of Dispersion*, in opposition to the *Point of Concourse*, which is the point wherein converging rays concur after refraction.

But the latter is more usually called *Focus*, and the former, *Virtual Focus*.

DISPLAYED, in heraldry, is understood of the position of an eagle, or other bird, when it is erect, with its wings expanded, or spread forth.

DISPONDEE, in the Greek, and Latin poetry, a double spondee; or a foot consisting of four long syllables: as *ῥαμηνήν, Δεῖξάντες, Οαυαλόντων*.

DISPOSITION, in rhetoric, is defined by Cicero, the art of distributing the things, or arguments invented, or found out, into a proper order; or a due placing, or ranging the several parts of a speech, or discourse.

The *Disposition* makes one of the great branches, or divisions of rhetoric.

The *Disposition* is of the same necessity in oratory, as the marshalling of an army, in order to a battle; or a beautiful composition in architecture, painting, &c. Horace enjoins it expressly in poetry: *singula quæque locum teneant sortita decenter*. The *Disposition*, then, is the order, or arrangements of the parts of an oration: which parts are usually reckoned four, *viz.* the exordium, or beginning; the narration; the confirmation; and the peroration, or conclusion. Though some make them fix: *viz.* the exordium, division, narration, confirmation, confutation, and peroration; as indicated in that popular verse.

Exorsus, narro, secō, firmo, refuto, peroro.

But the division is more naturally referred to the exordium; and the confutation to the confirmation.

The *Disposition* is either *natural*, or *artificial*. *Natural*, is the order the parts are above rehearsed in. *Artificial*, is, when for some particular reason we recede from the order of nature. See each part under its proper article, *EXORDIUM*, &c.

DISPOSITION, in architecture, is the just placing of all the several parts of an edifice, according to their proper nature and office. See *BUILDING*.

DISPROPORTION, a term of relation, implying a want of proportion, or suitableness.

DISPUTE, or *DISPUTATION*, in the schools, &c. a contest, or combat, either by word or writing, on some point of learning, or religion, for a degree, prize, exercise, or even for the mere sake of truth, or advantage of a party, or the honour of a triumph. See *THESES*.

The Port Royalists take occasion to observe, that nothing gives so many different lights, and openings for discovering the truth, as *Disputation*. The movements of a mind employed singly in the examination of any subject, are usually too cool, and languid: the mind needs a certain degree of heat, to awake its ideas. Now, by the oppositions in a *Dispute*, we come to find wherein the difficulty lies, and the impetus the mind has acquired, enables us to surmount it.

DISQUISITION, an enquiry into the nature, kinds, and circumstances of any problem, question, or topic; in order to gain a right notion of it, and to discourse clearly about it.

DISECTION, in anatomy, the operation of cutting, and dividing the parts of an animal body, with a knife, scissars, &c. in order to see, and consider each of them a-part.

The ancients made *Dissections* of living men: as we read of Herophilus, and Erasistratus, and in our own times, of Carpus, and Vesalius.

Yet, le Gendre observes, that the *Dissection* of a human body, even dead, was held a sacrilege till the time of Francis I. and the same author assures us, he has seen a consultation held by the divines of Salamanca, at the request of Charles V. to settle the question whether or no it were lawful, in point

of conscience, to *disssect* a human body, in order to learn the structure thereof?

DISSEISIN, in law, an unlawful dispossessing a man of his land, tenement, or other immovable, and incorporeal right. *Disseisin* is of three sorts; *viz.* *simple Disseisin*, committed by day, without force, and arms; and *Disseisin by force*; for which see *DEFORCEOR*; and *FRESH Disseisin*. See also *RE-DISSEISIN*, and *POST-DISSEISIN*. *Wrongful Force* makes no descent in law.

Affises are called *Writs of Disseisin*, which lie against *Disseisors* in any case: whereof some are termed *little writs of Disseisin*, as being vicintial, that is, suable before the sheriff in the county court, because determinable by him without assise.

DISSEISOR, he who *disseiseth*, or puts another out of his land: as *Disseisor*, is he who is so put out.

For the difference between *Disseisor*, and intruder, and deforceor.

DISSEMINATE Vacuum. See *VACUUM Disseminatum*.

DISSENTERS, a general denomination of equal import with Non-conformists.

It expresses certain sects, or parties in England, who in matters of religion, church discipline, and ceremonies, *dissent* from, or disagree with, the church of England, and have a toleration by law for the same.

Such, particularly, are the presbyterians, independents, anabaptists, and Quakers. See *PRESBYTERIANS*.

DISSIMILAR Leaves, denote the two first leaves of any plant at its first shooting out of the ground.

They are thus called, because they usually are of a different form from the common leaves of the grown plant.

These Dr. Grew observes to be nothing but the very lobes of the seed thus expanded, and thus advanced.

Their use is for the protection of the plumé; which, being young, and tender, is thus guarded on each side, and has also some rain, and dew gradually conveyed down to it by this means. See *PLUME*.

DISSIMILAR, in anatomy.—Authors divide the parts of the body into *similar*, and *dissimilar*.

Dissimilar parts, by some called also *compound*, and *organical* parts, are such as may be divided into various parts of different structure, &c. Thus the hand is divisible into veins, muscles, bones, &c. whose sub-divisions are neither of the same nature, nor denomination.

DISSIMILITUDE, in geometry, &c. See *SIMILITUDE*.

DISSIMILITUDE, or *DISSIMILI*, in rhetoric, &c. an argument, wherein, from *dissimilar*, or unlike things, other *dissimilar*s are deduced.

Thus Cicero, *si barbarorum est in diem vivere; nostra concilia sempiternum tempus spectare debent*. Catullus furnishes a very beautiful argument from *Dissimilitude*:

Soles occidere & redire possunt,

Nobis cum semel occidit brevis lux,

Nox est perpetua una dormienda.

DISSIPATION, in physics, an insensible loss, or consumption of the minute parts of a body; or, more properly, that flux whereby they fly off, and are lost. See *EFFLUVIA*.

We do not say *Dissipation*, but loss of blood, in speaking of the blood discharged at a wound, or in any other sensible manner: on the contrary, we say *Dissipation* or expence of spirits: this is more copious than that of the solid parts, and consequently the reparation thereof ought to be more copious.

DISSOLVENT, something that *dissolves*, i. e. divides, and reduces a body into its smallest parts. See *DISSOLUTION*.

Thus, aqua regia is the *Dissolvent* of gold; aqua fortis of silver, and other metals; water, of salts and gums; spirit of wine, of resins; spirit of vinegar, of pearls, corals, &c.

Sea-salt is found the proper *Dissolvent* of gold: this, in almost any form, whether as a fluid, or a solid, or a spirit, does the business: accordingly, this is the basis, or fundamental ingredient of aqua regia.

So nitre is the proper *Dissolvent* of silver; and has that effect, in whatever form it is applied: and accordingly it is the basis of aqua fortis.

Spirit of nitre added to that of sea-salt, makes it *dissolve* gold the better: but spirit of sea-salt added to spirit of nitre, disables it from having any effect on silver. Yet Mr. Homburg furnishes an instance of a *Dissolvent* of silver, made by the *Dissolvent* of gold. An aqua regia may be composed of spirit of salt, and spirit of nitre, only in such small quantity each, that they may float separately in a third liquor, and not meet often enough to unite, at least not in any quantity. This water may be made so weak, as not to *dissolve* gold, but only extract a slight yellow tincture from it, that scarce takes off any thing of the weight of the metal: nor will it *dissolve* silver; as being too weak: so that both metals are safe from it. But this aqua regia, after it has *dissolved* gold as far as it can do, that is, after it has extracted a yellowish tincture from it, is still in a condition to *dissolve* silver.

This phenomenon Mr. Homburg accounts for hence: that spirit of salt, whether alone, or joined with spirit of nitre, being

being employed in keeping those few particles of gold dissolved, will not meddle with the silver: which, by this means, receiving the impression of the greater quantity of spirit of nitre alone, is dissolved thereby. But the experiment cannot be inverted, i. e. aqua regia cannot begin with dissolving silver lightly first, and afterwards dissolve gold; by reason spirit of nitre does not hinder spirit of salt from acting on gold; as spirit of salt does spirit of nitre from acting on silver.

Dissolvents are usually called by the chemists *Menstruums*. *Universal Dissolvent*. See the article *ALCAHEMIST*.

DISSOLUTION, in physics, a discontinuation, or analysis of the structure of a mixt body; whereby, what was one, and contiguous, is divided into little parts, either homogeneous, or heterogeneous. See *ANALYSIS*, and *DIVISION*.

Dissolution, then, is a general name for all reductions of concrete bodies into their smallest parts, without any regard either to solidity, or fluidity: though in the usual acceptation of the word among authors, it is restrained to the reduction of solid bodies into a state of fluidity; which is more properly expressed by *Solution*, as a branch of *Dissolution*.

According to the opinion of Fr. Tertius de Lanis, now confirmed by that of the learned Boerhaave, in his chemistry, the power, or faculty of dissolving, is lodged in fire alone. Other fluids, commonly supposed *Dissolvents*, only produce their effect by means of the fiery spicula they abound withal. Even air, which is judged a powerful menstruum, owes all its force to the rays of light diffused therein.

Sir Isaac Newton accounts for all *Dissolutions*, and the several phenomena thereof, from the great principle of attraction; and, in effect, the phenomena of *Dissolution* furnish a great part of the arguments, and considerations, whereby he proves the reality of that principle.

A specimen of that great author's way of philosophizing on the subject of *Dissolution* take as follows:

When salt of tartar dissolves by lying in a moist place, is not this done by an attraction between the particles of the salt of tartar, and those of the water which float in the air in form of vapours? and why does not common salt, or salt-petre, or vitriol do the like; but for want of such an attraction? and when aqua fortis, or spirit of vitriol, poured on steel-slings, dissolves the filings, with a great heat, and ebullition; is not this heat and ebullition effected by a violent motion of the parts? and does not that motion argue, that the acid parts of the liquor rush towards the parts of the metal with violence, and run forcibly into its pores; till getting between the outermost particles, and the main mass of metal, they loosen them therefrom, and set them at liberty to float off into the water? when a solution of iron in aqua fortis dissolves lapis calaminaris, and lets go the iron; or a solution of copper dissolves iron immersed in, and lets go the copper; or a solution of mercury in aqua fortis poured on iron, copper, tin, or lead, dissolves the metal, and lets go the mercury; does not this argue, that the acid particles of the aqua fortis are attracted more strongly by the lapis calaminaris than by iron; by iron than by copper; by copper than by silver; and by iron, copper, tin, and lead, than by mercury? and is it not for the same reason, that iron requires more aqua fortis to dissolve it than copper; and copper more than the other metals; and that of all metals iron is dissolved most easily, and is most apt to rust; and next after iron, copper? when aqua fortis dissolves silver, and not gold; and aqua regia dissolves gold, and not silver; may it not be said, that aqua fortis is subtle enough to penetrate the pores of gold as well as of silver, but it wants the attractive force to give it entrance: and the same of aqua regia, and silver? and when metals are dissolved in acid menstrua, and the acids in conjunction with the metal, act after a different manner; so as that the taste of the compound is milder than that of the simples, and sometimes a sweet one; is it not because the acids adhere to the metallic particles, and thereby lose much of their activity? and if the acid be in two small a proportion to make the compound dissolvable in water; will it not, by adhering strongly to the metal, become unactive, and lose its taste; and the compound become a tasteless earth? for such things as are not dissolvable by the moisture of the tongue, are insipid. *Newt. Opt. in Galce.*

M. Geoffroy furnishes some curious experiments on cold *Dissolutions*: it is nothing surprizing, that a simple *Dissolution* should be cold; that common water, for instance, wherein sea-salt, or sal-ammoniac, or vitriol, has been cast, should become the colder, by the mixture of such salts; it being obvious, that the salts, being of themselves destitute of motion, and coming to share that which the fluidity gives the water, must diminish it, when they become intimately mixed therewith by *Dissolution*; and it is generally agreed among philosophers, that heat is a motion, and cold a cessation, or at least a diminution of motion.

Yet, notwithstanding this general principle, it is no great wonder all *Dissolutions* are not cold, as those are of all volatile

alkalies in common water; but that some are hot, as those of all fixed alkalies. This difference may be accounted for hence, that all fixed alkalies having been calcined by a vehement fire, they have imprinted, and retained in their pores some of the particles thereof.

But it is surprizing, that *Dissolutions* accompanied with fermentation, i. e. where the matters boil, and swell, and that with a great noise, should be cold, and make the thermometer fall, when immersed therein.

This coldness, with so considerable an augmentation of motion, is somewhat extraordinary. But this is not all: for of these cold fermentations, there are some that emit hot vapours. Thus it is with a mixture of oil of vitriol, and sal ammoniac; for a thermometer being plunged in the mixture, and another a little higher, to receive only the fumes thereof; the first thermometer is seen to fall very hastily, through the coldness of the fermentation, and the latter to rise through the heat of the vapours. M. Geoffroy adds an experiment, shewing that cold water is rendered still colder for a few moments, by throwing a large quantity of live coals therein.

DISSOLUTION, in chemistry, pharmacy, &c. denotes the reduction of a compact, hard, or solid body into a fluid state, by the action of some fluid menstruum, or *Dissolvent*.

Dr. Friend gives us a mechanical account of *Dissolution*, in the instance of salt dissolved in water, which is the most simple operation that falls under this head. This motion he ascribes to that attractive force, which is so very extensive in natural philosophy, that there is no kind of matter, but what is under its influence. It may be observed, he says, that the corpules of salts, which are the most simple of any, are withal very minute, and for their bulk very solid, and, therefore they exert a very strong attractive force, which, *ceteris paribus*, is proportional to the quantity of matter. Hence it comes to pass, that the particles of water are more strongly attracted by the saline particles, than they are by one another: the particles of water, therefore, cohering but loosely, and being easily moveable, approach the corpules of salts, and run, as it were, into their embraces; and the motion of them is quicker, or slower, according to their less, or greater distances; the attractive force in all bodies being strongest, at the point of contract. Therefore, if salt be thrown into the middle of a dish full of water, we shall find the aqueous particles, which are in the middle of the dish, sharp, and pungent to the taste; but the water upon the sides of the vessel almost insipid; so that, when such a motion once arises, the aqueous particles are carried with the same force towards the salts; and the moment of them is to be estimated from the ratio of their weight, and celerity, conjunctly. By the force of this impulse, they open to themselves a passage into the pores of the salts, which are very numerous; and at length they so break, and divide its texture, that all cohesion of the parts is destroyed: hereupon, being separated, and removed to a convenient distance from one another, they are dispersed, and float here and there about the water.

Dissolution of metals, &c. by fire, is particularly called *Fusion*.

Dissolution of the blood, is an affection of that humour, directly opposite to coagulation.

The *Dissolution* is such a comminution of the fibrous parts of the blood, as indisposes it for that separation of the crassamentum from the serous part, which always ensues in healthy blood on its cooling out of the body.

This *Dissolution* is frequently the consequence of malignant, and pestilential fevers, and shews itself in petechiae, or purple spots; also of certain poisons, particularly the bites of venomous beasts, &c.

Dissolution of parliament. See *PARLIAMENT*.

DISSONANCE, or **DISCORD**, in music, a false consonance, or concord.

A *Dissonance* is properly the result of a mixture, or meeting of two sounds, which are disagreeable to the ear: such are *Ditones*, *Tritones*, *False Fifth*, *redundant Fourth*, *Seventh*, &c. *Dissonances* are sometimes used in music, and have a good effect therein; though it be only occasionally. See *DISCORD*.

DISSYLLABLE, a word of two syllables; as *Fortune*, *lament*, &c.

The *Spondee*, *Trochee*, *Iambus*, and *Pyrrhichius*, are *dissyllabic* feet. See *SPONDEE*, &c.

DISTANCE, properly denotes the shortest line between two points, objects, &c.

The word is also used figuratively for an interval, not only in respect of place, but also of time, or quality.

Thus, we say the *Distance* of the creation of the world from the nativity of Jesus Christ is upwards of 4000 years: the *Distance* between the Creator and creature, is infinite.

For the *Vision* of *DISTANCE*, or the manner wherein we come by the idea of *Distance* in objects, see *VISION*.

DISTANCES,

DIS

DISTANCES, in geometry, are measured by the chain, decem-peda, and the like. See CHAIN, &c.

INACCESSIBLE DISTANCES are found by taking bearings theroeto from the two extremes of a line whose length is given. See PLAIN-TABLE, THEODOLITE, &c.

DISTANCE, in geography, is the arch of a great circle intersected between two places.

To find the *Distance* of two places A and B, (Tab. Geograph. fig. 4.) far remote from each other: assume two stations C and D, from which both the places A and B may be seen, and with a proper instrument find the angles ADC, CDB, ACD, and DCB; and measure the *Distance* CD.

Then in the triangle ACD we have two angles given ACD and ADC, together with a side, from which, by an easy rule in trigonometry, delivered under the article TRIANGLE, we find AD.

So also in the triangle CBD the base DC, and the angles at the same being given, DB is found.

Lastly, in the triangle ADB, having the sides AD and DB, together with the included angle ADB, the *Distance* required AB is found by the rules given for the resolution of triangles.

The height of a remote object being known, to find its *Distance*, when the eye first descries it; and again, the height of the eye given, to find the *Distance* to which the eye can reach on the surface of the sea, or land: Add the height of the eye AB, (fig. 9.) to the semi-diameter of the earth BC, by which you have AC: and since in the rectangle triangle ADC, the sides AC and DC are given, the angle DCA is found by the common rule for resolution of triangles; and the quantity of which angle forms the arch DB; which arch converted into feet, or the like, gives the *Distance* required.

Suppose, e. gr. the height of the eye AB five foot; which is somewhat less than in a man of ordinary stature. Since BC is 19695539, AC will be 19695544, and the angle DAB will be found $89^{\circ} 57'$ minutes, 43 seconds. Consequently DCB, or the arch DB is $2^{\circ} 17'$ or $137'$. And therefore, since 1° or $3600'$ make 343752 Paris feet, DB is 13081 feet.

After the same manner we find the *Distance* AB, to which an object of a given altitude DB may be seen; and consequently we know what *Distance* we are off from an object of a given altitude, when we first discover the top thereof.

DISTANCE, in navigation, is the number of miles, or leagues, that a ship has sailed from any point. See SAILING.

DISTANCE, in astronomy—The *Distance* of the sun, planets, and comets, is found from their parallax.

That of the fixed stars, as having no sensible parallax, we can do little more than guess at.

The *Distances* of the planets from the sun and earth, in semi-diameters of the earth, supposing the greatest horizontal parallax $6'$; and the dimensions of the orbits, as assigned by Kepler, are as follow:

Dist. from the Sun.	Great. ell.	Mean.	Leaft.	Dist. from the Earth.	Great. ell.	Mean.	Leaft.
Jupiter	34560	326925	308292	h	380556	327544	274532
Saturn	18:254	178640	170026	l	322257	179256	136263
Mars	57226	52326	47426	o	92221	52944	13668
Earth	34995	34377	33758	o	34996	34377	33759
Venus	25001	24889	24718	q	60056	34548	9041
Mercury	16142	13340	10537	y	51132	37179	25221

Mr. Cassini makes the *Distances* somewhat less; as supposing the sun's parallax a greater.

Dist. from the Earth.	Great. ell.	Mean.	Leaft.	Dist. from the Earth.	Great. ell.	Mean.	Leaft.
Jupiter	244000	210000	176000	Venus	380000	220000	60000
Saturn	143000	155000	87000	Mercury	330000	220000	110000
Mars	59000	33500	8000	Moon	61	57	53
Sun	22374	22000	21622				

Dr. Hook, by exact observation with a telescope of 16 foot perpendicularly placed, first discovered, that the *Distances* of the stars from the zenith is not the same at all times of the year; particularly the bright star in the dragon's-head he found 27, or 30 seconds near the zenith of Greenwich college, in the brumal solstice, than in the ektival. And after him Mr. Flamsteed observed the like variations in the pole-star.

DISTANCE of the sun from the moon's node, or apogee, is an arch of the ecliptic, intercepted between the sun's true place, and the moon's node, or apogee. See NODE.

CURVATE DISTANCE, is the *Distance* of the planets place from the sun, reduced to the ecliptic. See CURVATE.

DIS

Line of DISTANCE, in perspective, is a right line drawn from the eye to the principal point: such is the line OF, (Tab. Perspective fig. 12.) drawn between the eye O, and the principal point F.

This, as it is perpendicular to the plane, or table, can only be the *Distance* of the eye from the table.

Point of DISTANCE, in perspective, is a point in the horizontal line at such *Distance* from the principal point, as is that of the eye from the same.

Such is the point P, and Q, (Tab. Perspective, fig. 12.) in the horizontal line PQ; whose *Distance* from the principal point F, is equal to that of the eye from the same F.

DISTANCE of the Bastions, in fortification, is the side of the exterior polygon.

DISTASTE, or DISGUST; a loss of appetite, or an aversion, or repugnance to foods which are commonly eaten.

Distaste is held by physicians one of the principal disorders of the stomach. It arises from a want of sensation in the upper orifice of the ventricle; which may be occasioned various ways: as, by a too great abundance of food; thick, heavy humours in the stomach; fat, viscid aliment; obstructions of the lacteals; suppressions of the usual evacuations; intermissions of the ordinary exercises; a defect in the nerves, in having their natural faculty abolished, or suspended, as in a lethargy, and apoplexy; and, according to Syllius, by a gross viscid saliva, or a thick bile, ascending out of the small guts into the stomach.

DISTEMPER, in medicine. See the article DISEASE.

DISTEMPER, is also used in painting, for the working up of colours with something else besides bare water, or oil.

If the colours be prepared with the former of these, that kind of painting is called *Limning*; and if with oil, it is called *Painting in Oil*, or simply *Painting*.

If the colours be mixed with size, whites of eggs, or any such proper glutinous, or unctuous substance, and not with oil; they then say, it is done in *Distemper*; as those of the admirable cartoons at Hampton-court.

DISTENSION, the act of stretching a thing; also the state of a thing violently stretched, and *distended*. See TENSION.

The calculus is a hard, solid body, causing a stupor, obstructions, and *distensions*. Degori.

DISTICH, ΔΙΣΤΙΧΟΝ, a couplet of verses; or a piece of poetry, the sense whereof is comprehended in two lines.

There are excellent morals in Cato's *Distichs*. See Vigneul de Marville on the *Distichs* of Cato, T. 1. p. 54, 55.

Hexameter, and Pentameter verses, otherwise called elegiacs, are disposed in *Distichs*.

DISTICHIASIS*, in medicine, a disorder of the eye-lids, wherein, instead of one, they have two rows of cilia, or hairs.

* The word is formed of *dis*, twice, and *stich*, or *stich*, Order, Rank.

In the *Distichiasis*, over the common, and natural hairs, there grows another extraordinary row, which frequently eradicates, and tears up the former, and pricking the membrane immediately investing the eye, occasions pain, and draws defluxions upon it.

It is cured, by plucking up the second rows of hairs with nippers, and cauterizing the pores, out of which they issued.

DISTILLATION, or DESTILLATION, in chemistry and pharmacy, the art, or act of separating, or drawing off the spirituous, aqueous, oleaginous, or saline parts of a mixed body from the grosser, and more terrestrial parts, by means of fire; and collecting, and condensing them again by cold.

The use of *Distillation* is very great; it being by means hereof, that waters, spirits, essences, and extracts are chiefly made. *Distillation* is usually performed by means of fire raised to a greater, or lesser degree, as circumstances require.

The fire is either applied immediately to the vessels wherein the matters are to be *distilled*; or it is applied mediately, by means of water, sand, iron-slings, &c. These different methods of applying the fire, are called *Baths*, *Balnea*; *Bal-neum Mariæ*, or *Maris*, *Bal-neum Arensum*, &c. They are also called *Heats*; as sand-heat, water-heat, &c.

Distillation is two-fold, 1^o. *per ascensum*, by ascent; when the matter to be *distilled* is above the fire, and the spirit, or other principle, is raised from it.

2^o. *per descensum*, by descent; when the matter which is to be *distilled* is below the fire, and the vapour drawn from it, is precipitated to the bottom of the vessel.

Distillation by ascent, is either *right*, or *oblique*.

Right DISTILLATION, is performed with a common alembic, or cucurbit, wherein the liquor is raised, and descends again, in form of drops, into a receiver: this is chiefly used when the texture of the body is such as allows of an easy ascent, as in vegetables.

Oblique DISTILLATION, is performed side-ways, and in crooked vessels, as retorts. Its use is for such bodies as consist of heavier particles, and which cannot be raised without a strong impulse

impulse, nor even by the strongest: so high as the top of the alembick; of which kind are almost all minerals, and metals.

DISTILLATION by descent, is where the fire is applied on the top, and all around the vessel, whose orifice is at the bottom; and consequently, the vapour not being able to rise upwards, it is forced to precipitate, and distil down to the bottom.

There is a second kind of *Distillation* by descent, called *Per Deliquium*; which is a natural liquifying, or resolving of salts into a liquor, by means of moisture.

In the resolution of simples, an excellent method to preserve their virtues, is, in lieu of fire, or any other foreign heat, which might alter, or destroy these virtues, to make use of the heat of a dunghill made of putrefied herbs.

The process, and measures of *Distillation*, are very different according to the different subjects to be distilled.

Acid spirits are usually drawn in a reverberatory furnace, and with a vehement fire: ponderous woods, as gualacum, box, &c. are distilled in a retort, after the same manner. In these, first comes a little phlegm, and then, the fire increasing, the spirits fly out in white clouds. When they cease to come, the matter in the receiver is filtrated through a tunnel, which lets pass the spirits, leaving a black foetid oil behind.

Odoriferous plants, as balm, wormwood, sage, hyssop, &c. are distilled by the cucurbit, or vesica; first pouring a strong decoction of the same plant hot, upon the plant it self bruised, or adding common water to the plant, whether dry or fresh, cut with sheers into small pieces, and letting the whole digest in a close vessel two days. Then about half the water, or spirit is drawn away by *Distillation*; and what remains, being pressed, filtrated, and evaporated to the consistence of honey, is the extract of the plant. Lastly, drying what remained in the cloth after expression, and burning it, they make a lixivium of its ashes; which being filtrated and evaporated to dryness, what remains is the fixed salt of the plant.

Plants not odoriferous, are sometimes managed thus: The plant being pounded, and two thirds of the alembic, or retort filled with it, they pour a good quantity of the expressed juice of the same plant upon it, so as the bruised matter may float therein, without sticking any where to the vessel. Then they draw off about half as much water, as there was juice, which is the distilled water of that plant. What remains, being pressed in a cloth, and the juice settled, they filtrate, and evaporate it to two thirds, and setting it in a cool place, the essential salt shoots into crystals.

There is a method of **DISTILLING** cold; which is thus performed: They take, for instance, four pounds of flowers, more or less, and put them in three or four pints of water, and put the whole in a limbec, which they lute exactly; then place it in a vessel half filled with ice, beaten and salted, as if they meant to freeze the water; then fit on a receiver, and lute it well; then wetting a linnen cloth in hot water, they cover the limbec head therewith, repeating this several times; by which means the finest parts are raised from the flowers. But care must be taken, that all the superfluous water have been first emptied out of the limbec.

Dr. Beal, in the *Philosophical Transactions*, mentions an extraordinary kind of cold *Distillations*, viz. made by frost and cold air: His thermometer being exposed out of doors, during the severe frosts of 1665; fine clear drops, like dew, ascended to the top of the tube, which afterwards, in time, re-descended into the stem, and filled the space of half an inch; and, though the spirit of wine it self was tinged very deep, yet this second spirit was clearer and brighter than any crystal. The like he did by exposing his thermometer to the hot air in the middle of summer. And hence takes occasion to recommend a further prosecution of this ptychotechnia.

The ascent of fluids, we are taught by philosophy, is effected two ways: 1. On account of their specific gravity; and, 2. By impulse.

The first way of elevation is manifest from this lemma, viz. that particles of bodies which swim in any fluid, if they be specifically lighter, must be born upwards by that fluid. Hence, as distilled liquors are carried upwards through the air, it is to be inquired, how they come to be specifically lighter than air.

Now, a fluid will be specifically lighter than another, when, under a larger surface, it has an equal, or a less gravity: according to this proportion, the bulk of the fluid ought to be increased in *Distillation*; and how easily, by the help of fire, it may be increased, or, which is the same thing, rarefied, will appear from what we have said under the articles **RAREFACTION**, and **HEAT**.

It is known by computation, that the proportion of the specific gravity of water to that of air, is something more than as eight hundred to one. Since, therefore, similar spheres, or solids are as the cubes of their diameters, and the specific gravity decreases reciprocally, in the very same proportion, as the cubes of their diameters increase: In order to make a particle

of water lighter than a particle of air, no more is necessary than to rarify it, till its diameter becomes ten times greater, which in this case is but a very small degree of rarefaction: for the cube of the diameter in a particle so rarefied, is one thousand. If the diameter be made eleven times greater, the cube will be 1331; and if twelve, 1728. So that water, when rarefied but twelve degrees, will be above doubly lighter than air. And, if the rarefaction be carried on farther, it may easily be collected from the increase of the numbers, that a particle of water may be rendered almost infinitely lighter than air. Now, the elevation of bodies equally fluid, and heavy, is always proportionable to their different aptitude to be rarefied; that is, they ascend quicker, upon the application of any force, the more susceptible they are of rarefaction: but in bodies, whose aptitude to rarely is equal, the time of ascent is to be determined by their specific gravity.

But it is not only specific gravity that serves to elevate bodies in *Distillation*, but an external impulse may also cause their ascent: the impulse, we have here to do with, comes from the fire, whose particles, though extremely small and light, yet may raise bodies much heavier than themselves, by acting upon them with a certain degree of force: For since the moment of a body, or that force, by which it acts upon another, is in a compound ratio of the quantity of matter, and celerity; the celerity may be so increased, as to give a sufficient force to the body, though the quantity of matter in it be ever so small. Let some heavy body, therefore, be supposed to descend, with no other moment than what it receives from its own gravity; in this case then, the air, which is much lighter, may be moved with such celerity, as not only to sustain that body, but to mount it up higher; and the more rapid the impetus of the air is, or the surface of the body more diffused, the higher and swifter will the elevation be.

So fire, though it be a body of the minutest size, may be moved with that rapidity, as to acquire, and communicate what force can be desired towards removing any obstacles. When, therefore, the moment of fire is augmented in the manner explained, so as to exceed the force of the distilled body, it will remove it from its former situation; or what is here the same thing, because the direction of its motion tends upwards, it will carry it up. And thus, particles specifically heavier than the air contained in the retort, as those of acid spirits are, ascend by a more violent impulse of the fire used in *Distillation*.

Another thing to be noted, is, that the same quantity of matter is elevated so much the easier, in proportion, as the surface is enlarged; for the more this is diffused, the more particles of fire it receives: having, therefore, this united force to drive it up, it more easily ascends; so that, by the same degree of fire, bodies will not equally arise, though they are equally heavy, if there be that difference in their surfaces already supposed.

The air also has no small share in the business of an impulse; for being rarefied by the fire, it is not only impelled upwards it self, but it carries other particles up with it: and it may be learned by many very familiar experiments, what impetus bodies so rarefied exert. Whosoever, therefore, well considers these three things, viz. specific levity; an impelling force; and the extent of surface; and what may be effected by them, and how many ways, and in what proportions all of them may be changed, will very easily account for all the variety, which is found in the several processes of *Distillation*.

DISTINCT *Notion*, or *Idea*, according to Mr. Leibnitz, is, when we can enumerate marks and characters enough whereby to recollect a thing.

Such, e. gr. is this, that a circle is a figure bounded with a curve line that returns into it self; all the points whereof are equally distant from one middle part.

DISTINCT *Base*, in optics, is that distance from the pole of a convex glass, in which objects, beheld through it, appear distinct, and well defined: so that the *distinct base* coincides with what we otherwise call the focus.

The *distinct base*, is caused by the collection of the rays proceeding from a single point in the object, into a single point in the representation; and therefore, concave glasses, which do not unite, but scatter, and dissipate the rays, can have no real *distinct base*.

DISTINCTION, a diversity in things, or conceptions. Logicians define *Distinction*, an assemblage of two or more words, whereby disparate things, or their conceptions, are denoted.

There are three kinds of *Distinctions* taken from the three different modes of existence; the first *real*, the second *modal*, and the last *rational*.

Real *DISTINCTION*, is that between things which may exist, or be conceived to exist a-part from each other; such is that between two substances, or the modes of two substances.

Modal *DISTINCTION*, is that between several things, one whereof may exist without the other, but not *vice versa*, the other

other without that: such is that between the mind, and an act of will; between wax, and its hardness; water, and its freezing, &c.

DISTINCTIO RATIONIS, or *rational DISTINCTION*, is that between several things, which are really one and the same, and whereof one cannot exist without the other, nor *vice versa* the other without this: such is that between a thing, and its essence; between the essence, and properties, &c.

Of this *Distinction* some authors admit two kinds; the one barbarously called *rationis ratiocinatae*, having some foundation in things; as when we distinguish the justice of God from his mercy: the other called *rationis ratiocinantis*, which has no foundation at all, and therefore is by many quite rejected. Though others contend, that there is no *Distinction rationis*, but is at the same time a *real Distinction*: thus, say they, God, and just God, are to each other as milk and white milk; and a just God, and merciful God, as white milk and sweet milk. But when I say, milk is distinguished from white milk, or white milk from sweet milk, the *Distinction* falls between whiteness and sweetness, which is a *real Distinction*.

METAPHYSICAL DISTINCTION, called also by the schoolmen *Alietas*, *Alteritas*, and *Diversitas*, is a non-agreement of being, whereby this entity is not that, or one thing is not another.

DISTINCTIO, or *DISTINGUO*, in the schools, an expedient to evade an argument, or to clear up, and unfold an ambiguous proposition, which may be true in one sense, and false in another. The respondent was hard pressed, but he disengaged himself by a *Distinguo*. Moliere makes T. D. say to his mistress who had told him, he must submit to the will of a person he loved: *Distinguo*, Mademoiselle; pour l'intérêt de son amour, Concedo: contre sa passion, Nego.

DISTORTION, in medicine. **DISTORTIO ORIS**, or *DISTORTION of the mouth*, is a contraction, or shortening of one side of the mouth, occasioned by a convulsion, or a palsy of the muscles of one side of the face.

When the *Distortion* arises from a convulsion, it is on the same side with the convulsion, the force of the convulsed part being superior to that of the sound part: on the contrary, when it arises from a palsy, it is on the opposite side, the paralytic part being here surmounted by the sound.

In a *Distortion of the mouth* the patient can only spit on one side; and if you make him laugh, or oblige him to pronounce the letter O, you will easily perceive, that he only moves one side of his mouth.

The Greeks call this disorder *σπασμος κυνικος*, *spasmus cynicus*.

DISTORTION of the eye, called also *squinting*, or *strabismus*. See **STRABISMUS**.

DISTORTOR ORIS, in anatomy, a muscle of the mouth, called also *Zygomaticus*. See **ZYGOMATICUS**.

DISTRACTION, in medicine, sometimes denotes the act of pulling a fibre, membrane, or the like, beyond its natural extent; and what is capable of this enlargement, is said to be *distractable*.

DISTRAIN, in law.—To *DISTRAIN* is to attach, or seize on one's goods, for the satisfaction of a debt.

DISTRESS, in law, a compulsion had recourse to in certain real actions, for bringing a man to appear in court, or to pay rent, or other duty denied.

Distress is divided by Briton into *real*, and *personal*.

Personal DISTRESS is made by *distraining* a man's moveable goods, and seizing all the profits of his lands, and tenements, from the tithes, or date of the writ, for the defendant's contempt in not appearing to an action brought against him when he was summoned, or attached: and the issues so returned by the sheriffs, are forfeited to the king, and estreated into the exchequer.

Real DISTRESS is made on immoveable goods: It differs from an attachment in this, that it cannot be taken by any common person, without the compass of his own fee; except it be presently after the cattle, or other things, are driven, or bore off the ground, on purpose to avoid *Distress*.

Distress is also divided to *finite*, and *infinite*.

Finite DISTRESS, is that limited by law, how often it shall be made to bring the party to trial of the action: viz. once, twice, &c.

Infinite DISTRESS, is, without limitation, till the party come; as against a jury, which refuses to appear upon certificate of affide, the process is *venire facias*, *habeas corpus*, and *Distress infinite*.

Lastly, *Distress* is again divided into *grand Distress*, by Fitzherbert called *magna Distressio*; and *ordinary Distress*.

Grand DISTRESS, is that made of all the goods and chattels the party hath within the county.

The usual effect of *Distress* is to drive the party *distrained* to replevy the *Distress*, and so take his action of trespass against the *Distrainer*; or else to compound with him for the debt, or duty, for which *Distress* was made.

There are several things not *distrainable*: for a *Distress* must be of a thing, whereof a valuable property is in some body; and, therefore, dogs, bucks, coney, &c. that are *feræ naturæ*, cannot be *distrained*.

Again, although it be of a valuable property, as a horse, (yet when a man, or woman is riding on him) or an ax (in a man's hand cutting wood) and the like, are for that time privileged, and cannot be *distrained*.

Again, valuable things shall not be *distrained* for rent, which are for the benefit, and maintenance of trades, and which, by consequence, are for the common-wealth; and are by authority of the law there; as an horse in a smith's shop; materials in the weaver's shop for making cloth; cloth, or garments in the tailor's shop; sacks of corn, or meal in a mill, or a market; nor any thing *distrained* for damage-feasant, for it is in *custodia legis*.

Again, nothing shall be *distrained* for rent, which cannot be rendered again in as good a plight, as it was at the time of the *Distress* taken; as sheaves, or shocks of corn cannot be *distrained* for rent, but for damage-feasant they may. Again, beasts belonging to the plough shall not be *distrained*.

Lastly, furnaces, cauldrons, or the like, fixed to the fireholds, or doors, or windows of an house, or the like, cannot be *distrained*: when a *Distress* is taken that has life in it, it must be brought into the common pound; or kept in an open place, where the owner may give it food.

DISTRIBUTION, the act of dividing a thing into several parts, in order to the disposing each in its proper place. See **DIVISION**.

A dramatic poet should have *distributed* his subject into acts and scenes, before he proceed to the verification, &c. See **ACT**, &c. Orators *distribute* their harangues into exordium, narration, confirmation, &c.

The Jewish nation was *distributed* into 12 tribes.

The digest is *distributed* into 50 books.

The *Distribution* of the food throughout all the parts of the body, is one of the greatest wonders in nature.

Manual, and quotidian DISTRIBUTIONS, denote certain small sums of money, appointed by the donors, or founders thereof, to be *distributed* to such of the canons of a chapter as are actually present, and assistant at certain offices.

DISTRIBUTION, in rhetoric, is a kind of description; or a figure whereby an orderly division, and enumeration is made of the principal qualities of a subject.

For example, He has understanding to see our faults, justice to restrain them, and authority to punish them. Their throat is an open sepulchre, they flatter with their tongues; the poison of asps is under their lips; their mouth is full of cursing, and lyes; and their feet are swift to shed blood.

DISTRIBUTION, in printing, the taking a form asunder, separating the letters, and disposing them in the cases again, each in its proper cell.

DISTRIBUTION, in architecture. **DISTRIBUTION of the plan**, denotes the dividing, and dispensing the several parts, and members, which compose the plan of a building.

DISTRIBUTION of ornaments, is an equal, orderly placing of the ornaments in any member, or composition of architecture. See **ORNAMENT**.

DISTRIBUTIVE, that *Distributes*, from *dis*, asunder; and *tribuere*, to give.

DISTRIBUTIVE Justice, is that whereby we give every person what belongs to him. See **JUSTICE**.

DISTRIBUTIVES, in grammar. See **NUMERALS**.

DISTRICT, the territory, or extent of jurisdiction of a judge.

A judge or officer cannot act out of his own *District*. See **JUDGE**.

DISTRICT, in law, properly denotes the place wherein a man has the power of distraining; or, the circuit, or territory, wherein one may be compelled to appear.—Where we lay, *hors de son fee*; others say, *extra Districtum suum*.

DISTRINGAS, a writ directed to the sheriff, or other officer, commanding him to distrain one for a debt to the king; or for his appearance at a certain day. See **DISTRESS**.

DISVELOPED, in heraldry, is used much in the same sense with displayed.—Thus colours, said in an army to be flying, are in heraldry said to be *disveloped*.

DITCH, in fortification, called also *Foss*, and *Moat*, a trench dug round the rampart, or wall of a fortified place, between the scarp, and counterescarp.—See **Tab. Fortif. fig. 21. lit. h h h**, &c.

Some *Ditches* are dry; others full of water: each whereof have their advantage.—The earth dug out of the *Ditch* serves to form the rampart.

The *Ditch* would be of such breadth as that the tallest tree may not reach over it, i. e. from 15 to 20 fathoms; though the rule others give for the dimensions of the *Ditch*, is, that it afford earth enough to build the rampart of due magnitude.

The space between the rampart and *Ditch*, being about 6 feet, is called the *Berm*, or *Lift*.

DITHYRAMBIC, (something that relates to the *Dithyrambus*.

We say, a *dithyrambic verse*, *dithyrambic poet*, *dithyrambic heat*, &c.—a compound *dithyrambic* word, Mr. Dacier observes, has sometimes its beauty and force. Some moderns call compositions in the taste of the ode, only not distinguished

into strophes, and consisting of all kinds of verse indifferently, *dithyrambic odes*.

Dithyrambic poetry owes its birth to Greece, and the transports of wine. It favours strongly of its original; as admitting of no rules, but the follies of a fiery imagination. And yet art is not quite excluded; but delicately applied, to guide and restrain the *Dithyrambic* impetuosity, and only indulge it in flights that are pleasing. In effect, what our poets say of the ode, is more true of the *Dithyrambic*, than of the ode, that its disorder is an effect of art.

DITHYRAMBUS, ΔΙΘΥΡΑΜΒΟΣ, in the ancient poetry, a hymn in honour of Bacchus, full of transport, and poetical rage.

The measure, which is what distinguishes this kind of poetry, is said to have been invented by *Dithyrambus*, a Theban; but Pindar attributes it to the Corinthians; and the modern etymologists furnish us with another origin of the word.

In effect, the verse might be called thus from the god it was consecrated to, who himself was named *Dithyrambus*; either on account of his having been brought twice into the world, according to the fable of Semel and Jupiter, or by reason of his having triumphed twice: from *δύς*, twice; and *θραύω*, triumph. Be this as it will, the ancients, we are told by Aristotle and Horace, gave the appellation *Dithyrambus* to those verses wherein none of the common rules, or measures were observed; much like those called by the French *Vers Libres*, by the Italians *Versi Sciolti*, and by the modern Greeks *Politici*, a name they give to prose, which these verses resemble more than poetry.

We have now no remains of the *Dithyrambi* of the ancient poets, so that we cannot say precisely what their measure was: all we know is, that it was very bold, and irregular. The poets not only took the liberty to forge new words for the purpose, but they made double, and compound words, which contributed very much to the magnificence of the *Dithyrambus*.

Horace has sometimes imitated them. Dacier, Fa. Commire, and some other modern writers, have composed Latin pieces of all kinds of verse indifferently, according as the subject and words presented themselves, without any order, or distribution into strophes, and call them *Dithyrambi*. See **PINDARICK**.

DITONE *, **DITONUM**, in music, an interval comprehending two tones, a greater and a less. See **INTERVAL**, and **TONE**.

* The word is formed of *δύς*, twice; and *τῶν*, tone.

The ratio of the sounds that form the *Ditone* is of 4 to 5; and that of the *Semi-ditone*, of 5 to 6. Fa. Parran makes the *Ditone* the fourth kind of simple concords: others make it the first discord, dividing the *Ditone* into 18 equal parts, or comma's, the nine on the acute side go to the greater tone. Salomon de Caux.

DITRIGLYPH, in architecture, the space between two triglyphs. See **TRIGLYPH**.

DITTO *, in books of accounts, wrote contracted **D^o**. signifies the same, viz. as the preceding article.

* The word is corrupted from the Italian *detto*, the said: as in our law-phrase "the said premises," meaning the same as were aforementioned.

DIVAL, in heraldry, the herb night-shade, used by such as blazon with flowers and herbs instead of colours and metals, for sable, or black. See **SABLE**.

DIVALIA *, in antiquity, a feast held among the ancient Romans on the 21st of December, in honour of the goddess Angerona; whence it is also called *Angeronalia*.

* This feast was established on occasion of a disease which destroyed man, and beast: that disease was a kind of squinancy, or inflammation and swelling of the throat, called in Latin *Angina*; whence the appellation *Angeronalia*, as Macrobius relates Lib. I. Saturn. c. 12.

On the day of this feast, the pontifices performed sacrifice in the temple of Voluptia, or the goddess of joy and pleasure, who, some say, was the same with Angerona; and supposed to drive away all the sorrows and chagrins of life.

DIVAN *, a council-chamber, or court wherein justice is administered, in the eastern nations, particularly among the Turks.

* *Divan* is an Arabic word, signifying the same with *Sofa* in the Turkish dialect.

The word is also used for a hall, in the private houses of the orientals.—The custom of China does not allow the receiving of visits in the inner parts of the house, but only at the entry, in a *Divan* contrived on purpose for ceremonies. Le Compté. Travellers relate wonders of the silence, and expedition of the *Divans* of the east.—We say, the Grand Vizir has held a *Divan*; meaning, that he has assembled the grandes of the port, to deliberate of the affairs of the empire.

DIVAN-BEGHI, the appellation of one of the ministers of state in Persia.

The *Divan-Beghi* is the superintendent of justice: his place is the last of the six ministers of the second rank, who are all under the athemadauler, or first minister.

To the tribunal of the *Divan-Beghi* appeals lie from sentences passed by the governors. He has a fixed stipend, or appoint-

ment of 50000 crowns, that he may render justice gratis. All the sergeants, officers, &c. of the court, are in the service of the *Divan-Beghi*. He takes cognizance of the criminal causes of the chams, governors, and other great lords of Persia, when accused of any fault, and receives appeals from the daruga.

There are *Divan-Beghi*'s not only at court, and in the capital, but also in the provinces, and other cities of the empire.

This officer is not confined by any other law, or rule in the administration of justice, but the Algoran; which, also he interprets at pleasure. He takes no cognizance of civil causes.

DIVERGENT, or **DIVERGING Lines**, in geometry, are such whose distance is continually increasing. See **LINE**.

Lines which converge one way, *diverge* the opposite way. **DIVERGENT**, or **DIVERGING**, in optics, is particularly applied to rays, which issuing from a radiant point, or having in their passage undergone a refraction or reflection, do continually recede further from each other.

In which sense the word is opposed to *Convergent*, which implies the rays to approach each other; or to tend to a centre, where being arrived, they intersect, and if continued further, become *diverging*.

Concave glasses render the rays *diverging*; and convex ones, converging.

Concave mirrors make the rays converge; and convex ones, *diverge*.

It is demonstrated, in optics, that as the diameter of a pretty large pupil does not exceed $\frac{1}{2}$ of a digit; *diverging* rays, flowing from a radiant point, will enter the pupil, parallel, to all intents and purposes, if the distance of the radiant from the eye be 40000 feet. See **LIGHT** and **VISION**.

DIVERGING Hyperbola, is one whose legs turn their convexities towards one another, and run towards quite contrary ways.

DIVERSION, in war, the act of attacking an enemy in one place, where he is weak, and unprovided, with design to make him call his forces from another place, where he was going to make an irruption, or is to be attached with more force.

The Romans had no way to drive Hannibal out of Italy, but to make a *Diversion*, by attacking Carthage.

DIVERSION, in medicine, the turning of the course, or flux of humours from one part to another, by proper applications.

DIVERSITY, this differs from distinction in this, that the latter is the work of the mind; but the former is in things themselves, antecedent to any operation of the mind. For things that are several, are different; even though I do not conceive them. See **DISTINCTION**.

The *Diversity*, or difference of things, therefore, arises from their essential attributes.

DIVESTING, properly signifies undressing, or stripping off one's garment, in contra-distinction to *investing*.

In law, it is used for the act of surrendering, or relinquishing one's effects. By a contract of donation, or sale, the donor, or seller are said to be disinvested, and *divested* of their property in such a commodity, and the donee, or purchaser becomes *invested* therewith.

A demise is a general *Divestiture*, which the fathers and mothers make of all their effects, in favour of their children.

DIVIDEND, in arithmetic, the number given to be divided; or that whereof the *Division* is made.

The *Dividend* must always be greater than the divisor. The quotient always contains as many unites, as the *Dividend* contains the divisor times.

DIVINATION, the act, or art of foretelling future events, See **PROPHECY**, **ENTHUSIASM**, &c.

Divination is divided by the ancients into *artificial*, and *natural*.

Artificial DIVINATION, is that, which proceeds by reasoning upon certain external signs, considered as indications of futurity.

Natural DIVINATION, is that, which presages things from a mere internal sense, and persuasion of the mind, without any assistance of signs.

Natural Divination, again, is of two kinds; the one *native*, the other by *infux*.

The first is founded on this supposition, that the soul, collected within it self, and not diffused, or divided among the organs of the body, has, from its own nature and essence some fore-knowledge of future things: witness what is seen in dreams, extasies, the confines of death, &c.

The second is founded on this, that the soul receives, after the manner of a mirror, some secondary illumination from the presence of God, and other spirits.

Artificial Divination is also of two kinds: the one arguing from *natural causes*: such are the predictions of physicians about the events of diseases, from the pulse, urine, &c. such also are those of the politician, *Ob unalem urbem, & max perituram si emptorem inveneris!*

The second proceeds from experiments, and observations arbitrarily instituted; and is mostly superstitious.

Infinite are the systems of *Divination* reducible to this head: by birds, the entrails of beasts, dreams, lines of the hand, points

points marked at random, numbers, names, the motion of a sieve, the air, fire, the fortes prænestinae, Virgilianæ and Homerica; with numerous others, the principal species whereof, and their names, are:

Pychomancy, or Sciomancy, which consists in calling up the souls, or shades of the deceased, to learn of them something required. Dactyliomancy, performed by means of one, or more rings. Hydromancy, performed with sea-water. Pegomancy, with spring-water. Ornithomancy, or divining by the flight of birds, which was the business of the augurs. Clidomancy performed with keys. Coskinomancy, with a riddle, or sieve. Cledonism, by words, or voice. Extispicina, by the entrails of victims. Alphetomancy, or Aleuromancy, by flower. Keraunoscopia, by the consideration of thunder. Capnomancy, by smoke. Alecetryomancy, by cocks. Pyromancy, by fire. Lithomancy, by stones. Lychinomancy, by lamps. Necromancy, by the dead, or their bones, &c. Oheirocritica, by dreams. Ooscopy, by eggs. Lecanomancy, by a balon of water. Gasteromancy, by the belly, or by vials. Palpitation, Salisfatio, Πάλας, by the pulsation, or motion of some member. Axinomancy, by a hatchet, or cleaver. Catoptrism, or Crystallomancy, by a mirror. Chirromancy, by the lines of the hand. Geomancy, by the earth. Cero-mancy, by figures of wax. Arithmomancy, by numbers. Belomancy, by arrows. Sycomancy, &c. all described by Cardan, in his IVth book, *de Sapientia*; and under their proper articles in this Dictionary.

All these kinds of Divination have been condemned by the fathers, and councils, as supposing some compact with the devil. Fludd has several treatises on the several species of Divination: And Cicero has two books of the Divination of the ancients, wherein he refutes the whole system.

In Holy Scripture we find mention made of nine different kinds of Divination: the first performed by the inspection of planets, stars, and clouds: it is supposed to be the practitioners of this, whom Moses calls מַעֲנֵן *Maanen*, of אָנָן *anan*, cloud, Deuter. c. XVIII. v. 10. 2. Those, whom the prophet calls in the same place מְנַחֵם *Menachsch*, which the vulgate, and generality of interpreters render *Augur*. 3. Those, who in the same place are called מְכַשֵּׁף *Mecscheph*, which the septuagint, and vulgate translate, *a man given to ill practices*. 4. Such authors, whom Moses in the same chapter, v. 11. calls חוֹרֵב *Hober*. 5. Those, who consult the spirits called *Python*; or, as Moses expresses it in the same book, שֹׂחֵן *Schen*, those who ask questions of *Python*. 6. Witches, or magicians whom Moses calls יְדוּעֵן *Judeani*. 7. Those, who consult the dead, *Necromancers*. 8. The prophet Hoseah, c. IV. 12. mentions such as consult staves, שְׂחָלִים *Schalim*, which kind of Divination may be called *Rhabdomancy*. 2. The last kind of Divination mentioned in scripture, is *Hepatoscopy*, or the consideration of the liver. See RHABDOMANCY, &c.

DIVINE, something that comes from, or relates to, God. See God.

The word is also used figuratively, for any thing that is excellent, extraordinary, and that seems to go beyond the power of nature, and the capacity of mankind.

In which sense, the compass, telescope, clocks, &c. are said to be *divine* inventions: Plato is called the *divine* Author, the *divine* Plato; and the same appellation is given to Seneca: Hippocrates is called, the *divine* old man, *divinus senex*, &c. The Arabs give the appellation, *Divine*, אֱלֹהִיּוֹת *Elahiou*, to their second sect of philosophers, * consisting of such as admit a first mover of all things, a spiritual substance free from all kind of matter, in a word, a God. By this name they distinguish them from their first sect, whom they call *Deberious*, or *Thabaioun*, i. e. worldlings, and naturalists, as admitting of no principles beyond the material world, and nature.

* The word אֱלֹהִיּוֹת *Elahiou*, is derived from אֵל *Alla*, God: so that the *Elahiou* are the *Droines*, or theologues, as Caltellus renders it; or, such as own a God.

DIVING, the art, or act of descending under water to considerable depths, and abiding there a competent time.

The uses of *Diving* are very considerable, particularly in the fishing for pearls, corals, sponges, &c. See PEARL-Fishing. There have been diverse methods proposed, and engines contrived, to render the business of *Diving* more safe and easy. The great point in all these is to furnish the *Diver* with fresh air, without which, he must either make but a short stay, or perish.

Those who *dive* for sponges in the Mediterranean, help themselves by carrying down sponges dipt in oil in their mouths. But considering the small quantity of air that can be contained in the pores of a sponge, and how much that little will be contracted by the pressure of the incumbent air, such a supply cannot long subsist the *Diver*. For it is found by experiment, that a gallon of air included in a bladder, and by a pipe reciprocally inspired and expired by the lungs, becomes unfit for respiration in little more than one minute of time. For though its elasticity be but little altered in passing the lungs, yet it loses its vivifying spirit, and is rendered effete.

In effect, a naked *Diver*, Dr. Halley assures us, without a sponge, cannot remain above two minutes enclosed in water; nor much longer with one, without suffocating; nor, without long practice, near so long; ordinary persons beginning to be suffocated in about half a minute. Besides, that if the depth be considerable, the pressure of the water in the vessels makes the eyes blood-shot, and frequently occasions a spitting of blood.

Hence, where there has been occasion to continue long at the bottom, some have contrived double flexible pipes, to circulate air down into a cavity enclosing the *Diver*, as with armour; both to furnish air, and to bear off the pressure of the water, and give leave to his breast to dilate upon inspiration; the fresh air being forced down one of the pipes with bellows, and returning by the other of them, not unlike to an artery, and vein.

But this method is impracticable when the depth surpasses three fathoms; the water embracing the bare limbs so closely as to obstruct the circulation of the blood in them; and withal pressing so strongly on all the junctures where the armour is made tight with leather; that if there be the least defect in any of them, the water rushes in, and instantly fills the whole engine, to the great danger of the *Diver's* life.

The *DIVING-Bell*, is a machine contrived to remedy all these inconveniences. In this the *Diver* is safely conveyed to any reasonable depth, and may stay more or less time under the water, as the bell is greater or less.

It is most conveniently made in form of a truncated cone, the smallest base being closed, and the larger open. It is to be poised with lead, and so suspended, that it may sink full of air, with its open basis downward, and as near as may be in a situation parallel to the horizon, so as to close with the surface of the water all at once.

Under this covercle the *Diver* sitting, sinks down with the included air to the depth desired: and if the cavity of the vessel can contain a tun of water, a single man may remain a full hour, without much inconvenience, at five or six fathoms deep.

But the lower you go, still the more the included air contracts itself, according to the weight of the water that compresses it; so as at 33 feet deep, the bell becomes half full of water; the pressure of the incumbent water being then equal to that of the atmosphere: and at all other depths the space occupied by the compressed air in the upper part of the bell will be to the under part of its capacity filled with water, as 33 feet to the depth of the surface of the water in the bell below the common surface thereof. And this condensed air being taken in with the breath soon insinuates itself into all the cavities of the body, and has no ill effect, provided the bell be permitted to descend so slowly as to allow time for that purpose.

One inconvenience that attends it, is found in the ears, within which there are cavities which open only outwards, and that by pores so small as not to give admission even to the air itself, unless they be dilated, and distended by a considerable force. Hence, on the first descent of the bell, a pressure begins to be felt on each ear, which, by degrees, grows painful till the force overcoming the obstacle, what constricts these pores, yields to the pressure, and letting some condensed air slip in, presently ease ensues. The bell descending lower, the pain is renewed, and afterwards it is again eased in the same manner.

But the greatest inconvenience of this engine, is, that the water entering it, contracts the bulk of air into so small a compass, that it soon heats and becomes unfit for respiration; so that there is a necessity for its being drawn up to recruit it; besides the uncomfortable abiding of the *Diver* who is almost covered with water.

To obviate the difficulties of the *Diving-Bell*, Dr. Halley, to whom we owe the preceding account, contrived some further apparatus, whereby not only to recruit and refresh the air from time to time, but also to keep the water wholly out of it at any depth: which he effected after the following manner:

His *Diving-Bell* was of wood about 60 cubic feet in its concavity, coated externally with lead so heavy that it would sink empty; a particular weight being distributed about its bottom, to make it descend perpendicularly, and no otherwise. In the top was fixed a glass like a window, to let in light from above; with a cock, to let out the hot air: and, below, about a yard under the *Bell*, was a stage suspended from it by three ropes, each charged with an hundred weight, to keep it steady.

To supply air to this *Bell* when under water, he had a couple of barrels, holding 36 gallons a-piece, cased with lead, so as to sink empty, each having a bung-hole at bottom to let in the water as they descended, and let it out again as they were drawn up again. In the top of the barrels was another hole, to which was fixed a leathern pipe, or hose, long enough to hang below the bung hole; being kept down by a weight appended. So that the air driven to the upper part of the barrel by the encroachment of the water, in the descent, could not escape up this pipe, unless the lower end were lifted up.

These air-barrels were fitted with tackle, to make them rise and fall alternately, like two buckets; being directed in their descent by lines fastened to the under edge of the *Bell*: so that they came readily to the hand of a man placed on the stage, to receive them; and who taking up the ends of the pipes, as soon as they came above the surface of the water in the barrels, all the air included in the upper part thereof was blown forcibly into the *Bell*; the water taking its place. One barrel thus received, and emptied; upon a signal given, it was drawn up, and at the same time the other let down: by which alternate succession fresh air was furnished so plentifully, that the learned doctor himself was one of five, who were all together in 9 or 10 fathoms deep of water for above an hour and a half, without the least inconvenience; the whole cavity of the *Bell* being perfectly dry.

All the precaution he observed, was to be let down gradually about 12 foot at a time, and then to stop, and drive out the water that had entered by taking in four or five barrels of fresh air before he descended further. And being arrived at the depth intended, he let out as much of the hot air that had been breathed, as each barrel would replace with cold, by means of the cock at the top of the bell, through whose aperture, though very small, the air would rush with so much violence, as to make the surface of the sea boil.

Thus, he found, any thing could be done that was required to be done underneath. And by taking off the stage, he could, for a space as wide as the circuit of the bell, lay the bottom of the sea so far dry as not to be over shoes therein. Besides, that by the glass window so much light was transmitted, that, when the sea was clear, and especially when the sun shone, he could see perfectly well to write, or read, much more to fasten, or lay hold of any thing under him that was to be taken up. And by the return of the air barrels he often sent up orders written with an iron pen on a plate of lead, directing how he would be moved from place to place.

At other times, when the water was troubled and thick, it would be as dark as night below; but in such cases he was able to keep a candle burning in the *Bell*.

The same author intimates, that by an additional contrivance, he has found it practicable for a *Diver* to go out of the *Bell* to a good distance from it; the air being conveyed to him in a continued stream by small flexible pipes, which serve him as a clew to direct him back again to the *Bell*. So that there seems little further wanting to the perfection of *Diving*.

Yet, the famous Corn. Drebell, had an expedient in some respects superior even to this; if what is related of it be true. He contrived not only a vessel to be rowed under water, but also a liquor to be carried in the vessel, which supplied the place of fresh air.

The vessel was made for king James I. carrying twelve rowers, beside the passengers. It was tried in the river Thames, and one of the persons in that submarine navigation, then living, told it one from whom Mr. Boyle had the relation.

As to the liquor, Mr. Boyle assures us, he discovered by a physician, who married Drebell's daughter, that it was used from time to time, when the air in the submarine boat was clogged by the breath of the company, and unfitted for respiration: at which time, by unstopping the vessel full of this liquor, he could speedily restore to the troubled air such a proportion of vital parts, as would make it serve again a good while. The secret of this liquor Drebell would never disclose to above one person, who himself assured Mr. Boyle what it was. *Boyl. Exp. Phys. Mech. of the Spring of the air.*

DIVINITY, the quality, nature, and essence of God.

Divinity and *humanity* are joined together in Jesus Christ. It is falsely, that the atheists hold the notion of a *Divinity* to be a political invention of the ancient legislators, to secure and enforce the observation of their laws: on the contrary, it is certain, the legislators made use of that opinion, which they found already impressed on the minds of the people.

The *heathen Divinities* may be reduced to three classes: the first, *theological*, representing the *divine* nature under diverse attributes; thus Jupiter denotes the absolute power of God, Juno his justice, &c.

The second class of *Divinities* are *physical*: Thus *Æolus* is that power in nature, whereby vapours and exhalations are collected to form winds, &c.

The last are *moral Divinities*. Thus the furies are only the secret reproaches and stings of conscience.

DIVINITY is also used in the same sense with theology.

DIVISIBILITY, a passive power, or property in quantity, whereby it becomes separable into parts; either actually, or at least mentally.

The school-men define *Divisibility*, *Capacitas coextensionis cum pluribus*; a capacity of being coextended with several things: thus, a staff 4 feet long is *divisible*, because it may be coextended with 4 feet, or 48 inches, &c.

This, the Peripatetics, and Cartesians, universally hold an affection, or property of all matter, or body: the Cartesians, as holding the essence of matter to consist in extension; for

every part, or corpuse of the body being extended, has parts without parts, and consequently is *divisible*.

The Epicureans, again, hold *Divisibility* to agree to every physical continuum, as, without parts adjacent to parts, there can be no continuity; and wherever there are parts so adjacent, there must be *Divisibility*. But they deny, that this affection agrees to all bodies: for the primary corpuses, or atoms they hold perfectly inseparable, and indivisible.

The principal argument they alledge, is, that from the *Divisibility* of all body, and of every assignable particle of body, even after any repeated number of divisions, it follows, that the smallest corpuse is infinitely *divisible*, which with them is an absurdity. For a body can only be divided into such parts as it actually contains. But to suppose infinite parts in the smallest corpuse, say they, is to suppose it infinitely extended: for infinite parts placed externally to each other, as the parts of bodies doubtless are, must make an infinite extension.

They add, that there is a world of difference between the *Divisibility* of physical, and mathematical quantities. For every mathematical quantity, or dimension, they grant, may be increased and diminished infinitely: but physical quantity, neither the one nor the other.

An artist, dividing a continued body, arrives at certain minute parts, beyond which he cannot go; these we may call *minima artis*. In like manner, nature, which may begin where art ends, will find bounds; which we may call *minima nature*: And God, whose power is infinite, beginning where nature ends, may subdivide the *minima nature*, but he will at length come at certain parts, to which there being no other parts continuous, they cannot be taken away. These minute parts are *ATOMS*.

All we can say to the point, is, that on the one hand it is certain, every extended corpuse must have two sides, and consequently is *divisible*; for, if it had not two sides, it were not extended; and, if it had no extension, an assemblage of diverse such corpuses would not compose a body. And on the other hand, the infinite *Divisibility* supposes an infinity of parts in the minutest corpuse: whence it follows, that there is no body, how small soever, but may furnish as many surfaces, or parts, as the whole globe of the earth can; nay, and infinitely more; which, to say no worse, is a violent paradox.

The infinite *Divisibility* of mathematical quantity is thus proved, and illustrated by the mathematicians: suppose a line A D (*Tab. Geometry, fig. 35.*) perpendicular to B F; another, as G H, at a small distance from A, also perpendicular to the same line; with the centres C, C, C, &c. and distances C A, C A, &c. describe circles cutting the line G H in the points e, e, &c. Now, the greater the radius A C is, the less is the part e G: but the radius may be augmented in *infinitum*, and therefore the part e G may be diminished in the same manner; and yet it can never be reduced to nothing; because the circle can never coincide with the right line B F. Consequently, the parts of any magnitude may be diminished in *infinitum*.

The chief objections against the doctrine, are: That an infinite cannot be contained by a finite; and that it follows from a *Divisibility* in *infinitum*, either that all bodies are equal, or, that one infinite is greater than another:—To which it is answered, that to an infinite may be attributed the properties of a finite, and determined quantity: And who has ever proved, that there could not be an infinite number of parts infinitely small in a finite quantity; or that all infinities are equal? the contrary is demonstrated by mathematicians in innumerable instances. We are not here contending for the possibility of an actual division in *infinitum*, we only assert, that however small a body is, it may be still farther divided; which we imagine may be called a division in *infinitum*, because what has no limits, is called *infinite*.

It is true, that there are no such things as parts infinitely small; yet the subtilty of the particles of several bodies is such, that they very much surpass our conception; and there are innumerable instances in nature of such parts actually separated from one another.

Mr. Boyle gives us several instances of this. He speaks of a silken thread 300 yards long, that weighed but two grains and an half. He measured leaf-gold, and found by weighing it, that 50 square inches weighed but one grain: if the length of an inch be divided into 200 parts, the eye may distinguish them all; therefore there are in one square inch 40000 visible parts; and in one grain of gold there are 200000 of such parts; which visible parts no one will deny to be farther *divisible*. Again, a whole ounce of silver may be gilt with eight grains of gold, which may be afterwards drawn into a wire thirteen thousand feet long.

In odoriferous bodies we can still perceive a greater subtilty of parts, and even such as are actually separated from one another; several bodies scarce lose any sensible part of their weight in a long time, and yet continually fill a very large space with odoriferous particles.

By help of microscopes; such objects as would otherwise elude our sight, appear very large: There are some small animals scarce visible with the best microscopes; and yet these have all the parts necessary for life, as blood, and other liquors: how wonderful must the subtilty of the parts be which make up such fluids; whence is deducible the following theorem: Any particle of matter, how small soever, and any finite space, how large soever, being given; it is possible for that small sand, or particle of matter, to be diffused through all that great space, and to fill it in such manner, as that there shall be no pore in it, whose diameter shall exceed any given line; as is demonstrated by Dr. Keil. *Introduct. ad Ver. Phys.*

DIVISION, the act of separating a whole into the parts it contains.

If the whole be composed of parts really distinct, called *integral parts*, the *Division* made thereof is properly called *partition*: as when a house is divided into its apartments.

If the whole be composed of parts, called *subjective*; that is, if the whole be only one common term, the subjects comprised in the extent whereof are the parts, the *Division* thereof is what we properly call *Division*: such is the *Division* of a genus into its species, &c.

DIVISION, in physics, or *DIVISIO CONTINUI*, is the separation of the parts of a quantity; whereby, what before was one, is now reduced into several. See *CONTINUITY*. This *Division* is effected by means of motion, without which there can be no separation of any continuum, or even continuum.

This motion is performed diverse ways, by fraction, fission, section, fission; resolution, dilution, maceration, dispersion, effusion, distraction, &c.

DIVISION, in logic, is the separating any thing into diverse parts, or ideas. See *DISTRIBUTION*.

The school-men define it a discourse, explaining a thing by its parts: in which it approaches near to the nature of a definition; whose character is to define a thing by its parts.

Division, we have said, is a distribution of a whole, &c. But there are two sorts of wholes, as above expressed.

The first is what consists of integral parts; as the human body, which contains diverse members.

The second is properly no other than an abstract idea common to more things than one, as the universals: or a compound idea comprehending the substance, and its accidents, or at least most of its accidents.

This whole admits of a triple *Division*. 1^o. When the genus, or kind, is divided by its species, or differences; as when substance is divided into body and spirit; or into extended, and thinking.

2^o. When any thing is divided into several classes; by opposite accidents; as when the stars are divided into those which shine by their own light, and those that only reflect a borrowed light.

3^o. When the accidents themselves are divided according to the subjects in which they inhere; as when goods are divided into those of the body, the mind, and fortune.

The laws of *Division* are; 1. That it be full, and adequate, that is, that the members of the *Division* entirely exhaust the whole thing divided: as when all numbers are divided into equal, and unequal.

2. That the members of the *Division* be opposite; as equal, and unequal; corporeal, and not corporeal; extended, and thinking.

3. That one member of the *Division* be not contained in another, so as the other may be affirmed of it. Though, in other respects, it might be included without any fault in the *Division*: thus extension, geometrically considered, may be divided into a line, surface, and solid: though the line be included in the surface, and the surface in the solid.

4. The *Division* not to be made into too many, or too general parts. Lastly, the members, unless the subject require it, not to be too unequal; as if the universe were divided into heaven, and earth.

DIVISION of a word, is a discourse explaining the latitude, or comprehension of a word: the latitude, when the word is universal; as when the genus is divided into species, and differences: the comprehension, when the word is ambiguous, as *taurus*, bull; which sometimes denotes a constellation, sometimes a beast, and sometimes a mountain.

DIVISION of a mode, divides a quality into its degrees. Philosophers, after the physicians, suppose eight degrees of every quality: hence when a quality is said to be in the 8th degree, it marks, that it can be no further intended, or heightened.

DIVISION, in arithmetic, is the last of the four great rules, being that whereby we find how often a less quantity is contained in a greater; and the overplus.

Division, in reality, is only a compendious method of subtraction; its effect being to take a less number from another greater, as often as possible; that is, as oft as it is contained therein. There are, therefore, three numbers concerned in *Division*: 1. That given to be divided, called the *Dividend*.

2. That whereby the dividend is to be divided, called the *Divisor*. 3. That which expresses how often the divisor is contained in the dividend; or the number resulting from the *Division* of the dividend by the divisor, called the *Quotient*.

There are diverse ways of performing *Division*, one called the *English*, another the *Flemish*, another the *Italian*, another the *Spanish*, another the *German*, and another the *Indian* way, all equally just, as finding the quotient with the same certainty, and only differing in the manner of arranging, and disposing the numbers.

We have likewise *Division* in integers; *Division* in fractions; and *Division* in species, or algebra.

Division is performed by seeking how often the divisor is contained in the dividend; and when the latter consists of a greater number of figures than the former, the dividend must be taken into parts, beginning from the left, and proceeding to the right, and seeking how often the divisor is found in each of those parts.

For example, it is required to divide 6759 by 3: I first seek how oft 3 is contained in 6, viz. twice; then, how oft in 7, which is likewise twice, with one remaining. This 1, therefore, is joined to the next figure 5, which makes 15, and I seek how oft 3 in 15; and lastly, how oft 3 in 9. All the numbers expressing how oft 3 is contained in each of those parts, I write down according to the order of the parts of the dividend, that is, from left to right; and separate them from the dividend it self, by a line, thus.

Divisor. Dividend. Quotient.

3) 6759 (2253

It appears, therefore, that 3 is contained 2253 times in 6759; or that 6759 being divided into 3, each part will be 2253. If there be any remainder, that is, if the divisor repeated a certain number of times is not equal to the dividend, what remains is wrote over the divisor fraction-wise. Thus, if instead of 6759 the dividend were only 6758, the quotient will be the same as in the former case, except for the last figure 8; for 3 being only contained twice in 8, the last number in the quotient will be 2; and as twice three is only 6, there remains 2 of the dividend; which I write after the quotient, with the divisor underneath it; and a line to separate the two; thus,

3) 6758 (2252 $\frac{2}{3}$

Proof of *DIVISION*.

Division is proved by multiplying the quotient by the divisor, or the divisor by the quotient: and adding what remains of the *Division*, if there be any thing. If the sum be found equal to the dividend, the operation is just, otherwise there is a mistake.

DIVISION $\left\{ \begin{array}{l} \text{in Decimal Fractions,} \\ \text{in Vulgar Fractions,} \\ \text{of Proportion,} \end{array} \right\}$ See $\left\{ \begin{array}{l} \text{DECIMAL} \\ \text{FRACTION.} \\ \text{PROPORTION.} \end{array} \right.$

DIVISION, in species, or algebra, is performed by reducing the dividend and divisor into the form of a fraction: This fraction being the quotient.

Thus, if a b were to be divided by c d , it must be placed thus, $\frac{ab}{cd}$, and that fraction is the quotient: though others

chuse to write it thus, c d a b , or c d a b , or a b \div c d , which last mark \div is the most common character for *Division*.

To perform the work of *Division* algebraically, these rules are to be observed: 1. When the dividend is equal to the divisor, the quotient is unity, and must be placed in the quotient, because every thing contains itself once.

2. When the quotient is expressed fraction-wise (as in simple *Division*) if the same letters are found equally repeated in each member of the numerator, and denominator; cast away those letters, and the remainder is the quotient: thus, $\frac{a^2b}{ab^2c}$, and $\frac{abc}{ab^2c}$, &c.

3. When there are any co-efficients, divide them as in common arithmetic, and to the quotients annex the quantities expressed by letters: thus, $\frac{360ab}{24b} = 15a$.

4. The general way of *Division* of compound quantities, is like the ordinary way in common arithmetic, respect being had to the rules of algebraic addition, subtraction, and multiplication; as also that like signs give +, and unlike — in the quotient: taking care to divide every part of the dividend by its corresponding divisor, (that is, that whose letters shew it of the same kind with the other) to prevent a fraction, which would otherwise arise: thus,

$$\begin{array}{r} a + b \quad a + a + b \\ a + a + b \\ \hline 0 \quad 0 - ca - cb \\ \hline 0 \quad - ca - cb \\ \hline 0 \end{array}$$

That

That the same reason for like signs giving a positive, and unlike a negative quotient, does hold in *Division*, as in multiplication, is clear from considering the nature of *Division*; (which is only resolving the thing into its parts) consequently, since every dividend is nothing else but the product of the divisor, and quotient multiplied by each other, the quotient must consist of such signs, which could produce the dividend; therefore, if the dividend be divided by a quantity, that has a similar sign with it, the quotient must be positive; if by a quantity having a dissimilar sign, the quotient must be negative.—It may be a general rule in compound *Division* in algebra, always to place such a letter in the quotient, as will, when multiplied into the divisor, produce the dividend; for that is always a rectangle under the divisor, and the quotient: as for example,

$$\begin{array}{r} z^6-16z^4 \\ 8z^4-124zz \\ \hline 8z^4-128zz \\ \hline 4zz-64 \\ 4zz-64 \\ \hline 0 \end{array}$$

DIVISION by { *Nepairs Bones.* } See { *NEPAIRS Bones.*
 { *Logarithms.* } { *LOGARITHM.*

DIVISION, in lines, or *Geometrical DIVISION*, is also called *Application*; the design of which, when it is employed about the construction of plain problems, is this, viz. a rectangle being given, as also a right line; to find another right line, the rectangle contained under which with the right line given, shall be equal to the rectangle first given:—Such effect, or construction, is called the *Application* of a given rectangle to a right line given; and the right line arising by such application, is called the *Geometrical Quotient*. This is found by the rule of three, by saying, as the line given is to one side of the rectangle, so is the other side, to the line sought.

Not unlike to which is Des Cartes's way of working *Division* in lines, by scale, and compass: thus, suppose $ac (=6)$ were to be divided by $ad (=3)$ *Tab. Geometry, fig. 17.* make any angle at pleasure, and therein set off first $ad (=3)$ the divisor, and then on the same leg, $au =$ to unity: then on the other leg of the angle set $ac (=6)$ the dividend, and join dc , and to it through u , draw ub parallel to dc , which shall cut off ab the quotient sought; for as $ad : au :: ac : ab$; that is, as the divisor : is to unity :: so is the dividend : to the quotient; on which proportion depends all *Division*.

DIVISION, in music, imports the dividing the interval of an octave into a number of lesser intervals.

The 4th, and 5th, each of them, divide, or measure the octave perfectly, though differently. When the 5th is below, and serves as a base to the 4th, the *Division* is called *Harmonical*; when the 4th is below, the *Division* is called *Authentic*.

DIVISIONS of an Army, the several brigades into which it is cantoned. See *BRIGADE*.

DIVISIONS of a Battalion, the several parcels into which it is divided in marching: consisting generally of about 6 files each: lead by the lieutenants and ensigns. See *BATTALION*.

DIVISION, in the sea-language, the third part of a naval army, or fleet; or of one of the squadrons thereof, under the command of some flag officer. See *SQUADRON*. Naval battels are usually ranged in three lines, according to their three *Divisions*.

DIVISOR, the dividing number; or that which shews how many parts the dividend is to be divided into. See *DIVISION*.

DIVORCE, a breach, or dissolution of the bond of marriage. In our law *Divorce* is of two kinds: the one, a *vinculo matrimonii*; which alone is properly *Divorce*: the other, a *mensa & thora*; a separation from bed and board. The woman divorced a *vinculo matrimonii*, receives all again that the brought with her: the other has a suitable separate maintenance allowed her out of her husband's effects.

The first only happens through some essential impediment, as consanguinity or affinity within the degrees forbidden, precontract, impotency, adultery, &c. of which impediments the canon law allows fourteen, comprehended in these verses:

*Error, conditio, votum, cognatio, crimen,
Cultus, disparitas, vis, ordo, ligamen, honestas,
Si sis affinis, si forte coire nequibis,
Si parachi & duplicis desit presentia testis.
Raptoque sit mulier, nec parti reddita tuxa.*

Divorce is a spiritual judgment, and, therefore is passed in the spiritual court. Under the old law, the woman divorced was to have of her husband a writing, as St. Jerom and Josephus testify, to this effect: *I promise, that hereafter I will lay no claim to thee*; which was called a *Bill of Divorce*.

Divorce was allowed of in great latitude both among the Pagans and Jews. At Rome, barrenness, age, disease, madness,

and banishment, were the ordinary causes of *Divorce*. Carvilius, 500, or 600 years after the building of Rome, was the first who put away his wife because she was barren.

Justinian afterwards added impotency; a vow of chastity, and the profession of a monastic life, as valid reasons of *Divorce*. Among the Jews, ugliness, old age, or ill humour in a wife, were sufficient reasons for giving her a bill of *Divorce*. Nay, even the man's own pleasure, or his repenting of his match, were admitted as good reasons.

It is generally held, that Jesus Christ allowed of *Divorce* in the case of adultery. But some take this for a mistake; and maintain, that *Divorce* is no where permitted in the New Testament for adultery; but only a separation. See *Matth. XIX. 9.* Mark X. 11. Paul 1 Cor. VII. 27. See also the council of Florence; at the end, after the questions proposed to the Greeks. *Tertull. de Monogam. c. 9. and 10. Augustin. de Bono Conjugio, & de Adult. Conjug.* See also what we have delivered under the article *ADULTERY*.

Pope Innocent I. in his decretal to Exuperius, declares such as contract a new marriage after *Divorce*, adulterers; as well as the persons they marry withal. The occasion of this decree was, that such marriages were then allowed of by the Roman laws. There is an exception, however, in the case of marriage between two heathens, which the decrees allow to be dissolved after the conversation of one of the parties. And St. Paul says the same, 1 Cor. VII. 15. Yet even in this case, 1. The marriage is not immediately dissolved by the conversion of one of the parties, but they may still live together, and even on some occasions they ought to do so. Nor is it even dissolved by the separation of the infidel party; for in the meantime converted, he is obliged to take back his wife: as Innocent himself decides it, L. IV. *Decret. de Divort. C. Gaudemus*. But the marriage is totally dissolved by a second marriage of the converted party with another person.

2. Though the party converted to the faith, may, the minute of his conversion, legally separate himself, and contract with another; a liberty the christian law allows him; as in justice he is not deemed to owe any thing to an infidel; yet charity frequently forbids such *Divorce* and separation: as, e. gr. if the infidel consent to live with him, and do not molest him in his religion; if his faith be not at all in danger; if there be any hopes of converting her; or of gaining the children; if the separation would prove a scandal to the heathens, and render christianity odious, &c. See St. Paul 1 Cor. VII. 13, 14. St. Augustin L. 1. *de adult. Conjug. ad Pollent.*

The 4th council of Toledo decrees, that in a country where christianity is the prevailing religion, the infidel party must be advertized to become christian; which if she refuse, the marriage is to be dissolved.

The council of Trent prohibits *Divorce* on any occasion whatever. The papal dispensations, however, are a salvo for this piece of rigor.

In England *Divorce* can only be had by consent of parliament. Milton has an express treatise of the doctrine and discipline of *Divorce*, where he maintains, that *Divorce* ought to be permitted for a mere incompatibility of humors.

DIURESIS *, ΔΙΟΥΡΗΣΙΣ, that separation which is made of the urine by the kidneys.

* The word is formed from *dia*, through; and *urea*, I shake water.

DIURETICS, in medicine, are such remedies as provoke, or promote the discharge of urine.

Such is water drank plentifully, white wine drank in a morning; alkali salts of all kinds; sea-salt, sal gemmæ, nitre, borax, alum, tartar, sal ammoniac, whey, four milk, lemon juice, &c.

Aqueous liquors are generally *diuretic*, especially if mixed with salt, and drank cold. Fermented liquors are the least *diuretic* of all; and the less so as they are the fatter. Sharp thin four wines, rhenish, &c. as also acid spirits of vinegar, salt, sulphur, alum, vitriol, &c. asparagus, bitter almonds, smalage, eryngium, eupatorium, cassiafras, &c. are all *diuretics*.

DIURNAL, in astronomy, something relating to the day: in opposition to nocturnal, which regards the night.

DIURNAL Arch, is the arch, or number of degrees, that the sun, moon, or stars describe between their rising, and setting.

DIURNAL Circle, is an immoveable circle, in which any star, or point in the surface of the mundane sphere, moves by its diurnal motion.

Thus, if a right line be conceived to be continued from the centre of a star, perpendicular to the axis of the world, as far as the surface of the sphere of the world; it will describe a *diurnal circle* thereon, in making one revolution about its axis.

DIURNAL Motion of a planet is so many degrees and minutes, &c. as any planet moves in 24 hours.

The *DIURNAL Motion* of the earth is its rotation round its axis, the space whereof constitutes the natural day.

The reality of the *diurnal rotation* of the earth is now past all dispute.

DIURNAL is also used in speaking of what belongs to the nycthemeron, or natural day of 24 hours.—In which sense it stands opposed to annual, menstrual, &c.

The diurnal phenomena of the heavenly bodies are solved from the diurnal revolution of the earth; that is, from the revolution of the earth round its own axis in 24 hours.—To illustrate this: suppose the circle PRTH, (*Tab. Astronomy, fig. 2.*) to denote the earth; C the centre of the earth, through which its axis is conceived to pass, around which its diurnal revolution is performed: P denotes any place on the earth; the line EW the visible horizon of the place; E the east point of the said horizon, W the west: the circle a b c d e f the circumference of the heavens; the circle S the sun in the heavens, the semi-circle PRT, the enlighten'd hemisphere of the earth, or that half of it opposite to the sun; and lastly, the semi-circle PHT the darkened hemisphere of the earth. Now, the earth supposed in this situation, and moving round its axis towards the sun; it is evident, the place P of the earth, will then just begin to be enlightened by the sun, and so the sun will appear there to be just rising, or ascending the horizon at E the east point of it. The earth being moved round its own axis, so as the place P of the earth, which afore was under the point a in the heavens, is now under the point b; it is evident, the horizon of the said place P, will be now so situated, as that the sun will appear to a spectator at P, as ascended considerably above E the east end of the horizon. And while by the revolution of the earth round its axis, the place P passes from the under point b in the heavens, to the point c, the horizon of the place P will continually sink lower and lower in respect of the sun, and so the sun will appear to ascend higher and higher, till P is come under c, where the sun will appear in its greatest height above the horizon for that day; and so it will be noon, or mid-day, at the place P. The earth moving on, as the place P passes from under c to d, the west point of its horizon will ascend higher and higher, and so the sun will appear more and more to descend, as is represented by the horizon at the point of the earth under d. The place P being carried by the diurnal revolution of the earth from under d to under e, the sun will then appear just in W, the west point of the horizon, and so will appear to be just setting. The place P being come under f, it will be then mid-night there. Lastly, the place P being come round again under a; it will be there sun-rising again. The same holds good as to any other of the celestial lights, and the earth; as is obvious from the figure: the circle representing the sun being taken to denote any other star, planet, &c. It remains to observe, that whereas by the diurnal revolution of the earth, all the several celestial lights seem to move in the heavens from east to west, hence this seeming diurnal motion of the celestial lights is called their *common motion*, as being common to all of them.—Besides which, all the celestial lights except the sun, have a proper motion; from which arise their proper phenomena: as for the proper phenomena of the sun, they likewise seem to arise from the proper motion of the sun: but they are really produced by another motion, which the earth has, and whereby it moves round the sun once every year, whence it is called the *annual motion of the earth*.

DIURNARY, **DIURNARIUS**, an officer in the Greek empire, who wrote down in a book for that purpose, whatever the prince did, ordered, regulated, &c. every day. See the 8th law of the Theodosian Code, *de Cohort.*

DIVUS, **DIVA**, in antiquity, appellations given to men and women who had been deified, or placed in the number of the gods. See **DEIFICATION**.

Hence it is, that on medals struck for the consecration of an emperor, or empress, they give them the title of *Divus*, or *Diva*: for example, **DIVUS JULIUS**. **DIVO ANTONINO PIO**. **DIVO PIO**. **DIVO CLAUDIO**. **DIVA FAUSTINA AUG.** &c.

DIZZINESS. See the article **VERTIGO**.

DOCK, **DOCKING**, in law, a means, or expedient for cutting off an estate tail in lands, or tenements; that the owner may be enabled to sell, give, or bequeath the same.

To effect this a feigned writ of entry *fr. disseisin* in *le post* is brought of the lands whereof the party intends to dock the entail; and in a feigned declaration made thereon, it is pretended he was disseised by a person, who by a feigned fine, or deed of bargain and sale, is named, and supposed to be tenant of the lands.

The feigned tenant, if it be a single recovery, is made to appear, and vouch the bag-bearer of writs to the custos brevium in the court of common pleas; who making default, a judgment is by such fiction of law entered, that the demandant shall recover, and have a writ of seisin for the possession of the lands demanded; and that the tenant shall recover the value of the lands, against the lands of the vouchee bag-bearer, a poor, unlanded, illiterate person; which is feigned to be a satisfaction to the heir in law; though he never be to expect any.

Dock, in the sea language, a pit, pond, or creek by the side of an harbour, made convenient to work in, in order to build or repair ships.

VOL. I.

This is of two sorts: a *dry Dock*, where the water is kept out by great flood-gates, till the ship is built, or repaired, but afterwards can be easily let into it again to float, and launch her.

A *wet Dock*, is any place in the ouze, out of the tide's way, where a ship may be haled in, and so dock her self or sink her self a place to lie in.

DOCKET, sometimes denotes a little bill tied to wares or goods, and directed to the person, and place they are to be sent to.

DOCTOR, a person who has passed all the degrees of a faculty, and is empowered to teach, or practise the same.

The title of *Doctor* was first created towards the middle of the XIIIth century; to succeed to that of master, which was become too common, and familiar.

The establishment of the *Doctorate*, such as now in use among us, is ordinarily attributed to Innerius, who himself drew up the formulary. The first ceremony of this kind was performed at Bologna, in the person of Bulgarus, who began to profess the Roman law, and on that occasion was solemnly promoted to the *Doctorate*, i. e. *infallibilis juris utriusque Doctor*. But the custom was soon borrowed from the faculty of law to that of theology: the first instance whereof was given in the university of Paris, where Peter Lombard and Gilbert de la Porree, the two top divines of those days, were created *Doctors* in theology, *Sacrae Theologiae Doctores*.

Spelman gives another turn to the thing: he takes the title of *Doctor* not to have commenced till after the publication of Lombard's sentences, about the year 1140, and affirms, that such as explained that work to their scholars, were the first that had the appellation of *Doctors*.

Others go much higher, and holds Bede to have been the first *Doctor* at Cambridge, and John de Beverley at Oxford, which latter died in the year 721. But Spelman will not allow *Doctor* to have been the name of any title, or degree in England, till the reign of king John, about the year 1207.

To pass *Doctor in divinity* at Oxford, it is necessary the candidate have been 4 years bachelor of divinity. For *Doctor of laws*, he must have been 7 years in the university to commence bachelor of law; 5 years after which he may be admitted *Doctor of laws*. Otherwise, in three years after taking the degree of master of arts, he may take the degree of bachelor in law; and in four years more, that of *LLD*, which same method and time are likewise required to pass the degree of *Doctor in physic*.

At Cambridge, to take the degree of *Doctor in Divinity*, it is required the candidate have been 7 years bachelor of divinity. Though in several of the colleges, the taking of the bachelor of divinity's degree is dispensed with, and they may go out *per saltum*. To commence *Doctor in laws*, the candidate must have been five years bachelor of law, or seven years master of arts. To pass *Doctor in physic*, he must have been bachelor in physic five years, or seven years master of arts.

DOCTOR of the law, was a title of honour, or dignity among the Jews.

The Jews, it is certain, had *Doctors* long before Jesus Christ. The investiture, if we may so say, of this order, was performed by putting a key, and a table book in their hands; which is what some authors imagine our Saviour had in view, Luke XI. 2. where speaking of the *Doctors of the law*, he says, *Woe unto you Doctors of the law, for you have taken away the key of knowledge; you entered not in your selves, and them that were entering, you hindered.*

The Greek text of St. Luke calls them *Νομοιοι*; and the vulgate *Legisperiti*; agreeably to which our English translators call them *lawyers*. But the French version of *Docteurs de la loi*, seems the most adequate. In effect, the word *Lawyer*, *Legisperitus* is only found in St. Luke, and St. Paul, Titus III. 13. And *Νομοιοι* in St. Matthew, XXII. 35. is rendered by the vulgate, *legis Doctor*; though the English version still retains the word *lawyer*.

These Jewish *Doctors* are the same whom they otherwise call *Rabbins*. See **RABBIN**.

DOCTOR of the church, a title given to certain of the fathers whose doctrines and opinions have been the most generally followed, and authorized.

We usually reckon four *Doctors* of the Greek church, and three of the Latin. The first are St. Athanasius, St. Basil, St. Gregory Nazianzen, and St. Chrysostom. The latter are St. Jerom, St. Augustin, and Gregory the Great.

In the Roman breviary there is a particular office for the *Doctors*. It only differs from that of the confessors by the anthem of the *Magnificat*, and the lessons.

DOCTOR is also an appellation adjoined to several specific epithets expressing wherein the merit of such as the schools owned for their masters, consisted.

Thus Alexander Hales is called the *irrefragable Doctor*, and the *fountain of life*, as mentioned in Poffevinus. Thomas Aquinas is called the *angelical Doctor*; St. Bonaventure the *seraphic Doctor*; John Duns Scotus, the *subtile Doctor*; Rai-

DOG

rhond Lully the illuminated *Doctōr*; Roger Bacon the admirable *Doctōr*; William Ockham the singular *Doctōr*; John Gerson, and Card. Cusa the most christian *Doctōrs*; Dionysius the Carthusian, the extatic *Doctōr*; and an infinity of others to be met withal in ecclesiastical writers.

DOCTOR, ΔΙΔΑΚΤΑΟΣ, in the Greek church, is a particular officer, appointed to interpret part of the scriptures. He who interprets the gospels, is called *Doctōr of the gospels*: he who interprets St. Paul's epistles, *Doctōr of the apostle*: he who interprets the psalms, *Doctōr of the psalter*.

DOCUMENT, in law, some written monument produced in proof of any fact asserted, especially an ancient one. The antiquity of the foundation of such a church is proved by a number of authentic *Documents*.

DODECAGON, a regular polygon, or figure with twelve equal sides and angles.

Dials are sometimes drawn on all the sides of a *Dodecagon*. In fortification, a place surrounded with twelve bastions, is called a *Dodecagon*: such is Palma Nova in Friuli, &c.

DODECAHEDRON, in geometry, one of the regular bodies, comprehended under twelve equal sides, each whereof is a pentagon.

Or, a *Dodecahedron* may be conceived to consist of twelve quinquangular pyramids, whose vertices, or tops meet in the centre of a sphere conceived to circumscribe the solid; consequently they have their bases and altitudes equal.

To find the solidity of the *DODECAHEDRON*; find that of one of the pyramids, and multiply it by the number of bases, viz. 12; the product is the solidity of the whole body. Or its solidity is found by multiplying the base into $\frac{1}{3}$ of its distance from the centre, 12 times: and to find this distance, take the distance of two parallel faces: the half is the height.

The diameter of the sphere being given, the side of the *Dodecahedron* is found by this theorem: the square of the diameter of the sphere is equal to the rectangle under the aggregate of the sides of a *Dodecahedron*, and hexaedron inscribed in the same, and triple the side of the *Dodecahedron*. Thus, if the diameter of the sphere be r , the side of the *Dodecahedron* inscribed will be $(\sqrt{\frac{1}{2} - \sqrt{\frac{1}{4}}}) : 2$; consequently, that, is to this, as 2 to $(\sqrt{\frac{1}{2} - \sqrt{\frac{1}{4}}})$ and the square of that, to the square of this, as 4 to $5 - \sqrt{3}$. Therefore the diameter of the sphere is incommensurable to the side of an inscribed *Dodecahedron* both in it self, and its power.

DODECATEMORY, the twelfth part of a circle.

The term is chiefly applied to the twelve houses, or parts of the zodiac of the primum mobile; to distinguish them from the 12 signs.

DODECATEMORY, is also a denomination some authors give to each of the twelve signs of the zodiac, by reason they contain a twelfth part of the zodiac a-piece.

DODONÆUS*, **DODONIUM**, in antiquity, an epithet given to Jupiter, as adored, or worshipped in the temple of *Dodona*, in a forest of the same name.

* *Dodona*, whence the appellation arises, is an ancient city of Epirus, celebrated on diverse accounts, as the forest of *Dodona*, the oracle of *Dodona*, and the fountain of *Dodona*.

Dodona's forest, was a wood, or grove of oaks, all consecrated to Jupiter. In this was a temple of that god, wherein was the most famous, and as it is said, the most ancient oracle of all Greece.

Indeed, it was not in the temple only, that oracles were delivered; the very pigeons that inhabited the wood, are said to have done the same.

The origin, and occasion of this fable, we have from Herodotus, who observes, it was founded on this, that ΠΕΛΑΣΓΙΑΣ, which in the Thessalian language signifies a pigeon, does likewise signify a witch, or prophetess. But what is more extraordinary, is, another tradition among the poets, as if the very oaks of the forest of *Dodona* spoke, and delivered oracles. This fable is easily deduced from the former: the pigeons in the oaks being supposed to speak, it was no great flight of poetical fancy, to introduce the trees themselves speaking, &c. See *Vossius de Idolol.* L. I. c. 7. p. 27.

The fountain of *Dodona*, was in the temple of Jupiter. The ancient naturalists assure us, it had a property of re-kindling torches, &c. when newly extinguished. This, no doubt, it did by means of some sulphurous fumes exhaling from it; as we still find a fountain in Dauphine, called the *burning fountain*, do. It is also said, to have extinguished lighted torches; which is no great miracle, since plunging them into a place where the sulphur was too dense, or into the water, must have that effect.

DODRANS, in antiquity, a division of the *As*; being $\frac{1}{4}$ thereof, or 9 uncies. See *As*.

DOG, in astronomy, a name common to two constellations, called the *great*, and *little Dog*; but among astronomers, more usually, *Canis major*, & *minor*. See *CANIS major* & *minor*.

DOG-DRAW, in the forest-law, a manifest deprehension of an offender against venison in a forest; when he is found *drawing* after a deer by the scent of a hound, led in his hand.

DOG

There are four offences in the forest, noted by Manwood, viz. *Stable-stand*, *Dog-draw*, *Back-bear*, and *Bloody-hand*. See *STABLE-stand*, &c.

Bite of a Mad Dog. See the article *HYDROPHOBIA*.

DOGE*, the chief magistrate in the republics of Venice, and Genoa.

* The word properly signifies *Duke*, being formed from the Latin *Dux*; as *Dogate*, and *Dogade*, from *Ducatus*, *Dutchy*.

The *Dogate*, or office and dignity of *Doge*, is elective: at Venice, the *Doge* is elected for life; at Genoa, only for two years; he is addressed under the title of *Serenity*, which among the Venetians is superior to that of *Highness*.

The *Doge* is the chief of the council, and the mouth of the republic; he being always to answer for her. Yet the Venetians do not go into mourning at his death, as not being their sovereign, but only their first minister. In effect, the *Doge* of Venice is no more than the phantom, or shadow of the majesty of a prince; all the authority being referred to the republic. He only lends his name to the senate: the power is diffused throughout the whole body, though the answers be all made in the name of the *Doge*. If he give any answers on his own bottom, they must be very cautiously expressed, and in general terms, otherwise he is sure to meet with a reprimand. So that it is absolutely necessary he be of an easy, and pliable disposition.

Anciently, the *Doges* were sovereigns; but things are much altered; and at present, all the prerogatives referred to the quality of *Doge*, are these which follow. He gives audience to embassadors; but does not give them any answer on his own head, in matters of any importance: only, he is allowed to answer as he judges good, to the compliments they make to the signory; such answers being of no consequence. The *Doge*, as being first magistrate, is head of all the councils; and the credentials which the senate furnishes its ministers in foreign courts, are wrote in his name; and yet he does not sign them, but a secretary of state signs them and seals them with the arms of the republic. The embassadors direct their dispatches to the *Doge*; and yet he may not open them, but in presence of the counsellors. The money is struck in the *Doge's* name, but not with his stamp, or arms. All the magistrates rise, and salute the *Doge*, when he comes into council; and the *Doge* rises to none, but foreign embassadors.

The *Doge* nominates to all the benefices in the church of St. Mark; he is protector of the monastery delle Virgine; and bestows certain petty offices of ulcers of the household, called *Commanders of the Palace*. His family is not under the jurisdiction of the master of the ceremonies; and his children may have *Staff-officers*, and gondoliers in livery.

His grandeur, at the same time, is tempered with abundance of things which render it burthenfome. He may not go out of Venice, without leave of the council; and if he does go out, he is liable to receive affronts, without being entitled to demand satisfaction; and, if any disorder should happen where he was, it belongs not to him but to the Podestat, as being invested with the public authority, to compose it.

The children, and brothers of the *Doge*, are excluded from all the chief offices of state. They may not receive any benefice from the court of Rome; but are allowed to accept of the cardinalate, as being no benefice, nor including any jurisdiction. The *Doge* may not divest himself of his dignity, for his ease; and after his death, his conduct is examined by three inquisitors, and five correctors, who list it with a deal of severity.

DOGGER, a small ship, built after the Dutch fashion, with a narrow stern, and commonly but one mast; principally used in fishing on the *Doggers* bank.

DOGMA, a maxim, tenet, settled proposition, or principle; particularly in matters of religion, or philosophy.

We say, the *Dogmata of Faith*; such a *Dogma* was condemned by such a council. The *Dogmata* of the Stoics were most of them paradoxes. Speculative *Dogmata*, which do not lay any restraint on men, appear to them more essential to religion, than virtues which restrain, and confine them; nay, they often persuade themselves, that it is allowable to maintain those *Dogmata*, at the expence of all the virtues. See *FAITH*, &c.

DOGMATICAL, something relating to a doctrine, or opinion.

In common use, a *Dogmatical* philosopher is such a one as asserts things positively; in opposition to a Sceptic, who doubts of every thing.

A *Dogmatical* physician, is he who, on the principles of the school philosophy, rejects all medicinal virtues not reducible to manifest qualities.

DOGMATICI, **DOGMATISTS**, a sect of ancient physicians, called also *Logici*, logicians, from their using the rules of logic, and reason in subjects of their profession.

They laid down definitions, and divisions, reducing diseases to certain genera, those genera to species, and furnishing remedies for them all; supposing principles, drawing consequences, and applying those principles and consequences to the particular diseases under consideration.—In which sense the *Dogmatists* stand contra-distinguished to Empirics, and Methodists. The *Dogmatists* were those who brought physic into a form, and arrangement, like those of other speculative sciences; defining, dividing, laying down principles, and drawing conclusions: and hence they had also the appellation of *Logici*; q. d. Reasoners. They also applied themselves to seek the causes of diseases, the nature of remedies, &c. Erasistratus, a famous *Dogmatist*, went so far, that not contented to dissect dogs, and other brute animals, he begged condemned criminals of the magistrates, and opened them while alive, and searched in their entrails.

DOLE, in the Saxon tongue, signifies a part or portion, most commonly of a meadow.

Hence also *Dole-Meadow*; a meadow wherein several persons have shares.

The word still signifies a *share*; a distributing, or dealing of alms; or a liberal gift made by a great man to the people.

DOLIMAN, a kind of long caftock, worn by the Turks, hanging down to the feet, with narrow sleeves, buttoned at the wrist.

The Turks, both men and women, wear drawers next the skin; over that a shift, or shirt; and over the shift a *Doliman*. In summer it is linnen, or mulin; in winter, fatten, or stuff.

DOLLAR, or **DALLER**, a silver coin nearly of the value of the Spanish piece of eight, or French crown.

Dollars are coined in diverse parts of Germany, and Holland; and have their diminutions, as *Semi-dollars*, *Quarter-dollars*, &c.

They are not all of the same fineness, nor weight. The Dutch *Dollars* are the most frequent. In the Levant they are called *Astaini*, from the impression of a lion thereon.

DOLPHIN, *Delphinus*, in astronomy. See **DELPHINUS**.

DOM, or **DON**, a title of honour, originally Spanish, though used occasionally in other countries. See **TITLE**.

It is equivalent to *Master*, *Sir*, or *Lord*, *Monsieur*, *Sieur*, *Myneer*, &c.

Gollut in his *Mem. des Bourg. L. V. C. 11.* assures us, that the first, on whom the Spaniards conferred the title, was *Dom Pelayo*; when, upon their being routed, and driven out by the Sarazens, at the beginning of the VIIIth century, they rallied again on the Pyrenians, and made him king.

In Portugal, no body is allowed to assume the title of *Dom*, which is a badge or token of nobility, without the king's leave.

DOM, is likewise used in France among some orders of religious, as the Chartreux, Benedictines, &c.

We say, the reverend father *Dom Calmet*, *Dom Alexis*, *Dom Balhafar*, &c.

In the plural they write *Domi*, with an *s*, in speaking of several. RR. PP. *Doms* Claude du Ruble, and Jacques Douceur.

The word is formed from the Latin *Domnus*, or *Dominus*; of which it is an abbreviation: *Dominus* is found in diverse Latin authors of the barbarous age. Onuphrius assures us, it was a title first given the pope alone; then to the bishops, abbots, and others who held any ecclesiastical dignity, or were eminent for virtue and religion. At length it was usurped by the mere monks.

Some say, the religious declined the title *Dominus* out of humility, as belonging to God alone; and assumed that of *Domnus*, as expressing inferiority, *quasi minor Dominus*. Indeed, the appellation *Domnus* for *Dominus* appears very ancient, if we consider the surname of Julia, wife of the emperor Septimius Severus, who is called on medals, *JVLIA DOMNA*, for *JULIA DOMINA*.

DOMAIN *, the inheritance, estate, or possession of any one. See **DEMESNE**.

* Menage derives the word from *Domanium*, wrote in the barbarous Latin for *Dominium*. See **DOMINIUM**.

DOM-BOOK. See the article **DOMES-DAY**.

DOME, or **DOOM**, signifies judgment, sentence, or decree.—The homagers oath in the black-book of Hereford ends thus: So help me god at his holy *Dome*, and by my trowthe.

DOMES *, in architecture, a spherical roof; or a work of a spherical form raised over the middle of a building, as a church, hall, pavilion, vestibule, stair-case, &c. by way of crowning, or acroter.

* The word is formed from the barbarous Latin, *Dama*, which signified a *roof*, or *open porch*; as is observed by Papias. It is frequent in the corrupt Latin authors, who borrowed it from the Greeks, among whom *Trullus*, or *Trullum* is a common name for any round building; such as the palace of Constantinople, wherein was held the council thence called in *Trullo*.

Domes are the same with what the Italians call *Cappola's*; and we frequently *Cappola's*: The Latins according to Vitruvius, *Tholi*: See **CUPOLA**.

They are usually made round; though we have instances of square ones; as those of the Louvre; and others that are polygons, as that of the Jesuits church in the Rue St. Antoine at Paris. They have usually columns ranged around their out-sides, both by way of ornament, and to support the vault.

A *Flat Dome* is that whose sweep, or contour, is less than a hemisphere.

Eye of a Dome. See the article **EYE**.

DOME, in chemistry, the arched cover of a reverberatory furnace. See **REVERBERATORY**.

DOMES-DAY, or **DOOMS-DAY-Book**, *Liber judicarius vel consualis Angliæ*, the judicial book, or book of the survey of England; a most ancient record made in the time of William the Conqueror; upon a survey, or inquisition of the several counties, hundreds, tithings, &c.

Its name is formed from the Saxon *Dom*, doom, judgment, sentence; and *Day*, which has the same force: so that *Dome-day* is no more than a reduplicative, importing judgment judgment.

The drift, or design of the book, is to serve as a register, by which sentence may be given in the tenures of estates; and from which that noted question, whether lands be ancient demesne, or not, is still decided. Its contents are summed up in the following verses:

*Quid deberent fisco, quæ, quanta tributa,
Nominè quid censu, quæ vestigalia, quantum
Quisque teneret feudali solvere jure,
Qui sunt exempti, vel quos angaria damnat,
Qui sunt vel glebæ servi, vel conditionis,
Quove manumissus patrono jure ligatur.*

This book is still remaining in the exchequer, fair and legible; consisting of two volumes, a greater, and a less; the greater comprehending all the counties of England, except Northumberland, Cumberland, Westmoreland, Durham, and part of Lancashire; which were never surveyed; and except Essex, Suffolk, and Norfolk, which are comprehended in the lesser volume, which concludes with these words: *Anno millesimo octogesimo sexto ab incarnatione domini, vigesimo viro regis Wilhelmi, facta est ista descriptio non solum per hos tres comitatus, sed etiam alios.*

It is called *Liber Judicialis*, by reason a just, and accurate description of the whole kingdom is contained therein; with the value of the several inheritances, &c.

It was begun by five justices, assigned for that purpose in each county, in the year 1081. and finished in 1086. Camden calls its, *Gulielmi Librum Consualum*, king William's tax-book.

Our ancestors had many *Dome-Books*. We are told by Ingulphus, that king Alfred made a like register with that of William the Conqueror. It was begun upon that prince's dividing his kingdom into counties, hundreds, tithings, &c. when an inquisition being taken of the several districts, it was digested into a register, called *Domboc*, q. d. the judgment-book, and was deposited in the church of Winchester; whence it is also called the *Winchester-Book*, and *Rotulus Winton*. And upon the model of this *domboc* it is, that the *Doom-Day* of the conqueror was formed.

That of king Alfred referred to the time of king Ethelred. And that of the Conqueror, to the time of Edward the Confessor: The entries being thus made, *C. tenet Rex Gulielmus in Dominio, & valet ibi ducate*, &c. T. R. E. valebat; q. d. it was worth so much *Tempore Regis Eduardi*, in the time of king Edward.

There is a third *Dom-Boc*, or *Domes-Day-Book* in quarto, differing from the other in folio, rather in form, than matter. It was made by order of the same conqueror; and seems to be the more ancient of the two.

A fourth book there is in the exchequer, called *Domes-Day*; which, though a very large volume, is only an abridgment of the other two. It has abundance of pictures, and gilt letters at the beginning, which refer to the time of Edward the Confessor.

DOMESTIC, a term of somewhat more extent than that of servant; the latter only signifying such as serve for wages, as footmen, lacquies, porters, &c. Whereas *Domestic* comprehends all who act under a man, compose his family, and live with him, or are supposed to live with him. Such are secretaries, chaplains, &c.

Sometimes *Domestic* goes further, being applied to the wife, and children.

DOMESTIC gown, *Toga Domestica*. See **TOGA**.

DOMESTICUS, *Δομestικος*; in antiquity, was a particular officer in the court of the emperors of Constantinople.

Fabrot, in his glossary on Theophrastus Simocatta, defines *Domesticus* to be any person intrusted with the management of affairs of importance; a counsellor, *cujus fidei graviore alijus curæ, & sollicitudinis committuntur*.

Others hold, that the Greeks called *Domestici* those who at Rome were called *Comites*; particularly, that they began to use the name *Domesticus*, when that of count was become a name of dignity, and ceased to be the name of an officer in the prince's family.

Domestici, therefore, were such as were in the service of the prince, and assisted him in the administration of affairs; both those of his family, those of justice, and those of the church.

The **Grand DOMESTIC**, *Megadomesticus*, called also absolutely the *Domesticus*, served at the emperor's table, in quality of what we occidentals call *Dapifer*. Others say, he was rather what we call a *Major domo*.

DOMESTICUS *Mensa* did the office of grand seneschal, or steward.

DOMESTICUS *Rei Domestice* acted as master of the household. **DOMESTICUS** *Scholarum*, or *Legionum*, had the command of the reserved forces called *Schola Palatina*, whose office was to execute the immediate orders of the emperor.

DOMESTICUS *Murorum*, had the superintendence of all the fortifications.

DOMESTICUS *Regionum*, that is, of the east and west, had the care of public causes, much like our attorney or solicitor general.

DOMESTICUS *Icanatorum*, or of the military cohorts.

There were diverse other officers of the army, who bore the appellation *Domesticus*, which signified no more than commander, or colonel. Thus, the *Domesticus* of the legion called *Optimates*, was the commander thereof.

DOMESTICUS *Chori*, or *Chantor*, whereof there were two in the church of Constantinople; one on the right side of the church, and the other on the left.—They were also called *Protospathes*.

Dom. Magri distinguishes three kinds of *Domestici* in the church: *Domesticus* of the patriarchal clergy: *Domesticus* of the imperial clergy, that is, master of the emperor's chapel: And *Domesticus* *Despoticus*, or of the emperors.—There was another order of *Domestici*, inferior to any of those abovementioned, called *Patriarchal Domestici*.

DOMESTICI was also the name of a body of forces in the Roman empire.—Pancirollus takes them to have been the same with those called *Protectores*; who had the chief guard of the emperor's person, in a degree above the *Prætorians*; and who under the Christian emperors had the privilege to bear the grand standard of the cross.

They are supposed to have been 3500 before Justinian's time, who added 2000 more to the number. They were divided into several companies, or bands, which the Latins called *Scholæ*, some whereof are said to have been instituted by Gordian. Some of them were cavalry, and some infantry.

Their Commander was called *Comes Domestice*.

DOMICELLARY *Canons*. See the article **CANONS**.

DOMIFYING, **DOMIFICATION**, in astrology, the dividing or distributing the heavens into twelve houses; in order to erect a theme, or horoscope, by means of six great circles, called *Circles of Position*.

There are divers ways of *Domifying*, according to diverse authors. That of Regiomontanus, which is the most usual, makes the circles of position pass through the intersections of the meridian, and horizon. Others make them pass through the poles of the world, or the equator; and others through the poles of the zodiac.

DOMINATION, in theology, the fourth order of angels, or blessed spirits in the hierarchy; reckoning from the seraphim. See **HIERARCHY**, and **SERAPH**.

St. DOMINGO *Company*. See the article **COMPANY**.

DOMINI—*Anno DOMINI*. See the article **ANNO**.

Bull in Coena DOMINI. See the article **BULL**.

DOMINIAL *Offices*. See the article **OFFICES**.

DOMINICAL * *Letter*, in chronology, properly called *Sunday-Letter*, one of the seven letters of the alphabet ABCD EFG, used in almanacs, ephemerides, &c. to denote the sundays throughout the year.

* The word is formed from *Dominica*, or *Dominicus dies*, lord's day, Sunday.

The *Dominical Letters* were introduced into the calendar by the primitive christians, in lieu of the nundinal letters in the Roman calendar.

These letters, we have observed, are seven: and, that in a common year, the same letter should mark all the sundays, will easily appear; inasmuch as all the sundays are seven days a-part; and the same letter only returns in every seventh place.

But in bissextile, or leap year, the case is otherwise: for by means of the intercalary day, either the letters must be thrust out of their places for the whole year afterwards, so, *e. gr.* as that the letter which answers to the first of March, shall likewise answer to the second, &c. or else the intercalary day must be denoted by the same letter as the preceding one. This latter expedient has been judged the better, and accordingly the sundays after the intercalary day have another *Dominical Letter*.

Hence, 1^o. As the common Julian, and Gregorian year consists of 365 days, *i. e.* of 52 weeks, and one day; the beginning of the year, every common year, goes backwards by one day; thus, *z. gr.* if this year the beginning, or first day fall on a Sunday, the next year it will fall on Saturday, the next on Friday, &c. Consequently, if A be the *Dominical Letter* of the present year, G will be that of the next year.

2^o. As the Julian, and Gregorian bissextile, or leap-year, consists of 366 days, *i. e.* 52 weeks, and 2 days, the beginning of the next year after bissextile goes back 2 days. Whence, if in the beginning of the bissextile year, the *Dominical Letter* were A, that of the following year will be F.

3^o. Since in leap years the intercalary day falls on the 24th of February, in which case the 23d and 24th days are denoted by the same letter; after the 24th day of February the *Dominical Letter* goes back one place: thus, if in the beginning of the year the *Dominical Letter* be A, it will afterwards be G.

4^o. As every fourth year is bissextile, or leap-year; and as the number of letters is 7; the same order of *Dominical Letters* only returns in 28 years; which, without the interruption of bissextiles, would return in 4 years.

5^o. Hence the invention of the solar cycle of 28 years; upon the expiration whereof the *Dominical Letters* are restored successively to the same days of the month, or the same order of the letters returns.

To find the *DOMINICAL Letter* of any given year: Seek the cycle of the sun for that year; as directed under **CYCLE**: and the *Dominical Letter* is found corresponding thereto. Where there are two; the proposed year is bissextile; and the first obtains to the 24th of February; and the last for the rest of the year.

By the reformation of the calendar under pope Gregory, the order of the *Dominical Letters* was again disturbed in the Gregorian year: for the year 1582, which at the beginning had G for its *Dominical Letter*; by the retrenchment of 10 days after the 4th of October, came to have C for its *Dominical Letter*; by which means the *Dominical Letter* of the ancient Julian calendar is four places before that of the Gregorian: the letter A in the former answering to D in the latter.

DOMINICAL, in church-history. The council of Auxerre, held in 578, decrees, that women communicate with their *Dominical*. Some authors contend, that this *Dominical* was a linen cloth, wherein they received the species; as not being allowed to receive them in the bare hand. Others will have it a kind of veil, wherewith they covered the head. The most probable account is, that it was a sort of linen cloth, or handkerchief, wherein they received, and preserved the eucharist in times of persecution, to be taken on occasion.

DOMINICANS, an order of religious, called in some places *Jacobins*, and in others, *Predicants*, or *Preaching Fryars*. See **JACOBS**, &c.

The *Dominicans* take their name from their founder Dominic de Gusman, a Spanish gentleman, born in 1170, at Calarvega, in Old Castile. He was first canon and archdeacon of Oñate; and afterwards preached with great zeal, and vehemence against the Albigenses in Languedoc, where he laid the first foundation of his order. It was approved of in 1215, by Innocent III. and confirmed in 1216, by a bull of Honorius III. under the rule of St. Augustin, and the title of *Preaching Fryars*.

The first convent was founded at Tholouse, by the bishop thereof, and Simon de Montfort. Two years afterwards they had another at Paris near the bishop's house; and some time after, a third in the Rue St. Jacques, St. James's-street, whence the denomination of Jacobins.

St. Dominic, at first, only took the habit of the regular canons, that is, a black cassock, and rochet; but this he quitted in 1219, for that which they now wear, which, it is pretended, was shewn by the blessed virgin herself to the beatified Renaud d'Orleans.

This order is diffused throughout the whole known world. It has 45 provinces under the general, who resides at Rome; and 12 particular congregations, or reforms, governed by vicars general.

They reckon three popes of this order, above 60 cardinals, several patriarchs, 150 archbishops, and about 800 bishops. Beside masters of the sacred palace, whose office has been lately discharged by a religious of this order, ever since St. Dominic, who held it under Honorius III. in 1218.

The *Dominicans* are also inquisitors in many places. The Dogmata of the *Dominicans* are usually opposite to those of the Franciscans.

There are also nuns, or sisters of this order, called in some places, *Preaching Sisters*. These are even more ancient than the fryars; St. Dominic having founded a society of religious

maids.

maids, at Proutles, some years before the institution of his order of men, viz. in 1206.

There is also a *Third order of Dominicans*, both for men and women.

DOMINIUM, **DOMINION**, in the civil law, denotes the absolute power, or property of a thing, to use or dispose of it how we please.

Directum Dominium is the right alone of *Dominium*; and *Dominium utile*, the profit redounding from it. The wife retains the *Dominium directum* of her jointure, and the *Dominium utile* passes to her husband. With respect to signory, he who pays rent, has the *Dominium utile* of the lands; and the lord he pays it to the *Dominium directum*.

DOMINIUM, **DOMINION**, or **DOMAINE**, in our ancient customs, denotes a rent due to the lord, where the property is not his.

Affidatio DOMINORUM. See the article **AFFIDATIO**.

DOMINUS, in ancient times, a title prefixed to a name, usually to denote the person either a knight, or a clergyman. See **VICE-DOMINUS**.

Though, the title was sometimes also given to a gentleman not dubb'd; especially, if he were a lord of a manour. See **DOM**, **SIRE**, and **GENTLEMAN**.

Religio quando DOMINUS remisit. See the article **RECTO**.

DONATION, **DONATIO**, an act, or contract, whereby a man transfers to another, either the property, or the use of the whole, or a part of his effects, as a free gift.

A *Donation* to be valid, and complete, supposes a capacity both in the donor, and the donee; and requires consent, acceptance, and delivery: and by the French law also registry.

DONATISTS, ancient schismatics in Africa, so denominated from their leader, *Donatus*.

They had their origin in the year 311; when, in the room of Menisurius, who died in the preceding year on his return to Rome, Cæcilian was elected bishop of Carthage; whom the people refused to acknowledge, and to whom they opposed Majorinus, who accordingly, was ordained by Donatus, bishop of Casæ Nigræ. They were condemned in a council held at Rome, two years after their separation, and afterwards in another at Arles, the year following.

The errors of the *Donatists*, beside their schism, were, 1. That baptism conferred out of the church, that is, out of their sect, was null. 2. That there was no church but in Africa: all the rest of the churches they held as prostitute, and fallen.

Donatus seems likewise to have given into the doctrine of the Arians, with whom he was closely allied; and accordingly, St. Epiphanius, Theodoret, and some others, accuse the *Donatists* of Arianism. But St. Augustin, Ep. 185. to Count Boniface, affirms, that the *Donatists*, in this point, kept clear of the errors of their leader.

In 344, under the empire of Theodosius the Great, there arose a schism among the *Donatists* themselves, by which they were broke into two parties. For Parmenian, their bishop, being dead, some elected Primian, and were called *Primianists*; and others, Maximian, called *Maximianists*. The *Donatists* had likewise other appellations, as *Circumcelliones*, *Montenses*, or *Mountainers*, *Camptis*, *Rupites*, &c. They held three councils, or conciliabules; that of Ciria in Numidia, and two at Carthage. Constantine decreed exile, and even death, against the *Donatists*. Constantius, and Honorius, made laws for their banishment; and Theodosius, and Honorius, condemned them to grievous mulcts.

DONATIVE, **DONATIVUM**, a present made any person, called also *Gratuity*.

The Romans made large *Donatives* to their soldiers. Julia Pia, wife of the emperor Severus, is called on certain medals, **MATER CASTRORVM**, by reason of the care she took of the soldiery, by interposing for the augmentation of their *Donatives*, &c.

Donative was properly a gift made to the soldiery; as *Congiarium* was that made to the people. See **CONGIARIUM**.

Salmatius, in his notes to Lamprius in his life of Heliogabalus, mentioning a *Donative* that emperor gave of three pieces of gold per head, observes, that this was the common, and legitimate rate of a *Donative*. Cæsaubon, in his notes on the life of Pertinax by Capitolinus, observes, that Pertinax made a promise of three thousand Denarii to each soldier; which amounted to upwards of 97 pounds sterling. The same author writes, that the legal *Donative* was 20000 Denarii; and that it was not customary to give less, especially to the Prætorian soldiers; that the centurions had double, and the tribunes, &c. more in proportion.

DONATIVE, in the canon law, a benefice given, and collated to a person, by the founder, or patron; without either presentation, institution, or induction by the ordinary.

If chapels founded by laymen, be not approved by the diocesan, and, as it is called, *spiritualized*, they are not accounted proper benefices, neither can they be conferred by the bishop, but remain to the pious disposition of the founders: so that the

founders, and their heirs, may give such chapels without the bishop.

Gwin observes, that the king might of ancient time found a free chapel, and exempt it from the jurisdiction of the diocesan. So may he by letters patent give liberty to a common person to found such a chapel, and make it *Donative* not-presentable. And the chaplain; or beneficiary, shall be deprivable by the founder, or his heir, and not by the bishop. And this seems to be the original of *Donatives* in England.

All bishoprics in ancient time were *Donative* by the king. Again, where a bishop has the gift of a benefice, it is properly called a *Donative*, because he cannot present to himself.

DONJON, in fortification, generally denotes a large strong tower, or redoubt of a fortress, where the garrison may retreat in case of necessity, and capitulate with greater advantage. See **DUNGEON**.

DONOR, in law, he who gives lands, or tenements to another in tail.—As *Donee*, is he to whom the same are given.

DOOR, in architecture, an aperture in a wall, to give entrance, and exit in and out of the building, or some apartment thereof.

It ought to be a rule, 1. That the *Doors* of a house be as few in number, and as moderate in dimensions, as possible: for, in a word, all openings are weakenings.

2. That they do not approach too near the angles of the walls; it being a most glaring solecism to weaken that part which must weaken all the rest: a precept, well recorded, but ill practised by the Italians themselves, particularly at Venice.

3. That the *Doors*, if possible, be right over one another; that void may be over void, and full over full.

4. That, if possible, they be opposite to each other, so as that one may see from one end of the house to another: which will not only be graceful, but also convenient; as it affords a means of cooling the house in summer, by letting in air; and of keeping out the wind in winter, which way soever it fit.

5. It is not only ornamental, but secure, to turn arches over *Doors*; as it discharges them in great measure of the superincumbent weight.

The proportions of *Doors* are adjusted by those of a man: in larger buildings they must always be larger than in smaller; but in none should they be less than 6 feet high, to admit a man of just stature, erect; and as the breadth of a man, with his arms placed a-kimbo, is nearly subdupple his height, the width should never be less than 3 feet.

Some architects give us these dimensions: in small buildings the breadth of the *Door* 4 feet, of 4 and a half; in middling buildings, 5 or 6; in large ones, 7 or 8: in chambers of the first, 3 and a half, 3½, or 4; of the second, 4, or 4 and a half; and of the third, 5, or 6; in churches, 7, or 8; in gates, 9, 10, or 12: hence their height is easily determined; except for the gates of cities, which should only be ¼ of their breadth.

It is an observation of Palladio, that the principal *Door*, or entrance of a house, must never be regulated by any certain dimensions, but by the dignity of the person that is to live in it: yet, to exceed rather in the more, than the less, is a mark of generosity; and may be excused with some noble emblem, or inscription, as that of the Conte di Bevilacqua over his large gate at Verona, where had been committed a like disproportion, *Patet Janua, Cor magis*.

Scenography of a Door. See the article **SCENOGRAPHY**.

Architrave Doors. See the article **ARCHITRAVE**.

DORIC, in grammar.—The *Doric Dialect* is one of the five *Dialects*, or manners of speaking which obtained among the Greeks.

It was first used by the Lacedæmonians, and particularly those of Argos; thence it passed into Epirus, Lybia, Sicily, the islands of Rhodes, and Crete.

In this *Dialect*, Archimedes and Theocritus wrote, who were both of Syracuse; as likewise Pindar.

In strictness, however, we should rather define *Doric* the manner of speaking peculiar to the *Dorians*, after their recess near Parnassus, and Aëolus; and which afterwards came to obtain among the Lacedæmonians, &c.

Some even distinguish between the Lacedæmonian, and *Doric*, but in reality they were the same; setting aside a few particularities in the language of the Lacedæmonians; as is shewn by Rulandus in his excellent treatise, *de Lingua Græca, ejusque Dialectis*, L. V.

Beside the authors already mentioned to have written in the *Doric dialect*, we might add Archytas of Tarentum, Bion, Callinus, Simonides, Bacchylides, Cypselas, Alcman, and Sophron.

Most of the medals of the cities of Græcia Magna, and Sicily, favour of the *Doric dialect* in their inscriptions; witness.

DOR

ΑΜΕΡΑΚΙΩΤΑΝ, ΑΠΟΛΛΟΝΙΑΤΑΝ, ΑΡΕΠΟΝΤΑΝ, ΑΥΤ-
ΠΙΤΑΝ, ΗΡΑΚΛΕΩΤΑΝ, ΤΡΑΧΙΝΙΩΝ, ΘΕΡΜΙΤΑΝ, ΚΑΤ-
ΑΟΝΙΑΤΑΝ, ΚΟΠΙΑΤΑΝ, ΤΑΥΡΟΜΕΝΙΤΑΝ, &c. Which
shews the countries wherein the *Doric* dialect was used.
The general rules of this dialect are thus given by the Port
Royalists.

D' s Hra, *d'* s grand, *d'* s d'o & *d'* s l'a fait le Dorc.
D' s et fait vra; *d'* s, u; & *d'* s au fait encore.
Oste s de l'infini: & pour le singulier
Se sert au féminin du nombre pluriel.

But they are much better explained in the IVth book of Ru-
landus; where he even notes the minuter differences of the
dialects of Sicily, Crete, Tarentum, Rhodes, Lacedæmon,
Laconia, Macedonia, and Thessaly.

The *o* abounds every where in the *Doric*: but this dialect
bears so near a conformity with the *Æolic*, that many reckon
them but one.

DORIC, in architecture, is the second of the five orders; being
that between the Tuscan and Ionic.

The *Doric* order seems the most natural, and best proportion-
ed of all the orders; all its parts being founded on the natural
position of solid bodies. Accordingly, the *Doric* is the first,
and most ancient of the orders of architecture, and is what
gave the first idea of regular building.—See *Tab. Archit. fig.*
28. see also the article **ARCHITECTURE**.

At its first invention it was more simple than at present; and
when in after-times they came to adorn, and enrich it more,
the appellation *Doric* was restrained to this richer manner,
and the primitive simple manner they called by a new name
the Tuscan order.

The tradition is, that *Dorus*, king of Achaia, having first
built a temple of this order at Argos, which he dedicated to
Juno, occasioned it to be called *Doric*: though others derive
its name, I know not how, from its being invented, or used
by the Dorians.

Some time after its invention they reduced it to the propor-
tions, strength, and beauty of the body of a man. Hence, as
the foot of a man was judged the 6th part of his height, then
made the *Doric* column, including the capital, 6 diameters
high, i. e. six times as high as thick. Afterwards they added
another diameter to the height, and made it 7 diameters;
with which augmentation it might be said to be nearer the
proportion of a man: the human foot, at least in our days,
not being a 6th, but nearly a 7th part of the body.

The characters of the *Doric* order, as now managed, are, the
height of its column, which is 8 diameters; its frize, which
is enriched with triglyphs, drops, and metopes; its capital,
which is without volutes; and its admitting of cymatiums.

The ancients, we have already observed, had two *Doric* or-
ders: the first, which was the more simple and massive, they
used chiefly in temples; the second, which was the more light
and delicate, served in portico's, and theatres.

Vitruvius, indeed, complains of the *Doric* as very trouble-
some and perplexing, on account of the triglyphs, and me-
topes, so as scarce to be capable of being used, except in the
pseudostyle, by putting a triglyph between each two columns,
or in the areostyle, by putting three triglyphs between each
two columns.

The moderns on account of its solidity, use it in large strong
buildings; as in the gates of cities, and citadels, the outsid-
es of churches, and other massy works, where delicacy of orna-
ments would be unsuitable.

The most considerable ancient monument of this order, is the
theatre of Marcellus, at Rome, wherein the capital, the
height of the frize, and its projection, are much smaller than
in the modern architecture.

Vignola adjusts the proportions of the *Doric* order thus: the
whole height of the order, without pedestal, he divides into
20 parts, or modules; one of which he allows the base, 14
to the shaft, or fust, one to the capital, and four to the en-
tablature.

The particular proportions, &c. of the several parts, and
members, see under their respective articles, **COLUMN**, **CAP-
ITAL**, **ENTABLATURE**, **PEDESTAL**, **BASE**, **ARCHI-
TRAVE**, **FRIZE**, and **CORNICH**.

DORIC Cymatium. See the article **CYMATIUM**.

DORIC, in music. The *Doric Mode* is the first of the authen-
tic modes of the ancients.

Its character is to be severe, tempered with gravity, and
mirth: it is proper for occasions of religion, and war. It be-
gins with *D. Sol. Re*.

Plato admires the music of the *Doric* mode; and judges it
proper, to preserve good manners, as being masculine. And
on this account he allows of it in his common-wealth.

The ancients had likewise their *Sub-Doric Mode*, which was
one of their plagal modes. Its character was to be very grave,
and solemn. It began with *G Ut*, a diatessaron lower than
the *Doric Mode*.

DORMANT, is the herald's term for the posture of a lion,
or other beast, born as sleeping in a coat of arms.

DOS

DORMANT-TREE, in building, a name the workmen frequent-
ly give to a great beam lying across the house; usually called
a *Summer*.

DORMANT, or **DORMAR-TYLES**. See the article **TYLE**.

DORMER, or **DORMANT**, in architecture, denotes a win-
dow made in the roof of an house, or above the entablature;
being raised upon the rafters.

The Latins call it *Lucerna*, whence the French *Lucerne*, and
our *Luthern*.

There are diverse kinds; square, round, &c. See **LU-
THERN**.

DORMITORY*, a gallery in convents or religious houses,
divided into several cells, wherein the religious lodge, or
lie, &c.

* The word is formed from the Latin *Dormitorium*, of *dormire*,
to sleep.

It is deemed a crime in a religious to lie out of the *Dormitory*.
By chap. XXII. of the rule of St. Benedict, it appears, that
the ancient *Dormitories* were not divided into cells, but were
a kind of large open wards, filled with beds, as in our hos-
pitals.

DORMITORY, is also used for a burying-place. See the article
CORMETERIUM.

DORSAL Nerves. See the article **NERVES**.

DORSI Latissimus, in anatomy. See the article **LATISSIMUS**
Dorsi.

DORSI Longissimus, a muscle common to the loins, and the
back: it rises from the upper part of the Os sacrum, Ilium,
and first Vertebrae of the loins, and in its beginning is con-
founded, if not the same with the Sacrolumbalis. It runs
upwards along the whole tract of the back, and is connected
to every transverse process in its way; ending sometimes in
the first vertebra of the back, and sometimes in the first
of the neck.—See *Tab. Anat. (Myol.) fig. 7. n. 17. 17.*

Sacer DORSI. See the article **SACER**.

DORSIFEROUS, or **DORSIFEROUS Plants**, are those of
the capillary kind; which are without stem, and bear their
seeds on the backside of their leaves.

DORSUM, in anatomy, is the hind part of the thorax; com-
monly translated the *Back*.

The *Dorsum* includes also the loins. See the article **LOINS**.

DORSUM Manus, and **Pedis**, is the outside of the hand, and
foot; or that part opposite to the palm, and sole.

DORSUM Nasi, is the ridge of the nose, which runs the whole
length of that part.

In those we call Roman noses, the *Dorsum* is higher, and more
prominent about the middle, than in the rest; which part is
called the *Spina*, or *Spine*.

DOSE*, in pharmacy, &c. the quantity of a medicine to be
taken at one time.

* The word is formed from the Greek, *Dosis*, which signifies
gift, or a thing given, from *didaymi*, *do*, I give.

A secret in physic is nothing, unless the *Dose* be known. In
authors, and dispensaries, that describe the same remedy,
frequently the *Dose* is different; which occasions a great dif-
ference in its effect.

Dr. Cockburn has given us an essay towards determining the
Doses of purgative medicines, on mechanical principles.

DOSITHEANS, **DOSITHEI**, an ancient sect among the
Samaritans.

Mention is made in Origen, Epiphanius, Jerom, and diverse
other Greek and Latin fathers, of one Dositheus, the chief
of a faction among the Samaritans; but the learned are not
at all agreed, as to the time wherein he lived. St. Jerom in
his dialogue against the Luciferians, places him before our Sa-
viour; wherein he is followed by Drusus, who in his an-
swer to Serrarius, places him about the time of Sennacherib,
king of Assyria: but Scaliger will have him posterior to our
Saviour's time. And, in effect, Origen intimates him to
have been contemporary with the Apostles; where he ob-
serves, that he endeavoured to persuade the Samaritans, that
he was the Messiah foretold by Moses.

He had many followers; and his sect was still subsisting at
Alexandria in the time of the patriarch Eulogius; as appears
from a decree of that patriarch, published by Photius. In
that decree Eulogius accuses Dositheus, of injuriously treating
the ancient patriarchs, and prophets; and attributing to him-
self the spirit of prophecy. He makes him contemporary with
Simon Magus; and accuses him of corrupting the pentateuch
in diverse places, and of composing several books, directly
contrary to the law of God.

Archbishop Usher takes Dositheus to be the author of all the
changes made in the Samaritan pentateuch; which he argues
from the authority of Eulogius. But all we can justly gather
from the testimony of Eulogius, is, that Dositheus corrupted
the Samaritan copies since used in that sect. But that cor-
ruption did not pass into all the copies of the Samaritan pen-
tateuch,

tateuch, now in use among us, which vary but little from the Jewish pentateuch.

And in this sense we are to understand that passage in a Samaritan chronicle, where it is said, that Douis, i. e. Dositheus, altered several things in the law of Moses.

The author of that chronicle, who was a Samaritan by religion, adds, that their high-priest sent several Samaritans, to seize Douis, and his corrupted copy of the pentateuch. Epiphanius takes him to have been a Jew by birth, and to have abandoned the Jewish party for that of the Samaritans. He imagines him likewise to have been the author of the sect of the Sadduces; this is inconsistent with his being later than our Saviour. And yet the Jesuit Serrarius agrees to make Dositheus the master of Sadoc, from whom the Sadduces are derived.

Tertullian, making mention of the same Dositheus, observes, that he was the first who dared to reject the authority of the prophets, by denying their inspiration. But he charges that as a crime peculiar to this sectary, which, in reality, is common to the whole sect, who have never allowed any but the five books of Moses for divine.

DOTAL goods. See the article **GOODS**.

NOTE—Resto de DOTE. See the article **RECTO**.

DOUBLE Aspect.—See the article **ASPECT**.

DOUBLE Bastion. See the article **BASTION**.

Instances of DOUBLE Children, DOUBLE Cats, DOUBLE Pears, &c. are frequent in the *Philosoph. Transact.* and elsewhere. See **MONSTER**.

Sir John Floyer in the same *Transactions*, giving an account of a double turkey, furnishes some reflections on the production of double animals in general. Two turkeys, he relates, were taken out of an egg of the common size, when the rest were well hatched, which grew together by the flesh of the breast-bone; but in all other parts were distinct. They seemed less than the ordinary size, as wanting bulk, nutriment, and room for their growth, which latter, too, was apparently the occasion of their cohesion.

For, having two distinct cavities in their bodies, and two hearts; they must have arose from two cicatricula's; and consequently, the egg had two yolks; which is no uncommon accident. He had a dried double chicken, he assures us, that, though it had four legs, four wings, &c. it had but one cavity in the body, one heart, and one head; and that this consequently, was produced from one cicatricula.

So, Pareus mentions a double infant, with only one heart: in which case, the original, or flamen of the infant was one, and the vessels regular; only, the nerves and arteries towards the extremities dividing into more branches than ordinary, produced those double parts.

The same is the case in the double flowers of plants, occasioned by the richness of the soil. So it is in the eggs of quadrupeds, &c.

There are, therefore, two reasons of duplicity in embryo's: 1. The conjoining, or connexion of two perfect animals; and, 2. An extraordinary division, and ramification of the original vessels, nerves, arteries, &c.

DOUBLE Descant, in music. See the article **DESCANT**.

DOUBLE Digest. See the article **DIGEST**.

DOUBLE Eccentricity. See the article **ECCENTRICITY**.

DOUBLE Feast. See the article **FEAST**.

DOUBLE Fever. See the article **FEVER**.

DOUBLE Fiché, or DOUBLE Fichy, in heraldry. A cross is denominated double fiché, when the extremities are pointed at each angle; that is, when each extremity has two points: in contradistinction to fiché, where the extremity is sharpened away to one point.

Leigh calls it double pitchy, which seems to be a mistake. Gibbon expresses it by an octagonal cross, the two points whereof at each extremity are parted inwards by a small space of a line. By which it is distinguished from the cross of Malta, the two points whereof proceed from a third point; or acute angle between them.

DOUBLE Fine. See the article **FINE**.

DOUBLE Fugue. See the article **FUGUE**.

DOUBLE Letter, in grammar, a letter, which has the force and effect of two; as the Hebrew *Tsade*, which is equivalent to *T* and *S*; or the Greek ξ , or Latin *x*, &c.

These letters are evidently equal to two; when we pronounce the Latin *axis*, or the English *axillary*, we give the *x* the same sound, as if it were wrote with two *cc*, *accis*, *acillary*, or a *c* and *s*, *acsis*, *acillary*.

The Greeks have three χ , ψ , ϕ : The Latins only two *X* and *Z*. And most of the modern languages have the same.

DOUBLE Measure. See the article **MEASURE**.

DOUBLE Pedestal. See the article **PEDESTAL**.

DOUBLE Plea, in law, is where the defendant alleges for himself two several matters in bar of the action; whereof, either is sufficient to effect his desire, in debarring the plaintiff. This is not admitted in the common law: for which reason it is to be well observed, when a plea is double, and when not;

for if a man alledge several matters, one nothing dependant on another, the plea is accounted double; but if they be mutually depending on each other, then it is accounted but single.

DOUBLE Plough. See the article **PLOUGH**.

DOUBLE Point, in the higher geometry.—When all the right lines tending the same way with the infinite leg of any curve, do cut it in one only point, (as happens in the ordinates of the cartesian, and the cubical parabola, and in the right lines which are parallel to the abscissas of hyperbola's, and parabola's) then you are to conceive, that those right lines pass through two other points of the curve, placed (as I may say) at an infinite distance. Which coincident intersection, whether it be a finite, or an infinite distance, Sir Isaac Newton calls the double point.

DOUBLE Position. See the article **POSITION**.

DOUBLE Quarrel, duplex querela, a complaint made by a clerk, or other, to the archbishop of the province, against an inferior ordinary, for delaying justice in some ecclesiastical cause; as to give sentence, institute a clerk presented, or the like.

Its denomination seems owing to this, that it is commonly made both against the judge, and him at whose suit justice is delayed.

DOUBLE Ratio. See the article **DUPLE**.

DOUBLE Road. See the article **ROADS**.

DOUBLE Tenails. See the article **TENAILLE**.

DOUBLE Time. See the article **TIME**.

DOUBLE Vault. See the article **VAULT**.

DOUBLE Vessel, in chemistry, is when the neck of one vessel-head, or matras, is put, and well luted into the neck of another.

Of these there are diverse kinds and forms, used in the circulation of spirits, in order to their being exalted, and refined as high as can be. See **CIRCULATION**.

DOUBLE wheeled plough. See the article **PLOUGH**.

DOUBLE winding stairs. See the article **STAIRS**.

Grafting by DOUBLE incision. See the article **ENGRAFTING**.

Recovery with DOUBLE voucher. See the article **RECOVERY**.

DOUBLED Column. See the article **COLUMN**.

DOUBLINGS, in heraldry, the linings of robes, or mantles of state; or of the mantlings in achievements.

DOUBLING, in a military sense, is the putting two ranks, or files of soldiers, into one.

When the word of command is, *double your ranks*, then the second, fourth, and sixth ranks are to march up into the first, third, and fifth; so that of six ranks they make but three, leaving double the interval there was between them before.—But it is not so when they *double the half files*, because then three ranks stand together, and the three others come up to double them; that is, the first, second, and third, are doubled by the fourth, fifth, and sixth; or on the contrary.

Double your files, directs each to march to that next to it on the right, or left, according to the word of command; in which case the six ranks are turned into twelve, the men standing twelve deep; the distance between the files being now double of what it was before.

DOUBLING a Cape, or Point, in navigation, signifies the coming up with it, passing by it, and leaving it behind the ship.

The Portuguese pretend to be the first that ever doubled the Cape of Good Hope, under their admiral Vasquez de Gama: but we have accounts in history, particularly in Herodotus, of the Egyptians, Carthaginians, &c. having done the same long before them.

DOUBLON, DUBLON, a Spanish and Portuguese coin, being the Double of a pistole. See **PISTOLE**.

There are also double doubloons now current among us for 3 pound 12 shillings.

DOUBTING, the act of withholding a full assent from any proposition; on suspicion, that we are not thoroughly apprized of the merits thereof; or from our not being able peremptorily to decide between the reasons for, and against it.

The Sceptics, and Academics, doubt of every thing: the character of their philosophy is, not to allow any thing for true; but to withhold the assent, and keep the mind free; and in suspense. See **SCPTICS**.

The Epicureans trust their senses, and doubt of their reason: their leading principle is, that our senses always tell truth; that they are the first and only criterions of truth; and that go ever so little from them, and you come within the proper province of doubting.

The Cartesians, on the contrary, of all things bid us doubt our senses; they are perpetually inculcating the deceitfulness of our senses; and tells us that we are to doubt of every one of their reports, till they have been examined, and confirmed by reason. See **CARTESIANS**.

DOUBTING, in rhetoric, a figure wherein the orator appears some time fluctuating, and undetermined what to do, or say. What shall I do? shall I apply to those I once neglected! or implore those who now forsake me!

Tacitus furnishes us with an instance of doubting; almost to a degree

DOW

degree of distraction, in those words of Tiberius, written to the senate: *Quid scribam, P. S. aut quomodo scribam, aut quid omnino non scribam hoc tempore. Dii me demum pejus perdant quam perire quotidie sentio, si scio.*

DOUCINE, in architecture, a moulding, or ornament on the highest part of the cornice, in form of a wave, half convex, and half concave. See *Tab. Archit. fig. 8.*

The Doucine is the same with a *Cymatium*, or *Gula*. See *Cymatium*, and *Gularista*, and *inversa*.

DOVE-TAIL*, in carpentry, the strongest of all the kinds of jointings; wherein the tenon, or piece of wood that enters the other, goes widening to the extreme, and so cannot be drawn out again, by reason the tip, or extreme is bigger than the hole.

* It has its denomination from the resemblance the tenon bears to a Dove's tail.—The French call it *queue d' aronde*, swallow's tail; which name the English themselves also retain in fortification.

DOVETAILING, in architecture, is a way of fastening boards, or timbers together, by letting one piece into another indentedly, with a *Dove-tail* joint. See *DOVE-TAIL*.

DOWAGER, **DOTISSA**, (*q. d.* a widow *endowed*, or that has a jointure) a title, or addition applied to the widows of princes, dukes, earls, and persons of high rank only.

Queen Dowager. See the article *QUEEN*.

DOWER, **DOTARIUM**, or **DOARIUM**, a portion of lands, or tenements, which a widow enjoys for term of life, from her husband, in case she survives him; and which at her death, descends to their children.

Among the Goths, the *Dower* was only the tenth part of the husband's estate: among the Lombards, a fourth; among the Romans, and Sicilians, it was a third: which is the rate that still obtains among us, and most other nations.

Our law-books distinguish five kinds of *Dower*: *viz.* *Dower per legem communem*: *per consuetudinem*: *ex assensu patris*: *ad optium ecclesie*: and *de la plus belle*.

Dower by the common law, is a third part of such lands, as the husband was sole seized of in fee, during the marriage; which the wife is to enjoy during her life, and for which there lies a *writ of Dower*.

Dower by custom, gives the wife, in some places, half her husband's lands, so long as she lives single, as in gavelkind. And as custom may enlarge, so may it abridge *Dower* and refrain it to a fourth part.

In *Dower ex assensu patris*; and *ad optium ecclesie*, the wife may have so much *Dower*, as shall be assigned, or agreed upon; but it ought not to exceed the third part of the husband's lands. If this be done before marriage, it is called a *jointure*.

Dower de la plus belle. By this she is *endowed* with the fairest, and best part of her husband's estate.

Admeasurement of Dower. See *ADMEASUREMENT*.

Assignment of Dower. See the article *ASSIGNMENT*.

Tenant in Dower. See the article *TENANT*.

DOWN*, a bank or elevation of sand, which the sea gathers and forms along its shores; and which serves it as a barrier.

* The word is formed from the French *Dune*, of the Celtic *Dum*, a mountain. Charles de Visch. in his *Compend. Chronolog. Exord. & Progress. Abbat. Clariss. B. Marie, de Dunis*, says, *qualem reperit arenarum collibus (quos incolae Duyenen vocant) undique cinctam.*

Downs are particularly used for a famous road for ships, along the eastern coast of the county of Kent; from Dover to the north Foreland.

This road has excellent anchorage, and is well defended by the castles of Sandwich, Deal, and Dover.

Here it is, the English fleets usually meet. We say, the fleet is yet in the *Downs*: failed from the *Downs*.

DOWRY, *Dos*, is properly the money, or fortune, which the wife brings her husband in marriage, to have the use of it, during her marriage, towards supporting the charge thereof.

It is otherwise called *maritagium*, marriage goods; by the Romans *dos*; and it differs from *Dower*. See *DOWER*.

Among the Germans it was anciently customary for the husband, to bring a *Dowry* to his wife. *Romanis non in usu fuit uxori Dotes retribuere; ideo verbo genuinis carent quo hoc dignoscitur; & rem ipsam in Germanorum moribus miratur Tacitus: Dotem, inquit, non uxor marito, sed uxori maritus offert.* Spelman.

At present, in Germany, the women of quality have but very moderate fortunes. For instance, the princesses of the electoral house of Saxony, have only 30000 crowns: those of other branches of the same family, 20000 florins: those of Brunswick, and Baden, only 1500 florins besides a sum for cloaths, toys, and equipages. *Dist. de Trev.*

Dowry, is also used in a monastic sense, for a sum of money given along with a maid, upon entering her in some religious order.

In France, the *Dowry* of persons entering a monastery, to make profession of a religious life, is limited by law. That, *e. gr.* given upon entering a monastery of Carmelites, Ursulines, and others, not regularly founded, but established since

DRA

the year 1600, by letters patents, must not exceed the sum of 8000 livres, in towns where parliaments are held; nor 6000, in other places.

DOKOLOGY, an appellation given by the Greeks to the 14th verse of the second chapter of St. Luke, *Glory be to God in the highest*, &c. because beginning with the Greek word *δοξα*. *Glory*.

This they distinguish by the name of *great Dokology*: and the *Gloria Patri*; *Glory be to the Father*, they call the *less Dokology*, as beginning with the same word *δοξα*.

Philostorgius, L. III. N. 13, gives three formula's of the *less Dokology*. The first is, *Glory be to the Father, and to the Son, and to the Holy Ghost*. The second, *Glory be to the Father, by the Son, in the Holy Ghost*. And the third, *Glory be to the Father, in the Son, and the Holy Ghost*.

Sozomen, and Nicephorus, give a fourth, *viz.* *Glory be to the Father, and the Son, in the Holy Ghost*.

The first of these *Dokologies*, is that in common use throughout the western church. It was first instituted about the year 350, by the Catholics of Antioch, then called *Eustathians*.

The three others were composed by the Arians: the second was that of Eusebius, and Eudoxus, and which was approved by Philostorgius. The three were all made about the year 341, in the council of Antioch, when they first began to disagree among themselves: Philostorgius assures us, that Flavian, afterward patriarch of Antioch, was the author of the first, or *catholic Dokology*; but Sozomen, and Theodoret, say nothing of it; and Philostorgius, an Arian author, scarce deserves to be credited on his single word.

There were anciently very great disputes, and principally at Antioch, as to the form of *Dokology*: that mostly used among the orthodox, was the same as still obtains; the rest were affected by the Arians, and other Antitrinitarians: yet, St. Basil, in his book, on the *Holy Spirit*, defends the second as orthodox, and legitimate.

Some authors write hymnology, as synonymous with *Dokology*: but there is a difference; hymnology is applied to psalms, or the recitation of psalms; and *Dokology* only to the little verse, *Glory be the Father*, &c. repeated at the end of each psalm.

DOZEIN. See the article *DECENNIER*.

DOZINERS. See the article *DECENNIER*.

DRACHM, ΔΡΑΧΜΗ, an ancient silver coin, used among the Greeks. See *COIN*.

The *Drachma* is supposed by most authors to have been the same among the Greeks, with *Denarius*, or penny among the Romans, which was equivalent to four sesterces.

Of this opinion is Budæus, *de Assse*; who confirms it from the authorities of Pliny, Plutarch, Strabo, and Valerius Maximus, with whom *δραχμή* is synonymous with *Denarius*.

But this is no strong conviction, that the two moneys were precisely of the same value: those authors, not treating expressly of coins, might easily render the one by the other, provided there were no considerable difference between them.

Scaliger, in his dissertation, *de Re Nummaria*, does not say absolutely, that the *Denarius* and *Drachma* were the same thing; but from a Greek passage, in an ancient law, C. XXVI. *Mandati*, where the *Drachma* is said to be composed of six Oboli, he concludes, that in the age of Severus, at least, the *Denarius* and *Drachma* were the same.

But Agricola, *de Mens. & Ponder.* L. IV. proves from Pliny, Celsus, and Scribonius Largus, that the *Denarius* only contained 7 ounces; and from Livy, Appian, Cleopatra, &c. that the *Drachma* contained 8: and maintains, that when some Greek authors speak of the ounce as only containing 7 *Drachms*; they do not mean the *Attic Drachm*, but the Roman *Denarius*, which Greek authors render by *δραχμή*.

Gronovius agrees with Agricola, *viz.* that the *Drachma* was the 8th part of an ounce. The opinion is confirmed by Ildore, L. XIV. c. 24, by Fannius, who says as much in express terms, and by Volusius who divides the ounce into 24 scriptuli, or scruples, whereof the *Drachm* comprehended three.

Thus much supposed, and supposing likewise the ancient Roman ounce equal to the modern one, and of consequence 40 grains less than the French, it follows, that the ancient Roman ounce weighed 536 French grains, and the *Attic Drachma* 67 grains. Lastly, supposing the silver at Athens of the same fineness with ours; and taking ours at the price it now bears, the *Attic Drachma* will be found equivalent to 7 pence 3 farthings sterling.

The Grecian way of accounting sums of money, was by *Drachmæ*: 10 of which were equal to 6 shillings, 5 pence $\frac{2}{3}$ penny; and 100 equal to a mina.

DRACHM, is also a weight, used by our physicians; containing just fifty grains; or 3 scruples; or the 8th part of an ounce.

DRACHM was likewise an ancient Jewish money, having on one side a harp, and on the other side a bunch of grapes.

This coin was a half shekel; and was so called by the Jews. It is only the Greeks called it *δραχμή*. It was equal to two *Attic Drachmæ*. See *SHEKEL*.

DRACO, **DRAGON**, in astronomy, a constellation of the northern hemisphere; whose stars according to Ptolemy, are 31; according to Tycho, 32; according to Bayer, 33; and according to Mr. Flamsteed, 49.

The longitudes, latitudes, magnitudes, &c. whereof are as follows:

NAMES and SITUATIONS of the STARS.	Longit.	Latitude North.	Magn.

DRACO Volans, among meteorologists, a fat heterogeneous, earthy meteor, appearing long, and sinuous, something in the shape of a flying Dragon.

This shape is supposed to arise from the hind part of the matter of this meteor being fired with greater impetuosity than what comes first out of the cloud; and it is supposed that the broken parts of the cloud, and the sulphurous matter which adheres to them, form the apparent wings of this imaginary dragon.

DRACONARIUS, in antiquity, *Dragon-bearer*. Several nations, as the Persians, Parthians, Scythians, &c. bore dragons on their standards; whence the standards themselves were called *Dracones*, *Dragons*. The Romans borrowed the same custom from the Parthians, or, as Casaubon has it, from the Dace; or, as Codin, from the Assyrians.

The Roman *Dracones* were figures of dragons painted in red, on their flags; as appears from Ammianus Marcellinus: but among the Persians, and Parthians, they were like the Roman eagles, figures in full relief; so that the Romans were frequently deceived, and took them for real dragons.

The soldier, who bore the dragon, or standard, was called by the Romans *Dracnarius*; and by the Greeks $\Delta\rho\alpha\kappa\omega\nu\alpha\rho\iota\varsigma$, and $\Delta\rho\alpha\kappa\omega\nu\iota\sigma\tau\eta\varsigma$; for the emperors carried the custom with them to Constantinople.

Pet. Diaconus *Chron. Casin.* l. IV. c. 39. observes, that the Bajuli, Ceroftatarii, Staurophori, Aquiliferi, Leoniferi, and Dracoparii, all marched before King Henry when he entered Rome.

Caput DRACONIS. See the articles **CAPUT**, and **DRAGON**.

Cauda DRACONIS. See the article **CAUDA**.

Sanguis DRACONIS. See the article **SANGUIS**, and **DRAGON**.

Venter DRACONIS. See the article **VENTER**.

DRACONTIC Month, the space of time wherein the moon going from her ascending node, called *Caput Draconis*, returns to the same.

DRACUNCULI, in medicine, a disease in children, wherein they feel a vehement itching; supposed to arise from little worms, called *Dracunculi*, generated of a viscid humour under the skin, about the back, shoulders, and arms.

Children seized with the *Dracunculi*, become hectic, and scarce receive any nourishment at all, though they eat plentifully.

The disease, however, is not so peculiar to children, but that grown persons have been sometimes affected with it. The emperor Henry V. is said, to have died of it; having had it from his birth.

The women in Poland cure their children of the *Dracunculi*, after the following manner: the child is washed, and bathed in warm water, wherein a quantity of crumbed bread, and a handful of ashes have been cast. The water being poured off, and the bread gathered into a mass; when they come to break it again the next day, they find in it an infinite quantity of fine hairs, which some call *Dog's Hair*, and others, *Worms*; and it is those hairs, or worms, which are supposed to be the cause of the disease.

After thus bathing the children, they rub their shoulders, and arms, with flour steeped in vinegar, or honey; upon which immediately there arises on the skin a great number of tubercles, like poppy-seed; supposed to be the heads of worms. These they scrape off as fast as they appear; otherwise they withdraw beneath the skin again. The operation is repeated till such time as no more tubercles arise.

The *Dracunculi* is a disease little known in England. The editors of the *Leipfic acts*, speaking of it, in the tome for the month of October 1681, call the bodies, which put forth at the pores after bathing, thick hairs, *corpuscula pilorum crassiorum instar densa & spissa*, and not fine slender hairs, as Degori calls them. They add, that these little corpufcles are hence called *Crinones*; and by reason of their devouring the food, which should nourish the children, *Comedones*.—Velschius, in a curious dissertation on the subject, calls them *Capillary Worms*: *exercitatio de vermicibus capillaribus infantum*.

As to the nature and figure of these little bodies, the same editors observe, that the microscopes have put it past doubt, that they are real living animals, of an ash-colour, having two long horns, two large round eyes, and a long tail terminated with a tuft of hair; but that it is difficult to draw them out whole, by scraping the child's body; in that being very soft, the least rubbing bruises them, and breaks them. See *Supplement*, article **DRACUNCULI**.

DRAG, in building.—a door is said to *drag*, when in opening and shutting it hangs, or grates upon the floor.

DRAGOMAN*, or **DROOMAN**, a term of general use through the east, for an interpreter, whose office is to facilitate commerce between the orientals, and occidentals.

* The word is formed from the Arabic, *Targemari*, or *Targiman*, of the verb *Targam*, he has interpreted. From *Dragoman*, the Italians formed *Dragomano*, and, with a nearer relation to its Arabic etymology, *Dracimano*; whence the French, and our *Trucheman*, as well as *Dragoman*, and *Dragman*.

DRAGON, in astronomy. *Dragon's head*, and *tail*, *caput* & *cauda Draconis*, are the nodes of the planets; or the two points, wherein the ecliptic is intersected by the orbits of the planets; and particularly that of the moon; making with it angles of five degrees.

One of these points looks northward; the moon beginning then to have northward latitude; and the other southward; where she commences south.

This her deviation from the ecliptic seems (according to the fancy of some) to make a figure like to that of a *Dragon*, whose belly is, where she has the greatest latitude; the intersections representing the head and tail, from which resemblance the denomination arises.

But note, that these points abide not always in one place, but have a motion of their own in the zodiac, and retrograde-wise almost three minutes a day; completing their circle in about 19 years: so that the moon can be but twice in the ecliptic, during her menstrual period; but at all other times will have latitude, as they call it.

It is in these points of intersection that all eclipses happen.

They are usually denoted by these characters \odot *Dragon's head*, and γ *Dragon's tail*.

DRAGON's Blood*, *sanguis draconis*, in medicine, a resinous substance brought from the east, of considerable use, as an agglutinant, against fluxes, &c.

* It derives its name *Dragon's Blood* from the redness of its colour, and gives its name *Dragon* to the tree that yields it. Some botanists talk of the figure of a *Dragon*, finely represented under the rind of the fruit of that tree. But this is a mere fiction.

D R A

The ancients had a notion, that the *Dragon* fighting with the elephant, sucked all its blood through its eyes and ears; that the elephant falling down dead, crushed the *Dragon*; and that from their blood, thus mixed on the ground, arose what they called *Dragon's Blood*, which they held in high esteem.—This is the account given by Solinus, Pliny, Idore, and others after them; but this combat is a mere fable, originally invented by the merchants.

The genuine *Dragon's Blood* is the juice, or resin of a large tree, called *Draco Arbor*, the *Dragon tree*, growing in Africa, and America, as well as in China. The resin is of a dark red, and easily dissolves when brought towards the fire: if cast into the fire, it flames; but it dissolves with much difficulty in any liquor.

It is a good astringent; and is used in hæmorrhages, and dysenteries; as also to fasten the teeth, and strengthen the gums. There is also a counterfeit *Dragon's Blood*, made of the gum of the cherry, or almond-tree, dissolved, and boiled in a tincture of Brazil wood; but this is of no use, except for external diseases of horses.

DRAGONNEE, in heraldry. A *Lyon Dragonnee*, is where the upper half resembles a *Lion*; the other half going off like the hind part of a *Dragon*.

The like may be said of any other beast as well as the lion.

DRAGONS*, in war, an order of soldiery, who march on horse-back, and fight on foot, though sometimes, too, on horse-back.

* *Ménage* derives the word *Dragon* from the Latin *Draconarius*, which in *Vegetius* is used to signify soldier. But it is more probably derived from the German *Tragen*, or *Draben*, which signifies to carry; as being infantry carried on horseback.

The *Dragoons* are usually posted in the front of the camp and march first to the charge, like a kind of *enfants perdus*. They are usually reputed as belonging to the infantry, and in that quality have colonels, and serjeants; but they have cornets, too, like cavalry. In the French army they are said to ride without boots.

Their arms are a sword, fire-lock, and bayonet. In the French service, when the *Dragoons* march on foot, their officers bear the pike, and the serjeants the halbert; neither of which are used in the English service.

DRAGS. See the article **SEA-DRAGS**.

DRAMS. See the article **CORDIALS**.

DRAMA*, in poetry, a piece, or poem, composed for the stage.

* The word is Greek *ᾠδῆα*, which literally signifies *Action*; by reason in *Drama*, or dramatic poems, they act, or represent *Actions*, as if they really passed.

A *Drama*, or as we popularly call it, a *Play*, is a composition either in prose or verse, consisting, not in the simple recitation, but in the actual representation of an action.

Our *Drama's*, are tragedies, comedies, and farces: for those grotesque entertainments, lately introduced upon the stage, scarce deserve the appellation.

Some critics take the book of canticles for a *Drama*, or *Dramatic poem*: others maintain the fame of the book of Job. Some scrupulous authors would restrain *Drama* to serious pieces; as tragedies: but with respect to the etymology, a comedy is as much a *Drama*, as a tragedy.

The primary parts of the *Drama*, as divided by the ancients, are the *Prologis*, *Epitasis*, *Catastasis*, and *Catastrophe*.—The secondary parts, are the *Acts* and *Scenes*.—The accessory parts, are the *Argument* or *Summary*, the *Prologue*, *Chorus*, *Mimus*, *Satura*, and *Atellana*.—Lastly, the *Epilogue* which pointed out the use of the piece, or conveyed some other notice to the audience in the poet's name.

DRAMATIC, in poetry, is an epithet given to pieces wrote for the stage.

For the laws of *Dramatic* poetry. See **UNITY**, **ACTION**, **CHARACTER**, **FABLE**, &c.

Stylis **DRAMATICO**. See the article **STYLE**.

DRAPERY*, in painting, and sculpture, the representation of the garments, or clothing of human figures.

* The word is French *Draperie*, formed from *Drop*, cloth.

In the general sense, *Drapery* includes not only the garments, but also the rapistry, linens, and most other things that are not carnations, nor landscapes.

The art of *Drapery* consists chiefly in three points, viz. the ordering of the folds, or plaits; the different quality of the stuffs; and the variety of their colours.

As to the folds, they should be so managed, that you may easily perceive what it is that they cover, and distinguish it from any thing else. For instance, that you see it is an arm that is under the *Drapery*, and not a leg, &c. The folds, again must be large, as breaking, and dividing the sight the less. There should likewise be contrast between them, otherwise the *Drapery* will appear stiff.

The quality of the stuffs should likewise be well considered; some making their folds abrupt, and harsh, and others more soft, and easy. The surface of some, again, has a lustre, others

D R E

are dull: some are fine, and transparent; others strong, and solid.

The variety of colours, when well managed makes the great beauty of a painting; all being not equally amicable, and friendly with respect to each other; and some are never to be placed near certain others.

M. de Piles gives abundance of good observations, relating to *Drapery*. Their first effect, he observes, and that which the painter ought to have principally in view, is, that they express the thing they are supposed to cover: and they must never be made to adhere, and stick to the parts of the body: a great lightness, and motion of the *Drapery*, are only proper for figures in great agitation, or exposed to the wind. The nudities of the figures should always be defined, before the painter proceed to the *Draperies*. Paolo Veronese excelled in *Draperies*.

DRASTIC, a strong and powerful medicine, more particularly, a purgative that works with speed, and vigour; as Jalap, Scammony, and the other stronger cathartics.

DRAUGHT, in medicine. See the article **POTION**.

DRAUGHT, in trade, is an allowance made in the weighing of commodities; the fame as clough. See **CLOUGH**.

DRAUGHT, in painting, &c. See the article **DESIGN**.

DRAUGHT, or, as it is pronounced, **DRAFT**, in architecture, the figure of an intended building described on paper; wherein is laid down by scale and compass, the several divisions, and partitions of the apartments, rooms, doors, passages, conveniences, &c. in their due proportion.

It is usual, and even exceedingly convenient, before a building is begun to be raised, to have *Draughts* of the ichnography, or ground-plot of each floor, or story; as also of the form and fashion of each front, with the windows, doors, ornaments, &c. in an orthography, or upright. Sometimes the several fronts, &c. are taken, and represented in the fame *Draught*, to shew the effect of the whole building, this is called a *scenography*, or *perspective*. See **SCENOGRAPHY**.

Reduction of a **DRAUGHT**. See the article **REDUCTION**, and **PENTAGRAM**.

DRAW.—A ship is said to draw so much water, according to the number of feet she sinks into it.

Thus, if fifteen feet from the bottom of her be under water, or if she sink into the water fifteen feet perpendicularly, she is said to draw fifteen feet water; and according as the *draws* more, or less, she is said to be of more, or less *Draught*.

DRAW, in the forest-law. See the article **DOG-DRAW**.

DRAW-BACK, in commerce, a rebate, or discount upon the price of commodities, purchased on certain conditions. See **REBATE**, and **DISCOUNT**.

DRAW-BRIDGE, a bridge made after the manner of a floor, to be drawn up, or let down, as occasion serves, before the gate of a town or castle.

DRAWING MEDICINES, or **DRAWERS**. See **EPISPASTICS**, and **RIPENERS**.

DRAWING of gold, or silver, is the passing it through a number of holes in an iron, each less than other, to bring it into a wire. See **WIRE-DRAWING**.

DRAWING of a bill of Exchange, is the writing, signing, and giving it to the person who has already paid the value, or content thereof, to receive it in another place.

A person should never draw a bill of exchange, unless he be well assured, it will be accepted, and paid. See **BILL of Exchange**.

DRAWING, in painting, &c. See **DESIGNING**, and **COUNTER-DRAWING**.

DRAWING, among hunters, is when they beat the bushes after a fox.

DRAWING amisé, is when the hounds, or beagles hit the scent of their chase the contrary way, so as to pursue it up the wind, when they should have done it down the wind.

DRAWING on the spot, is when the hounds touch the scent, and draw on till they route or put up the chase.

Fine-DRAWING. See the article **FINE-DRAWING**.

DRAW PLOUGH. See the article **PLOUGH**.

DRENCH, among farriers, a physical draught, or potion given a horse, by way of purge.

DRENCHES, or **DRENGES**, **DRENCH**, or **THRENGI**, in our old customs, a term about which the lawyers and antiquaries are a little divided. See **THRENGUS**.

Drengis, says an ancient manuscript, were *tenentes in capite*: according to Spelman, they were *e genere vassallorum non ignobilium, cum singuli qui in domes-day nominantur singula possidentia maneria*: such, as at the coming in of the conqueror, being put out of their estates, were afterwards upon complaint restored thereto; for, that, they, being before owners thereof, were neither in auxilio, nor concilio against him.

DRESSING of meat, the preparing them for food, by means of culinary fire.

The design of *dressing*, is to loosen the compages, or texture of the flesh, and dispose it for dissolution, and digestion in the stomach. Flesh not being a proper food without *dressing*, is alleged

alleged as an argument, that man was not intended by nature for a carnivorous or flesh-eating animal.

The usual operations are *roasting*, *boiling*, and *steeping*.—In *roasting*, it is observed, meat will bear a much greater and longer heat than either in *boiling*, or *steeping*; and in *boiling* greater and longer than in *steeping*. The reason is, that *roasting* being performed in the open air, as the parts being externally to warm, they extend and dilate, and so gradually let out part of the rarefied included air, by which means the internal successions, on which the dissolution depends, are much weakened, and abated; *boiling* being performed in water, the pressure is greater, and consequently, the successions to lift up the weight, are proportionably strong; by which means the coction is hastened: and even in this way there are great differences; for the greater the weight of water, the sooner is the business done.

In *steeping*, though the heat be infinitely short of what is employed in the other ways, the operation is much more quick, because performed in a close vessel, and full, by which means the successions are more often repeated, and more strongly reverberated. Hence the force of Papin's digester; and hence an illustration of the operation of digestion.

Boiling, Dr. Cheyne observes, draws more of the rank, strong juices from meat, and leaves it less nutritive, more diluted, lighter, and easier of digestion: *roasting*, on the other hand, leaves it fuller of the strong, nutritive juices, harder to digest, and needing more dilution. Strong, grown, and adult animal food, therefore, should be *boiled*; and the younger, and tenderer, *roasted*.

DRESSING OF hops. See the article HOPS.

DRIE, or DRY. See the article DRY.

DRIFT of the forest, an exact view, or examination of what cattle are in the forest; that it may be known, whether it be overcharged, or not, and whose the beasts are; and whether they are commonable beasts, or not. See FOREST, and COMMON.

DRIFT-SAIL, in a ship, a sail used under water; veered out right a-head, by sheets, as other sails are: its use being to keep the ship's head right upon the sea, in a storm; and to hinder a ship's driving too fast in a current; with which view it is generally used by fishermen, especially in the north-sea.

DRINK, a part of our ordinary food, in a liquid form, serving to dilute, and moisten the dry meat.

The *Drinks*, in different countries, are different. Those ordinarily used among us, are, water, malt-liquors, and wine. The extraordinary ones, are, cyder, punch, brandy, tea, strong waters, &c. See each under its proper article CYDER, &c. The *Malt-Drink* brewed in England, in one year, Chamberlayne assures us, amounts to very near two millions of barrels strong and small.

Water, Dr. Cheyne observes, was without all dispute the primitive, original drink of man, as it is the only simple fluid (for there are but three more in nature, mercury, light, and air, none of which is fit for human *Drink*) fitted for diluting, moistening and cooling; the only ends of *Drink* appointed by nature: and happy had it been for the race of mankind, had other mix'd, and artificial liquors never been invented. Water alone is sufficient, and effectual for all the purposes of human wants in *Drink*. Strong liquors were never designed for common use. They were formerly kept, here in England, as other medicines are, in apothecaries shops, and prescribed by physicians, as they do dia-cordium, and Venice treacle, to refresh the weary, strengthen the weak, and raise the low-spirited. The effect of the ordinary use of wine, and spirituous liquors, as natural causes will always produce their effects, is to inflame the blood into gout, stone, and rheumatism, fevers, pleuritis, small pox, &c. to draw up the juices, and scorch and shrivel the solids. Those, whose appetite, and digestion is good, and entire, never want strong liquors to supply them with spirits: such spirits are too volatile, and fugitive for any solid, or useful purposes of life. Two ounces of flesh meat, well digested, beget a greater stock of more durable, and useful spirits, than ten times as much strong liquors.

All strong liquors are as hard to digest, and require as much labour of the concoctive powers, as strong food it self. Water is the only universal dissolvent, or menstruum, and the most certain diluter of all bodies proper for food. There are a great many spirituous liquors, which not only will not dissolve, but which will harden, and make more indigestible, certain parts especially the salts of bodies, wherein their active qualities, that is, those which can do most harm to human constitutions consist. And we have known persons of tender constitutions, who could neither eat, nor digest, upon *drinking* wine, who, by *drinking* at meals common water, warm'd, have recovered their appetites, and digestion, and have thriven, and grown plump. It is true, strong liquors by their heat and stimulation on the organs of concoction, by increasing the velocity of the motion of the fluids, and thereby quickening the other animal functions, will carry off the load that lies upon the stomach, with more present cheerfulness. But then, beside the future damages of such a quantity of wine to the stomach, and the

fluids by its heat, and inflammation, the food is hurried into the habit unconcocted, and lays a foundation for a fever, a fit of the colic, or some chronical disease. *Essay on Health*, &c. p. 47, & seqq.

DRINKING-Glasses. See the article GLASSES.

DRIP, in architecture. See the article LAMIER.

DRIPS, is also used in building for a kind of steps, on flat roof, to walk upon.

This way of building is much used in Italy; where the roof is not made quite flat, but a little raised in the middle; with *Drips*, or steps, lying a little inclining to the horizon. See ROOF.

DRIVE, in the sea-language.—A ship is said to *drive* when an anchor being let fall, it will not hold her fast, but that she fails away with the tide, or wind.

The best way to prevent this, is to veer out more cable; for the more cable she has, the surer, and safer the ride; or else to let fall more anchors.

Also, when a ship is a-hull, or a-try, they say, the *drives* to leeward, or in with the shore, according to the way she makes.

Wool-DRIVERS. See the article WOOL.

DROGMAN. See the article DRAGMAN.

DROIT, Jus, in our law-books, signifies right, or law: whereof some distinguish six kinds, viz.—1. *Jus recuperandi*, right of recovering: 2. *Jus intrandi*, right of entering; 3. *Jus habendi*, right of having: 4. *Jus retinendi*, right of retaining: 5. *Jus percipiendi*, right of receiving; 6. *Jus possidendi*, right of possessing. See LAW, and RIGHT; as also RECTUM, ENTRY, POSSESSION, &c.

Monstrans de DROIT. See the article MONSTRANS.

DROPAX, ΔΡΟΪΑΞ, in pharmacy, an external medicine, in form of a plaster, used to take off the hairs from any part. See HAIR, and DEPLATORY.

The *Dropax* is of two kinds, *simple*, and *compound*.—The *simple* is made of an ounce of dry pitch, and two drachms of oil.

The *compound* is made with pitch, wax, colophony, common salt, bitumen, sulphur, vivum, pepper, euphorbium, cantharides, and castor.—There are also other ways of making it, to be found in the dispensatories.

It was anciently much in use also to warm the parts, to draw the blood and spirits to them, and to cure atrophies. To this purpose it was applied hot on the part affected, after first shaving it; and was pulled off again before quite cold, then heated a-fresh, and applied again; and the operation thus repeated, till the part were rendered very red.

DROPPING, or **DRIPPING**, a term used among falconers, when a hawk mutes directly downwards, in several *Drops*, not throwing out her dung straight forwards.

DROPS, in meteorology. See the article RAIN.

The spherical form, into which the *Drops* of fluids conform themselves, is a phenomenon that has a little perplexed the philosophers.—The solution commonly given, was, that the equable, uniform pressure of the ambient, or incumbent atmosphere closed them into this form.—But this account will no longer pass; now that we find the phenomenon holds in vacuo as well as in air.

The Newtonian philosophers, therefore, ascribe it to their attraction, which being greater between the several particles of the fluids, than between them, and those of the medium, they are, as it were, concentrated, and brought as near each other, and into as little compass, as may be: which cannot be, without their being spherical.*

* Thus, Sir Isaac Newton: *Gutta enim corporis cujusque fluidi, ut figuram globosam inducere conantur, facit motus partium suarum attractio; eodem modo quo terra marique in retunditatem undique conglobantur, partium suarum attractione mutua, quae est gravitas.* Opt. p. 338.

Drops, in medicine, a liquid remedy, whose dose is estimated by a certain number of *Drops*.

A little lowness of spirits, says Dr. Cheyne, speaking of the softer sex under fits of the vapours, &c. requires *Drops*, which pass readily down under the notion of physic: *Drops* beget drams, and drams beget more drams, till they come to be without weight, and without measure. Higher, and more severe fits, begot by these, bring forth farther necessity upon necessity of *Drops*, drams, and gills, till at last, &c. *Essay on Health*.

English Drops, or **volatile English Drops**, *guttae anglicanae*, is a liquor drawn by fire from a great number of ingredients, and found a powerful remedy against coagulations of the blood, obstructions, apoplexies, malignant fevers, small-pox, &c. Its inventor was Dr. Goddard, a physician of London, King Charles II. had much ado to purchase the secret of him, though he offered 5000 pounds for it: However, he prevailed at length; but the physician looked on it as a favour done the prince, to impart it to him on such terms.—Hence it is, that the remedy took the name of *guttae anglicanae*. See *GUTTA Anglicana*.

DROPI, *Guttae*, in architecture, an ornament in the doric entablature, representing *Drops*, or little bells, immediately under the triglyphs.—See *Tab. Archit. fig. 28. lit. e and v.* See also TRIGLYPH.

DROPPER. See **FISHING.**

DROPSY *, **ῥαπῶν**, in medicine, a preter-natural collection of serum, or water, in some part of the body; or a too great proportion thereof in the blood.

* The word is compounded of the Greek *ῥαπῶν*, water.

The *Dropsy* acquires different names from the different parts it afflicts, or the different parts the waters are collected in.—That of the abdomen, or lower belly, called simply, and absolutely *Dropsy*, is particularly denominated *Ascites*.—That of the whole habit of the body, *Anasarca*, or *Leuoplegmatia*.—That of the head, *Hydrocephalus*.—That of the scrotum, *Hydrocele*.

There is also a species of this disease supposed to be caused, instead of water, by a collection of wind, called *Tympanites*, and by Hippocrates, the *dry Dropsy*.

We also meet with *Dropsies* of the breast, pericardium, uterus, ovaries, &c.

The causes of *Dropsies*, in general, are whatever may obstruct the serous part of the blood, so as to make it stagnate in the vessels; or burst the vessels themselves, so as to let the blood out among the membranes; or weaken, and relax the tone of the vessels; or thin the blood, and make it watery; or lessen the perspiration.

These causes are various, viz. sometimes acute diseases, scirrhous tumors of any of the more noble viscera, excessive evacuations, particularly hæmorrhages, hard drinking, &c.

The ascites, or *Water-Dropsy* of the abdomen, is the most usual case, and what we particularly call the *Dropsy*: its symptoms are tumors, first of the feet, and legs, and afterwards of the abdomen, which keep continually growing; and if the belly be struck, or shook, there is heard a quashing of water. Add to this three other attendants, viz. a dyspnoea; intense thirst; and sparing urine: with which may be numbered heaviness, listlessness, costiveness, a light fever, and an emaciation of the body.

The curative indications are two, viz. the evacuation of the water; and the strengthening of the blood, and viscera. The first is effected by strong purgatives, particularly elæctium, and the infusion of crocus metallorum, tho' this last works upwards more than downwards. For such are too weak to bear purgatives, Dr. Sydenham recommends diuretics, whereof the best are those made of the lixivial salts.

For the second intention, exercise and change of air, wine, and other generous liquors, also stomachics, chalybeats, and other corroborating medicines are prescribed.

Where other means fail for evacuating the water, recourse is to be had to the paracentesis, or operation of tapping. Mayerne recommends mercurius dulcis, and nitre, and ants eggs, for the promoting of urine, and draining the tumour. Exercise and change of air; wine, and other generous liquors cautiously taken; have also their use.

Baglivi notes, that in a *Dropsy* arising from a morbid liver, there is always a vehement dry cough: which is never observed in any other species. Tycho Brahe, notes, that hydropic persons usually die about the full moon. Wainwright extols an infusion of green tea in rhenish wine; as also briony juice, as excellent in this disease. Some commend garlic. See Supplement article **HYDROPS**.

DROWNING, the act of suffocating, or being suffocated, by water.

People not accustomed to diving, Dr. Halley observes, begin to drown in about half a minute's time.

Drowning was anciently a kind of punishment: in the time of Louis XI. of France, the chronicles assure us, that they frequently drowned their criminals, instead of hanging them. *Chron. Scand.*

Natural historians, and physicians, furnish us with diverse well attested instances of surprising recoveries of persons drowned: which, if maturely considered, might perhaps let a little light into the dark notion of life, and death.

Pechlin, *de Aer. & Alim. def. c. 10.* gives the history of a gardener of Troningholm, then living, aged 65 years, who 18 years before slip'd under the ice to the depth of 12 ells, where he stood at the bottom, upright as it were, for 16 hours; when, being drawn out with a drag struck into his head, and wrapped up in clothes, from the common persuasion of those people, that he would recover; he was afterwards stroaked, rubbed with linnen swaths, and air blown up his nostrils for several hours; till the blood began to move. Lastly, plying him with antipoplectic, and genial liquors, he was restored to life. In memory of this accident, the queen mother settled a yearly stipend upon him, &c.

Tilesius, keeper of the king's library, gives us a yet less probable history of a woman he himself knew, who he says was under the water three whole days, yet brought to life again after the same manner as the Troningholm gardener; and was at the time of his writing the account alive.

But what shall we say to Burmannus, who assures us, that being in the village Bonels, of the parish of Pithou, he assisted at the funeral sermon of one Laur. Jona, an old man of seventy; where the preacher related, that when a youth of 17, he had been buried seven weeks under water, and at

length drawn forth, and brought again to life. Pechlin, *ubi sup. fit penis ipsum fides!*

DRUG, in commerce, a general name for all spices, and other commodities, brought from distant countries, and used in the business of medicine, dying, and the mechanic arts.

The *Drugs* used in medicine, are very numerous, and make the greatest part of the commerce of our *Druggists*. Some of them grow in England, France, &c. But the greatest part are brought from the Levant, and the East-Indies.

A list of all of them would be endless. Some of the principal are, aloes, amber-gris, amber, assa foetida, antimony, bezoar, borax, benjoin, camphor, cantharides, cardamum, cassia, castoreum, colcoquintida, civet, coral, cubes, coffee, cocoa, gum animæ, armoniac, adraganth, elemi, gamboge, labdanum, opopanax, fagapenum, sandarac, lacca, jalap, manna, mastic, myrrh, muisc, opium, pearls, quinquina, hellebore, galanga, zedoary, rhubarb, farfaparilla, storax, galbanum, sanguis draconis, fenna, sperma ceti, spica nardi, scammony, sal ammoniac, tamarinds, tea, turpentine, turbit, tutia, &c.

The natural history, &c. whereof see under their respective articles **ALOE**, **AMBER-GRIS**, &c.

The *Drugs* used by dyers, are of two kinds: the *colouring*, which give a dye or colour; and *non-colouring*, which only dispose the stuffs to take the colours the better, or to render the colours more shining.—Of the first kind, are, pascels, woad, indigo, kermes, cochineal, madder, turmeric, &c.—Of the second kind, are, alum, tartar, arsenic, realgal, salt-petre, common salt, sal gemmæ, sal ammoniac, crysalls of tartar, agaric, spirit of wine, urjine, pewter, iron, bran, starch, lime, ashes, &c.

There is a third sort of *Drugs*, which answer both intentions; as the root, bark, and leaf of the walnut-tree, galls, coppers, &c.

DRUGGET, in commerce, a sort of stuff, very thin, and narrow, usually all wool, and sometimes half wool and half silk; having sometimes the whale, but more usually without: and woven on a worsted chain.

Those without the whale are wove on a loom with two treadles, after the same manner as linnen, camblet, &c.—M. Sa-very invented a kind of gold, and silver *Druggets*; the warp being partly gold and silver thread, and the woof linnen.

DRUIDS *, **DRUIDES**, or **DRUIDÆ**, the priests, or ministers of religion, among the ancient Celtæ, or Gauls, Britons, and Germans.

* Some authors derive the word from the Hebrew **דְּרוּשׁ** *Derushim*, or *Drushim*, which they translate, *contemplators*. Picard, *Celtæped. L. II. p. 58.* believes the *Druids* to have been thus called from *Drui*, or *Dryus*, their leader, the 4th, or 5th king of the Gauls, and father of Saron, or Naumes. Pliny, Salmastius, Vigenere, &c. derive the name from *Δρυς*, *Oak*; on account of their inhabiting, or at least frequenting, and teaching in forests; or perhaps, by reason, as Pliny says, they never sacrificed but under the oak. But it is hard to imagine, how the *Druids* should come to speak Greek. Menage derives the word from the old British *Drui*, demon, magician. Borel from the Saxon *Dry*, magician; or rather the old British *Dru*, *Oak*; whence he takes *Δρυς* to be derived. Gorop. Becanus, Lib. I. takes *Drui* to be old Celtic, and German word, formed from *Druidis*, or *Druidia*, a doctor of the truth, and the faith: which etymology Vossius acquiesces in.

The *Druids* were the first, and most distinguished order among the Gauls, and Britons: they were chose out of the best families; and the honours of their birth, joined with those of their function, procured them the highest veneration among the people. They were versed in astrology, geometry, natural philosophy, politics, and geography; and had the administration of all sacred things; they were the interpreters of religion, and the judges of all affairs, indifferently. Whoever refused obedience to them, was declared impious and accursed.

We know but little as to their peculiar doctrines; only that they believed the immortality of the soul, and as is generally also supposed, the metempsychosis: though a late author makes it appear highly probable they did not believe this last, at least not in the sense of the Pythagoreans.

They were divided into several classes, or branches; viz. the *vacerri*, *bardi*, *eubages*, *semmothii*, or *semmethi*, and *faronide*.—The *vacerri* are held to have been the priests: the *bardi* the poets; the *eubages*, the augurs; and the *faronide*, the civil judges, and instructors of youth.—As to the *semmethi*, who are said to have been immediately devoted to the service of religion, it is probable, they were the same with the *vacerri*.

Strabo, however, Lib. IV. p. 197. and Picard after him, in his *Celtopædia*, do not comprehend all these different orders under the denomination of *Druids*, as species under their genus, or parts under the whole; but make them quite different conditions, or orders.

Strabo, in effect, only distinguishes three kinds; *bardi*, *vacerri*, and *Druids*. The *bardi* were the poets; the *vacerri*, *Ovarus*, (apparently the same with the *vacerri*) were the priests, and naturalists; and the *Druids*, beside the study of nature, applied themselves likewise to morality.

Diogenes Laertius assures us in his prologue, that the *Druids* were the same amongst the ancient Britons, with the *Sophi*, or philosophers among the Greeks, the *Magi* among the Persians, the *Gymnosophists* among the Indians, and the *Chaldeans* among the Assyrians:

The *Druids* had one chief, or *Arch Druid* in every nation, who acted as high-priest, or pontifex maximus. He had absolute authority over all the rest; and commanded, decreed, punished, &c. at pleasure. At his death he was succeeded by the most considerable among his survivors; and if there were several pretenders, the matter was ended by an election, or else put to the decision of arms.

The *Druids*, we have observed, were in the highest esteem. They presided at sacrifices, and other ceremonies, and had the direction of every thing relating to religion. The British and Gaulish youth flocked to them in crowds, to be instructed by them. The children of the nobility, Mela tells us, they retired withal into caves, or the most desolate parts of forests; and kept them there, sometimes for 20 years, under their discipline.

Beside the immortality, and metempsychosis, they were here instructed in the motion of the heavens, and the course of the stars, the magnitude of the heavens, and the earth, the nature of things, the power and wisdom of the gods, &c. They preferred the memory and actions of great men in their verses, which they never allowed to be wrote down, but made their pupils get them off by heart. In their common course of learning, they are said to have taught them 24000 such verses.

They held the plant mistletoe in singular veneration. Pliny relates the ceremony wherewith they gathered it every year. Lib. XVI. c. 44. They placed a world of confidence also in serpents eggs gathered after a peculiar manner, and under a certain disposition of the moon described by Pliny; and imagined them effectual means for the gaining of law-suits, and procuring the good graces of princes. And hence, the same author concludes it is, that the caduceus, or rod encompassed with two serpents interwove, has been assumed as a symbol of peace. Suetonius, in his life of Claudius, assures us, they sacrificed men; and Mercury is said to be the god they offered these inhuman victims to. Diod. Siculus, Lib. VI. observes, it was only upon extraordinary occasions they made such offerings: as, to consult what measures to take, to learn what should befall them, &c. by the fall of the victims, the tearing of his members, and the manner of his blood gushing out. Augustus condemned the custom: and Tiberius, and Claudius, punished and abolished it. See *Cæsar* Lib VI. c. 13. and Mela Lib. III. c. 2.

We learn from *Cæsar*, that the *Druids* were the judges, and arbiters of all differences and disputes, both public and private, they took cognizance of murders, inheritances, boundaries, and limits, and decreed rewards, and punishments. Such as disobeyed their decisions, they excommunicated, which was their principal punishment; the criminal being hereby excluded from all public assemblies, and avoided by all the world; so that no body durst speak to him, for fear of being polluted.—Strabo observes, they had sometimes interest and authority enough to stop armies, upon the point of engaging; and accommodate their differences.

They held an assembly every year at a certain season about the middle of the country; and there in a place consecrated for the purpose, they kept their assizes, and terminated the differences of the people, who flocked thither from all parts.

Cæsar, who had seen some of the *Druids* in Britain, was of opinion, they had comethence into Gaul: diverse among the moderns, take this for a mistake, and believe the very contrary. In effect, it appears pretty probable, that the ancient Britons were originally Gauls; that some of the Celts, or Belge, Gaulish nations, were the first that entered our island, and peopled it: and that the *Druids* went along with them.

Hornius, in his history of philosophy, Lib. II. c. 12. believes all the learning and philosophy of the *Druids* to have been derived from the Assyrian Magi, who are still called in Germany, *Truttn*, or *Truttn*; and that, as *Magus* has lost its ancient signification, which was honourable, and now signifies a magician, or forcerer; so *Druid*, which had the same sense, has likewise degenerated, and now signifies no other, than a person who has commerce with the devil, or is addicted to magic. And accordingly, in Friesland, where there anciently were *Druids*, witches are now called *Druids*.—Gale, Dickenson, and some others, vainly contend, that the *Druids* borrowed all their philosophy, as well as religion, from the Jews.

There were also women, who bore the appellation *Druides*, or *Druidæ*, among the Gauls, &c.—The authors of the *Historia Augusta*, particularly Lampridius, and Vopiscus, make mention hereof. A *Druidæ*, says Lampridius, p. 125. told Alexander Severus something which denoted he should be unhappy. Vopiscus, in the life of Aurlian, relates, that having consulted the Gaulish *Druides*, whether or no the empire should remain in his family; they gave him for answer, that no

name should be more glorious in the empire, than that of the descendants of Claudius. On which the historian takes occasion to observe, that Constantius, the father of Constantine, was a Claudius.

Lastly, the same Vopiscus, in his life of Numerianus, relates, that a *Druidæ* had foretold Dioclesian, that he should be emperor when he should have killed Aper, which signifies a boar; and which also was the name of a *Præfectus Prætorij*, whom he killed with his own hand.

Salmasius, in his notes on Lampridius, is a little in doubt who these women were: but he gives into the most easy, and plausible opinion, that they were either the wives, or the children of the *Druids*.

DRUM, *Tympanum*, a military, musical instrument, of use principally among the foot, serving to call the soldiers together, and to direct their march, attack, retreat, &c.

The body of the *Drum* is made of very thin oak which is bent into a cylinder, and covered at each end with parchment, which is strained, or braced more or less, according to the height, or depth of the sound required, by strings; and is then struck with sticks. The depth of the *Drum* is equal to its breadth, which does not exceed two foot and a half, by reason, no skins can be had to cover bigger.—There are also *Drums*, whose body is of brass.

DRUM, or **DRUMMER**, also denotes a soldier appointed to beat the *Drum*.—In each company of infantry there is at least one *Drum*; usually two; and a *Drum Major* in every regiment. There are diverse beats of the *Drum*: as the march, double march, assembly, charge, retreat, alarm, chamade, &c. See **ASSEMBLY**, **CHAMADE**, &c.

DRUM, in anatomy, or **EAR-DRUM**, denotes a cavity in the inner ear, thus called from the resemblance it bears to the figure of a *War-Drum*. See **EAR**.

Its outer extreme is covered with a membrane, by anatomists called also *tympanum*, *Drum*; but more properly, *membrana tympani*.

The office of this *Drum*, or *membrana tympani*, has been greatly controverted among anatomists. The account best warranted, is; that being a medium for the conveyance of the sound to the auditory nerve, by its different degrees of tension, it serves to modify the sound, and propagate it to the nerve well proportioned, and commensurate thereto. See **SOUND** and **HEARING**.

String of the DRUM. See **CHORDA Tympani**.

DRUM, in architecture. See the article **TAMBOUR**.

DRUNGUS, ΔΡΟΥΤΟΣ, a body, or company of forces, thus called in the later times of the Roman empire.

The name *Drungus**, as appears from Vegetius, Lib. III. c. 16. was at first only applied to foreign, and even enemy's troops; but under the eastern empire, it came in use for the troops of the empire it self, where it amounted pretty nearly to what we call a *regiment* or *brigade*.—Leunclavius observes, that the *Drungus* was not less than 1000 men, nor more than 4000.

* The same author notes, that ΔΡΟΥΤΟΣ among the modern Greeks signifies a *pass*, or *rod*, the badge of a dignity, or office, as *agla* among the Turks; and he thinks, that the name may be formed from the Latin *truncus*. But it appears from Vegetius, that *Drungus* is a barbarous, not a Latin word.—Spelman takes it for Saxon, because at this day, *throng*, in English signifies a multitude: Salmasius derives it from ΠΥΡΟΣ, *beak*; on account of the *Drungus*'s being disposed beak-wise, or terminating in a point.

DRUNKENNESS, *Ebrietas*, physically considered, consists in a preter-natural compression of the brain, and a discomposure of its fibres; occasioned by the fumes, or spirituous parts of liquors.

It is accounted for thus: an immoderate quantity of wine taken into the stomach, is there heated, and undergoes a kind of effervescence; which arises the more readily, as the liquor abounds the more in sulphur. By this action it becomes attenuated, and rarefied; so that the grosser parts being left behind, its finer parts are fitted to penetrate, and shoot through the veins to the brain; or are conveyed through the veins to the heart; whence, after a further heat, and rarefaction, they are sent through the carotid arteries, &c. to the brain. Hence necessarily arises a repletion of the meninges of the brain; and a compression of the fibres of the brain it self, from the fresh flock of rarified sulphur continually exploded into them: hence also an obstruction of the pores, or passages of the brain, arise a frequent, and disorderly pulsation of the fibres, and the other symptoms of this distempered state. Hence it is, that all liquors will not give *Drunkenness*; but only such as by their sulphur, or spirit, are disposed for an effervescence in the stomach, and heart, to diffuse their subtle attenuated parts plentifully to the brain.

It is a popular mistake, that the only remedy for gluttony, is *Drunkenness*; or that the cure of a surfeit of meat, is a surfeit of wine: than which nothing can be more contrary to nature. *Chymic*.

The ancient Lacedæmonians used to make their slaves frequently *drunk*, to give their children an aversion, and horror

DUC

for this Vice. The Indians hold *Dryunkenniss* a species of madness; and in their language, the same term *ramjam*, that signifies *Drunkard*, signifies also a phrenetic.

DRY Baths.

DRY Confects.

DRY Dock.

DRY Exchange, *Cambium Siccum* *, a soft appellation, anciently used to disguise usury under; intimating something to pass on both sides; whereas, in truth, nothing passed but on one: in which respect it might be called *dry*. See *INTEREST*, and *USURY*.

* *Cambium siccum*, says Lud.-Lopes, *de Contract. & Negot. off. Cambium non habens existentiam Cambii, sed apparentiam, ad instar arboris exsiccate*, &c.

DRY Fish.

DRY Fruits.

DRY Maf.

DRY Moat.

DRY Rent.

DRY Storax.

DRY Suture.

DRY Measures.

DRY Spavin.

DRYADES, *DRYADS*, in the heathen theology, the nymphs of the woods; a sort of imaginary deities, which the ancients believed to inhabit the woods, and groves; and to hide themselves under the bark of the oak, called by the Greeks *Δρυς*.

The *Dryades* differed from the *Hamadryades*, in that these latter were attached to some particular tree, with which they were born, and with which they died; whereas the *Dryades* were the goddesses of the trees, and woods in general, and lived at large in the middle thereof. For though *Δρυς* properly signifies an *Oak*; it was also used for *Tree* in general. We likewise find mention made in divers authors of a kind of prophetesses, or witches, among the Gauls, called *Dryades*, or rather *Druides*. See *DRUIDS*.

DUBIOUS Acids. See the article *ACIDS*.

DUBITATIVE Conjunctions. See *CONJUNCTION*.

DUCAL. The letters patent granted by the senate of Venice are called *Ducals*.—So also are the letters wrote in the name of the senate to foreign princes.

The denomination *Ducal* is derived hence, that at the beginning of such patents the name of the duke, or doge, is wrote in capitals, thus: *N—Dei Gratia Dux Venetiarum*, &c.—The date of *Ducals* is usually in Latin; but the body is in Italian. A courier was dispatched with a *Ducal* to the emperor, returning him thanks for renewing the treaty of alliance (in 1716) against the Turks, with the republic of Venice.

DUCAT, a foreign coin, either of gold, or silver, struck in the dominions of a duke; being about the same value with a Spanish piece of eight, or a French crown, or 4 shillings and 6 pence sterling, when of silver: and twice as much, when of gold. See *COIN*.

The origin of *Ducats* is referred to one Longinus, governor of Italy; who revolting against the emperor Justin the younger, made himself duke of Ravenna, and called himself *Exarcha*, i. e. *without lord, or ruler*. And to shew his independence, struck pieces of money of very pure gold in his own name, and with his own stamp; which were called *Ducati*, *Ducats*; as Procopius relates the story.

After him, the first who struck *Ducats*, were the Venetians, who called them also *Zecchini*, or *Sequins*, from *Zecca*, the place where they first were struck. This was about the year 1280, in the time of John Danduli: but we have pretty good evidence, that Roger king of Sicily, had coined *Ducats* as early as 1240. And du Cange scruples not to affirm, that the first *Ducats* were struck in the Dutchy of Apulia, in Calabria. The chief gold *Ducats* now current, are the single, and double *Ducats* of Venice, Florence, Genoa, Germany, Hungary, Poland, Sweden, Denmark, Flanders, Holland, and Zurich. The heaviest of them weighs 5 penny weights 17 grains, and the lightest 5 penny weights 10 grains; which is to be understood of the double *Ducats*, and of the single in proportion. The Spaniards have no *Ducats* of gold, but in lieu thereof they make use of the silver one; which with them is no real species, but only a money of account like our pound. It is equivalent to 11 rials. See *RIAL*.—The silver *Ducats* of Florence serve there for crowns.

DUCATOON, a silver coin, struck chiefly in Italy, particularly at Milan, Venice, Florence, Genoa, Lucca, Mantua, and Parma; though there are also Dutch, and Flemish *Ducatons*.

They are all nearly on the same footing: and being a little both finer and heavier than the piece of eight, are valued at 2 pence or 3 pence more; viz. at about 4 shillings and 8 pence sterling.

There is also a gold *Ducatoon*, struck, and current chiefly in Holland. It is equivalent to 20 florins, on the footing of 1 shilling, 11 pence, half-penny, the florin.

DUC

DUCENARIUS, in antiquity, an officer in the Roman army, who had the command of two hundred men.

The emperors had also *Ducenarii* among their procurators, or intendants, called *procuratores Ducenarii*.—Some say that these were such whole salary was 200 sesterces; as in the games of the circus, horses hired for two hundred sesterces, were called *Ducenarii*.—Others hold, that *Ducenarii* were those who levied the two hundredth penny; or the officers appointed to inspect the raising of that tribute. In the inscriptions at Palmyra the word *Ducenarius*, in Greek Δυκναριος, occurs very often.

DUCES *Ticum*, a writ commanding one to appear at a day in chancery, and to bring with him some evidences, or other things, which the court would view.

DUCES *tecum licet languidus*, a writ directed to a sheriff, who having in his custody a prisoner, in a personal action, returns upon a habeas corpus, that he is *adeo languidus*, that without danger of death he cannot have his body before the justices.

DUCKING, or plunging in water, Olaus Magnus tells us, this was a diversion anciently practised among the Goths, by way of exercise; but among the Celts, and Franks, it was a sort of punishment. Tacitus likewise assures us, that it was executed among the ancient Germans on the lazy, and infamous. At Marfeilles, and Bourbon, their men and women of scandalous life are condemned to the *cale*, as they call it, that is, to be shut up, naked to the shift, in an iron cage fastened to the yard of a shallop, and *ducked* several times in the river. The same is also done at Tholoufe, to blasphemers.

DUCKING, is also a punishment for seamen; who are thrown into the sea from the top of the yard of the main-mast, several times, according to the quality of their offence.

Sometimes a cannon-ball is fastened to their feet, to make the fall the more rapid.

There is also a kind of *dry ducking*, wherein the patient is only suspended by a rope, a few yards above the surface of the water: this is a species of *strappada*.

The punishment is usually made public by the discharge of a cannon.

DUCKING-*Stool*, in our customs. See *CUCKING-*Stool**.

DUCT, *DUCTUS*, in anatomy, is applied in a general sense, to all the canals, or tubes in the animal body, as veins, arteries, &c. through which the humours, or juices are conveyed. DUCT has also a more immediate application to several particular vessels; as the

DUCTUS *Alimentalis*, a name given by Dr. Tyson, to the gula, stomach, and intestines; all which make but one continued canal, or *Duct*. This *Duct* he makes the proper characteristic of an animal.

DUCTUS *Adiposi*, are little vesicles in the omentum, which either receive the fat separated from the adipose loculi, or cells, or else bring it to them: for the extreme fineness of these vessels renders it extreme difficult to trace their origin, or course. Indeed it remains somewhat doubtful, whether they be hollow, and real *Ducts*; or whether they be not solid fibres, such as are observed in the spleen, along which the liquid fat does, as Dr. Drake expresses it, drill its way, as the easiest it can find. Malpighi, their first discoverer, inclines to the former opinion *. All we know for certain, is, that they terminate in little globules of fat; concerning the use and progress whereof much remains to be discovered.

* Malpighi starts a doubt, whether the adipose ducts may not be propagated from fibres which abound in the spleen; or those fibres from them?—As also, whether there be not a yet undiscovered communication between the adipose membrane and the omentum?

Aquose DUCTS. See the article *AQUOSE*.

DUCTUS *Cyliferus*, or *Roriferus*, the same as *Ductus Thoracicus*. See *THORACIC*.

DUCTUS *Communis Choledochus*, a large canal formed by an union of the *Ductus cysticus*, and hepaticus. This *Duct* descending about four inches, discharges it self into the Duodenum, by an oblique insertion, which does the office of a valve, in preventing the regrefs of the bile conveyed hereby into the intestines.—See *Tab. Anat. (Splanchn)* fig. 5. lit. k. See also the articles *BILE*, and *CHOLEDOCHUS*.

The *Ductus communis* sometimes opens into the duodenum at the same aperture with the pancreatic *Duct*.

DUCTUS *Cysticus*, or *Mentus Cysticus*, a canal about the bigness of a goose-quill, which arising from the neck of the gall-bladder, about two inches distance therefrom, joins the porus biliaris, and together with it constitutes the *Ductus communis*.—See *Tab. Anat. (Splanchn)* fig. 1. lit. d. fig. 5. lit. g. g.

EXCRETORY DUCTS. See the article *EXCRETORY*.

GALACTOPHOROUS DUCTS. See the article *GALACTOPHOROUS*.

DUCTUS *Hepaticus*. See the article *CYST-HEPATIC*.

DUCTUS *Hepaticus*, called also *Mentus Hepaticus*, and *Biliary Pore*. See *PORUS BILIARIUS*.

DUCTUS *Lachrymales*, the excretory vessels of the glandulæ lachrymales, serving for the effusion of tears. See *LACHRYMAL DUCTS*.

DUCTUS

DUCTUS Pancreaticus, a little canal arising from the pancreas, and opening into the duodenum, serving to discharge the pancreatic juice into the intestines. See **PANCREAS**, and **PANCREATIC JUICE**.

This *Duct* being first discover'd by Wirtfungus, is frequently called *Ductus Virtsungianus*. See **VIRTUNGIANUS**.

Pecquets DUCT. See the article **PECQUETS**.

DUCTUS Salivales, the excretory tubes of the salival glands; serving to discharge the secreted saliva into the mouth. See **SALIVAL DUCTS**.

DUCTUS Thoracicus. See the article **THORACIC DUCT**.

DUCTUS Umbilicalis. See the article **FUNICULUS UMBILICALIS**.

DUCTUS Urinarius, the same as *Urethra*. See the article **URETHRA**.

DUCTUS Virtsungianus. See the article **VIRTUNGIANUS**.

DUCT, DUCTUS, in building. See **CALIDUCT, VENTIDUCT, SEWER, CLOACA, &c.**

DUCTILITY, in physics, a property of certain bodies, whereby they become capable of being beaten, pressed, drawn, or stretched forth, without breaking; or whereby they are capable of great alterations in their figure, and dimensions; and of gaining in one way, as they lose in another.

Such are metals, which being urged by the hammer, gain in length and breadth what they lose in thickness; or being drawn into wire through holes in iron, grow longer as they become slenderer.

Such, also, are gums, glues, resins, and some other bodies, which, though not malleable, yet may be denominated *Ductile*, in as much as when softened by water, fire, or some other menstruum, they may be drawn into threads.

So that we have two classes of *Ductile* bodies: the one *hard*, and the other *soft*; on each of which we shall bestow some considerations.

The cause of *Ductility* is very obscure; as depending in great measure on hardness, than which there is nothing in nature we know less of. It is true, we usually account for hardness, from the force of attraction between the particles of the hard body; and for *Ductility* from the particles of the *ductile* body, being, as it were, jointed, and entangled within each other.

Instead of fanciful hypotheses to account for *Ductility*; we shall here entertain the reader with some truly amazing circumstances, and phenomena thereof, in the instances of gold, glass, and spiders-webs.

DUCTILITY of gold—One of the properties of gold, is to be the most *ductile* of all bodies; of which the gold-beaters, and gold wire-drawers, furnish us with abundant proof.

—Fa. Merfenne, M. Robault, Dr. Halley, &c. have made computations thereof: but they trusted to the reports of the workmen. M. Reaumur, in the *memoires de l'Académie Royale des sciences*, an. 1713, took a surer way: he made the experiment himself. A single grain of gold, he found, even in the common gold-leaf, used in most of our gildings, is extended into 36 and a half square inches; and an ounce of gold, which in form of a cube is not half an inch either high, broad or long, is beat under the hammer into a surface of 146 and a half square feet: an extent almost double to what could be done 90 years ago. In Fa. Merfenne's time, it was deemed prodigious, that an ounce of gold should form 1600 leaves; which together only made a surface of 105 square feet.

But the diffusion of gold under the hammer (how considerable soever) is nothing to that it undergoes in the drawing iron.—There are gold leaves, in some parts, scarce $\frac{1}{2}$ of an inch thick; but $\frac{1}{160000}$ part of an inch is a notable thickness, in comparison of that of the gold spun on silk in our gold thread.

To conceive this prodigious *Ductility*, it is necessary, to have some idea of the manner wherein the wire-drawers proceed.—The wire, and thread we commonly call *Gold-Thread*, &c. which every body knows is only silver-wire gilt, or covered over with gold, is drawn from a large ingot of silver, usually about 30 pound weight. This they round into a cylinder, or roll, about an inch and a half in diameter, and 22 inches long; and cover it over with the leaves prepared by the gold-beater, laying one over another, till the cover is a good deal thicker than that in our ordinary gilding. And yet even then it is very thin; as will be easily conceived from the quantity of gold that goes to gild the 30 pound of silver. Two ounces, ordinarily, do the business; and frequently little more than one. In effect, the full thickness of the gold on the ingot rarely exceeds $\frac{1}{100}$, or $\frac{1}{200}$ part, and sometimes not $\frac{1}{1000}$ part of an inch.

But this thin coat of gold must be yet vastly thinner: the ingot is successively drawn through the holes of several irons each smaller than other, till it be as fine, or finer than a hair. Every new hole lessens its diameter; but it gains in length what it loses in thickness, and of consequence increases in surface. Yet the gold still covers it: it follows the silver in all its extension; and never leaves the minutest part bare, not even to the microscope. Yet, how inconceivably must it be

attenuated while the ingot is drawn into a thread, whose diameter is 9000 times less than that of the ingot.

M. Reaumur, by exact weighings, and rigorous calculation, found, that one ounce of the thread was 3232 feet long, and the whole ingot 1163520 feet, Paris measure, or 96 French leagues, equal to 1264400 English feet, or 240 miles English: an extent which far surpasses what Fa. Merfenne, Furetiere, Dr. Halley, &c. ever dreamt of.

Merfenne says, that half an ounce of the thread is 100 toises; or fathoms long; on which footing, an ounce would only be 1200 foot; whereas M. Reaumur finds it 3232. Dr. Halley makes six foot of the wire one grain in weight, and one grain of the gold, 98 yards, and consequently the ten thousandth part of a grain, above one third of an inch. The diameter of the wire he found one 186th part of an inch; and the thickness of the gold one 154500th part of an inch. But this, too, comes short of M. Reaumur: for on this principle, the ounce of wire would only be 2680 feet.

But the ingot is not yet got to its full length. The greatest part of our gold-thread is spun; or wound on filk; and before they spin it, they flat it, by passing it between two rolls, or wheels of exceedingly well polished steel; which wheels, in flattening it, lengthen it by above one seventh. So that our 240 miles are now got to 274. The breadth, now, of these laminae, or plates, M. Reaumur finds, is only one 8th of a line, or one 66th of an inch, and their thickness one 3072d. The ounce of gold, then, is here extended to a surface of 1190 square feet; whereas, the utmost the gold-beaters can do, we have observed, is, to extend it to 146 square feet.

But the gold, thus exceedingly extended, how thin must it be? From M. Reaumur's calculus it is found to be one 175000th of a line, or one 100000th of an inch; which is scarce one 13th of the thickness of Dr. Halley's gold. But he adds, that this supposes the thickness of the gold every where equal; which is no ways probable; for in beating the gold-leaves, whatever care they can bestow, it is impossible to extend them equally. This we easily find by the greater opacity of some parts than others. For where the leaf is thickest, it will gild the wire the thickest.

M. Reaumur computing what the thickness of the gold must be where thinnest, finds it only one 315000th of an inch. But what is the one 315000th part of an inch? Yet this is not the utmost *Ductility* of Gold: for instead of two ounces of gold to the ingot, which we have here computed upon, a single one might have been used; and then the thickness of the gold, in the thinnest places, would only be the 630000th part of an inch.

And yet, as thin as the plates are, they might be made twice as thin, yet still be gilt; by only pressing them more between the flatter's wheels, they are extended to double the breadth, and proportionably in length. So that their thickness at last will be reduced to one thirtieth, or fourteenth millionth part of an inch.

Yet with this amazing thinness of the gold, it is still a perfect cover for the silver. The best eye, or even the best microscope, cannot discover the least chasm, or discontinuity. There is not an aperture to admit alcohol of wine, the subtlest fluid in nature, nor even light itself. Add, that if a piece of this gold-thread, or gold-plate, be laid to dissolve in aquafortis, the silver will be all excavated, or eat out, and the gold left entire in little tubules.

As to the **DUCTILITY of soft Bodies**, it is not yet carried to that pitch. The reader, however, must not be surprized, that among the *ductile* bodies of this class, we give the first place to the most brittle of all other, glass.

DUCTILITY of Glass—We all know, that when well penetrated with the heat of the fire, the workmen can figure, and manage *Glass* like soft wax: but what is most remarkable, it may be drawn, or spun out into threads exceedingly fine, and long.

Our ordinary spinners do not form their threads of silk, flax, or the like, with half the ease, and expedition, as the glass-spinners do threads of this brittle matter. We have of them used in plumes for children's heads, and diverse other works, much finer than any hair; and which bend, and wave like it with every wind.

Nothing is more simple and easy than the method of making them: there are two workmen employed: the first holds one end of a piece of glass over the flame of a lamp; and when the heat has softened it, a second operator applies a glass-hook to the metal thus in fusion; and withdrawing the hook again, it brings with it a thread of glass, which still adheres to the mass. Then, fitting his hook on the circumference of a wheel about two feet and a half in diameter, he turns the wheel as fast as he pleases; which drawing out the threads, winds it on its rim; till after a certain number of revolutions it is covered with a skain of glass-thread.

The mass in fusion over the lamp, diminishes insensibly, being wound out, as it were, like a peloton, or clue of silk upon the wheel; and the parts, as they recede from the flame, cooling, become more coherent with those next to them; and this by

degrees:

degrees: the parts nearest the fire, are always the least coherent, and of consequence must give way to the effort the rest make to draw them towards the wheel.

The circumference of these threads is usually a flat oval, being three or four times as broad as thick. Some of them scarce seem bigger than the thread of a silk-worm; and are flexible to a miracle. If the two ends of such threads be knotted together, they may be drawn and bent, till the aperture, or space in the middle of the knot do not exceed one 4th of a line, or one 48th of an inch in diameter.

Hence M. Reaumur advances, that the flexibility of glass increases in proportion to the fineness of the threads; and that probably had we but the art of drawing threads as fine as those of a spider's web, we might weave stuffs, and clothes hereof, for wear—Accordingly, he made some experiments this way: and found he could make threads fine enough, as fine in his judgment, as any spider's web, but he could never make them long enough, to do any thing with them.

DUCTILITY of Spider-webs—The ingenious author, who often above cited, observes, that the matter whereof spiders, and silk-worms form their threads, is brittle when in the mass, like dry gums. As it is drawn out of their bodies, it assumes a consistence, much as glass-threads become hard, as they recede from the lamp; though from a different cause. The Ductility of this matter, and the apparatus thereto, being much more extraordinary in spiders, than in silk-worms; we shall here only consider the former. Something also has already been said of each under the article *SILK*, which see.

Near the anus of the spider are six papillæ, or teats, represented in *Tab. Nat. History*, fig. 6. The extremities of the several papillæ are furnished with holes, that do the business of wire-drawers, in forming the threads. Of these holes, M. Reaumur observes, there are enough in the compass of the smallest pins-head, to yield a prodigious quantity of distinct threads. The holes are perceived by their effects: take a large garden-spider ready to lay its eggs, and applying the finger on a part of its papillæ, as you withdraw that finger, it will take with it an amazing number of different threads. M. Reaumur has often counted 70, or 80 with a microscope, but has perceived, that there were infinitely more than he could tell. In effect, if he should say, that each tip of a papilla furnished a thousand, he is persuaded, he should say vastly too little. The part is divided into an infinity of little prominences, like the eyes of a butterfly, &c. each prominence, no doubt, makes its several thread; or rather, between the several protuberances, there are holes that give vent to threads; the use of the protuberances, in all probability, being to keep the threads at their first exit, before yet hardened by the air, asunder. In some spiders those protuberances are not so sensible; but in lieu thereof there are tufts of hair, which may serve the same office, viz. to keep the threads a-part. Be this as it will, there may threads come out at above a thousand different places in every papilla; consequently, the spider having six papillæ, has holes for above 6000 threads. It is not enough that these apertures are immensely small: but the threads are already formed before they arrive at the papilla, each of them having its little sheath, or duct, in which it is brought to the papilla from a considerable distance.

M. Reaumur traces them up to their source, and shews the mechanism by which they are made. Near the origin of the belly, he finds two little soft bodies, which are the first source of the silk. Their form and transparency resemble those of glass-beads (see fig. 7.) by which name we shall hereafter denote them. The tip of each bead, as R, goes winding, and makes an infinity of turns, and returns towards the papilla. From the base, or root of the bead, proceeds another branch much thicker; which winding variously, forms several knots, and takes its course like the other, towards the hind part of the spider. In these beads, and their branches, is contained a matter proper to form the silk, only that it is too soft. The body of the bead is a kind of reservoir, and the two branches two canals proceeding from it. A little further backwards, there are two other lesser beads, which only send forth one branch a-piece, and that from the tip. Beside these, there are three other larger vessels on each side the spider, which M. Reaumur takes for the last reservoirs, where the liquor is collected. They are represented (fig. 8.) The biggest is near the head of the insect, and the least near the anus. They all terminate in a point; and from the three points of these three reservoirs it is, that the threads, at least the greatest part of the threads drawn out at the three papillæ, proceed. Each reservoir supplies one papilla. Lastly, at the roots of the papillæ, there are discerned several fleshy tubes: probably, as many as there are papillæ. Upon lifting up the membrane, or pellicle, that seems to cover these tubes, they appear full of threads, all distinct from each other, and which, of consequence, under a common cover, have each their particular use; being kept like knives in sheaths. The immense quantity of threads contained here, M. Reaumur concludes

upon tracing their course, does not all come from the points of the reservoirs; but some from all the turns, and angles; nay probably, from every part thereof. But by what conveyance the liquor comes into the beads, and out of the beads into the reservoirs, remains yet to be discovered.

We have already observed, that the tip of each papilla may give passage to above a thousand threads; yet the diameter of that papilla does not exceed a small pins-head: but we were there only considering the largest spiders.

If we examine the young, growing spiders, produced by those; we shall find, that they no sooner quit their eggs, than they begin to spin. Indeed their threads can scarce be perceived; but their webs, formed thereof, may: they are frequently as thick, and close, as those of house-spiders; and no wonder: there being often 4, or 500 little spiders concurring to the same work. How minute must their holes be? the imagination can scarce conceive that of their papillæ! The whole spider is, perhaps, less than a papilla of the parent which produced it.

This is easily seen: each big spider lays 4 or 500 eggs; these eggs are all wrapped up in a bag; and as soon as the young ones have broke through the bag, they begin to spin. How fine must their threads at this time be?

Yet is not this the utmost nature does: There are some kinds of spiders so small at their birth, that they are not visible without a microscope. There are usually found an infinity of these in a cluster, and they only appear like a number of red points. And yet there are webs found under them, though well nigh imperceptible. What must be the tenacity of one of these threads; the smallest hair must be to one of these what the most massive bar is to the finest gold-wire above-mentioned.

The matter whereof the threads are formed, we have observed, is a viscid juice. The beads are the first receptacles where it is gathered, and the place where it has the least consistence. It is much harder when got into the six great reservoirs, whither it is carried by canals from the former: This consistence it acquires in good measure in its passages; part of the humidity being dissipated in the way, or secreted by parts destined for that purpose.

Lastly, the liquor is dried still further, and becomes thread, in its progress through the respective canals to the papillæ. When these first appear out at the holes, they are still glutinous; so that such as spring out of neighbouring holes, stick together. The air completes the drying.

By boiling the spider, more, or less, the liquor is brought to a greater or less consistence, fit to draw out into threads; for it is too fluid for that purpose while yet included in its reservoirs.

The matter contained in these reservoirs, when well dried, appears a transparent gum, or glue, which breaks when much bent: like glass, it only becomes flexible by being divided into the finest threads. And probably it was on this account nature made the number of holes so immense. The matter of silk formed in the bodies of spiders being much brittle than that formed in silk-worms, needed to be wound smaller. Otherwise we do not conceive, why she should form a great number of threads, which were afterwards to be reunited: a single canal might else have done.

DUEL*, a single combat, at a time and place appointed, in consequence of a cartel, or challenge.

* The word is usually derived from *Duellum*, used by the barbarous Latin writers, *quasi duorum bellum*.

Duels were anciently allowed by common law, in cases where proof could not be had.—In which view, Fleta defines *Duel*, *singularis pugna inter duos ad probandam veritatem litis*, *Et qui vicit, probasse intelligitur*. Stat. de Finib. Levat. 27. Edw. I.

This *Duelling* was so general a method of terminating differences among the nobility; that even ecclesiastics, priests, and monks, were not excused from the same. Only, to prevent their being stained with blood, they obliged these to procure champions to fight in their stead; as is shewn at large by father Dacheri, in the VIIIth tome of his *Spicilegium*. None were excepted from these legal *Duels* but women, sick people, and cripples, and such as were under 21 years of age, or above 60.

The custom was for the two champions to enter a list, or small enclosure, appointed by the authority of the ordinary judge, not only on criminal occasions, but on some civil ones, for the maintenance of their right.

The monk Sigebert even relates, that a question on a point of law being presented to the emperor Otto I. viz. whether representation had place in direct succession? and the doctors finding themselves embarrassed in the resolution thereof; the emperor remitted the decision of so critical a point to the judgment of arms; and pitched on two bold fellows to maintain the *pro* and the *contra*. The victory fell to him who contended for representation; in favour of whom a law was straightway made, which is in force to this day.

This custom came originally from the northern nations; among whom it was usual to end all their differences by arms; as we are assured by Paterculus. It afterwards passed as a law among the Germans, Danes, and Franks; especially after Gondebaud, king of the Burgundians, admitted it in lieu of swearing. M. Godeau, in his history of the church, VII. cent. says, it was the Lombards who first introduced into Italy the barbarity of single combats, whence the custom spread throughout the rest of Europe.

The form of the combat was this.—The accuser and accused giving pledges to the judge, on their respective behalves; the judge took first up that of the defendant, and next that of the demandant. They were then both clapped up in safe prison; and the chief justice was to furnish them with suitable arms.—Such as fought on foot had only a sword and buckler: the horsemen were armed at all points, as well as their horses. The day of combat being come, they made choice of four cavaliers to guard the field; and performed diverse ceremonies, prayers, oaths, &c. described by Pasquier, and other authors and quoted by du Cange, who mentions an ordonnance of king Philip the Fair in 1306, prescribing the several rules, conditions, and ceremonies, to be observed herein.

The vanquished, whether accuser, or accused, was punished with death, or mutilation of members, or was ignominiously dragged out of the camp, and hung on a gibbet, or burnt, according to the circumstances of the case.

The method of trial by *Duel*, was instituted as a way of consulting providence, to learn who was the criminal; and it was imagined, that God thus interrogated, would not fail to declare himself in favour of the innocent. But it happened so often, that the unjust accuser came off victorious; that they at length began to be convinced, they must not prescribe to his wisdom, the necessity of interrupting the course of second causes. This was giving rules to murder, and disguising assassinations under method and measure.

Saxo Grammaticus observes, that as early as the year 981, the kings of Denmark had abrogated the proof by *Duel*; and in lieu thereof, appointed the proof by red-hot iron, which was also annulled in its turn.

But *Duels* were condemned before by a council held at Valentinia in 855; where the person who killed his enemy, was excommunicated; and the person killed was pronounced unworthy of burial. Afterwards, the popes Nicholas I. Celestin III. and Alexander III. likewise interposed; and Frederick I. and II. prohibited them in Germany. St. Louis did what he could to abolish them in France; but his ordonnance only took place in his own territories, and not in those of his vassals. After his example, the counts d'Auvergne and Poitou, and several other lords, forbade them likewise. Philip the fair, following the foot-steps of his grand-father, St. Louis, at one time forbade all gages, or pledges of battle; and yet he permitted them in four cases, in the ordonnance above-mentioned of the year 1306. The last *Duel* of note was in the year 1547, before king Henry II. between Jarnac and Chataigneraye, mentioned by Thuanus, and de Serres.

In England, the trial by *Duel* is disused; though the law on which it is founded be still in force.—The last trial of this kind admitted, was in the 6th year of king Charles I. between Donnell, lord Rey, or Rhee, appellant, and David Ramsey esquire, defendant, in the painted chamber at Westminster.

DUEL is also used for a single combat on some private quarrel, or occasion.

The *Duel* must be premeditated; otherwise it is only a rencounter.

The folly, or rather madness of *Duelling* reigned for some ages in France; where the flower of the noblesse perished thereby. It is one of the glories of the late Louis XIV. to have used all his power and authority for abolishing *Duels*. The severe edicts and laws he made against *Duelists* have in a great measure put a stop to the custom.

DUKE *, *Dux*, a sovereign prince; without the title, or quality of king.—Such are the *Duke* of Lorraine, *Duke* of Holstein, &c.

* The word is borrowed from the modern Greeks, who call *Doucas*, what the Latins call *Dux*.

There are also two sovereigns, who bear the title of *Great-Duke*; as, the *Grand-Duke* of Tuscany, and the *Grand-Duke* of Muscovy, now called the *Czar*, or emperor of Russia.—The emperor of Germany is *Arch-Duke* of Austria.

DUKE, *Dux*, is also a title of honour, or nobility, the next below princes.

The *Dukedom*, or dignity of *Duke*, is a Roman dignity, denominated a *Ducatus*, leading, or commanding.—Accordingly, the first *Dukes*, *Duces*, were the *Ductores Exercituum*, commanders of armies.—Under the late emperors, the governors of provinces in war time were entitled *Duces*.—In after times the same denomination was also given to the governors of provinces in time of peace.

The first governor under the name of *Duke*, was a *Duke* of

Vol. I.

the Marchia Rhetica, or Grisons, whereof mention is made in Cassiodorus.—The Goths, and Vandals, upon their over-running the provinces of the western empire, abolished the Roman dignities wherever they settled. But the Franks, &c. to please the Gaulish people, who had long been used to that form of government, made it a point of politics, not to change any thing therein; and accordingly they divided all Gaul into dutchies, and counties; and gave the names sometimes of *Dukes*, and sometimes of counts, *comites*, to the governors thereof.

In England, during the Saxons time, Camden observes, the officers and commanders of armies were called *Dukes*, *Duces*, after the ancient Roman manner, without any addition. After the conqueror came in, the title lay dormant, till the reign of king Edward III. who created his son Edward, first called the *black-prince*, *Duke* of Cornwall. After whom; there were more made, in such manner as that their titles descended to their posterity. They were created with much solemnity, *per cincturam gladii, cappaeque, & circuli aurei in capite impositionem*.

Though the French retained the names, and form of the ducal government, yet under their second race of kings, there were scarce any such thing as *Dukes*; but all the great lords were called *Counts*, *Peers*, or *Barons*. Excepting, however, the *Dukes* of Burgundy, and Aquitaine; and a *Duke* of France, which was a dignity, Hugh Capet himself held, corresponding to the modern dignity of *Maire de Palais*, or the king's lieutenant.

By the weakness of the kings, the *Dukes*, or governors sometimes made themselves sovereigns of the provinces trusted to their administration. This change happened chiefly about the time of Hugh Capet; when the great lords began to dismember the kingdom, so that that prince found more competitors among them than subjects. It was even with a great deal of difficulty they could be brought to own him their superior, or to hold of him by faith, and homage.

By degrees, what with force, and what by marriages, these provinces, both dutchies, and counties, which had been rent from the crown, were again united to it. But the title *Duke* was no longer given to the governors of provinces.

From that time *Duke* became a mere title of dignity, affected to a person, and his heirs male, without giving him any domain, territory, or jurisdiction over the place whereof he is *Duke*. All the advantages thereof now consist in the name, and the precedence it gives.

The *Dukes* of our days retain nothing of their ancient splendor, but the coronet on their escutcheon; which is the only mark of their departed sovereignty.—They are created by patent, cincture of the sword, mantle of state, imposition of a cap, and coronet of gold on the head, and a verge of gold in their hand.

The eldest sons of *Dukes* are by the courtesy of England styled *Marquises*, and the younger sons, *Lords*, with the addition of their christian name, as lord James, lord Thomas, &c. and they take place of viscounts, though not so privileged by the laws of the land.

A *Duke* has the title of *Grace*; and being writ to, he is styled, in the heralds language, *most high, potent, and noble prince*. *Dukes* of the blood royal, are styled, *most high, most mighty, and illustrious princes*.

DUKE-DUCE, a quality given in Spain to a grandee of the house of Sylva, on account of his having several dutchies, from the uniting of two considerable houses in his person.

Don Roderigo de Sylva, eldest son of Don Ruy Gomez de Sylva, and heir of his dutchies, and principalities, married the eldest daughter of the *Duke* de l'Infantado; in virtue of which marriage, the present *Duke* de Pastrana, who is descended therefrom, and is grandson of Don Roderigo de Sylva, has added to his other great titles, that of *Duke-Duke*, to distinguish himself from the other *Dukes*, some whereof may enjoy several dutchies, but none so considerable ones, nor the titles of such eminent families.

DULCIFYING, *Sweetening*, a term used in physick, for rendering a fluid less acid, and rough; either by taking away its salts, or breaking their points, or by covering them with something smooth, and soft.

DULCIS, *Assa*, or *Aja*. See the article *ASSA*.

DULIA, ΔΟΥΛΙΑ, *Service*. See the articles *WORSHIP*, *LATRIA*, and *HYPERDULIA*.

DULL *Appui*. See the article *APPUI*.

DUMBNESS, the state of a person who wants the natural use of speech.

People born deaf, are said to be all naturally *dumb*, as not being able to learn words.

Dumbness is sometimes the result of the want, or even the ill conformation, of the tongue.—Yet in the third tome of the *Ephem. German.* we have an account of a book, entitled, *Jac. Rolandi Aglossistographia, sive Descriptio: Ovis sine Lingua, quod perfecte loquitur, &c.* See *TONGUE*, and *MUTE*.

DUNG, in agriculture, and gardening. See **MANURING**, and **COMPOST**.

DUNGEON *, **DONJON**, in fortification, the highest part of a castle built after the ancient mode; serving as a watch-tower, or place of observation.

* The word comes from the French *Donjon*, which signifies the same; and which Fauchet derives from *Domicilium*, in that the *Dungeon* being the strongest part of the castle, was usually the lord's apartment. Menage derives it from *Dominion*, or *Dominus*, which in some ancient writings we find used in the same sense. Others derive it from *Domus Julii Caesaris*, or *Domus Jugi*; and others from *Domus Juliani*, the emperor Julian having built several such castles among the Gauls, whereof there is one still standing in Lorraine, called *Dom-Julien*. Du Cange derives the appellation from *Dunus* and *Colle Edificatum*, which the barbarous writers have altered into *Dunjo*, *Dungo*, *Dongio*, *Dangio*, *Dongio*, and *Dominio*.

In some castles as that of Vincennes, &c. the *Donjon* serves as a prison for persons they would have the most securely kept; whence the general use of our word *Dungeon*, for a dark close prison under ground.

DUO, in music, a song, or composition to be performed in two parts only; the one sung, and the other played on an instrument; or by two voices alone.

Duo, is also when two voices sing different parts, accompanied with a third, which is a thorough bass.—Unifons and Octaves are rarely to be used in *Duo's*, except at the beginning and end.

DUODENA Arteria, and *Vena*, a branch of an artery, which the Duodenum receives from the celiac; to which answers a vein of the same name, returning the blood to the porta.

DUODENUM *, in anatomy, the first of the *intestina tenuia*, or small guts; being that which receives the food half chylified from the stomach.—See *Tab. Anat.* (Splanchn) fig. 1. lit. b and i. fig. 2. lit. c.

* It has its name *Duodenum*, as being above twelve fingers breadth, long: on which account, some call it *Dodecastylum*.

The *Duodenum* arises from the pylorus, or right orifice of the stomach; whence descending towards the spine, from right to left, quite straight, it terminates where the circumvolutions of the rest begin.

Its coats are thicker, and its cavity or canal is less than in any of the other intestines. At its lower end are two canals, opening into its cavity, one from the liver, and gall-bladder, called the *ductus communis choledochus*; and the other from the pancreas, called *pancreaticus*.

The *Duodenum* is quite straight; but the *intestinum jejunum* makes diverse windings, and inflexions: the reason is, that the bile, and pancreatic juice mixing at the beginning thereof, or at the end of the *Duodenum*, would otherwise precipitate not only the gross parts of the excrements, but also the chyle it self, too hastily.

DUPLA, DUPLÉ Ratio, is where the antecedent term is double the consequent; or, where the exponent of the Ratio is 2:—Thus 6 : 3 is in a *Duple Ratio*. See **RATIO**.

SUB-DUPLE Ratio, is where the consequent term is double the antecedent; or, the exponent of the Ratio is $\frac{1}{2}$:—Thus, 3 : 6 is in a *Sub-duple Ratio*.

DUPLA-Sesquialtera } Ratio } See **RATIO**.

DUPLE Tima. See the article **TIME**.

DUPPLICATE *, a second instrument, or act, in writing; or a transcript, or copy of another.

* The word is formed from the Latin *Diploma*, of *Duplum*, double.

It is usual to send a *Duplicate*, when it is apprehended the first dispatch, &c. is lost.

DUPPLICATE, in chancery, is particularly used for a second letter patent granted by the lord chancellor, in a case where he had formerly done the same. See **PATENT**.

DUPPLICATE Ratio, the Ratio between the squares of two quantities.—Thus the *Duplicate Ratio* of *a* to *b* is the Ratio of *aa*, to *bb*, or of the square of *a* to the square of *b*.

In a series of geometrical proportions, the first term to the third is said to be in a *Duplicate Ratio* of the first to the second; or as its square is to the square of the second: Thus, in 2, 4, 8, 16, the Ratio of 2 to 8, is *Duplicate* of that of 2 to 4; or as the square of 2 to the square of 4; wherefore *Duplicate Ratio* is the proportion of squares; as triplicate is of cubes, &c. and the Ratio of 2 to 8, is said to be compound of that of 2 to 4, and of 4 to 8.

DUPPLICATION, DOUBLING, in arithmetic, and geometry, the multiplying a quantity, either discrete, or continued, by two.

DUPPLICATION of a Cube, is the finding the side of a cube that shall be double in solidity to a given cube: which is a famous problem cultivated by the geometricians these two thousand years.

It was first proposed by the oracle of Apollo at Delphos; which, being consulted about the manner of stopping a plague then raging at Athens, returned for answer, that the plague should cease when Apollo's altar, which was cubical, should be doubled.—Upon this, they applied themselves in good earnest, to seek the *Duplication* of the cube, which hence forwards was called the *Delian Problem*.

The problem is only to be solved by finding two mean proportionals between the side of the cube, and double that side; the first whereof will be the side of the cube doubled, as was first observed by Hippocrates Chius.

Eutochius, in his comments on Archimedes, gives several ways of performing this by the mesolabe. Pappus Alexandrinus, and his commentator Commandine, give three ways: the first, according to Archimedes; the second, according to Hero; and the third, by an instrument invented by Pappus, which gives all the proportions required.

The Sieur de Comiers has likewise published an elegant demonstration of the same problem, by means of a compass with three legs: but these methods are all only mechanical.

Re-DUPPLICATION. See the article **RE-DUPPLICATION**.

DUPPLICATUM Arcanum. See the article **ARCANUM**.

DUPPLICATURE, in anatomy, a doubling, or folding of membranes, or other like parts.

Such are the *Duplicatures* of the peritonæum, of the omentum, of the pleura, &c.

In the history of the French academy for the year 1714. an account is given of a young man, who died at the age of 27 years, in the *Duplicature* of whole meninges there were found little bones, that seemed to proceed out of the inner surface of the dura mater, and with their acute-points stimulated the pia mater.

That *Duplicature* of the peritonæum, wherein the ancients placed the bladder, is not found by the modern anatomists. Dionis.

Fabricius ab Aquapendente, first discovered the *Duplicature* of the cuticula.

DUPONDIUS, in antiquity, a weight of two pounds: or a money of the value of two As's. See **AS**.

As the As, at first, weighed a just pondo, or libra; the *Dupondius*, then weighed two. And hence the name.

And though the weight of the As was afterwards diminished, and of consequence that of the *Dupondius* also; yet they still retained the denomination. See **POUND**, and **LIBRA**.

DURA Mater, or *Meninx*, a strong, thick membrane, which lines, or covers all the inner cavity of the cranium, and includes the whole brain; being itself lined on its inner, or concave side by the pia mater, or *meninx tenuis*.—See *Tab. Anat.* (Osteol.) fig. 4. lit. ee. fig. 6. lit. cc.

The *dura Mater* sticks very close to the basis of the skull, and its sutures by the fibres, and vessels it sends to the pericranium.

It is fastened to the pia mater, and the brain, by the vessels which pass from one to the other. It gives a coat, or covering to all the nerves which rise from the brain; and to the medulla spinalis, and all the nerves, which rise from it.

Its surface is rough towards the skull, and smooth towards the brain. It is a double membrane, woven of strong fibres, which may be plainly seen on its inside, but very little on its outside next the skull: It has three processes made by the doubling of its inner membrane.—The first resembles a sickle, and is therefore called *Falc*.—The second separates the cerebrum from the cerebellum, down to the medulla oblongata, that the weight of the cerebrum may not offend the cerebellum, which lies under it. This process is very strong, and thick, and in ravenous beasts for the most part it is bony, because of the violent motion of their brain.—The third is the smallest, and separates the external substance of the hind parts of the cerebellum into two protuberances.

In the *dura Mater* are several sinusses, or channels, which run between its internal and external membranes: the four principal ones, are the sinus longitudinalis; the second and third sinusses are called *Lateralis*; and the fourth, *Torcular*. Besides these, there are more of inferior note, mentioned by anatomists, as du Verney, Dr. Ridley, &c.—Their use is, to receive the blood of the adjacent parts from the veins, to which they serve as so many trunks, and to discharge it into the internal jugulars.

The vessels of the *dura Mater*, are, first, a branch from the carotid, while it is in its long canal, which is dispersed in the fore and lower part of the *dura Mater*; secondly, an artery, which

which enters the hole of the skull, called *foramen arteria dura matris*; it is dispersed on the sides of this membrane, and runs as high as the sinus longitudinalis: the vein which accompanies the branches of this artery, goes out of the skull, by the foramen lacerum. Thirdly, a branch of the vertebral artery, and vein, which last passes through the hole behind the occipital apophysis, where they are dispersed in the hind-part of the *dura Mater*.—It has also nerves from the branches of the fifth pair, which give it an exquisite sense.

It has a motion of systole, and diastole, which is caused by the arteries which enter the skull. No doubt, the great number of arteries in the brain contribute more to it, than those few peculiar to it felt; these may assist a little, though not very sensibly, because of their smallness, and paucity.

The use of the *dura Mater* is to cover the brain, the spinal marrow, and all the nerves; to divide the cerebrum into two, and to hinder it from pressing the cerebellum.

DURA PORTIO. See the article PORTIO.

DURABLE Fortification. See the article FORTIFICATION.

DURATION, an idea we get by attending to the fleeting, and perpetually perishing parts of succession.

The idea of succession we get by reflecting on that train of ideas, which continually follow one another in our minds, while awake. The distance between any parts of this succession is what we call *Duration*: and the continuation of the existence of ourselves, or any thing else commensurate to the succession of ideas in the mind, is called our *own Duration*, or that of the thing coexisting with our thinking. So that we have no perception of *Duration*, when that succession of ideas ceases.

Duration, in Mr. Locke's philosophy, is a mode, or modification of space.

The simple modes of *Duration*, are any lengths, or parts thereof, whereof we have distant ideas; as hours, days, weeks, months, years, time, eternity, &c.

Duration, as marked by certain periods, and measures, is what we properly call *Time*.

1. By observing certain appearances, at regular, and seemingly equidistant periods, we get the ideas of certain lengths, and measures of *Duration*, as minutes, hours, &c. 2. By being able to repeat those measures of time, as often as we will, we come to imagine *Duration* where nothing really endures, or exists: thus, we imagine, to-morrow, next year, yesterday, &c. 3. By being able to repeat such idea of any length of time, as of a minute, year, &c. as often as we will, and add them to one another, without ever coming to an end, we get the idea of eternity.

Time is to *Duration*, as place is to space, or expansion. They are so much of those boundless oceans of eternity, and immensity, as is set out, and distinguished from the rest; and they thus serve to denote the position of finite, real beings, in respect of each other in those infinite oceans of *Duration*, and space.

DURATION of Action. See the article ACTION.

DURATION of an Eclipse. See the article ECLIPSE.

Scruples of half DURATION. See the article SCRUPLE.

DURATION of a solar Eclipse. See the article ECLIPSE.

DURE, DOOR. See the article SUTH-DURE.

DURESSÉ, Hardship, in law, is, where a person is kept in prison, or restrained of his liberty, contrary to order of law; or is threatened to be killed, maimed, or beaten.

In which case, if a person is in prison, or in fear of such threats, make any specialty, or obligation, by reason of such imprisonment, or threats; such deed is void in law: and in an action brought on such specialty, the party may plead, that it was brought by *Duressé*.

DUST, minute and almost insensible particles broken off from any hard body.

Those broken from stones, or formed of extremely small stones are more properly called *Sand*. See SAND.

The subtle matter of des Cartes, is a sort of *Dust* produced by the collision of the matter of the second element. See SUBTILE MATTER.

DUTCHY-COURT, a court wherein all matters belonging to the *Dutchy*, or county palatine of Lancaster, are decided by decree of the chancellor of that court.

The original of this court was in Henry the IVth's time, who obtaining the crown by deposition of Richard II. and having

the *Dutchy* of Lancaster, by descent, in right of his mother, became seized thereof as king, not as duke. So that all the liberties, franchises, and Jurisdictions of the said county passed from the king, by his great seal, and not by livery, or attornment, as the earldom of March, and other possessions, which descended to him by other ancestors than the king's, did.

Henry IV. by authority of parliament, severed the possessions, liberties, &c. of the said *Dutchy* from the crown: but Edward IV. restored them to their former nature.

The officers belonging to this court, are a chancellor, attorney general, receiver general, clerk of the court, and messenger; beside the assistants, as an attorney in the exchequer, another in chancery, and four counsellors. See CHANCELLOR and ATTORNEY of the *Dutchy*.

The *Dutchy* of Lancaster, says Gwin, grew out of the grant of Edward III. who gave that *Dutchy* to his son John of Gaunt, and endowed it with royal rights, equal to those of the county palatine of Chester. And so far as it came afterwards to be extinct in the person of king Henry IV. by reason of its union with the crown; the same king suspecting himself more rightfully duke of Lancaster, than king of England, determined to save his right in the *Dutchy*, whatever should befall the kingdom. Accordingly, he separated the *Dutchy* from the crown; and settled it so in his own person, and heirs, as if he had been no king, or politic body at all: in which condition it continued during the reigns of Henry V. and VI. who descended from him; till Edward IV. who, by recovery of the crown, reuniting the right of the house of York, appropriated the *Dutchy* to the crown again. Yet so, as he suffered the court and officers to remain as he found them. In this manner, it came, together with the crown, to Henry VII. who taking Henry IV's policy (by whose right, indeed, he obtained the kingdom) re-separated the *Dutchy*, and so left it to his posterity, who still enjoy it.

DUTY, in a moral sense. See OFFICE.

DUTY of marriage. See the article MARRIAGE.

DUTY, in policy, and commerce, an impost, laid by authority of a prince, &c. on merchandizes, and commodities, either of his own country, or brought from abroad; towards supporting the expences of the government. See CUSTOMS.

The *Duties* on various kinds of commodities are infinite. The principal are, the

DUTIES of exportation, and importation, paid upon the bringing in, or carrying out, of the diverse kinds of goods, animals, and even persons; agreeable to the tariffs settled between the several nations. See EXPORTATION, &c.

There is no state in Europe, or perhaps in the world, where the *Duties* of exportation and importation, are so many, and so considerable, as in England.—The two principal, are the *Duties* of tonnage, and poundage. The first charged on liquors, in proportion to their measure, and content. See TONNAGE.—The second on the other commodities, and paid according to their value, settled in a tariff. See POUNDAGE.

These two *Duties*, which have a long time been on foot in England, were re-established at the restoration of king Charles II. in 1660, upon the parliaments annulling all the laws made under Cromwell, and decreeing the executing of the ancient ordinances.

To these there have been eighteen new *Duties* added since that time: ten of them for liquors, and the other eight on other kinds of commodities.

The *DUTIES on liquors*, are the ancient *Duty* of tonnage, or old subsidy: the additional *Duty*; *Duty* of excise, *Duty* of coinage, the old imposition, the additional imposition, the orphan's money, the *Duty* on French wines, the new subsidy, the *Duty* on Hungary wines, and the one third, and two thirds subsidies.

The *DUTIES on other commodities*, are the ancient *Duty* of poundage: the additional *Duty* of 1660, on linnens, and silks: the new imposition of poundage, called the *impost* of 1690: another imposition of four fifths in 1693: the *Duty* of 25 per cent. on French goods, imposed in 1695: the new subsidy of poundage in 1697: another additional subsidy of a third of poundage in 1703: another third in 1704: a *Duty* on fish, oils, and whalefins, in 1709: another on leather, velom, and parchment in 1711: a second on the same goods, in 1712: and lastly, in the same year, a *Duty* on paper, paste-board, and soap.

We shall here enter into a more particular detail of the *Duties* on liquors; as wines, brandies, vinegars, cyders, &c.—First then, the *DUTY of tonnage*, or the old subsidy, we have already observed, was established in the twelfth year of king Charles II. It was at first only granted to him for life; but afterwards was continued for the first year of king James II. and after this during the life likewise of that prince. And lastly, by several acts, in the reign of queen Anne, it was again continued for 96 years, ending in the year 1808.

This first *Duty* of tonnage, is 4 pound 10 shillings sterling per tun, on all French wines brought by English vessels into the port of London; and only 3 pound, into the rest. The same

fame wine brought by foreign vessels into the port of London, pays 6 pound; and into the other ports, 4 pound 10 shillings sterling. French vinegar made of wine, pays 4 pound 10 shillings, brought by English vessels; and six pound by foreign. French cyder, and perry, and vinegar made of those liquors, pay as in the preceding article. Rhenish wine brought into any port of England, pays 1 pound sterling per awine, a measure amounting to the sixth of a tun, so that the *Duty per tun* is about 7 pound 7 shillings, which is a fourth more than that of French wine. Spanish and Portuguese wines, mulcades, malmsseys, and other Greek wines, pay the same as French wines; and the like is to be understood of vinegars made thereof.

Additional Duty of the old subsidy. This first augmentation of the old tunnage, was made in 1660, and continued like the subsidy it self to 1808.

For this *Duty*, French wines pay 3 pound sterling per tun. Rhenish wines pay as French wines. Spanish wines pay 4 pound; Portugal wines, 3 pound; mulcades, malmsseys, and other Greek wines, pay the same as Spanish wines. Vinegar, cyder, and perry, are exempt from this *Duty*. See *SUBSIDY*.

Duty of excise, is not laid on wines, but only on malt-liquor, &c.

Duty of coinage was imposed in the 18th year of king Charles II. to defray the expence of coining the money. It has been continued by diverse acts to the year 1715, and since that time.

Wines of all kinds pay equally 10 shillings sterling per tun on this *Duty*. See *COINAGE*.

Duty of old imposition of tunnage was established in the year 1685, and continued by diverse acts; that of 1711 made it perpetual.

By this *Duty*, French wines pay 8 pound sterling per tun in all the ports of England; Spanish, Portugal, Mulcadine, and other Greek wines, 12 pound; vinegar 8 pound.

Duty of additional imposition was established in 1690, continued by diverse acts to 1710, and in 1712 made perpetual. This *Duty* none but the French pay, the other nations being exempt from it.

Each tun of French wine pays for this *Duty* 8 pound sterling in any port of England: vinegar, cyder, and perry pay 25 per cent. of their value.

Orphans-Duty is only charged on wines brought into the port of London. Its name expresses the pious office it is intended for. It had its rise in the 6th year of king William III. It is fixed at 4 shillings per tun on all wines indifferently.

Additional Duty on French wines, is one of the *Duties* to which French wines alone are subject. It was established in the year 1695, for 20 years, and since continued.—It is rated at 25 pound sterling per tun for wines: and for vinegars at 15 pound.

Duty, called *new subsidy*, was granted to king William III. in 1695, for his life, and after continued to queen Anne for her life.

This is properly a duplicate of the *Duty* of tunnage, to which French and other wines are equally subject, whether brought in English, or in foreign vessels; though there are some differences, as to vinegars, cyders, and perry.

Duty on Hungary wines, is very late, only established in the first year of queen Anne. It is the same with that paid by Rhenish wines.

Duty, called *third subsidy*, is a third of the old subsidy, first established in 1703, and since continued by diverse acts to expire in 1805.

Duty, called *two thirds subsidy*, is likewise a new *Duty*, first established in 1704, to last only for a certain time, though since made perpetual.—It consists in two other thirds of the old subsidy, so that these two *Duties* of 1703, and 1704, are equal to the whole subsidy.

Besides these *Duties* imposed on all wines imported, both by natives and foreigners; there are likewise the *Duty* of Butlerage, another *Duty* called *alien's*, another of Bristol, and another of Southampton, amounting together to about 40 shillings per tun: but as these *Duties* are only levied on wines imported in foreign vessels, it is but rarely that they are paid; most of the wine-trade being managed by English vessels.

From this state of the several *Duties* paid by wines and other liquors brought into England, it appears that French wines imported by Englishmen into the port of England, pay 55 pound, 16 shillings, and 8 pence sterling per tun. Those imported by the same into the other ports, 51 pound 23 shillings, and 6 pence: those brought by foreigners into the port of London, 61 pound, 15 shillings, and 10 pence; and into the other ports, 57 pound, 12 shillings, and 8 pence.

Spanish, Italian, Mulcadine, Malmsley, and other Greek wines, imported by the English into the port of London, pay 27 pound, 7 shillings, and 10 pence sterling; and brought by the same into the other ports, 23 pound, 4 shillings, and 9 pence. The same wines brought to London by foreigners, pay 33 pound, 7 shillings, 3 fourths.

Portugal, Rhenish, and Hungary wines brought to London

by English vessels, pay 26 pound, 10 shillings, and 3 pence; into the other ports, 22 pound, 7 shillings, and 2 pence: the same wines imported to London by foreigners, pay 32 pound, 9 shillings, and 5 pence; and into other ports, 28 pound, 6 shillings, 3 pence.

French vinegars imported to London by the English, pay 27 pound, 10 shillings, 11 pence; and into the other ports, 26 pound, 4 shillings, 6 pence: imported by foreigners into London, they pay 28 pound, 17 shillings, 3 pence; and in the other ports, 27 pound, 10 shillings, 11 pence.

Spanish and Portugal vinegars, imported to London by English vessels, pay 12 pound, 10 shillings, 11 pence; in the other ports, 11 pound, 4 shillings, 6 pence: the same vinegars imported to London by foreign vessels, pay 13 pound, 17 shillings, 3 pence; and in the other ports, 12 pound, 10 shillings, 1 penny.—As to cyders, and perries, the importation is not considerable.

French brandies imported by any vessel into any port, pay 78 pound, 4 shillings sterling per tun; and brandies from any other countries, except France, only 48 pound, 4 shillings: all other foreign brandies being exempted from *Duties* of 20 pound sterling, charged on French brandies by acts of parliament, under the reign of king William III.

The English merchants, it is to be observed, are not obliged to pay these several *Duties* before 12 months; nor foreigners before 9: giving security for the same. Or, if they pay ready money, there is a deduction made them of 5 per cent. on the old new third, and two third subsidy, and on the other *Duties* 6, and one fourth per cent. Add, that if these merchandizes be again exported into other countries, after they have been entered in England, the *Duties* are returned; though this only within the compass of a year to natives, and of 9 months to foreigners.

In Spain, the *Duties* of export, and import, are called, *Duties of alcavala*, and amount to about 5 per cent. of the value of the goods: for instance, the piece of velvet of 40 Spanish vares, or yards, pays 20 rials: hats of Vigonia, 5 rials a-piece: linnens, 224 rials per 100 vares: gold and silver laces, 2 rials 3 quarters, the mark weight. The *Duties* of exportation are nearly on the same footing.

In Portugal, the *Duties* of importation were anciently the same on all kinds of goods; viz. 18 per cent. of the value. But since the year 1667, silks have been excepted out of the general tariff, and reduced to 13 per cent. For exportation the *Duties* are only 6 per cent.

In Holland, the *Duties* of exportation, and importation, are nearly alike; both of them being about the rate of 5 per cent. of the value of the goods.—At Hambourg, and Bremen, the *Duties* are but 1 per cent.—At Lubeck, three 4ths per cent.—In Muscovy they are 5 per cent.

At Venice, these *Duties* are 6 and three 4ths per cent. for what the natives import; and 10 and a half to strangers: the *Duties* of exportation are 9 per cent.—At Leghorn, the *Duties* of exportation, and importation, are very inconsiderable; but with the addition of a number of petty dues, they become as great as at Venice.

In the ports of the Levant, Constantinople, Smyrna, Aleppo, &c. the *Duties* of exportation, and importation are nearly on an equal footing, viz. 3 per cent. except to the Venetians, and Jews, who pay 5 per cent.—The consuls *Duties* are likewise to be added for Smyrna, &c. which are about 2 per cent.

At Cairo, Alexandria, and some other cities of Egypt, the *Duties* are of two kinds: one for goods brought in ships from Europe; the other, for those brought by the caravans from Asia. The first are fixed at 20 per cent. The second are arbitrary, but they are always very high. Beside the ordinary *Duty*, they here pay the golden *Duty*, which is the tenth part of what is paid for the first *Duty*.—As to *Duties* of exportation, they may be said to pay none, the 1 and a half per cent. being rather the custom-house fee, than any *Duty* paid the sovereign.

DUUMVIR, a general appellation among the ancient Romans, given to magistrates, commissioners, and officers, where two were joined together in the same function.—So that they had almost as many *Duumviri*, as they had officers joined two by two in commission.

There were *Duumviri* to direct the building, repairing, and consecrating of temples, and altars; *capital Duumviri*, who took cognizance of crimes, and condemned to death: *Duumviri* of the marine, or navy, &c.—But the most considerable of the *Duumviri*, and those usually thus called by way of eminence, were the

DUUMVIRI SACROTIUM, created by Tarquin, for the performance of sacrifices, and keeping of the Sibyl's books.—These were chose from among the nobility, or Patricians; and held their office for life: they were exempted from serving in war, and from the offices imposed on the other citizens: and without them the oracles of the Sibyls could not be consulted.

The commission lasted till the year of Rome 388; when, at the request of C. Licinius, and L. Sextius, tribunes of the people, they were changed into *Decemviri*; that is, in lieu of

two persons, the trust was committed to *ten*, who were half patricians, half plebeians.

Sylla added five more to their number, upon which they became denominated *Quindicemviri*. Their body was afterwards much increased, and at length amounted to sixty; yet still it retained the denomination of *Quindicemviri*.

They were entirely abolished under the emperor Theodosius, along with the rest of the heathen superstitions.

The *capital Duumviri*, *Duumviri perduellionis*, were not ordinary magistrates; but created only on certain occurrences.

—The first commissioners of this kind were those appointed to judge the surviving Horatius, for killing his sister, after vanquishing the Curiatii.

There were also *Duumviri* in the Roman colonies; who held the same rank and authority in their respective colonies, that the consuls held at Rome.—They were chose out of the body of Decurions, and wore the *prætecta*, or robe bordered with purple.

We also read of *municipal Duumviri*, whom Vigenere compares to our sheriffs, or rather mayors of towns.

DUUMVIRATE, *DUUMVIRATUS*, the magistrature, office, or dignity of the *Duumviri*. See *DUUMVIR*.

The *Duumvirate* lasted till the year of Rome 388; when it was changed into a *Decemvirate*.

DWALE, or *DWAL*, in heraldry, the herb nightshade; used by such as blazon with flowers and herbs, instead of colours and metals, for sable, or black.

DWARF. See *GIANT*, *PYGMY*, and *STATURE*.

DWARF-TREES, a sort of diminutive fruit-trees, frequently planted in the borders of gardens: thus called from the lowliness of their stature.

They seldom are suffered to grow above four or five feet high; and have usually a hoop tied within the middle of the branches, to make them spread abroad.

Dwarf-trees are of special advantage for table-fruit, whether pears, apples, plums, or cherries; the fruit they yield is usually of the finest, and best kind; and as such they make a considerable article in the gardeners' province.

There are diverse ways of producing *Dwarfs*.—*Dwarf-pears* are usually had by inoculating on quince-stocks, which grow the *Dwarf's* height.

As for *dwarf-apples*, the stocks they chuse to graft on are those raised of the cuttings of the apple-tree.—In order to provide stocks of each kind, they chuse such stems, and branches, as grow straightest, in the month of October, from trees whose cuttings will grow, and which in the places they are to be grafted in are at least an inch thick: these they cut off an hand's breadth below the knots or burs, which are the places where they usually put forth their roots; and cut off the top, that they may not be above a yard long. If they cannot be got so long of quinces, shorter must do. They cut off all side-branches close to the body, except one small twig near the top for the sap to vent it self at. Set them in beds, as seed-plants are: and keep them a foot above ground.

It being somewhat difficult, to get enough of such branches as have burs and knots on them; a particular method has been invented to bring those knots, and burs, artificially, called *circumposition*. It is performed by tying some earth in a piece of old hat, a foot long, about the place where you intend to cut, in the month of February; and in October it will have shoot roots therein.

Such trees alone, as are very apt to put forth roots, are proper for *dwarf* stocks; as the Kentish codlin, genet moil, some sorts of sweet apples, bitter sweets, the quince-tree, and the Paradise apple-tree.

Stocks for *dwarf* apple-trees are likewise raised by cutting down an old tree, which is apt to cast forth good suckers from the old roots; these at two years age may be transplanted, or else inoculated where they stand.

As for *dwarf* pear-trees, stocks may be raised for them from the suckers of old pear-trees. Else, cut off the top of some old ill pear-tree, and the roots will cast forth suckers.

For *dwarf* cherries and plums, suckers of the common red cherry, and ordinary plum-tree are the best.

As to the grafting, or inoculating of *dwarf*-stocks, it must be done as low as may be, with two cyons, and those longer than in grafting for long standards; that they may spread from the ground.

As to the planting of *dwarf*-trees, it is best in a light, hot earth, from the middle of October, to the end of November. In a cold, wet soil, it is best in March and April. The stem of the tree to be cut off seven or eight inches above the graft; and remember to cut off half the length of the roots, and hairy fibres; to turn the cut of the tree towards the north; to let the graft be always two or three inches above the ground, left it take root; to plant them shallow, as being apt of themselves, in light ground, to sink a foot deep, which is sufficient; and to cover the ground, when they are planted, with horse-litter. See *ENGRAFTING* and *PLANTING*.

DYADIC Arithmetic. See the article *ARITHMETIC*.

VOL. I.

DYE *, in architecture, the trunk of the pedestal; or that part between the base and the cornice: being so named, because it is frequently made in the form of a cube, or *Dye*.—See *Tab. Archit. fig. 24, 26, 28, 30, 32*.

* It is also called *Dado*, by the Italians; and by Vitruvius, *Tetracus*. See *PRESTAL*.

DYE, is also used for a cube of stone, placed under the feet of a statue, and over its pedestal; to raise it, and shew it the more.

DYERS Black. See the article *BLACK*.

DYERS Blue. See the article *BLUE*.

DYING, the art; or act of tinging cloth, stuff, or other matter with a permanent colour, which penetrates the substance thereof.

Dying differs from bleaching; or whitening, which is not the giving a new colour, but the brightening of an old one: it also differs from painting, gilding, marbling, and printing, or stamping, in that the colours in these only reach the surface.

Dying may be defined the art of colouring wool, linen, cotton, silk, hair, feathers, horn; leather, and the threads and webs thereof, with woods, roots, herbs, seeds and leaves; by means of salts, limes, lixiviums, waters; heats; fermentations, macerations, and other processes.

Dying with regard to the manner of applying the colours; is divided into *hot*, and *cold*.

DYING hot, *Θεσιόβασις*, is that wherein the liquors and ingredients are boiled; before the cloth be dipped therein; or even where the cloths themselves are boiled in the *Dye*.

DYING cold, *Ψυξιόβασις*, is where the ingredients are dissolved cold; or at least suffered to grow cold, before the stuffs be put in them.—V. *Savar. D. Comm. T. 2. p. 1697. voc. Teinture. Salmat. Exert. ad Solin. T. 2. p. 1167*.

Origin of DYING.—The *dying* art is of great antiquity; as appears from the traces of it in the oldest sacred, as well as profane writers. The honour of the invention is attributed to the Tyrians*; though what lessens the merit of it, is that it is said to have owed its rise to chance. The juices of certain fruits; leaves, &c. accidentally crushed, are supposed to have furnished the first hint: Pliny assures us, that even in his time the Gauls made use of no other *Dyes*: it is added, that coloured earthen, and minerals washed and soaked with rain, gave the next *dying* materials. —But the purple, an animal juice, found in a shell fish called *Murex*, *Conchylium*, and *Purpura*, seems from history to have been prior to any of them. This indeed was reserved for the use of kings, and princes; private persons were forbidden by law to wear the least scrap of it. The discovery of its tinging quality is said to have been taken from a dog, which having caught one of the purple-fishes among the rocks, and eaten it up, stained his mouth and beard with the precious liquor; which struck the fancy of a Tyrian nymph so strongly, that she refused her lover Hercules any favours till he had brought her a mantle of the same colour. —V. *Plin. Nat. Hist. Lib. XXII. c. 2. Savar. Lib. cit. p. 1698. Leg. I. C. Quæ res ven. non poss. Salmuth ad Panciroli. Lib. I. Tit. x. p. 8. seg. Poll. Lib. I. de verb. Idon. ad Commod. Polyd. Virg. de Invent. Rer. Lib. III. c. 7. See also the article PURPLE*.

* Pliny seems to ascribe the invention of the art of *dying* wools to the Lydians of Sardis: *Ischire lanas Sardibus Lydi*; where the word *incipire* must be understood. —But a modern critic suspects a false reading here; and not without reason, for *Lydi*, substitutes *Lydda*, the name of a city on the coast of Phœnicia, where the chief mart of the Purple-dye was.—V. *Plin. Hist. Nat. Lib. VII. c. 26. Harcourt. not. ad loc. Nurra, in Bibl. Chiof. T. 20. p. 193. seg.*

* After the Phœnicians, the Sardinians seem to have arrived at the greatest perfection in the *dying* art; inasmuch that *παρμα Σαρδινιακον*, *Sardinian Dye* passed into a proverb among the Greeks. Aristophanes in two places, to express a thing red as scarlet, compares it to the *παρμα Σαρδινιακον*. —Salmuth, Palmerius and Spanheim indeed for *Σαρδινιακον* substitute *Σαρδενιακον*, which they suppose a possessive of Sardis, and to denote *Sardian Dye*: but Nurra in a dissertation expressly on the subject has strenuously supported the pretensions of his country against this innovation.—Aristoph. in *Acharn.* v. 112. item *Pax. v. 11, 74.* —I Paul Nurra *Diff. de Varia Lestione Adagii ΒΑΜΜΑ ΣΑΡΔΙΝΙΑΚΟΝ, tinctura Sardinica. Flor. 1709. 4^o. le Clerc. Bibl. Chiof. T. 20. p. 187. seg.*

Till the time of Alexander we find no other sort of *Dye* in use but purple, and scarlet.—It was under the successors of that monarch, that the Greeks applied themselves to the other colours; and invented, or at least perfected, blue, yellow, green, &c. —For the ancient purple it has been long lost, but the perfection to which the moderns have carried the other colours, abundantly indemnifies them of the loss. In this, particularly in the scarlet and black colours, the French under the auspices of that excellent minister M. Colbert, seem to have outstripped most of their neighbours. —See *GODELINS.*—V. Pitife. *L. Ant. T. 1. p. 249. voc. Baphia.* —Savar. lib. cit.

Among the Romans, the *Dye-house*, *Baphia*, were all under the direction of the comes sacrorum largitionum; though they

had each their peculiar *præpositus*, as at Alexandria, Tyre, &c. ¹—The *Dyers* of London make the 13th company of the city, incorporated under Hen. VI. confisting of a master, warden, and livery ².—At Paris, and in most of the great cities in France, the *Dyers* are divided into three companies; viz. those of the *great Dye*, *du grand et bon teint*, who are only to use the best ingredients, and such as strike the fairest and most lasting colours.—*Dyers of the lesser Dye*, *du petit teint*, who are allowed to use the inferior sorts of drugs, which only yield false and fading colours.—And silk, wool and thread *Dyers*.—All the higher prized cloths and stuffs are reserved to the *Dyers* of the first sort: those of less value, particularly such as are not rated at above 40 sols the ell in white, are committed to the masters of the *petit teint*. Blue, red, and yellow, are reserved more peculiarly to those of the *grand teint*; browns, fallows and blacks are common to both sorts. As to black, it is begun by the *Dyers* of the *grand teint*, and finished by those of the *lesser* ¹.—It seems there is a tradition among *Dyers*, that Jesus Christ was of their profession; which we also find delivered in the *gospel of the infancy of Jesus*, tho' on what grounded we know not. But it is hence that the Persian *Dyers*, notwithstanding all their Mahometanism, have chosen Jesus for the patron of their art; inasmuch that among them a *Dye-house* is called *Christ's shop* ^m.—^h V. Notit. Imper. Hoffm. L. T. 1. p. 469. ⁱ Pitisc. loc. cit. ^k New View of Lond. T. 2. p. 601, seqq. ^l Savar. D. Comm. T. 2. p. 1688. voc *Teint*. ^m Sike Not. ad Evang. Infant. p. 55. Hilfcher de Stud. Christ. in Misc. Lips. Obs. 96. § 10. T. 5. p. 34.

Requisites in DYING.—There are three things demanded by the Greek chemists to a good *Dye*; viz.—*Asaisma*, opening or rarefying of the body to be dyed, to dispose it to imbibe the colour.—*Bæon*, the tincture or *Dye* itself.—*Katoxh*, or *Στυψις*, by the Romans called *aligatio*, the binding or fixing the colour, to prevent its fading or being discharged.—Some add a fourth condition, viz. *Σταψις*, by the Latins called *lumen*, by us *lustre* or *brightness*.

Among these, these three were done severally at three different operations, in different liquors, or decoctions: by the first, the stuff was prepared to receive the *Dye*; this was called *πρεσβασις*, and *ὑπερσση*; by the second, the desired colour was given it; and by the third, the colour was fixed on it.—But others did all three at once, with one decoction, and at one dip.—V. Salmat. Exerc. ad Solim. T. 2. p. 1146, seqq.

Advancement of DYING. The basis of a just history of Dying, must be a theory of light and colours. Two things, it may be observed, are chiefly aimed at in the enquiry of colours, the first to increase the *materia tinctoria*; the second, to fix those colours we have.

In order to these it may be remembered, that some colours are *apparent*, as those of flowers, the juices of fruits, and those of animals.—Others are *latent*, and only discovered by the effects which the several species of salts and other things have on them.

Concerning the *apparent* colours of vegetables and animals, and the effects of different salts in changing them from one colour to another, we have many instances in Mr. Boyle, collected and ranged in a new order by Dr. Lister, as,—^{1st}, That acid salts advance the colours of flowers, and berries: thus they make the infusions of balauftia or pomegranate flowers, red-roses, clove-july flowers, mezerion, pease-bloom, violets, and cyanus flowers, of a very fine red; and the juices of the berries of lignumturn, of black-cherries, and buckthorn berries, of a much fairer red.—To the same purpose it is observed, that acid salts make no great alterations upon the white flowers of jasmijn and snow-drops.

^{2dly}, Urinous salts and alkalies, on the contrary, quite alter the colours of the flowers last named, as well as the juices of the berries abovementioned, from red to green.

^{3dly}, Urinous salts and alkalies advance, at least they do not hurt the colours of the juices of vegetable leaves, woods and roots.

—Thus urinous spirits and alkalies make the yellow infusions of madder roots, red; of brazil wood, purplish; of lignum nephriticum, blue; the red infusion of logwood, purple; and that of the leaves of fena, red.

^{4thly}, Acid salts quite alter the said infusions from red or blue to yellow.

^{5thly}, Cochineel, which of it self is red, upon the affusion of oil of vitriol, an acid salt, strikes the most vivid crimson that can be imagined; and with urinous salts and alkalies, it will be again changed into an obscure colour betwixt a violet and a purple.

^{6thly}, All red, blue and white flowers are immediately, upon the affusion of an alcaly, changed to a green colour; and thence, in no long process of time, they turn yellow.

^{7thly}, All the parts of vegetables which are green, will in like manner strike a yellow with an alcaly.

^{8thly}, What flowers are already yellow, are not much changed, if at all, by an alcaly, or urinous spirit.

^{9thly}, The blue seed-husks of glastum sylvestre old gathered and dry diluted with water, stain a blue, which upon the affusion of lye strikes a green; which said green or blue being

touched with oil of vitriol *dyes* a purple: and all these three colours stand.

^{10thly}, On the tops of the fungus tubulosus are certain red knots, which upon the affusion of lye, will strike a purple, and stand.

For the *latent* colours in animals and vegetables, discovered to us by the affusion of salts; they likewise are very numerous. We will only mention a few.—^{1st}, The milky juice of the lactuca sylvestris costa spinosa, & fenchus asper & levis, upon the affusion of lye, will strike a vivid flame-colour or crimson, and after some time quite degenerate into a dirty yellow.

^{2dly}, The milk of the cataputia major, upon the affusion of lye, especially if it be drawn with a knife, and have any time stood upon the blade thereof, will strike a purple or blood red colour, and soon after will change into a dull yellow.

^{3dly}, The common hawthorn-caterpillar will strike a purple or carnation with lye, and stand.

^{4thly}, The heads of beetles, pismires, &c. will with lye strike the same carnation colour, and stand.

^{5thly}, The amber coloured scolopendra will give with lye a most beautiful and pleasant azure, or amethystine, and stand. It remains to be observed,—^{1st}, That in all the instances abovementioned, whether vegetable or animal, there is not one colour truly fixed; though there may be some use made of them, as they are.—By not truly fixed, we mean, not proof against salt and fire; for, what seem to stand, and be lye-proof, are either wholly destroyed by a different salt, or changed into a much different colour; which must needs prove a stain and blemish, when it shall happen in the use of any of them.

^{2dly}, That both the apparent and latent colours of vegetables are fixable: an instance whereof we may observe in the seed husks of glastum, and the use *Dyers* make of the leaves of that plant after due preparation.

^{3dly}, It is probable from the same instance, that we may learn from the colour of some part of the fruit or seed, what colour the leaves of any vegetable, and the whole plant, might be made to yield for our use.

^{4thly}, That the latent colours of vegetables are pre-existent, and not produced; from the same instance of woad; and likewise from this, that the milky juice of lactuca sylvestris affords of it self a red serum.

^{5thly}, That the change of colours in flowers is gradual and constant.

^{6thly}, That the colours of flowers, which will not stand with lye, seem to be wholly destroyed by it, and irrecoverable.—Thus one part of a violet leaf, upon the affusion of lye, is changed very soon into yellow, and will never be revived into a red by an acid salt; but if another part of the same leaf be still green, it will be revived.

^{7thly}, That dryness seems to be a means, if not of fixing, yet of bringing the vegetable colour into a condition of not wholly and suddenly perishing by the otherwise destroying alcaly.

^{8thly}, That those plants or animals which will strike different yet vivid colours, upon the affusion of different salts, and stand, as the cochineel, and glastum, are of all others to be reckoned the best.—V. Lift. in Phil. Trans. N^o. 70. p. 2132, seqq. see also Boerh. Elem. Chem. P. 3. T. 2. p. 467, seqq. Edit. Lips.

DYING Ingredients, or the *materia tinctoria*, are best reduced under two heads:—*Colorata*, or those which properly give the colour.—And *Non-colorata*, used to prepare the stuffs for better taking the *Dye*, and to heighten the lustre of the colours.

The *colouring* ingredients are of three sorts, blue, yellow and red.—To the first sort, belong indigo, woad, weld, wood-wax, and log-wood; to the second, fustic; to the third, madder, brazil, cochineel, kermes, safflower, and sanders.—To which may be added arnotto, and young fustic, for orange-colours: lastly, wood foot.

The *non-colouring* ingredients are,—Certain *refringent* or *binding* materials, as galls, sumac, alder bark, pomegranate peel, walnut rinds and roots, sapling bark, and crab-tree bark.—Certain *salts*, as alum, argol, salt-petre, sal armoniac, potashes, lime and urine.—*Liquors*, as well water, river water, aqua vite, vinegar, lemon juice, aqua fortis, honey, and molasses.—*Gums*, as tragacanth, arabic, mastic, and sanguis draconis.—*Smectics*, or *absterfives*, as soap, fullers earth, linseed-oil, ox-gall, &c.—*Metals*, as steel filings, slippes, and pewter, to which add copperas, verdgrease, antimony, litharge, and arsenic.—Lastly, bran, wheat-flower, yolks of eggs, leaven, cumin seed, fenugreek seed, agaric and fenna.

Of most of these ingredients some account may be found under their respective articles in the course of this book; but with regard to their use and effect in *dying*, it will be necessary to consider them more particularly, and to bring together in one view.

Among the *non-colouring* drugs, then, from the mineral kingdom come; ^{1st}, Copperas, steel filings, and slipp (the stuff found in the troughs of old grind-stones whereon edge-tools have been ground) these are used for all true or Spanish blacks; though not for the Flanders blacks.—^{2dly}, Pewter dissolved in aqua fortis, used for the new scarlet or bowdye.—

3dly, Litharge, though not owned or allowed, is used to add weight to dyed silks.—*4thly*, Antimony used chiefly for the same purpose, though it also contains a tingent sulphur, which by precipitation, &c. affords a great variety of colours.—*5thly*, Arsenic used in dying crimson, on pretence of giving a lustre.—*6thly*, Verdegrease, used by linen dyers, in their yellow and green colours.—*7thly*, Alum, much used, though with what intent is not agreed on; whether to fix the dye to render water a proper menstruum to extract the tingent particles of certain hard drugs? or to scower the fibres, which may interpose between the stuff and the dye, and hinder their due adhesion? or to intenerate the hairs of wool, and hair stuffs, that they may better imbibe their colours? or to contribute to the colour it self, as copperas does to galls in making black, or juice of lemons to cochineal in carnations, or aqua fortis impregnated with pewter in the bowdye? or which seems most probable, to serve as a vinculum between the cloth and the colour, as clammy oils, and gum waters, do in painting; alum being a substance whose aculeated particles, dissolved with hot liquors, will enter the pores of stuffs, and on which the particles of dying drugs will catch! though it may also serve another use, *viz.* to dry up certain particles which disagree with the colour to be superinduced: to which add, that it may also serve to brighten a colour, by incrustating the stuff to be dyed with its crystals, on which the dye coming to be applied, has a finer effect, than if it were applied on a scabrous matter, such as an unalumined cloth is.—*8thly*, Bran, and bran water, whose flower entering the pores of the stuff, levigates its surface, and thus renders the colour laid on it more beautiful; much as woods to be gilded, are first smoothened over with white colours.—*9thly*, Saltpetre, used chiefly in aqua fortis, in the bowdye, to brighten colours by back boiling; for which purpose.—*10thly*, Argol is more commonly used.—*11thly*, Lime, or calke, used in the working of blue fatts.

Non-colouring ingredients of the animal kind, are.—*1st*, Honey.—*2dly*, Yolks of eggs.—*3dly*, Ox-gall: though this, and the two last, are only used by a few particular dyers to fower, promote fermentation, and increase weight.—*4thly*, Stale urine, used as a lixivium to fower, also to help the fermenting, and heating of woad; though it is also used in the blue fatts instead of lime: in reality, as it discharges the yellow, wherewith blue, and most greens, are compounded, it is used to spend weld withal: yet it is known, that the urine, or old mud of pissing places, will dye a well fowered piece of silver of a golden colour; it being with this (not Bath water, as imagined) that the Bath fixepces, &c. are prepared.

To the class of non-colouring ingredients may also be added water, by dyers called *white liquor*, which is of two sorts.—*1st*, Well water, used in reds, and in other colours wanting refringency, as well as in dying stuffs of a loose contexture, as callico, fustian, and the several species of cottons: but naught for blues, and making yellows and greens look rusty.—*2dly*, River water, softer and sweeter than the former, and dissolving soap better, used in most cases by the dyers, for washing, rinsing, &c. their cloths after dying.—*3dly*, Liquor absolutely so called, which is bran liquor made of one part bran, and five of river water, boiled an hour, and put in a leaden cistern to settle: four or five days in summer turn it too sour, and unfit for use: its office is to contribute to the holding of the colour: it is known that starch, which is only the flower of bran, makes a clinging paste, which will conglutinate paper, though not wood or metals. Accordingly, bran liquors are used to mealy dying stuffs, as to madder, which is rendered clammy and glutinous by being boiled in bran water; and thus made to stick better to the villi of the stuff dyed.—*4thly*, Gums, tragacanth, arabic, mastic, and sanguis draconis, are used in dying silk, chiefly to give it a glossiness, which may make it seem finer, as well as stiffer, and to encrease its weight.

For the colouring ingredients, *colorantia colorata*, we have.—*1^o*, Iron and steel, or what is made from them, which we have observed, are used in dying blacks; though how they contribute thereto is not so obvious: we know that green oaken boards become black by the attrition of a saw; a green four apple cut with a knife turns of the same colour; the white grease wherewith the wheels of coaches are anointed becomes likewise black by means of the iron boxes wherewith the nave is lined, and the friction between the nave and the axle-tree; and that an oaken-sick becomes black by a violent friction against other wood in a turning lathe; and the black colour on earthen-ware is given with scalings of iron vitrified. From all which it seems to follow, that the business of blacking lies in the iron, and particularly in its ululation or attrition.

Be this as it will, copperas, the most usual ingredient for dying black, is the salt of the pyrites wherewith old iron is incorporated. And, wherever this is used, some of the affringents are to accompany it.—*2^o*, Redwood chopped, and ground in a mill, is used for dying cloth, rugs, &c. of the coarser sort. Its tincture, which is a sort of brick-co-

lour, is got out by long-boiling it with galls, and the cloth with it. It stands better than brazil.—*3^o*, Brazil chopped also, and ground, dyes a pink-colour, or carnation near it approaching cochineal: it is used with alum: with pot-ashes it also serves for purple. It easily stains.—*4^o*, Madder gives a colour near approaching the bow-dye, or new scarlet: those called bastard-scarlets are dyed with it. It endures much boiling, and is used both with alum and argol; and holds well: the brightest dyes with madder are made by over-dyeing the stuff, and then discharging part of it by back-boiling in argol. It is used with bran water instead of white liquor.—*5^o*, Cochineal, used with bran liquor in a pewter vessel, with aquafortis, gives the dye called among us, though improperly, *scarlet in grain*. Too much acid takes off the intense redness of this colour, and turns it towards an orange, or flame colour. With this colour the Spanish leather and wool used by ladies, are dyed.—*6^o*, Annatto gives an orange colour, especially to silks, linens and cottons: for it does not penetrate cloth: it is used with pot-ashes.—*7^o*, Weld, by the help of pot-ashes, yields a deep lemon colour; though it is used to give all sorts of yellows.—*8^o*, Wood-wax, or green wood, called also *genista tinctoria*, and the dyer's *weed*, has the like effect, as weld, though its use is chiefly confined to coarse cloths: It is set with pot-ashes, or urine.—*9^o*, Fustic is of two sorts, young and old.—The former chopped and ground, yields a kind of reddish orange colour: the latter a hair colour distant several degrees of yellow from the former. It spends with or without salts, works either hot or cold, and holds firm.—*10^o*, Wood-foet, containing not only a colour, but a salt, needs nothing to extract its dye, or make it strike on the stuff. The natural colour it yields is that of honey, but it is the foundation of many other colours on wool, and cloth, only.—*11^o*, Woad ground, or chopped with a mill for the purpose, is made up into balls, which being broken, and strewn on lime or urine, is used with pot-ashes, or sea-weed, and gives a lasting blue. The lime or chalk accelerates the fermentation of the woad, which in three or four days will work like a guile of beer, and be covered with a greenish froth or flower. An intense woad colour is almost black, that is, of a damson colour. It is the foundation of so many colours, in its different degrees or shades, that the dyers have a scale whereby to compute the lightness and depth of this colour. See WOAD.—*12^o*, Indigo is of the like nature, and used for the same purpose as woad, only that it is stronger.

13^o, Logwood, chopped and ground, yields a purplish blue: it may be used with alum: formerly it was of ill repute as a most false and fading colour; but, since it has been used with galls, it is less complained of.—V. Petty's *Apparat. to Hist. of dying*, in Sprat's *Hist. Roy. Societ.* p. 21. p. 288, *seqq.* Merr. *Not. on Neri*, c. 1101 p. 335, *seqq.*

The dying materials are generally applied in decoctions made in water, more or less strong, according to the occasion; sometimes by only dipping the stuff in the vat of dye; sometimes by boiling it therein; and sometimes by leaving it a day or more to steep.—For the alum, in dying silks, it is always applied cold, in which state alone it contributes to the brightness of the dye.

The Art of DYING may be divided into as many branches as there are different colours to be communicated, and sorts of different stuffs to be the subjects of it.

DYING of Cloths, Serges, Druggets, and other woollen Manufactures.—For black, in cloths and stuffs of price, it is begun with a strong decoction of woad and indigo, which give a deep blue; after which, the stuffs, being boil'd with alum and tartar, or pot-ashes, are to be maddered with common madder; then dyed black with aleppo galls, copperas, and sumac; and finished by back-boiling in weld.—Scarlet is dyed with kermes and cochineal, with which may also be used agaric and arsenic.—Crimson scarlet is given with cochineal mastic, aqua fortis, sal armoniac, sublimatè, and spirit of wine.—Violet-scarlet, purple, amaranth, and pansy-scarlets, are given with woad, cochineal, indigo, brazilietto, brazil, and orchal.—For common reds, pure madder is used, without any other ingredients.—Crimson-reds, carnations, flame and peach-colours, are dyed according to their several hues, with cochineal mastic, without madder, or the like.—Crimson-red is prepared with Roman alum, and finished with cochineal.—Peach-colour, must be back-boiled a little with galls and copperas, or the like.—Orange-aurora, or golden-yellow, brick-colour, and onion-peel-colour, are given with woad and madder, tempered according to their respective shades.—For blues, the dark are given with a strong tincture of woad: the brighter, with the same liquor, as it weakens in working.—Dark-browns, minims, and tan-colours, are given with woad, weaker in decoction than for black, with alum and pot-ashes; after which, they are maddered higher than black: for tan-colours, a little cochineal is added.—Pearl-colours are given with galls and copperas; some are begun with walnut-tree-roots, and finished with the former; though

though to make them more serviceable they usually dip them in a weak tincture of cochineal.—*Greens* are begun with woad, and finished with weld.—*Pale-yellow, lemon-colour, and sulphur-colour*, are given with weld only.—*Olive-colours* of all degrees are first put in green, and taken down again with foot, more or less, according to the shade required.—*Seuilemort, hair-colour, musk, and cinnamon-colour*, are given with weld and madder.—*Nacarar, or bright orange-red*, is given with weld, and goats hair, boiled with pot-ashes. Fustic here is forbid, as a false colour.—*V. Savar. D. de Comm. T. 2. p. 1690, seqq.* See also *le Teinturier Parfait, Leid. 1708, 120. Salm. Polygraph. l. 3. c. 37.*

DYING of wools for tapestry, is performed after the same manner as cloths, excepting blacks, which are only to be woaded, and then put in black, as above.

Black wools for cloths and serges may be begun with walnut-tree root, and walnut rinds, and finished by dipping in a vat of black.

DYING of silks is begun by boiling them with soap, &c. then scowring and washing them out in the river, and steeping them in alum water cold.—For crimfon they scower them a second time before putting them in the cochineal vat.

Red crimfon is dyed with pure cochineal mestic, adding galls, turmeric, arsenic, and tartar, all put together in a copper of fair water almost boiling: with these the silk is to be boiled an hour and a half; after which, it is suffered to stand in the liquor till next day.—*Violet crimfon* is also given with pure cochineal, arsenic, tartar, and galls; but the galls in less proportion than in the former. When taken out it is to be well washed, and put in a vat of indigo.—*Cinnamon crimfon* is begun like the violet, but finished by back-boiling, if too bright, with copperas; if dark, with a dip in indigo.—*Light blues* are given in a back of indigo.—*Sky blues* are begun with orchal, and finished with indigo.—For *citron colours*, the silk is first alumed, then welded, with a little indigo.—*Pale yellows*, after aluming, are dyed in weld alone.—*Pale and brown aurora's*, after aluming, are welded strongly, then taken down with rocou dissolved with pot-ashes.—*Flame-colour* is begun with rocou, then alumed, and dipped in a vat or two of brazil.—*Carnation, and rose-colours*, are first alumed, then dipped in brazil.—*Cinnamon-colour*, after aluming, is dipped in brazil, and braziletto.—*Lead-colour* is given with fustic, or with weld, braziletto, galls, and copperas. But the galls, on these and other occasions, are not to be overdoled, which encreases the weight to the damage of the purchaser; for which reason, it is punished in France as a fraud: and in reality few but black silks need galls.

Black silks of the coarser sort, are begun by scowring them with soap, as for other colours; which done, they are washed out, wrung, and boiled an hour in old galls, where they are left to stand a day or two; after which, they are washed again with fair water, wrung, and put in another vat of new and fine galls; then washed and wrung again, and finished in a vat of black.—*Fine black silks* are only put once into galls, viz. the new and fine sort, which has only boiled an hour; then they are washed, and rung out, and dipped thrice in black, to be afterwards brought down by back-boiling with soap.—*V. Savar. lib. cit. p. 1693, seqq.*

DYING of thread is begun by scowring it in a lye of good ashes; after which, it is rung, rinsed out in river water, and wrung again.—For a *bright blue*, it is given with braziletto, and indigo.—*Bright green* is first dyed blue, then back-boiled with braziletto, and verdeter, and lastly woaded.—For a *dark green* it is given like the former, only darkening more before woaded.—*Lemon, or pale yellow*, is given with weld, mixt with rocou.—*Orange and Isabella*, with fustic, weld, and rocou.—*Red*, both *bright and dark*, with *flame-colour*, &c. are given with brazil, either alone, or with a mixture of rocou.—*Violet, dry rose, and amaranth*, are given with brazil, taken down with indigo.—*Seuilemort, and olive-colour*, are given with galls and copperas, taken down with weld, rocou, or fustic.—*Black* is given with galls and copperas, taken down and finished with braziletto wood.

DYING of hats is done with braziletto, galls, copperas, verdegreafe, dissolved and boiled in a copper capable of receiving, besides the liquor, twelve dozen of hats on their blocks, or moulds. Here the hats are suffered to boil some time; after which, they are taken out, and suffered to stand and cool; then dipped again; and thus alternately, often or seldom, as the stuff is of a nature to take the dye with more or less difficulty. *Savar. lib. cit. p. 1697.* See also the article **HAT**.

Proof of DYES.—There are diverse ways of proving the truth of *Dyes*, or examining the justness and legitimacy of their composition.—To discover whether a cloth have been duly treated by the dyer, and the proper foundation laid, a white spot, by the French called *Rosette*, of the bigness of a shilling, ought to be left; besides a white stripe between the cloth and the list.

Farther proof is had by boiling the dyed stuff in water with other ingredients different according to the quality of the dye to be proved. If the colour sustain the test, i. e. do not dif-

charge at all, or very little, so that the water is not tintured by it, the dye is pronounced good: otherwise it is false.

Proof of the DYES of silks.—For red crimfon, the proof is made by boiling the silk with an equal weight of alum.—For scarlet crimfon, it is boiled with soap almost of the weight of the silk.—For violet crimfon, with alum of equal weight with the silk, or with citron juice, about a pint to a pound of silk.—These ingredients are to be mixed, and put in fair water when it begins to boil; after which, the silks are also to be put in; and after boiling the whole for half a quarter of an hour, if the dye be false, the liquor of the red crimfon will be violet, in case it have been dyed with orchal, or very red, if with brazil.—That of crimfon scarlet, if rocou have been used, will become of an aurora colour, or, if brazil have been used, red.—And that of violet crimfon, if brazil, or orchal have been used, will be of a colour bordering on red.—On the contrary, if the three sorts of crimfon be truly dyed, their liquors will discover very little alteration.

A still surer way to discover whether crimfon silks have been rightly dyed, is by boiling a piece of standard dyed crimfon silk, kept for that purpose at Dyers-hall, after the same manner, and then comparing the tinctures of the two liquors.

To discover whether other colours have been dyed with galls, the silk is to be put in fair boiling water, with pot-ashes, or soap, nearly of the weight of the silk; after some time, it is taken out; upon which, if it have been dyed with galls, the colour will be all vanished, and nothing but that of the galls left, which is a sort of seuilemort, or wood colour.

The *dying* of silk with galls may also be detected by putting it in boiling water, with a gallon of citron juice; being taken out, and washed in cold water, and then dipped in a black dye, if galls have been used, it will turn black; if not, it will be of a brown-bread colour.

To discover whether black silk have been overdoled with galls, steel filings, or flipp, it is boiled in fair water, with twice its weight of soap: if it be loaden with galls, it will turn reddish, otherwise, it will keep its colour.

To discover whether black cloth have been first woaded, and madder; a sample of it, and at the same time, a sample of standard black, kept for that purpose by the Dyers company, is to be taken; and then as much roman alum as is equal in weight to both, together with a like weight of pot-ashes, is to be put over the fire in a pan of bran water: when it begins to boil, the two samples to be put in; and after half an hour to be taken out, and compared.—The piece which has only been woaded will be found bluish, with somewhat of a dull green; if it have been both woaded and madder, it will be of a tan, or minim colour; and, if it have been neither woaded, nor madder, its colour will be dunnish, between yellow and fallow.

For cloths dyed of a minim colour, the proof is to be made after the same manner as that of blacks.

To know whether scarlet, or crimfon cloth, have been dyed with pure cochineal, they are to be boiled with an ounce of alum to a pound of cloth.

For cloths of other colours, the proof is to be made in the same manner as that of blacks and minims.—*V. Savar. lib. cit. T. 1. p. 1665, seqq. voc. Debouilli.*

Theory of DYING.—This article we cannot better close, than with some general deductions which may let a little necessary light into the theory of *dying*. As,

1°. That all the materials, of which of themselves give colour, are either red, yellow, or blue; so that out of them, and the primitive fundamental colour, white, all that great variety, which we see in dyed stuffs, arises.—2°. That few of the colouring materials, (as cochineal, foot, wood-wax, or woad) are in their outward and first appearance, of the same colour, which by the slightest solutions in the weakest menstrua, they dye upon cloth, silk, &c.—3°. That many of the colouring materials will not yield their colours without much grinding, steeping, boiling, fermenting, or corrosion by powerful menstrua; as red-wood, weld, woad, arnotto, &c.—4°. That many of the said colouring materials will of themselves give no colouring at all, as copperas, or galls, or with much disadvantage, unless the cloth, or other stuff to be dyed, be first covered or incrustated as it were, with some other matter, though colour-less, as forchard, as madder, weld, and brazil, with alum.—5°. That some of the colouring materials, by the help of other colour-less ones, do strike different colours from what they would alone, and of themselves; as cochineal, and brazil.—6°. That some colours, as madder, indigo, and woad, by reiterated tinctures, will at last become black.—7°. That though green be the most frequent and common of natural colours, yet there is no simple ingredient, which is now used alone, to dye green with upon any material; sap-green, the condensed juice of the rhamnus or buckthorn-berry, being the nearest; and this only used by country people.—8°. There is no black thing in use which dyes black; though both the coal and foot of most things burnt, or scorched, be of that colour; and the blacker, by how much the matter, before it was burnt, was whiter,

whiter, as in the famous influence of ivory black.—9°. The tincture of some dying stuffs will fade even with lying, or with the air, or will stain even with water; but very much with wine, vinegar, urine, &c.—10°. Some of the dyers materials are used to bind and strengthen a colour; some to brighten it; some to give lustre to the stuff; some to discharge and take off the colour; either in whole or in part; and some out of fraud, to make the material dyed, if costly, to be heavier.—11°. Some dying ingredients, or drugs by the coarseness of their bodies, make the thread of the dyed stuff seem coarser; and some by shrinking them, smaller; and some by levigating their asperities, finer.—12°. Many of the same colours are dyed upon different stuffs with different materials; as red-wood is used in cloth; not in silks; anatto in silks, not in cloth; so that they may be dyed at several prices.—13°. Scowring, and washing of stuffs to be dyed, is to be done with appropriate materials; as sometimes with ox-galls, sometimes with fullers earth, sometimes with soap: this latter however, is pernicious in some cases, where pot-ashes will stain or alter the colour.—14°. Where great quantities of stuffs are to be dyed together, or where they are to be done with great speed, and where the pieces are very long, broad, thick, &c. they are to be differently handled, both in respect to the vessels and ingredients.—15°. In some colours and stuffs the tingent liquor must be boiling; in other cases only blood-warm, in some it may be cold.—16°. Some tingent liquors are fitted for use by long keeping; and in some the virtue wears away by the same.—17°. Some colours, or stuffs, are best dyed by reiterated dippings ever into the same liquor at several intervals of time; and some by continuing longer, and others lesser whiles therein.—18°. In some cases, the matter of the vessel wherein the liquors are heated, and the tinctures prepared, must be regarded; as that the kettles be pewter for bow-dye.—19°. Little regard is had how much liquor is used in proportion to the dying drugs; the liquor being rather adjusted to the bulk of the stuff, as the vessels are to the breadth of the same; the quantity of dying drugs being proportioned to the colour higher or lower, and to the stuffs both; as likewise the salts are to the dying drugs.

Concerning the weight which colours give to silks, for in them it is most taken notice of, as being sold by weight, and being a commodity of great price; it is observed, that one pound of raw silk loses four ounces by washing out the gums, and natural fordes.—That the same fowred silk may be raised to above thirty ounces from the remaining twelve, if it be dyed black, with certain materials. That the reason why black colour may be dyed the heaviest is, that all ponderous drugs may be dyed black, being all of colours lighter than it; whereas, perhaps, there seem to be few or no materials wherewith to encrease the weight of silk, which will conflict with fair light colours; such as will having been used, as white arsenic to carnations.

Of things useful in dying, especially black, nothing encreases weight so much as galls; by means whereof black silks recover the weight which they lost by washing out their gum: Nor is it counted extraordinary, that blacks should gain about four or six ounces in the dying upon each pound.—Next to galls, old fustic encreases the weight, about 1 1/2 in 12.—Madder about an ounce in the pound.—Weld half an ounce.—The blue fat, in deep blues of the fifth salt, adds no considerable weight.—Neither do logwood, cochineal, or anatto; nor even copperas of it self, where galls are not used.—Slipp adds much to the weight, and gives a deeper black than copperas, which affords a good excuse for the dyers that use it.

—Petty's *Appar. to Hist. of Dying*, ap. Sprat. lib. cit. p. 302, seqq.

DYING, in a more extensive sense, is applied to all kinds of colourings given to bodies of any fort.

In which sense, *Dying* amounts to the same with *coloration*; and includes staining, painting, gilding, marbling, printing, &c.—The Chinese are said to practise the *Dying* of tea with catechu, which gives the worse sorts of green tea-leaf the colour, and its infusion the tincture of bohea.—V. Short. *Diff. on Tea*, pref. p. 15. See also the articles *TEA*, and *CATECHU*.

The sorts of *Dying*, or coloration, now commonly used in vulgar trades, are, 1. Whitening of wax, and several sorts of linnen, and cotton clothes, by the sun, air, and reciprocal effusions of water. See *BLEACHING*.—2. Staining of wood and leather by lime, salt, and liquors, as in staves, canes, marble leathers, marquetry, &c.—3. Marbling of paper by tempering the colours with ox-gall, and applying them upon a stiff gummed liquor. See *PAPER*.—4. Colouring, or rather discolouring silks, tiffanies, &c. by brimstone.—5. Colouring several iron and copper works into black with oil.—6. Giving leather a gold colour, or rather dying silver-leaves like gold, by varnishes; and in other cases by urine and sulphur.—7. Staining of marble and alabaster, with heat and coloured oils.—8. Tinging silver into brass with brimstone or urine.—9. Colouring the barrels and locks of guns blue and purple with the temper of small-coal heat.

—10. Colouring glass, crystals, and earthen ware, with the rusts, and solutions of metals. See *POTTERY*, &c.—11. Colouring live hair, as in Poland, both horse and man's hair; and also of furs &c.—12. Enamelling and annealing. See *ENAMELLING*.—13. Application of colours, as in the printing of books, and pictures; and the making of playing cards, jappanning. See *PRINTING*, *CARDS*, and *JAPANNING*.—14. Gilding, and tinning with mercury, block tin, and sal armoniac. See *GILDING* and *TINNING*.—15. Colouring metals, as copper with calamine into brass, and with zink or spelter into false gold, or into false silver with arsenic. See *CALAMIN*, *BRASS*, *ZINK*, *ARSENIC*, &c.—16. Making painters colours, by preparing of earth, chalk, and slates, as in amber, ocher, cologen earth, &c. out of the calces of lead, as cerulus and minium; by sublimates of mercury and brimstone, as in vermilion; by tinging of white earths variously, as in verdeter, and some of the lakes; by concrete juices or secules, as in indigo, pinks, sap-green, and lakes; and by rusts, as in verdegreafe, &c. See *CERUSS*, *MINIUM*, *VERMILION*, *INDIGO*, &c.—17. The applying of these colours by the adhesion of ox-gall, as in the marbled paper aforesaid; or by gum-water, as in linning; or by clammy drying oils, as the oils of linseed, nuts, spike, turpentine, &c. See *PAINTING*, *LINNING*, &c.—18. Watering of tabbies. See *WATERING*, *CALENDER*, *TABBY*, &c.—V. *Petty Appar. Hist. of Dying*, ap. *Sprat Hist. Roy. Societ.* p. 285, seqq.

* Glass dyed is the common matter of artificial jewels: the tinctures are given with zaffer, manganese, ferretto, crocus martis, &c.—The processes are described at large in Antonio Neri, *de Re Vitraya*, Lib. I. c. 12, 13, 14, seqq.—See also *GLASS*, *GEM*, &c.

** The Peruvian wombt, when grown old, dye their grey hairs black by a very untoward operation, viz. holding the head some hours with the hair sopped in a boiling tincture of the root of a tree called *Cuchau*, by the Spaniards *Maquis*.—Thole brooks and springs mentioned by Strabo, Pliny, and others, were much more commodious, which would change the colour of the hair, as well as of the coats of animals, with only drinking their waters. For the use of anglings, white hair is dyed green by boiling it in ale with allum.—then steeping it in a decoction of copperas in common water.—It is dyed yellow by boiling in alum and ale with walnut-tree leaves stamped in it.—And brown, by steeping in salt and ale.—V. *Mem. de Trev.* Sept. 1707. p. 1606, seqq. * *Ajrid. Hist. Anim. de Gener.* Lib. IV. and V. Probl. §. 9. *Conring. de Habit. Germ. Corp. Gauf.* p. 126. * *Gent. Angl.* p. 9, seqq.

DYING of leather, skins; &c.—A Blue colour is given by steeping the subject a day in urine and indigo, then boiling it with alum: or it may be given by tempering the indigo with red wine, and washing the skins therewith.—Red is given by washing the skins, and laying them two hours in galls; then wringing them out; dipping them in a liquor made with liguistrum, alum and verdegreis in water; and lastly, in a Dye made of brazil wood boiled with lye.—Purple is given by treating the skins with a solution of roche alum in warm water, and when dry again, rubbing them with the hand with a decoction of log-wood in water cold.—Green is given by smearing the skin with sap-green and alum water boiled: to darken the colour, a little more indigo may be added.—Dark green is also given with steel filings and sal armoniac steeped in urine till soft, then smeared over the skin; which is to be dried in the shade.—Sky colour is given with indigo steeped in boiling water, and the next morning warmed and smeared over the skin.—Yellow, by smearing the skin over with aloes and linseed oil dissolved and strained: or by infusing it in wel.—Orange-colour is given by smearing with fustic berries boiled in alum-water: or for a deep orange, with turmeric.—V. *Salm. Polygr.* lib. III. c. 24. p. 272, seqq.

DYING or staining of wood, for inlaying, veneering, &c.—Red, is done by boiling the wood in water and alum; then taking it out, adding brazil to the liquor, and giving the wood another boil in it.—Black, by brushing it over with log-wood boiled in vinegar, hot; then washing it over with a decoction of galls, and copperas, till it be of the hue required.—Any other colour may be given by squeezing out the moisture of home-dung through a sieve, mixing it with dissolved roche alum and gum arabic; and to the whole adding green, blue, or any other colour designed: after standing two or three days, pear-tree, or other wood, cut to the thickness of half a crown is put into the liquor boiling hot, and suffered to remain till it be sufficiently coloured.—V. *Park. Treat. of Japann.* c. 27. p. 82, seqq.

DYING of bone, horn or ivory.—Black is performed by steeping brass in aqua fortis till it be turned green: with this the bone, &c. is to be washed once, or twice; and then put in a decoction of log-wood and water, warm.—Green is begun by boiling the bone, &c. in alum-water; then with verdegreis, sal armoniac and white wine vinegar; keeping it hot therein till sufficiently green.—Red* is begun by boiling it in alum-water, and finished by decoction in a liquor compounded of quicklime steeped in rain-water, strained, and to every pint an ounce of brazil

wood added: the bone, &c. to be boiled herein till sufficiently red.—Other methods are given by Salmon.—And from him by Houghton.—^a V. Park. lib. cit. p. 83, *seqq.* ^b Salm. *Polygraph.* l. 3. c. 35. p. 275, *seqq.* ^c Hought. *Collect.* N^o. 138. T. 1. p. 361.

The refuse of the bow-dye given hogs to feed on, is said to tinge their very bones red: This is a spontaneous kind of *dying*, not unlike that in Virgil; who speaks of *dying* wool, on the sheeps backs, as seems in the text, by their feeding on properly coloured plants.

*Nec varios discet mentiri lana colores:
Ipse sed in pratis aries jam suave rubenti
Murex, jam croceo mutabit vellera luto:
Sponte sua fandyx pascentes vestiet agnos.*

Eccl. 4. v. 42. *seqq.*

The difficulty is to conceive how lambs should feed on the fandyx, which is a mineral substance; the same with what is otherwise called *Sandaracha*? It is certain the poet takes it for a plant, as was long ago observed by Pliny: *Animadverso Virgilium existimasse verbum id esse.* Hist. Nat. l. 35. c. 6. This inference is chiefly drawn from the word *pascentes*, which can mean nothing else, but that the lambs browsing on the fandyx, should receive the dye in their fleeces from the aliment. Dr. B— here gives us a correction which sets all to rights: for *pascentes* he reads *nascentes*. On which footing the tenor of the passage is this: from that time there will be no need of *dying* wool with beautiful colours; but the sheep shall have their fleeces dyed naturally, and spontaneously; some with the *murex*, or purple colour; others with the *luteus*, or yellow; others with *fandyx*, or red. Those that were already in being, and had white fleeces, shall change them in *pratis*, in the meadows; but all the lambs shall be dyed beautifully *nascentes*, at their birth. V. *Mém. of Liter.* T. 2. art. 2. p. 7. *seqq.*

DYNASTY*, a term in history, signifying a race or succession of kings of the same line, or family. See **RACE**.

* The word is formed from the Greek *dynasteia*, of *dynastus*, to be powerful, to be king.

We find frequent mention in ancient history of *Dynasties* of Persians, Assyrians, Medes, &c. Manetho has left an historical chronology of Egypt, divided into 30 *Dynasties*.

DYPTYCHA, or rather **DIPTYCHA**. See **DIPTYCHA**.

DYSCRASY, an ill temperament or habit of the blood and humours, as in a jaundice, or the like.

DYSENTERY, **ΔΥΣΕΝΤΕΡΙΑ**, in medicine, a bloody diarrhœa; or a flux of blood by stool; attended with pains, and griping.

The word *Dysentery* is formed from the Greek *δύς*, difficulty, and *εντερία*, intestine; and properly signifies that kind of flux of the belly, characterized by the frequency of stools, or defæctions, mixed with blood, and accompanied with gripes: the fever, ulcers, &c. which attend it, are not essential to the disease; though many, both of the ancients and moderns, think the latter are.

The *Dysentery*, Sydenham observes, begins with a chilliness, and shivering; which is followed by a heat; then gripings of the belly ensue, with mucus, or sanious stools, which in progress of time are found interperfed with streaks of blood, and attended with vehement pain.

The stools are sometimes void of blood; and yet, if they be frequent, and attended with gripes, and a mucous colluvies, the same author says, it is a proper *Dysentery*.

Along with the excrements, belide a whitish mucosity, frequently there comes scrapings of the guts, in form of little skins. If pure blood be evacuated the patient's life is in great danger.

Etmuller makes three kinds of *Dysenteries*.—1. When a laudable blood is evacuated, from a mere plethora, or plenitude, without any disorder of the intestines; as in the hæmorrhoidal flux.

2. When a thin, watery blood is evacuated; called the *Hepatic Flux*, though really arising from the hæmorrhoidal vessels.

The third kind, which is that we more peculiarly call *Dysentery*, is, when blood is cast out mixed with a purulent matter in the excrements.

This is either *benign*, i. e. without a fever, and not contagious; or *malignant*, which is attended with a pestilential fever, and frequently ravages whole cities, and provinces: happening most commonly in armies. In the last stage, a sort of caruncles are frequently ejected along with the purulent matter, which are difficult to be accounted for, unless from an excoriation, and ulceration of the intestines. Sometimes the intestines in this case are even gangrened.

The cause of the *Dysentery*, as assigned by some physicians, is a ferous, or other morbid humour, mixed with the mass of blood; the consequence of which is a too great fermentation in the blood, and a dissolution of its parts, which

are thus rendered too liquid.—The second cause is a vellecation, and irritation of the nervous fibres of the intestines, occasioned by sharp, acid humours separated from the blood; which occasion the spiral fibres, that produce the peristaltic motion of the guts, to move too fast, and thus to expel the matters too hastily out of the intestines.—The mediate cause, in the physicians language, is some foreign body adhering strongly to the intestines, and by its sharp points, vellicating the nervous fibres of the intestines, and at length ulcerating them.—The remote causes are any thing that corrupts the mass of blood, as viscid and crude, sharp juices; ill foods; autumnal fruits; grapes; new wine drunk in excess; poisons; violent medicines; waters that have corroded leaden pipes; rainy weather in the spring, with a dry winter, and a hot summer, and autumn.

The seat of the disease is in the intestines, either the large, or the small, or both: when the disease is in the small ones, the gripes begin long before the stools, and are felt about the navel; and the blood, and excrements, are more blended; as being longer together. When the larger intestines are seized, the pain is less vehement, and is felt lower, &c.

Purgatives have rarely any good effect in *Dysenteries*; as increasing the fermentation of the blood, and irritating the fibres of the intestines more and more. Nor are emetics much better; as tending to draw the peccant humours into the stomach, or at least into the higher intestines, and thus cause more frequent stools.

Ipecacuanha, however, is excellent on this occasion: not so much as a vomitory, Dr. Friend observes, as a sudorific; having this faculty beyond all other emetics, that it corrects the *Dysenteric* ferment, in proportion as it evacuates it.—In the *Philosophical Transactions* we have an express discourse on the subject; where it is asserted to be infallible in all *Dysenteries* and loosenesses, how dangerous and inveterate soever; except in pulmonary and hydropic patients, whose fluxes are indications of approaching death.

Sydenham commends phlebotomy: but Willis says, no evacuation is good: and prescribes hot cardiacs, as spirit of wine a little burnt, &c.—Balsamic, and styptic medicines are also to be used, according to the diverse causes, and symptoms of the disease.

Borri, in a letter to Bartholine, affirms there is no better medicament in *Dysenteries* than rose-water, wherein gold has been extinguished.

Doleus relates, that he cured above an hundred persons with oil of sweet almonds, mixed with orange juice. See *Supplement*, article **DYSENTERY**.

DYSPEPSY*, **ΔΥΣΠΕΨΙΑ**, in medicine, a difficulty or weakness of digestion. See **DICTION**.

* The word is formed from the Greek *δύς*, difficulty, and *ψεύς*, coquetry, to concoct.

The *Dyspepsy* may arise from the too great weakness of the ferment of the stomach, or its being too sparing in quantity; from a relaxation of the fibres of the stomach; the want of a proper heat in the stomach, &c.—Bitters, and sub-astringents, are its proper remedy.

DYSPNOEA*, **ΔΥΣΠΝΟΙΑ**, in medicine, a difficulty of breathing.

* The word is formed from the Greek *δύς*, difficulty, and *πνέω*, I breathe.

The *Dyspnœa* admits of three degrees: a short-breath; an asthma; and an orthopnœa.—The short-breath, is the first, and lightest degree.—The asthma is more violent, and is accompanied with a wheezing.

The orthopnœa is the highest of all; the patient affected therewith not being able to lie down, but obliged to keep erect, without which he could not respire.

The most usual causes of *Dyspnœa*'s are phlegm lodged in the bronchia; or the too strong contraction of the bronchia themselves, which prevent the easy ingress of the air into the lungs.

See **ASTHMA** and **ORTHOPNœA**.

DYSURIA*, **ΔΥΣΟΥΡΙΑ**, in medicine, a difficulty of making urine, accompanied with pain, and a sense of heat.

* The word is formed from the Greek *δύς*, difficulty, and *ουρῶν*, to make urine.

It is also called *Arduor Urinæ*, by reason the urine seems to burn the urethra, as it issues forth.

The *Dysuria* differs chiefly from the strangury in this, that in the strangury, the urine only oozes out, as it were drop by drop; whereas in the *Dysuria* when it is made it streams out without an interruption, and frequently in the proper quantity.

The ordinary causes of the *Dysuria*, are the acrimony, or sharpness of the urine; and the excoriation, or exulceration of the neck of the bladder, or of the urinary passage.

E.

E

E.

The fifth letter of the alphabet, and the second vowel.

E, is a letter that admits of some variety in the pronunciation, in most languages; whence grammarians usually distinguish several E's, or kinds of E. The Greeks, *e. gr.* have their short and long *e*, viz. *e* and *η*, epsilon and eta.

The Latins have an opener *e*, called *vastius*; such was the second *e*, in the word *here*, master; and another closer, as that in the adverb *here*, yesterday. This latter *e* they frequently used promiscuously with *i*. Thus for *here*, they wrote, *heri*: and, in diverse places, we meet with *sibe*, *quase*, &c. for *sibi*, *quasi*, &c.

The Roman *e*, was likewise sometimes wrote, by corruption, for which reason, F. Hardouin takes that medal of Gallienus, GALLIENÆ AUGUSTÆ, not to be any satirical medal, as others have imagined; nor to be a dative feminine, but a vocative masculine, *Galliene auguste*, wrote with the *e*. In English we easily distinguish three E's, or three sounds of E: The first, *mute*, and not heard at all; as in *Amsterdam*, *sense*, *blue*, &c. The second, *close* or *short*, pronounced with the lips nearly shut; as in *nettle*, &c. The third, *open* or long, as in *scar*, *east*, &c.

The French have, at least, six kinds of E; the first, pronounced like A; as in *importer*, *orient*, &c. The second, a final mute, in the last syllable of diverse words not pronounced at all; as in *bonne*, *donne*, &c. The third, an imperfect mute, pronounced much like the diphthong *ea*, &c. as in *Je*, *de*, *te*. The fourth, *e ferme*, or *e masculine*, marked at the ends of words with an accent *é*. The fifth, is *e ouvert*, or long *e*, having the same sound with *ai*, as in *mer*, *seste*, &c. In the middle of words it is sometimes marked with a circumflex, and in the end, with an accent, *ê*. The sixth, is an intermediate *e*, between the *ouvert* and *ferme*; as in *cabaret*, *lettres*, &c. Some add a seventh kind of *e*, not reducible to any of the former, as that in *grammarians*, *historians*, &c. And others admit of only three kinds, viz. the mute, open, and shut; but they make variations therein, which amounts to the same thing.

As to the figure of the letter E, we borrow it from the Latins, who had it from the Greeks, and they from the Phœnicians, by Cadmus, who first brought it them. Now the Phœnicians had the same characters with the Hebrews. Accordingly, the form of the antient Hebrew *He*, was the same with that of our E, as may be seen in the Hebrew medals, and the Jesuit Souciet's dissertation thereon, p. 143. All the difference between them consists in this, that the Hebrews reading from right to left, turn their letters that way; whereas the moderns, reading from left to right, write their letters accordingly.

The little *e*, was formed of the great one, by writing it fast, and making the cross strokes at top and bottom without taking pen off paper, and then adding the stroke in the middle.

The Greek *η*, or *Η*, *Eta*, or *Ita*, was no original letter; but was added to the alphabet in after times. Of this we have proofs still extant in the antient monuments; particularly, the Farnese columns, brought to Rome from the *Via Appia*, where the *Epiphon*, E, is used in lieu of the *Η*: *e. gr.* ΔΕ ΜΕΤΡΟΣ ΚΟΡΕΣ, or ΔΗΜΗΤΡΟΣ ΚΟΡΗΣ. This letter is said to have been added by Simonides. *Bibliand, de Ration, Cohnun. Linguar. p. 40.*

The pronunciation of the *η*, seems to have been varied; it having been sometimes the same with the Latin *e*, sometimes with *i*. Terentianus assures us of the former; and the Greeks themselves for many ages have only used the latter.

It has been much disputed how the Latins render the *η*, in their language? The common opinion is, that they render it by an *e*: as in *Amphic*, *βίλλα*, *Βύσση*, *Θνοσθη*, *Θναυθη*, &c. which they rendered *Demetrius*, *Beta*, *Hemera*, *Thefeus*, *Thefaurus*, &c. Though there are persons exceedingly well versed in antiquity, who hold that they pronounced it like an *i*. Lud. de Dieu, one of the most learned grammarians of his age, observes as much in his animadversions on Genesis vi. 24. Adding, that it is for this reason, that the Hebrews, *e. gr.* the paraphrast Jonathan, express it by a *Phirik*; *משכין*. J. Rod. Wetstein proves the same in his learned oration on the true pronunciation of the Greek tongue from an infinity of instances. To this purpose he cites a MS. *Psalter* of the VIIIth century, where all the *η*'s are expressed by *i*'s. In effect, Wetstein shews, not only that the Latins pronounced and wrote it as an *i*, which might happen from its being so easily confounded in writing with an *i*; but also that they ren-

E A G

dered it by an *e*, and *ai*; that it was often used for *r* and *Ei*; and that in the time of Plato this letter had a kind of intermediate sound between the *e* and *i*. See that author, and Vossius *de Idolol. L. II. C. 16.*

E on the keys of an organ, or harpsichord, denotes the tones *E*, *mi*, *la*.

On the compass, in sea-charts, &c. it marks the east point, or wind. E. East. ESE. East South East. NE. North East, &c.

In the calendar, E makes the 5th of the dominical letters. Among authors, *E. gr.* stands for *exempli gratia*, for instance. In several *Dictionaries* we find it noted, that the letter E, among the ancients was a numeral letter, signifying 250, according to the verse,

E quoque Ducentos & Quingenta tenebis,

But it has already been observed, that this use of numeral letters was unknown among the earliest people. Isidore Hispanensis, an author of the VIIth century, says as much in express terms, in the first book of his *Origines*, cap. III. In effect, it was first introduced in the times of barbarism and ignorance.

EAGER Wine. See the article WINE.

EAGLE, *Aquila*, *Aeror*, in natural history, the largest, strongest, and swiftest of all the birds that live by prey.

It has a long beak, hooked almost from the root; yellow, scaly legs; thick, crooked talons; and a short tail. Its plumage is chestnut coloured, brown, tuddy and white. Its beak, black at the tip; and in the middle, blue, though in some yellow.

The Eagle is distinguished from the hawk by his beigness; and from the vulture, by the crookedness of his beak.

Its airy, or nest, is usually on the highest rocks; sometimes on the tops of old trees. It feeds its young till such time as they are able to fly, and then drives them out of the nests. Its food is birds, hares, lambs, kids and fawns; nay, Sir Robert Sibbald assures us, children too, when it can catch them; of which he gives an instance in the Orcades islands. *Prod. Nat. Hist. Scot. L. III. p. 2. and 14.*

Ray mentions an Eagle's nest, found near the river Derwent, in 1668. It consisted of large strong sticks, one end whereof was laid on the crag of a rock, and the other on two beech-trees; it was two yards square: in it were found one Eaglet, with the carcasses of one lamb, one hare, and three grylls. *Synops. Method. Av. p. 6.* The Eagle frequently watches the fishing hawk, and as soon as it perceives it to have struck a fish, takes wing, pursues the bird till it lets fall its prey, and often catches it before it reaches the earth or water. *Philos. Transact. N^o. 201.*

It lives very long, and as naturalists assure us, rarely dies but of hunger; the upper part of its crooked beak growing so long with age, that it closes up the lower, and so disables it from opening and taking in food. But this seems to be only a popular error.

Its sight is quick, strong and piercing to a proverb. The reason why the Eagle, the fibres of whose optic nerves are not stronger than those of other animals, is able to face the sun, and endure its brightest rays, the Jesuit Angelus, in his *Optica*, assures us, is, that it has two sets of eye-lids, the one thick and close, and the other thinner and finer, which last it draws over the eye, when it looks at any luminous body, and thus breaks the force of its rays.

The falconers have trained up Eagles to the game; but they only succeed in mountainous countries. On plains they cannot keep any time on the wing, and when they stoop, or light are weak, so that the farker beats them.

Aristotle, and Pliny, reckon up six kinds of Eagles, to which they give names corresponding to the variety of their plumage: as the Eagle-royal, called by Aristotle, *γυναίκα*, and *αεταίς*, from the ruddy, golden colour of its feathers, which are likewise spotted as it were with *flats*. The black Eagle, *valeria*, the smallest and most vigorous of all. The white-tailed Eagle, or *pygargus*. The middle sized Eagle, with a large tail, living in morasses, *morphus*: The Sea-Eagle, *halietus*: and the Bearded-Eagle, a kind of *offstraga*.

EAGLE, in heraldry, is the symbol of royalty, as being, according to Philostratus, the king of birds; and for that reason dedicated, by the ancients, to Jupiter.

The Eagle, is the arms of the emperor, the king of Poland, &c. It is accounted one of the most noble bearings in heraldry, and, according to the learned in that art, ought never to be given, but in consideration of singular bravery, generosity, &c. On which occasions, either

either a whole *Eagle*, or an *Eagle Naissant*, or only the head, or other parts, agreeable to the exploit, may be granted. The *Eagle* is sometimes represented with one head, and sometimes with two, though never more than one body, two legs, and two wings opened, be stretched out, in which posture, it is said to be *spread* or *displayed*: such is that of the empire, which is blazoned a *spread Eagle, sable, diademed, langued, beaked and membered, gules*.

The reason why *Eagles* are generally given in heraldry displayed, is partly, because in that posture they fill up the escutcheon better, and partly, because it is imagined a posture natural to the *Eagle*, when it plumes its feathers, or faces the sun. However, there are *Eagles* born in other postures: and some monstrous ones, with human or wolves heads, &c. The late authors only say *displayed*, to express the two heads: and say an *Eagle*, without any addition, when it has but one. The kingdom of Poland bears *gules, an Eagle argent, crowned and membered, or*.

The *Eagle* has been born, by way of ensign, or standard, by several nations. The first who seem to have assumed the *Eagle*, are the Persians; according to the testimony of Xenophon. Afterwards, it was taken by the Romans; who, after a great variety of standards, at length fixed on the *Eagle*, in the second year of the consulate of C. Marius: till that time, they used indifferently wolves, leopards, and *Eagles*, according to the humour of the commander.

Several among the learned maintain, that the Romans borrowed this custom from Jupiter, who had appropriated the *Eagle* as his own badge, in commemoration of its supplying him with nectar, while he lay concealed in Crete, for fear of being devoured by his father Saturn. Others hold that they borrowed it from the Tuscans, and others from the Epirotes.

The *Roman Eagles*, it must be observed, were not painted on a cloth, or flag; but were figures in relief, of silver or gold, bore on the tops of pikes; the wings being displayed, and frequently a thunder-bolt in their talons. Under the *Eagle*, on the pike, were piled bucklers, and sometimes crowns. Thus much we learn from the medals. See Fechtius in his *Dissert. de Insignibus*. And Lipius, *de Militia Romana*, L. IV. Dial. V.

Constantine is said to have first introduced the *Eagle* with two heads, to intimate, that though the empire seemed divided, it was yet only one body. Others say, that it was Charlemagne, who refusing the *Eagle*, as the Roman ensign, added to it a second head: but that opinion is destroyed, by an *Eagle* with two heads, noted by Lipius, on the Anthonine column: as also by the *Eagle's* only having one head on the seal of the golden-bull, of the emperor Charles IV. The conjecture, therefore, of F. Menestrier, appears more probable, who maintains, that as the emperors of the east, when there were two on the throne at the same time, struck their coins with the impression of a cross, with a double traverse, which each of them held in one hand, as being the symbol of the christians; the like they did with the *Eagle* in their ensigns; and instead of doubling their *Eagles*, they joined them together, and represented them with two heads. In which they were followed by the emperors of the west.

Fa. Papebroche, wishes that this conjecture of Menestrier were confirmed by ancient coins; without which, he rather inclines to think the use of the *Eagle* with two heads, to be merely arbitrary: though he grants it probable, that it was first introduced on occasion of two emperors in the same throne.

The *Eagle* on medals, according to M. Spanheim, is a symbol of divinity, and providence; and according to all other antiquaries, of empire. The princes on whose medals it is most usually found, are the Ptolemies and the Seleucides of Syria.—An *Eagle* with the word CONSECRACTIO, expresses the apotheosis of an emperor.

EAGLE, Aquila, in astronomy, is a constellation of the northern hemisphere, having its right wing contiguous to the equinoctial.

For the stars in this constellation, their number, longitude, latitude, &c. See **AQUILA**.

There are also three several stars, particularly denominated among the Arab astronomers, *Nafr*, i. e. *Eagle*. The first, *Nafr Sobail*, the *Eagle of Canopus*, called also *Sitarab Yemen*, the star of Arabia felix, over which it is supposed to preside: the second, *Nafr Althair*, the flying *Eagle*; and the third, *Nafr Alwake*, the resting *Eagle*.

White Eagle, is a Polish order of knighthood, instituted in 1325, by Uladilas V. on marrying his son Casimire, with a daughter of the great duke of Lithuania.

The cavaliers of this order were distinguished by a gold chain, which they wore on the stomach, whereon hung a silver *Eagle* crowned.

Black Eagle, was a like order, instituted in 1701, by the elector of Brandenburg, on his being crowned king of Prussia.

EAGLE, in architecture, is a figure of that bird antiently used as an attribute, or cognizance of Jupiter, in the capital and friezes of the columns of temples consecrated to that god.

EAGLE-STONE, in natural history, a stone, by the Greeks, called *Ætites*, and by the Italians, *pietra d'Aquila*, as being supposed to be sometimes found in the *Eagle's* nest; it is of famous traditionary virtue, either for the forwarding, or preventing the delivery of women in labour, according as it is applied above, or below the womb.

Matthiolus tells us, that birds of prey could never hatch their young without it, and that they go in search for it as far as the East-Indies. Bauhch. has an express Latin treatise on the subject. See Supplement article **ÆTITES**.

EAGLET, or **EAGLON**, a diminutive of *Eagle*, properly signifying a young *Eagle*.

The *Eagle* is said to prove his *Eaglets* in the brightness of the sun; and if they shut their eye lids, he disowns them.

In heraldry, when there are several *Eagles* on the same escutcheon, they are called *Eaglets*.

EALDERMAN, or **EALDORMAN**, among the Saxons, was of like import with *earl* among the Danes. Camb. Britan. p. 107.

The word was also used for an elder, senator, or statesman. Hence, at this day, we call those *Aldermen*, who are officiators to the chief officer in the common council of a city or corporate town.

EAR, Auris, the organ of hearing; or that part whereby animals receive the impression of sounds.

The *Ear* is generally divided into *internal* and *external*.—The *external*, or *outer Ear*, in most animals, consists of two principal parts, viz. that which appears prominent from the head, called the *Auricle*; and an inner part, which enters the skull by a narrow passage, called the *Meatus Auditorius*, and leads to the *Auris*, or *Ear*, properly so called.

The *Auricle*, or outer part of the *external Ear*, is semi-circular, and contains diverse sinuosities. Its upper part, which is the broadest, is called *pinna*, and sometimes *ala*; and the lower, which is narrower, softer and pendant, the *lobes*, or *fibra*, being that to which ladies hang their ear-rings, &c.

The outer area, or extent of the *Auricle*, is called the *helix*; and the inner, opposite thereto, the *anthesis*: the little protuberance of the side next the face, is called the *tragus*, or *tireus*; and the ridge just above, and opposite to it, the *antitragus*; and the cavity, leading to the beginning of the *meatus*, the *concha*. See each part described under its proper article.

The *Auricle* stands out from the head, and is furrowed with diverse winding canals, which receive and collect the wandering circumambient impressions, and undulations of sound, and modify and forward them to the inner *Ear*. It is formed of a thin cartilage, covered with a skin. It has two muscles, which in men are very small, whence some anatomists deny there are any at all, though others increase their number to three, one attollent, and two retrahent; and others to four. But in brutes, which move and prick the *Ears*, as horses, asses, &c. they are very large and considerable. Those who have lost their *Auricles*, M. Dionis observes, have but a confused way of hearing; and are obliged either to form a cavity round the *Ear* with their hands, or to make use of a horn, applying the end of it to the *meatus auditorius*.

The inner part of the *external Ear*, is possessed by the *meatus auditorius*, or auditory passage, which commences from the bottom of the concha, called the *Alvearium*, and is continued in a winding direction, turning sometimes this way, and sometimes that, to the *membrana tympani*. The *meatus* is dug out of the *os temporis*, and lined with a skin, or membrane, which is furnished with diverse little glands, that secrete a thick, yellow, glutinous humor, called *cerumen*, or *ear-wax*, serving to defend the *Ear* from the ingress of vermin, and other extraneous bodies. This *meatus* is all the *external Ear*, in diverse animals, as reptiles, birds, moles, diverse fishes, &c. The further end thereof is closed by a thin, dry, round, transparent membrane, called the *membrana tympani*, and improperly, *tympanum*, or drum, which separates the *external Ear* from the *internal*.

Behind the *membrana tympani*, is a cavity called, by different authors, the *tympanum*, *cavitas tympani*, *concha interna*, and *meatus auditorius internus*. In this cavity are five considerable parts, viz. four little bones, two apertures, called *foramina*, or *fenestræ*, as many *meatus's*, or passages; four muscles, and a branch of a nerve.

The first of the bones, or ossicles, is the *malleolus*, *malleus*, or hammer: the second, is called the *incus*, or anvil: the third, the *stapes*, or stirrup: and the fourth, the *orbicularis*. These bones are nearly of the same bigness at the birth of the child, as when it is arrived at maturity; so that all that age does is to harden them.

To give motion to these bones, is the office of the four muscles of this cavity; three of them belonging to the malleus, viz. the

the externus, obliquus, and internus; and the fourth to the flapes, called the *musculus stapedis*.

The two meatus's are situate at the sides of the cavity; the one opening into the palate, called *aqueductus*; the other shorter and bigger, opening into the sinus in the mamillary process.

The two apertures, or fenestræ, of the tympanum, are in the surface of the os petrosum, which is opposite to the membrane of the tympanum. The first, called *fenestra ovalis*, by reason of its figure, is situate a little higher than the other, and receives the basis of the flapes. The other is called *rotunda*, notwithstanding its figure, is oval like the former, and is closed by a thin, dry, transparent membrane, resembling that of the tympanum.

The last thing considered in the cavity of the tympanum, is a fine chord which runs over the inner surface of the membrane, called *chorda tympani*. Anatomists have long disputed, whether it was an artery, a vein, a nerve, or the tendon of one of the muscles of the malleus: but it is now discovered to be a branch of the fifth pair of nerves, which meets the portio dura of the auditory nerve.

The two fenestræ abovementioned, open into a cavity dug out of the os petrosum, called the *labyrinth*, as being perplexed with diverse windings and meanders. In this cavity is supposed to be contained the innate air. It is divided into three parts; the first called the *vestibule*, by reason it leads into the other two: in it are observed nine apertures, or foramina. The second, placed on one side of the vestibulum towards the back of the head, comprehends three round canals, disposed in a semi-circular form, and thence called *canales semi-circulares*. The third is the *cochlea*, which consists of two parts, viz. a spiral semi-oval canal; and a lamina, formed into a spiral flight. The canal makes two turns and an half round a newel, or axis, still growing less as it ascends. The spiral lamina divides this cavity into two, being fattened by its base to this newel, and by its other extremity, to the surface of the canal opposite to the newel, by means of a very fine membrane. The cavity of the cochlea thus divided, forms, as it were, two winding stair-cases, both formed on the same newel, one over the other, but without any communication between them. In the aqueduct is the auditory nerve, which consists of two branches, or parts, the one soft, called *portio mollis*; and the other harder, *portio dura*: the soft part is spent on the organ of hearing, being divided into five branches, which form a delicate web, that lines the vestibulum, cochlea, &c. The hard part, passing out of the cranium is distributed among the parts of the external ear, &c.

The other vessels of the internal ear, are arteries and veins from the carotids and jugulars.—Particular descriptions of each part of the ear, see under the proper articles, FENESTRA, MALLEOLUS, STAPES, ORBICULAR, LABYRINTH, VESTIBULE, COCHLEA, CANALES *Semi-circulares*, AUDITORY NERVE, &c.

The immediate organ of hearing, has been generally supposed to be the membrane of the tympanum: but later anatomists shew this to be a mistake, from diverse instances wherein that membrane has been absolutely destroyed, and broke, without the least diminution of the sense of hearing.

The parts that bid the fairest for this prerogative are those which compose the labyrinth, viz. the cochlea, lamina spiralis, vestibule, and semi-circular canals: the portio mollis of the auditory nerve, ramified and diffused through these parts, receives the impressions of sounds, and propagate them to the brain.

Behind, and under, the external ear, are a number of large glands called *parotides*, wherein is separated a great deal of saliva, which is conveyed by the excretory ducts into the mouth.

Distempers incident to the ear and adjacent parts, are noises, otalgia, otocoele, deafness, &c.

The comparative anatomy of the ear furnishes abundant instances of the creator's wisdom:—In birds, the outer ear is of a form proper for flight; not protuberant, as that would obstruct their progress, but close and covered.

In quadrupeds, its form is agreeable to the posture and motion of the body, but admirably varied, according to their various occasions: in some, as the hare, it is large, open, and erect; by which means, that timorous, defenceless creature, is warned of the least approach of danger: in others, it is covered, to keep out noxious bodies. In the subterraneous quadrupeds, who are forced to mine and dig for their food and habitation, as a protuberant ear would obstruct them, and be liable to injuries, their ears are very short, and are lodged deep and backwards in the head.

Thus moles have no auricle at all, but only a round hole, between the neck and shoulder. Some authors observe, that this meatus, or passage, is closed with a little skin, which opens and shuts like an eye-lid. The sea-calf, and the several species of lizards and serpents, are likewise without any external

ear. And the tortoise, camelion, and generality of fishes, have the passage of the ear quite stopped, or covered over. And there is a sort of whale, which has the aperture of the ear under the shoulder.

Among all the varieties in the structure of this organ, none, Dr. Grew observes, are more remarkable than those in the passage into the os petrosum. For in an owl, which perches on a tree, or beam, and hearkens after the prey beneath her, it is produced further out above, than below, for the better reception of the least sound: in a fox, which scouts underneath the prey at roost, it is for the same reason produced further out below: in a pole-cat, which hearkens strait forwards, it is produced behind, for the taking of a forward sound: whereas in a hare, which is very quick of hearing, and thinks of nothing but being pursued, it is supplied with a bony tube, directed backwards, so as to receive the smallest, and most distant sound that comes behind her.

Schelhammer denies the existence of the innate air, so much talked of, in the labyrinth; and with good reason, as there is a passage out of the labyrinth into the throat, through which the innate air must escape. This is past doubt: since by stopping the breath, and straining, we can force the external air into the ear, and even hear it rushing in. When the passage is any way stopped, as by a cold, &c. the hearing thereby becomes dull and obtuse: and when by strong swallowing, or other motion of the throat, the passage is opened, we perceive it by a sudden crack, and immediately hear very clearly; the load of feculent air being then discharged from the inner ear.

Several naturalists and physicians have held, that cutting off the ears rendered persons barren, and unprolific; and this idle notion was what first occasioned the legislators to order the ears of thieves, &c. to be cut off, lest they should produce their like.

The ear has its beauties, which a good painter ought by no means to disregard: where it is well formed, it would be an injury to the head to be hidden. Suetonius insists particularly on the beauties of Augustus's ears; and Ælian, describing the beauties of Aspasia, observes she had short ears.

Martial also ranks large ears among the number of deformities, Felibien.

Among the Athenians, it was a mark of nobility to have the ears bored, or perforated. And among the Hebrews and Romans this was a mark of servitude.

Tingling of the EAR. See the article TINNITUS.

EAR, in music, denotes a kind of internal sense, whereby we perceive and judge of harmony, and musical sounds.

In music, we seem universally to acknowledge something like a distinct sense from the external one of hearing; and call it a good ear. And the like distinction we should probably acknowledge in other affairs, had we got distinct names to denote those powers of perception by.

Thus, a greater capacity of perceiving the beauties of painting, architecture, &c. is called a fine taste.

EAR-RING, } See the articles { PENDANT.

EAR-WAX, } { CERUMEN.

EAR, is also applied to a long cluster of flowers, or seeds, produced by certain plants, and usually called by botanists, *spica*. The flowers and seeds of wheat, rye, barley, &c. grow in ears. The same holds of the flowers of lavender, &c. We say, the stem of the ear, i. e. its tube or straw: the knot of the ear: the lobes, or cells, wherein the grains are enclosed: the beard of the ear, &c. great numbers of ears of wheat have been known to arise from the same root.

Jews EAR. See the article JAW.

EARING Third. See the article THIRD.

EARL, an English title of honour, or degree of nobility, next below a marquis, and above a viscount.

Earls, were anciently attendants, or associates of the king in his councils, and martial expeditions; much as comites, counts, were of the magistrates of Rome, in quality of deputies, to execute their offices for them.

Hence, also Earls are called in Latin, *comites*; in French, *comtes*, counts, &c.—The Germans call them *graves*, as landgrave, markgrave, palgrave, &c. The Saxons, *ealdormen*; the Danes, *eorlas*; and the English, *Earls*. Originally, the title Earl always died with the man; William the Conqueror first made it hereditary; giving it in fee to his nobles; and annexing it to this or that shire or county: for the support of the state thereof, he allotted the third penny out of the sheriffs court, issuing out of all pleas of the shire from which the Earl took his title. But of later days the matter is much altered.

Earls are now created by charter, without any authority over, or particular relation to, their counties; and without any profit arising thence, except some annual stipend out of the exchequer for honour sake. The number of Earls being of late much increased, and no more counties being left for them; several of them have made choice of some eminent part of a

county, as Lindsey, Holland, Craven, &c. Others, of some town, as Marlborough, Exeter, Bristol, &c. And others of some village, or their own seat, park, &c. as Godolphin, Bolton, Danby, Wharton, &c.

Two *Earls* we have which are not local, *i. e.* not dignified from any places, but from noble families, *viz.* *Earl Rivers*, and *Earl Pauler*. A third is denominated from his office, *viz.* the *Earl Marshal*.

Earls are created by cincture of sword, mantle, a cap and a coronet put on his head, and a charter in his hand. They are styled by the king, *confranguini nostri*, our cousins. Their title is, *most potent and noble lord*. Their coronet has the pearls raised on points, with leaves between.

Earl was a mighty title among the Saxons: it is observed to be the most ancient of any of the peerage; and that there is no other title of honour in use among the present nobility which was likewise used among the Saxons, beside it.—The original titles of honour among the Saxons, were *Eseling*, *Ealþepman*, and *Begen* or *Begn*.—The first appropriated to those of the royal family: the other two to the rest of the nobility; only the thani were afterwards distinguished into majores and minores.

EARL-MARSHAL, is a great officer, who had anciently several courts under his jurisdiction, as the court of chivalry, now almost forgotten; and the court of honour, lately revived.

He has also some prehemine in the court of marshalsea; where he may sit in judgment against criminals offending within the verge of the court; whence the chief officer under him is called *Knight-Marshal*.—Under him is also the herald's office, or college of arms.

The office of *Earl-Marshal* is hereditary in the most noble family of Howard; and enjoyed by the duke of Norfolk, the principal branch thereof; though now, for reasons of state, it is discharged by deputation: but yet it is to be observed, it is not given out of the name, and family of Howard.

EARNEST, *Arrha*, money advanced to compleat, or assure, a verbal bargain, and bind the parties to the performance thereof.

By the civil law, he who recedes from his bargain, loses his *earnest*: or, if the person, who received the *earnest*, give back, he is to return the *earnest* double. But, with us, the effect of *earnest* is more: the person who gave it, is in strictness obliged thereby to abide by his bargain; and in case he decline it, is not discharged upon forfeiting his *earnest*; but may be sued for the whole money stipulated.

EARTH, *Terra*, in natural philosophy, one of the four vulgar or peripatetical elements; defined a simple, dry and cold substance; and as such, an ingredient in the composition of all natural bodies.

It should be well observed, that the element *earth* is a very different matter from the *earth* whereon we tread: Aristotle having laid down cold and dry as his first element; to give it a suitable name, looked among the diverse bodies, for that which should come the nearest thereto; which being *earth* he gave his first element that denomination: though, thus borrowing a word that had been used for a different thing, occasioned a great part of his followers to run into an extravagant error, and to suppose, that this habitable fossil *earth*, was an element.

EARTH, in chymistry, is the fourth of the chymical elements, or principles, into which all bodies are resolvable by fire.

After drawing off the spirit, sulphur and phlegm, and salt, *e. gr.* of wine, what remains in the retort, is a tasteless smellless, dusty matter, not capable either of being raised by distillation, or dissolved by solution, and is called *earth*, or *terra damnata*, or *caput mortuum*. See *CAPUT MORTUUM*.

This *earth* is supposed to be the basis, or substratum of all bodies; and that, wherein the other principles reside. It is all that is solid, *e. gr.* in an animal or vegetable body, *i. e.* all the real vascular part; the rest being juices.

EARTH, in natural history, is a fossil, or terrestrial matter, whereof our globe principally consists; whose character is to be neither dissoluble by fire, water nor air; not transparent, more fusible than stone, and generally containing some degree of fatness.

Of such *earths* some are simple, and immutable; others, compound and fatty. Of the first kind is chalk, pumice, and rotten-stone; of the second, or compound kind, are boles of all kinds, red, white and brown; fullers *earth*, the diverse kinds of medicinal *earth*, as the cretica, hungarica, turcica, fœcica, lemnian *earth*, malta *earth*, terra sigillata, &c. To this class are likewise referred argillæ, or clay-*earths* formed into potters ware.

These *earths* are all chymically resolvable into an oil, a little acid salt, &c. and a calx, which is the basis, or the *earth* properly so called. See the divers kinds of earths described

under their proper articles, **CHALK**, **PUMICE**, **BOLE**, **SIGILLATA**, *Terra*, &c.

Naturalists generally rank sand as a species of *earth*; though with no great propriety. Sands being, in strictness, a sort of crystals, or little transparent pebbles, calcinable, and by the addition of a fixed alkaline salt, fusible, and convertible into glass: and therefore properly reducible to the class of stones.

By means of sand it is, that the fatty *earth* is rendered fertile, and fit to seed vegetables, &c. for pure *earth* is liable to coalesce into a hard coherent mass, as in clay; and *earth* thus imbedded and as it were glued together, would be very unfit to nourish plants. But if with such *earth*, sand, *i. e.* hard crystals which are indissoluble in water, and still retain their figure, be intermixed, they will keep the pores of the *earth* open, and the *earth* it self loose and incompact, and by that means will give room for the juices to move, ascend, &c. and for plants to be nourished thereby. Thus a vegetable, planted either in the sand alone, or in the fat glebe and *earth* alone, receives no growth or increase; but is either starved or suffocated: but mix the two, and the mass becomes fertile. In effect, by means of sand, the *earth* is rendered in some measure organical: by preserving a sort of pores, and interstices therein, somewhat analogous to vessels is effected, by which the juices of the *earth* may be conveyed, prepared, digested, circulated, and at length excreted and thrown off into the roots of plants. See Supplement article **TERRÆ**.

CASTING, in **EARTH**. See the article **CASTING**.

EARTH, in geography, this terraqueous globe, or ball, whereon we inhabit, consisting of land and sea.

The *earth*, considered in different relations, or habitudes, makes the subject of geography, and geometry.

The figure of the **EARTH** is demonstrated to be nearly spherical. Thus the moon is frequently seen eclipsed by the shadow of the *earth*; and in all eclipses, that shadow appears circular, what way soever it be projected, whether towards east, west, north or south, and howsoever its diameter vary, according to the greater or less distance from the *earth*.

Hence it follows, that the shadow of the *earth*, in all situations, is really conical; and consequently the body that projects it, *i. e.* the *earth*, is nearly spherical.

The natural cause of this sphericity of the globe is according to Sir Isaac Newton, the great principle of attraction, which the creator has stamped on all the matter of the universe; and whereby all bodies, and all the parts of bodies mutually attract one another.

And the same is the cause of the sphericity of the drops of rain, quicksilver, &c.

We say it is nearly spherical; for the inequalities on its surface prevent its being perfectly so. Besides, that Huygens and Sir Isaac Newton have shewn, that the *earth* is higher and bigger under the equator, than at the poles: so that its figure, nearly, is that of an oblate spheroid, swelling out towards the equatorial parts, and flattened or contracted towards the poles. The ratio of the greater diameter to the less, Huygens determines to be as 578 to 577.

The reason of this inequality is deduced from the diurnal rotation of the *earth* on its axis; as is already shewn in that of the sun.

This roundness of the *earth* is further confirmed by its having been frequently sailed round: the first time was in the year 1519, when Ferd. Magellan made the tour of the whole globe in 1124 days. In the year 1557, our countryman Drake performed the same in 1056 days: in the year 1586, Sir Thomas Cavendish made the same voyage in 777 days; Simon Cordes, of Rotterdam, in the year 1590; and in the year 1598, Oliver Noort, a Hollander, in 1077 days; Will. Corn. van Schouten, in the year 1615, in 749 days; Jac. Heremites and Joh. Huygens, in the year 1623, in 802 days: all of whom sailing continually from east to west, at length arrived in Europe, whence they set forth; and in the course of their voyage observed all the phenomena, both of the heavens and earth, to correspond to and confess this spherical figure.

What the *earth* loses of its sphericity by mountains and valleys, is nothing considerable; the highest eminence being scarce equivalent to the minutest protuberance on the surface of a lemon: what it loses by the swelling of the equatorial parts is more sensible.

Sir Isaac Newton makes the greatest diameter 34 miles bigger than the less, fixing the ratio, as 692 to 688. If the *earth* were in a fluid state, its revolution round its axis would necessarily make it put on such a figure, by reason the centrifugal force being greatest towards the equator, the fluid would there rise, and swell most: and that it should be so now, seems necessary to keep the sea in the equinoctial regions from overflowing the *earth* thereabouts.

Add, that experiments made on pendulums, which must be

of different lengths, to swing equal times here and at the equator, evince the same thing.

M. de la Hire and M. Derham, indeed, have shewn, that this diversity may arise either from the greater heat, or the greater rarity of the air there than here; as having observed a like variation between pendulums when heated and cold, and when in vacuo and open air. But, besides that Sir Isaac Newton and M. Bernoulli, have set aside these causes as insufficient; M. Cassini has found, that the degrees of a meridian grow larger, the further we go towards the line by one eight hundredth part of every degree; which puts the spheroidism of the earth beyond question.

The ancients had various opinions as to the figure of the earth: some, as Anaximander, held it cylindrical; and others, as Leucippus, in form of a drum. But the principal opinion was, that it was flat; that the visible horizon was the bounds of the earth, and the ocean the bounds of the horizon; that the heavens and earth above this ocean was the whole visible universe, and that all beneath the ocean was Hades. Of which opinion were not only divers of the ancient poets and philosophers, but also some of the christian fathers, as Lactantius, St. Augustine, &c.

Fa. Taquet draws some pretty conclusions from the spherical figure of the earth; as, 1. That if any part of the surface of the earth were quite plain; a man could no more walk upright thereon, than on the side of a mountain: 2. That the traveller's head goes a greater space than his feet; and a horseman than a footman, as moving equal arches of greater circles: 3. That a vessel full of water being raised perpendicularly, some of the water will be continually flowing out, yet the vessel still remain full; and on the contrary, if a vessel full of water be let perpendicularly down, though nothing flow out, yet it will cease to be full: consequently there is more water contained in the same vessel at the foot of a mountain, than on the top; by reason the surface of the water is compressed into a segment of a less sphere below than above. *Tuq. Astronom. L. I. c. 2.*

The magnitude of the EARTH, and the number of miles its diameter contains, has been variously determined by various authors, ancient and modern. The way to arrive at it, is, by finding the quantity of a degree of a great circle of the earth. But this degree is found very different, according to the different methods and instruments made use of, as well as the different observers.

The method observed by Mr. Norwood, and the French astronomers, Picard, Cassini, &c. viz. by measuring the distance between two remote places on the same meridian, is undoubtedly the best; and was performed with such exceeding accuracy, especially by M. Cassini, that hardly any thing further or better can be expected. According to that author, the ambit or circumference of the Earth is 123750720 Paris feet; or, 134650777 English feet; or, 25031 $\frac{1}{2}$ of our statute miles: whence, supposing the Earth spherical, its diameter must be 7967 statute miles; and consequently its radius, or semi-diameter, may be taken in a round number for 20000000 feet: its surface will be 199444206 miles; which being multiplied into $\frac{1}{2}$ of its semi-diameter, gives the solid content of the globe of the earth 26485600000 cubic miles. On the surface of the earth are conceived the same circles, as on the surface of the mundane sphere already described; viz. an EQUATOR, ECLIPTIC, TROPICKS, POLAR-CIRCLES, MERIDIANS, HORIZON, PARALLELS, &c. which see, as also SPHERE and GLOBE.

The terraqueous globe is now generally granted to have two motions, the one diurnal, around its own axis, in the space of 24 hours, which constitutes the natural day or nycthemeron.

The other, annual, round the sun, in an elliptical orbit, or track, in 365 days 6 hours, constituting the year.

From the former we derive the diversities of night and day. (See NIGHT and DAY.) And from the latter, the vicissitudes of seasons, spring, summer, &c.

See the motion of the earth proved under the article EARTH in astronomy.

In the terraqueous globe we distinguish three parts, or regions, viz. 1. The external part, or crust, which is that from which vegetables arise, and animals are nourished. 2. The middle, or intermediate part, which is possessed by fossils, extending further than human labour ever yet penetrated. 3. The internal, or central part, which is unknown to us, though by many authors supposed of a magnetic nature; by others, a mass, or sphere of fire; by others, an abyss, or collection of waters, surrounded by the strata of earth; and by others, a hollow, empty space, inhabited by animals, who have their sun, moon, plants, and other conveniences within the same. Others divide the body of the globe into two parts, viz. the external part, which they call the cortex, including the whole depth or mass of the strata of the earth; and the internal, which they

call the nucleus, being of a different nature from the former, and possessed by fire, water, or the like.

The external part of the globe either exhibits inequalities, as mountains and valleys; or it is plain and level; or dug in channels, fissures, beds, &c. for rivers, lakes, seas, &c.

These inequalities in the face of the earth, and by most naturalists supposed to have arose from a rupture, or subversion of the earth, by the force either of the subterraneous fires or waters. The earth in its natural and original state, Des Cartes, and after him Burnet, Steno, Woodward, Whiston, and others, suppose to have been perfectly round, smooth, and equable; and they account for its present, rude and irregular form, principally from the great deluge. See DELUGE.

In the external, or cortical part of the earth, we meet with various strata, which are supposed to be the sediments of various floods, the waters whereof being replete with matters of diverse kinds, as they dried up, or soaked through, deposited these different matters, which in time hardened into strata of stone, sand, coal, clay, &c.

Dr. Woodward has considered the business of these strata, with great attention, viz. their order, number, situation with respect to the horizon, depth, intersections, fissures, colour, consistence, &c. He ascribes the origin and formation of them all, to the great flood, or cataclysmus. At that terrible revolution, he supposes all the terrestrial bodies of all kinds to have been dissolved and mixed with the waters, and sustained therein, so as only to constitute one common mass therewith. This mass of terrestrial particles, intermixed with water, he supposes to have been at length precipitated to the bottom, and that generally, according to the laws of gravity, the heaviest sinking first, and the lighter in their order. By such means were the strata formed, whereof the earth consists, which attaining their solidity and hardness by degrees, have continued so ever since. These sediments, he further concludes to have been at first all parallel and concentrical, and the surface of the earth formed thereby, perfectly smooth and regular: but that in course of time, diverse changes happening from earthquakes, vulcano's, &c. the order and regularity of the strata was disturbed and broke, and the surface of the earth, by such means, brought to the irregular form in which it now appears. See further particulars under DELUGE.

EARTH, in astronomy, is one of the primary planets, according to the system of Copernicus. Its character is 2.

In the hypothesis of Ptolemy, the earth is the centre of the system.

Whether the earth move, or remain at rest, i. e. whether it be fixed in the center, with the sun, heavens, and stars moving round the same from east to west; or whether the heavens and stars being at rest, the earth move from west to east, is the great article that distinguishes the Ptolemaic from the Copernican system?

Motion of the EARTH.—The happy industry of the astronomers of our age, has put the mobility of the earth beyond all reasonable doubt: on which account, the names of Copernicus, Gassendus, Kepler, Hook, Flamsteed, &c. will ever be mentioned with the highest honour.

Indeed, the same motion had been held by many of the ancient philosophers. Cicero, in his *Tus. Quest.* assures us, that Nicetas of Syracuse first discovered that the earth had a diurnal motion, by which it revolved round its axis in the space of 24 hours: and Plutarch, *de Placit. Philosoph.* tells us, that Philolaus discovered its annual motion round the sun. And about 100 years after Philolaus, Aristarchus the Samian, proposed the motion of the earth in stronger and clearer terms, as we are assured by Archimedes, in *Arenar.*

But the religious opinions of the heathen world, prevented the doctrine's becoming more cultivated. For Aristarchus being accused of sacrilege by Cleanthes for moving Vesta, and the tutelary deities of the universe out of their place; the philosophers began to lay aside so perilous a position.

Many ages afterwards, Nic. Cusanus revived the ancient system, in his *Dott. de Pignorant.* and asserted the motion of the earth: but the dogma got but little ground till the time of Copernicus, who shewed its great use and advantages in astronomy; and who had, immediately all the philosophers and astronomers, that durst think differently from the croud, and were not afraid of ecclesiastical censures, on his side. So that Kepler, his contemporary, made no scruple to cry: *hodierno tempore præstantissimi quique philosophorum & astronomorum Copernico adspiciuntur: jectæ est hæc glacies; vincimus suffragiis melioribus: cæteris pene sola obstat superstitiis aut metus a Cleanthibus.*

The arguments alledged against the motion of the earth, are weak and frivolous. The principal are,

1. That it is a heavy body, and very unfit for motion.
2. That if the earth were to move round its axis in 24 hours, all our houses, buildings, &c. would tumble down.
3. That bodies would not fall upon the places perpendicularly under

under them: nor could a bullet, *e. gr.* shot perpendicularly from the ground, fall back again upon the same spot.

4. That it is contrary to the words of scripture: and,
5. That it is repugnant to our senses, which represent the *earth* at rest, and the sun in motion.

The arguments for the motion of the *earth* are of another kind; and carry other sort of evidence with them; being deduced from actual observation and phenomena, and not from the fanciful surmises of timorous zealots. They are these: 1. The sun will equally appear in motion, and the *earth* as standing still, to a spectator on the *earth*; whether the sun really move round the *earth* at rest; or the *earth* move round the sun at rest.

For suppose the *earth* in T, (*Tab. Astronom. fig. 15. n^o. 2.*) and the sun in 1; the sun will then appear in Y. And suppose the sun to proceed in an orbit, surrounding the *earth*, from 1 to 2, he will then appear in X; and if he proceed further to 3, he will be seen in W; and thus will he appear to go on, according to the order of the signs in the ecliptic.

Suppose again the *earth* in 1; and the sun in S; the sun will now be seen in π : let the *earth* go on from 1 to 2, the sun will appear to the inhabitants of the *earth* to have proceeded from π to μ ; and if the *earth* proceed to 3, the sun will appear to have advanced further from μ to τ ; and so on, according to the successions of the sign of the ecliptic.

Thus does the sun appear alike to move, whether he really move or stand still; so that the objection from sense is of no force. But again,

2. If one of the planets be supposed to have moved a certain space, from west to east; the sun, *earth*, and other planets, together with the fixed stars, will all seem to an inhabitant of that planet, to have moved just so far round it the contrary way.

For suppose a star M, (*fig. 16. n^o. 2.*) in the zenith of an inhabitant of a planet placed in T; and suppose the planet to have revolved on its axis from west to east; in a certain space of time, the sun S, will have arrived at the zenith of T; then the star I, then N, then the *earth* L, and at length the star M again. To the inhabitant of the planet therefore, the sun S, with the *earth* L, and the stars I, N, M, &c. will appear to have moved round the planet a contrary way.

Thus, to the inhabitants of the planets, if any such there be, the mundane sphere, with the sun, stars, and all the other planets, will, as to us, appear to move round them from east to west. And accordingly, the inhabitants of our planet the *earth*, are only liable to the same delusive appearances with those of the rest.

3. The orbits of all the planets include the sun, as the common center of them all: but it is only the orbits of the superior planets that include the *earth*, which however is not in the centre of any of them, as we have already shewn under the articles SUN and PLANET.

4. The *earth's* orbit being proved to be between those of Venus and Mars; it follows, that the *earth* must turn round the sun: for, as it lies within the orbits of the superior planets, their motion would indeed appear unequal and irregular; but they would never either be stationary or retrograde without this supposition.

5. From the orbits and periods of the several planets about the sun, and of the moon and satellites round the *earth*, Jupiter and Saturn, it is evident, that the law of gravitation is the same towards the *earth*, Jupiter and Saturn, as towards the sun; and the periodical times of the several bodies moving around each, are in the same ratio to their several distances from them.

Now, it is certain, that on the hypothesis of the *earth's* annual motion, her periodical time exactly suits this law, bearing such a proportion between those of Mars and Venus, as the several other bodies directed by the same law do bear, *i. e.* the squares of the periods are in all, as the cubes of the distances from the centre of their orbits. But supposing the *earth* too at rest, this law is broken most exorbitantly.

For if the *earth* do not move round the sun, the sun must move with the moon round the *earth*: now the distance of the sun to that of the moon, being 10000 to 46; and the moon's period being less than 28 days, the sun's period should be found no less than 242 years, whereas in fact it is but one year. Which single consideration, Mr. Whiston thinks of weight enough to determine the controversy between the two systems, and to establish the motion of the *earth* for ever.

Whereas, supposing our *earth* to have once revolved about the sun in a circular orbit, whose semi-diameter were equal to the *earth's* original distance from the sun six degrees past its perihelion, the annual period would be found exactly and surprisingly equal to the lunar of the ancient solar year, which were exactly commensurate; containing 12 fynodical, or 13 periodical months, *i. e.* 365 days, 4 hours, 19 minutes.

6. The distances of certain of the fixed stars from the zenith, have been observed to be various at various times of the year.

That, particularly, of the pole-star from the pole, has been discovered by Mr. Flamsteed from repeated observations, for 7 years successively; to be greater about the summer solstice, than about the winter, by about 40 seconds. Whence it appears, that the *earth* changes its situation; receding from the pole-star, and returning back to it again annually.

Which argument is further confirmed from this, that the *earth* is nearer the sun at Christmas than at Midsummer; as appears both from the sun's apparent diameter being greater in December than in June; and from its motion being swifter by one 25th part in the former season, than the latter: whence it is that there are about 8 days more in the summer half year, *viz.* from March to September, than in the winter, from September to March.

7. Either the heavenly bodies revolve round the *earth* in 24 hours, or the *earth* revolves round its axis in that time. Now the planets, revolving round the sun, perform their revolutions in greater or less times, as their orbits are greater or less, *i. e.* as they are more or less remote from the sun. Of consequence, if the stars and planets revolved round the *earth*, they would perform their revolutions in unequal times, according as their orbits, or their distances, were unequally big. At least, the fixed stars, which are at such prodigious distances from the *earth*, would never move round it in 24 hours, as the nearest planet is supposed to do.

This is an inelegancy, which is avoided in the system where the *earth* is supposed to move; and where every planet is so much the longer in describing its annual orbit round the sun, as that orbit is greater.

8. In all the works of nature which we are acquainted withal, the Creator appears to act by the shortest, easiest, and simplest means. Now, if the *earth* be at rest, and the stars move, the velocity of these latter must be immense; and yet all the purposes thereof, might have been answered by a moderate motion of the *earth* alone.

For the moon's mean distance from the *earth*, is 57 semi-diameters of the *earth*; which, supposing a semi-diameter of the *earth* 3440 geographical miles, amounts to 196680 miles. Hence, the circumference of the moon's diurnal circle, being 1231380 such miles, the moon's horary motion must be 483308 miles: consequently in each second, a space less than that of the pulse of an artery, the moon, though the slowest of all the heavenly bodies, must move 3 miles and five 9ths. Again, the sun's mean distance from the *earth* is 22000 semi-diameters of the *earth*, or 75680000 geographical miles; consequently the sun's diurnal progress, when in the equator, must be 475270400 miles: and therefore in the space of one second, *i. e.* in the twinkling of an eye, he must move 5480 miles.

Again, the distance of the sun from the *earth*, is to that of Mars nearly as one and a half; to that of Jupiter, as one to five and a quarter; and to that of Saturn, as one to nine: wherefore, as the diurnal spaces, and all other things described in the same time, are in the same ratio; Mars in one twinkling of an eye, must fly 8222; Jupiter 28688; and Saturn 52060 miles. Lastly, the fixed stars being yet vastly more remote from the *earth* than Saturn, their motion in, or near the equator, must be vastly swifter than that of Saturn.

9. If the *earth* be at rest, and the stars move by any common motion, the several planets must each day describe several spirals running forth to a certain term towards the north, and thence returning to the opposite term towards the south; sometimes narrower, and sometimes broader.

For the distances of the several planets from the zenith alter every day; increasing to a certain point towards the north, and thence decreasing again towards the south: consequently, the altitude of the pole, being always found the same, and the planets not returning to the same point of the meridian; they do not describe circles but spirals. Add, that as the several planets do not retain the same distance from the *earth*, but are sometimes nearer, and sometimes recede further from it; at a greater distance, a greater spiral, and at a less, a less is described.

Further, as their motion is slower, when the planet is further from the *earth*; the greater spirals are described in lesser times than the lesser. And as the greatest and least distance of the planets from the *earth* is not affixed to the same point of the heavens, the planets have moved in different tracts every day from the beginning.

10. Bodies let fall from any considerable height, are found by experiment not to fall upon the spot perpendicularly under them, but to the south-east thereof. See DESCENT.

The experiments was proposed to Dr. Hook, in the year 1679, by a person, who suggested, that if the *earth* had any diurnal motion, the body would fall to the east of the perpendicular. Dr. Hook, on that occasion, read a discourse before the Royal Society, wherein he endeavoured, *a priori*, to assign what curve a falling body would describe; asserting particularly that the fall of the body would not be directly east, but south-east: which was confirmed by diverse actual trials.

11. The power of gravity is found to decrease as you approach nearer to the equator: which is a circumstance that agrees to all bodies which have a motion on their axis, and them only, as being really the necessary result of such motion.

For a body, revolving on its axis, the parts, or appendages thereof, are continually endeavouring to recede from the centre. Consequently, the equator being a great circle, and the parallels all decreasing towards the poles, the centrifugal force is greatest in the equator, and decreases towards the poles, in the ratio of the diameters of the parallels to that of the equator. Now the power of gravity determines the several parts or appendages towards the centre of the whole; consequently the centrifugal force acting contrary to the power of gravity, retards the descent of bodies, and that most where it is greatest.

Dr. Keil computes, that the force of gravity to the centrifugal force at the equator is as 289 to 1; consequently, a body placed there, would lose one 289th part of the weight it would have, were the earth at rest. Consequently, the centrifugal force at the poles, being infinitely small, a body will there weigh 289 pounds, which at the equator only weighs 288.

12. The following is an actual demonstration of the earth's motion, drawn from physical causes, for which we are indebted to the discoveries of Sir Isaac Newton; and which Dr. Keil takes for conclusive and unanswerable.

All the planets, it is demonstrated, gravitate towards the sun: and observations testify to us, either that the earth turns round the sun, or the sun round the earth, in such manner, as to describe equal areas in equal times. But it is demonstrated further, that whenever bodies turn round each other, and regulate their motion by such law, the one must of necessity gravitate to the other: consequently, if the sun in its motion, do gravitate to the earth; action or re-action being equal and contrary, the earth must likewise gravitate towards the sun. Again, the same author has demonstrated, that when two bodies gravitate to one another, without directly approaching one another in right lines; they must both of them turn round their common centre of gravity: the sun and earth, therefore, do both turn round their common centre of gravity; but the sun is so great a body in respect of our earth, which is, as it were, but a point; that the common centre of gravity of the two bodies, will lie within the body of the sun itself, and not far from the centre of the sun. The earth, therefore, turns round a point, which is in the body of the sun; and therefore it turns round the sun. Q. E. D.

To say no more, to suppose the earth at rest, confounds and destroys all the order and harmony of the universe, annuls its laws, and sets every part at variance with other, robs the Creator of half the praise of his work, and mankind of the pleasure of the contemplation thereof. In effect, it renders the motions of the planets inextricable and useless, which otherwise are plain and simple. So that such of the later astronomers, as have asserted it with the most zeal, have been forced to set it aside, when they came to compute the motions of the planets. None of them would ever attempt to compute these motions in variable spirals; but in all their theories they tacitly suppose the earth to move on its axis, so as to turn the diurnal spirals into circles.

Thus, the jesuite Ricciolus, tho' he, at the pope's command, opposed the motion of the earth with all his might, as something contrary to holy scripture; yet, to frame astronomical tables, which should any thing tolerably agree to observation, he was forced to have recourse to the motion of the earth, as his only refuge.

This, De Chales, another of the same fraternity, frankly confesses: 'P. Ricciolus—nullas tabulas aptare potuit quæ vel mediocriter observationibus responderent; nisi secundum systema terre motæ; notwithstanding, that he called in all the foreign and forced assistances of moveable epicycles: so that in his *Astronomia reformata*, where he undertakes to give accurate tables of the celestial motions, he gives into the hypothesis of the motion of the earth.' De Chales *Astron. Reformata*. l. X. c. 1.

The system, then, which supposes the earth at rest, is, of it self, of no use, or significance in astronomy; nor does it avail more in physics: for the principal phenomena are no way deducible from it; but the retainers thereto are either forced to fly to the immediate agency of the deity (which in physics is the same as the *retinendum ad absurdum* in geometry) or to reasons and principles unknown.

Some oppose the motion of the earth, as contrary to revelation; there being mention made, in holy scripture, of the sun's rising and setting; of his standing still in the time of Joshua; and his going back in that of Hezekiah.

Now, to take the genuine sense of these passages, the laws of interpretation must be settled. 1. Then, we suppose, that the several words of scripture have their several ideas corresponding to them; and that a man takes their sense, in whom those ideas are excited by the reading. 2. That the words of scripture, attentively read, are sufficient to excite those ideas in a mind not prepossessed. Hence, 3. It follows,

that either God must have exhibited the definitions of the words that occur in scripture; or, that he supposes prior notions, and leaves us to take their sense in the ordinary way. Hence, 4. We argue, that no other ideas are to be affixed to the words of scripture, but such as occur to a person who looks or attends to the things themselves spoke of.

By the sun's rising, therefore, is meant no more than his re-appearance in the horizon; after he had been hid below it: and by his setting, an occultation of the sun, which was before visible in the horizon. When the preacher therefore says, Eccles. i. 5. *The sun rises, and sets, and returns to his place*; he means, doubtless, no more than the sun, which before was hid, is now seen in the horizon; and after being there conspicuous, is hid again, and at length re-appears in the east. For thus much only appears to a person who views the sun; and therefore thus much, and no more, is expressed by the sacred writers.

In like manner, when in Josh. x. 12, 13. the sun and moon are said to have stood still; all meant by itation is, that they did not change their place, with respect to the earth. For that general, by *sun stand thou still over Gibeon, and thou moon, over the valley of Ajalon*; required no more, than that the sun, which then appeared over that city, should not change its situation. And from his bidding the sun to keep his situation, it would be unjust to infer, that it moves round the earth at rest.

Gassendus, very pertinently to the present purpose distinguishes two faced volumes, the one written, called the bible; the other, nature, or the world; God having manifested himself by two lights, the one of revelation, and the other of demonstration. Accordingly, the interpreters of the former are divines, of the latter mathematicians. As to matters of natural knowledge, the mathematicians are to be consulted; and as to the objects of faith, the prophets; the former, being no less interpreters, or apostles, from God to men, than the latter. And as the mathematician would be judged to wander out of his province, if he should pretend to controvert, or set aside any article of faith from principles of geometry; so it must be granted, the divines are no less out of their limits, when they venture to pronounce on a point of natural knowledge, beyond the reach of any not versed in geometry, and optics, merely from holy scripture, which does not pretend to teach any thing of the matter.

For instances, we may quote Lactantius, and Augustine; the first of whom rendered himself ridiculous by disputing, from scripture, against the roundness of the earth; and the latter, against the antipodes. See ANTIPODES.

The earth, thus proved to move, it is to be further observed, that the altitude of the pole being found at all times of the year, i. e. in all points of its annual orbit, (the ecliptic,) to be the same; it follows, that the earth proceeds in such manner along its orbit, as that its axis is constantly parallel to the axis of the world, and of consequence parallel to it self.

This motion, which Copernicus calls the *motion of libration*, may be well enough illustrated, by supposing a globe, with its axis parallel to that of the earth, painted on the flag, or ancient of a mast, moveable on its axis, and continually driven by the west wind, while it makes the tour of an island: it is evident that in every situation of the ship, the axis of the painted globe will continue parallel to the axis of the world.

According to Sir Isaac Newton's principles, the earth's axis does, in every annual revolution, incline twice towards the ecliptic, and twice return to its former position. On which mutation it is, that the precession of the equinoctial points is supposed to depend; and as Mr. Flamsteed imagines, the annual parallax of the fixed stars likewise.

AXIS, and ANGLE.

EARTH, in agriculture, and gardening. See SOIL, LAND, &c. Untried EARTH, the soil, or earth which is six or seven inches deep, where neither spade nor plough has reached.

This is greatly recommended by Mr. Lawrence, for amendments and improvements, both in the fruit and kitchen garden: he assures us, from his own experience, that no kind of compost, made with art, exceeds it; and adds, that if the choicest fruit trees be planted herein, they presently discover an uncommon healthfulness and vigour: and that if any tender sorts of annuals be sown in this earth, made fine by sifting, their looks, colour, &c. soon discover that they like the soil. Melons and cucumbers, need no other compost but this *untried earth*: and asparagus it self will prosper, at least, as well in this *untried earth*, if laid a foot and a half deep, as with all the usual expence of dung. Though for the tenderer flowers, and exotics, this earth is not found to have any extraordinary excellencies. For annual plants, produced

from seed, a coat of this *untried earth*, two inches deep, may suffice: on other occasions, a greater depth is required.

EARTH THING, in the general sense. See *INTERRING.*

EARTHING, in agriculture, and gardening, denotes the covering of vines, fellery, and other shrubs and plants with *earth*.

EARTHQUAKE, in natural history, a vehement shake, or agitation of some considerable place, or part of the earth; from natural causes; attended with a terrible noise like thunder, and frequently with an eruption of water, or fire, or else of smokes or winds.

Earthquakes are the greatest, and most formidable phenomena of nature. Aristotle, and Pliny, distinguish two kinds, with respect to the manner of the shake, *viz.* a *remor*, and a *pulse*; the first being horizontal, in alternate vibrations, compared to the shaking of a person in an ague. The 2d, perpendicular, up and down: which latter kind are also called by Aristotle, *pegmatas*, from the resemblance of their motion to that of boiling.

Agricola increases the number, and makes four kinds; which Alb. Magnus again reduces to three, *viz.* *inclination*, when the earth vibrates alternately from right to left; by which mountains have been sometimes brought to meet, and clash against each other: *pulsation*, when it beats up and down like an artery: and *trembling*, when it shakes and quavers every way, like a flame.

Phenomena of EARTHQUAKES.—The *Philosoph. Transact.* furnish us with abundance of histories of earthquakes; particularly, one at Oxford, in 1665, by Dr. Wallis and Mr. Boyle. Another, at the same place, in 1683, by Mr. Pigot. And another in Sicily, in 1692-3, by Mr. Hartop, Fa. Alessandro Burgos, and Vin. Bonajutus; which last, is one of the most terrible ones in all history.

This shook the whole island, and not only that, but Naples and Malta shared in the shock. It was of the second kind mentioned by Aristotle and Pliny, *viz.* a perpendicular pulsation, or succussion. It was impossible, says the noble Bonajutus, for any body, in this country, to keep on their legs, on the dancing earth; nay, those that lay on the ground, were tossed from side to side, as on a rolling billow: and high walls leaped from their foundations several paces, &c. *Phil. Trans. N^o. 207.* The mischief it did is amazing: almost all the buildings in the countries were thrown down. Fifty-four cities and towns, beside an incredible number of villages, were either destroyed or greatly damaged. We shall only instance the fate of Catania, one of the most famous, ancient, and flourishing cities in the kingdom; the residence of several monarchs, and an university. This once famous, now unhappy Catania, to use the words of Fa. Burgos, had the greatest share in the tragedy. Fa. Anthon. Serrovita, being on his way thither, and at the distance of a few miles, observed a black cloud, like night, hovering over the city; and there arose from the mouth of Montebello, great spires of flame, which spread all around. The sea all of a sudden began to roar, and rise in billows: and there was a noise, as if all the artillery in the world had been at once discharged. The birds flew about astonished, the cattle in the fields ran crying, &c. His and his companions horses stopped short, trembling; so that they were forced to alight. They were no sooner off, but they were lifted from the ground above two palms; when casting his eyes towards Catania, he with amazement saw nothing but a thick cloud of dust in the air. This was the scene of their calamity: for of the magnificent Catania, there is not the least footstep to be seen. S. Bonajutus assures us, that of 18914 inhabitants, 18000 perished therein. The same author, from a computation of the inhabitants, before and after the earthquake, in the several cities and towns, finds that near 60000 perished out of 254900. *Ibid. n^o. 202.*

Jamaica is remarkable for earthquakes. The inhabitants, Dr. Sloan informs us, expect one every year. This author gives us the history of one in 1687: and another horrible one in 1692, is described by several anonymous authors. In two minutes time this shook-down and drowned nine 10ths of the town of Port-Royal. The houses sunk out-right, 30 or 40 fathoms deep. *Phil. Transact. n^o. 209.* The earth opening, swallowed up people; and they rose in other streets; some in the middle of the harbour, and yet many were saved; though, there were 2000 people lost, and 1000 acres of land sunk. All the houses were thrown down throughout the island. One Hopkins had his plantation removed half a mile from its place. Of all wells, from one fathom to six or seven, the water flew

out at the top with a vehement motion. *Ibid.* While the houses, on one side of the street were swallowed up, on the others they were thrown on heaps; and the sand in the street rose like waves in the sea, lifting up every body that stood on it, and immediately dropping down into pits; and at the same instant, a flood of water breaking in, rolled them over and over; some catching hold of beams and rafters, &c. ships and floops in the harbour were overfet and lost; the Swan Frigate particularly, was thrown over by the motion of the sea, and sinking of the wharf, and was driven over the tops of many houses, *Ibid.* It was attended with a hollow rumbling noise like that of thunder. In less than a minute, three quarters of the houses, and the ground they stood on, with the inhabitants, were all sunk quite under water; and the little part, left behind, was no better than a heap of rubbish. The shake was so violent, that it threw people down on their knees, or their faces, as they were running about for shelter. The ground heaved and swelled like a rolling sea; and several houses, still standing, were shuffled and moved some yards out of their places. A whole street is said to be twice as broad now as before; and in many places, the earth would crack, and open, and shut, quick and fast. Of which openings, two or three hundred might be seen at a time; in some whereof, the people were swallowed up; others, the closing earth caught by the middle, and pressed to death; in others, the heads only appeared. The larger openings swallowed up houses; and out of some would issue whole rivers of waters, spouted up a great height into the air, and threatening a deluge to that part the earthquake spared. The whole was attended with stench and offensive smells, the noise of falling mountains at a distance, &c. and the sky in a minute's time, was turned dull and reddish, like a glowing oven. Yet, as great a sufferer as Port-Royal was, more houses were left standing therein, than on the whole island beside. Scarce a planting-house, or sugar-work was left standing in all Jamaica. A great part of them were swallowed up, houses, people, trees, and all at one gape: in lieu of which afterwards, appeared great pools of water, which when dried up, left nothing but sand, without any mark that ever tree, or plant had been thereon. Above 12 miles from the sea, the earth gaped and spouted out, with a prodigious force, vast quantities of water into the air: yet the greatest violences were among the mountains and rocks; and it is a general opinion, that the nearer the mountains, the greater was the shake; and that the cause thereof lay there. Most of the rivers were stopped up for 24 hours, by the falling of the mountains; till swelling up, they made themselves new tracks and channels; tearing up in their passage trees, &c. After the great shake, many of those people who escaped, got on board ships in the harbour, where many continued above two months; the shakes all that time being so violent, and coming so thick, sometimes two or three in an hour, accompanied with frightful noises like a rustling wind, or a hollow rumbling thunder, with brimstone blasts, that they durst not come ashore. The consequences of the earthquake was a general sickness, from the noisome vapours belched forth, which swept away above 3000 persons of those who were left. *Ibid.* After the detail of these horrible convulsions, the reader will have but little curiosity left, for the less considerable phenomena of the earthquake at Lima, in 1687, described by Fa. Alvarez de Toledo, wherein above 5000 persons were destroyed; this being of the vibratory kind, so that the bells in the church rung of themselves: or that at Batavia in 1699, by Witzen: that in the North of England in 1703, by Mr. Thoresby; or, lastly, those in New-England in 1693, and 1670, by Dr. Mather. We will therefore relieve him with some attempts towards a theory of earthquakes.

Causes of EARTHQUAKES.—Naturalists are here divided. Some ascribe earthquake to water, others to fire, and others to air; and all of them with some reason. To conceive which, it is to be observed, that the earth every where abounds in huge subterraneous caverns, veins and canals; particularly about the roots of mountains: that of these cavities, veins, &c. some are full of water, whence are composed gulphs, abysses, springs, rivulets; and others full of exhalations; and that some parts of the earth are replete with nitre, sulphur, bitumen, vitriol, &c.

This premised, 1. The earth it self may be the cause of its own shaking; when the roots, or basis, of some large mass being dissolved, or wore away by a fluid underneath, it sinks into the same; and with its weight, occasions a tremor of the adjacent parts; and produces a noise; and frequently an inundation of water.
